"Bathe now in the stream before you,
Wash the war-paint from your faces,
Wash the blood-stains from your fingers,
Bury your war clubs and your weapons,
Break the red stone from this quarry,
Mould and make it into peace pipes.
Take the reeds that grow beside you,
Deck them with your brightest feathers,
Smoke the calumet together,
And as brothers live henceforward."

LONGFELLOW.

CHAPTER I.

THE ENGLISH STRANGER.—LIFE IN GUDVANGEN.

AT the lower end of the Grand Pass of the Nærodal in Norway, the ravine widens, and space is found for a few corn patches, some small potato fields,

"She was the fairest maiden for miles around."

and a river-side planting of alder and birch bushes, whose young twigs and withered leaves will form the winter sustenance of the cows when they return from the sæters, and of the few which may be seen ranging the pasture lands that extend a mile or two up the gorge.

The nimble creatures, in search of nutriment, make their way up the sides of the lowering cliffs, which are terrific in their awful grandeur, and the sweet clang of the cow-bells is heard amidst the grey rocks, hundreds of feet above the high road which winds through the vale below, and terminates at Gudvangen, in the clear, still green waters of the Næröfjord.

Hardly a mile inland from the fjord, stands a group of cottages. They are built of wood, and are a deep red brown in colour; the roofs project; the windows are small, and admit but very little light through the dull, thick panes. By each doorway stands a wood stack. In winter, buried in snow, and all the sunshine, seldom as it comes at all, excluded by the awful heights of the Sjerpenut, it is indeed a dreary place. But the little hamlet lay warm and picturesque in the sunlight, that summer's Sunday morning. The small window-panes sparkled, the wooden walls glowed with shades of Burnt sienna and Indian Lake; tall poppies stood stiffly up, and nodded their scarlet heads in the softly swaying breeze. The women came out to sit on the decaying beam which lay near the road-side, to watch the children as they climbed over the disused snow-plough, and gathered the flowers of the wild thyme, racing merrily to lay their pungent offerings on the old grandmother's knee. Presently the smallest of them all, a wee girl in a thick blue valmal gown and white linen cap, grew weary. The old woman lifted her into her lap, and in a cracked, shrill voice, chanted the metrical version of the twenty-third Psalm; then the little head nestled on to her shoulder, and the child slept, with its two little brown fists still clasping her drooping poppies and ox-eyed daisies.

The Sabbath in Norway is often passed without a Service, for the churches are long distances apart, and the præst takes them in turn. If a church stands on the shore of a fjord, it is a pretty sight to see a score of boats, heavily laden with the gaily dressed peasants, making their way over the waters to the sacred gathering point. There neighbours meet, and greetings are exchanged; and, as in Scotland, a long Service rewards those who come so far to hear it; none wearying of the Word of God, and as many men as women crowding to worship and to listen with undoubting faith. But when unable to attend a Service, still the peasants do not forget the Sabbath-day. They bring out their old black-lettered Bibles and books of Psalmody; the covers are heavy, and the clasps often of massive silver. So it was upon this Sunday morning. Anna, the little one's mother, read aloud, in her droning voice, the chapter which tells of Jesus walking on the water, and of Peter's ardent love, yet wavering faith. The words passed into the hearts of the listeners, and they realised that if they also loved truly, they too often let their fears hide the Lord from their sight, and a silence fell upon them all.

With the group stood Ammitta Loen, or, as she was generally called, Mitta Bersdatter. She was the fairest maiden for miles around. Light, supple, but strong were her rounded limbs; her fair hair hung in two long plaits down her back; her eyes were blue as the sky overhead. and looked out with calm cheerfulness from under her broad forehead; smiles lurked about her mouth, and dimples came and went on her rosy cheeks. She listened with but a half-interest to the monotonous tones of her mother's voice, as they rose and fell in an even cadence; for as yet she lived in the present, and for her eternal realities had no interest. She paid no attention at all to the children, for her eyes were fixed on the road, and down the whole length she looked towards the station. This structure consisted of two wooden inns, crowded often with English tourists, and beyond both these, one could see the pier and the green-grey waters of the Næröfjord. She was not alone in the eager watch she kept. At the window of the nearest cottage, a white attenuated face was seen, the face of a lad of nineteen. His dark eyes burnt feverishly, and his brown hair hung in dank locks about his forehead. No glimpse of his figure could be gained, only the gleam of the white face showed behind the glass. His eyes were sometimes turned to the distant fjord, but more frequently were fixed on Mitta; and then their impatient expression changed to one of peace and restfulness.

Presently there rang through the clear air the distant bell of the approaching steamer. Just then, there strolled up to the group of women an English traveller, attired in cricketing flannels and a grey coat. He was a young-looking man, and pleasant, with a keen eye and kindly smile. Raising his straw helmet, he politely wished the women "Good morning," to which they smilingly responded "Gud dag;" and then the stranger seated himself on the grass, and began to make friends with the children, showing them his watch, and letting them count the tag-holes in his boots. He glanced up now and again at the tall, fair girl whose knitting rested so idly in her hands, but she, after her first bright look of welcome, took no further notice of him, but gazed away at the fjord. Suddenly a flush came to her cheek, a light to her eyes, and then she turned and walked away towards the cottages, round the angle of the first of which she was quickly hidden.

The Englishman looked after her with some surprise, and, as he did so, caught sight of the white face still gleaming behind the window-pane, and pressed close to the glass. He could not see it distinctly, but it seemed both a sick and sad one; both states appealed to his kind heart, and he motioned to Lisbet Loen to observe it. She nodded her head energetically, and, speaking quickly in Norse, pointed to another of the women. Then both tried to explain something to the Englishman; but what it was they wished him to understand, he could not make out, neither could he comprehend their signs, which seemed to imply the breaking of something.

While they were busy speaking, a man who had come in by the steamer and had walked quickly up to the hamlet, joined them, and was received with exclamations of welcome. He was of middle height, with dark hair and serious dark-grey eyes; his complexion was bronzed by the weather, and both dress and bearing proclaimed him to be a sailor. He listened to the statement of the women, and then turned to the foreigner and said in English: "You want, sir, to know who that is? That is my brother, Lars Olsson; he is sick."

"Is he?" cried the Englishman eagerly. "I am a doctor; can I see him?"

"Yes, with many thank you's, sir," said the sailor, taking off his cap and standing henceforward bare-headed. "Here we have only district medical officers, they come round but seldom, and a doctor costs much money. I have often said when at Liverpool or Hull, would that poor Lars was in the beautiful English hospital."

The man spoke with a singular accent, but though sometimes hesitating for a word, quite intelligibly.

"Then he has been long ill? Is it here?" asked the doctor, touching his own chest.

"Ah, no, it is his leg and his arm broken."

"I am a surgeon, a doctor who mends bones. How did it happen?"

"Tell the gentleman, Eric Olsson," urged Lisbet, who had caught the meaning of the conversation.

He nodded. His face had flushed; his eyes brightened, and he twirled his cap rapidly in one hand, as he pointed with the other.

"We are brothers, sir. Our father and mother died long ago; we live with our Uncle Agdur and our Aunt Kirstin," pointing to a thin woman, over middle age, who formed one of the group. "I ever loved the water. First I got on to a fish boat on the Sogne, which went down to Bergen, and thence on board an English ship which sails between Hull and Leith and Bergen, Christiania and Tronjheim. I have likewise been to Liverpool, wherefore I speak the English. Lars stayed at home; he is four years younger than I. He was twelve years with Agdur, and helped with the farm and went to the sæter. All went well for years, and we did as others do in Norway, not rich as you, Mr. Englishman, would think; but with sufficient of fladbrod, cheese, with potatoes and fish to eat, and good sheepskin for the beds. Then last winter it was cold, very cold; it snowed all day for three weeks, see you. It was dark all that time here in Gudvangen; the beasts had to be fed indoors. Lars had much work. Then the snow ceased, and the frost grew strong again. Agdur had some hay up there," and the sailor pointed to the rugged side of the Slobjörgemit, "where back between there, and there in the hollow, is a little field. The fodder had not been brought down, because the hay house here was full, so they covered it over and left it, and now, because the beasts had little left to eat, Lars must go to fetch it. It was a dangerous climb, being slippery, but he brought one load down on his sleigh; then he went again, but he came not back. Kirstin and Lisbet and the rest of the women grew afraid, but the men said all was well. Many hours passed, and it would soon be evening, so they went at last to look, and there"—pointing to a plateau some hundreds of feet up—"they found Lars. He was dragging a good load of hay, when he came on a great lump of 'gammel' snow; it broke away and carried him down with the sleigh and many loose rocks; and his leg here," said Eric, touching his own knee, "and his arms were broken. They carried him home and fetched the hay next day, but poor Lars has been in his chair ever since. It was only the good Lord who saved his life."

"Yeg, Yeg," said the women eagerly. Their eyes had followed the sailor's gestures, and they now in a troop attended the doctor to the cottage, and waited about the door as the men and Kirstin went within.

It was a strange change from the brightness, space, and grandeur of outside nature to that cottage interior. They stepped down into a low-roofed room; the floor of beaten earth, the ceiling of heavy brown beams.

The whole furniture of the place consisted of a couple of beds in rough bedsteads, a table, a bench, and two or three chairs. In one of the chairs, which had arms, but could not be called easy, and seated on a couple of poor cushions, with a pillow at his back, and wrapped in an old thin blanket, sat, as close to the window as he could be placed, Lars Olsson, much wasted by his long illness. The doctor bent down and examined his leg ; the right knee was bent and had become fixed in that position ; the bones of his left wrist had sustained what is known amongst medical men as "Coles's fracture," and was fearfully misplaced and out of shape. The doctor looked about for something to make a splint of, but in vain, so Eric ran out and brought in a piece of chip from the wood pile, but it would not bend. At length the Englishman espied, on a shelf made by one of the cross beams on the low ceiling, a few old books, and tore the covers off the largest one. Lars clasped his hands and cried so earnestly, "No, no, not my books!" that his brother went to his side, took his hand tenderly, and tried to console him. Kirstin, too, could hardly restrain her tears, when the doctor coolly seized on a poor dish-cloth which was drying on a string after being washed, and tore it into bandages.

"Now, Eric, kneel here. Hold your brother's foot *so:* I am going to straighten the knee. Now!"

The women at the door started back as they heard poor Lars' piercing shrieks, and the tears rolled down Eric's cheeks as he knelt without flinching, and saw his brother clasp his thin hands, and turn round in his chair, appealing to Kirstin, who stood by his side, trying to comfort him in her thin, trembling voice.

"Soon, soon it will be over," she said. "Drink some water, my little one ; oh, my poor one, drink. Be patient, for the Lord's sake!"

It was over in a few seconds, and then the doctor swiftly and skilfully bandaged on the improvised splint, and helped Eric to place the lad in his bed.

"If I had your brother in the Stanley Hospital at Liverpool, I could cure this leg, and I think this wrist too—at all events, make it serviceable ; but I dare not do more to-day. He must stay in bed with his leg thus for three months to come. At any rate, it is straighter, and I hope may improve."

"Mange tak, mange tak," cried Lars, looking up to the kind face of the doctor, and kissing his hand fervently.

"My brother thanks you, sir," said Eric.

"Yes, I see that. Poor lad, I only wish I could do more for him ; but, to make a cure, he needs carefully watching and nursing for months, and I fear you have no means of that kind here."

"Sir," said Eric slowly, "if I could bring Lars to Liverpool, could you put him in that hospital you mention?"

"Yes, certainly. See," said the doctor. smiling, "I promise, if you will bring him, I will look after him myself. This is my card, on it is the name of my home, and the hospital in Liverpool."

"What does the gentleman say?" questioned the sick youth, eagerly.

His brother translated the opinion. Lars' pallid face flushed, then his eye moistened, and he turned his face to the wall and wept —at first silently, then soon with but half-stifled sobs.

"Do not cry," said Kirstin ; "it is the will of God." But her own voice trembled, and she hid her face in her apron.

"It is easy to say that," cried Lars ; "but look at Eric. If it is the will of God, I say," he cried passionately, "it is a hard will—a very hard will—and why should it come to me? What harm have I done? Why should I be for ever lame and ill, when a little money would take me to England, and I should return hither as strong as Eric or any one else? I do not like the will of God, if that it is. I hate it."

"Oh, hush! my little one, hush!" cried his aunt, who was shocked.

But Lars sobbed on in passionate grief. The doctor, though he could not understand the words, guessed at the despair the lad's tones conveyed, and was glad to escape from the painful scene. He came out from the dimness of the hut into the Pass. The blue sky was flecked with filmy clouds, and the sun shone warmly on the high cliffs of the Nærödfjord, and glittered on the surface of its deep blue waters, which reflected the surrounding cliffs and the motionless steamer, with its lazy trail of white vapour.

Eric remained by the bedside. He held the card in his hand. He could not thank his friend, but he wrung the gentleman's hand fervently, and waited for an hour at the door of Helland's, till the Englishman again appeared, and then, lifting his portmanteau, carried it on board the boat. As the moment of parting came, he gained courage again to speak.

"Sir," and there was a wistful look in his eyes, "are you *sure* my brother could be cured if he came to England?"

"As certain as it is possible to be, where there must be a doubt. We have treated worse cases in the hospital successfully."

Eric gazed down the fjord, but he did not see the circling gulls or the beetling rocks ; he looked farther than the vista of blue waters, even over the untravelled years of the future—his brother's future and his own. His eyes enlarged, and the gloom of a deep anguish darkened them.

Just as the steam-boat was preparing to throw off, he roused himself, for Ammitta Loen stepped across the deck, and with a smile, offered the Englishman two red grouse and a basket full of ripe raspberries, and darted back again. "Farvel! farvel" she cried from the little pier, waving her hand, and the Englishman thought she made a pretty picture, with the Norwegian sailor by her side, and a background of the long vista of glittering rocks and golden misty light about her.

A week later he was back in all the rush and whirl of a busy life in a great city, and the remembrance of his last morning at Gudvangen faded, and became indistinct as a shadow from another world. Each day, many cases of bitter distress and suffering crowded in upon his notice, and in doing the Christ-like work of healing the sick and ministering to the poor, he forgot the pale, discontented face of Lars Olsson. But in Gudvangen the English doctor was well remembered. He had brought new thoughts into many minds. To do good is a certain road to the kind remembrance of others.

CHAPTER II.

AMMITTA.

WHAT the English doctor had done for Lars Olsson became the talk of the hamlet, and the remembrance of his brief visit lingered longer amongst the neighbours, than would have been the case in any place where stirring events more frequently happened. The peasants saw hundreds of English men and women come and go. Some even stayed weeks in the gorge, but they came and went without any care for the sorrows or trials of the natives ; without remembering that God has made all of one great brotherhood, and has redeemed all nations by the same awful Sacrifice.

The strangers came to enjoy themselves, and they did so ; they were kind and cheerful because they were happy, but that was all. Here, one had come with a touch of natural sympathy, and so he was not forgotten ; and when his brief visit had passed, he left influences behind him which remained in these peasant hearts and lives for many a day.

To Lars himself, who for nine months had been a cripple, it had been a revelation. At first he had fought against his hard fate. He had insisted on being helped from his bed to the seat by the window, although the pain was very great ; but, at length, even his hope that he was progressing towards recovery dwindled away and died. Eric was seldom at home ; his Uncle Agdur and his Aunt Kirstin having now extra work to do, had no time to devote to him. After breakfast, when he had his piece of fladbrod, and his dip into the gröd bowl, the same as they, he was left alone for hours, sometimes even until the evening. His one pleasure was when Ammitta Loen came in to see him. Then she would shake his pillows, give him water to drink, bring him at dinner-time a potato, or a bit of fish hot from her mother's fire, or tell him the news of the hamlet, which, trifling as it was, interested him.

The four precious books they possessed, he had read and re-read till he knew them by heart, although in the book of Psalmody, with the darkly-worn wooden covers and leathern clasps, he took little interest. The Psalms spoke too much of resignation, and of the Will of God, and he loved to think of neither. He rebelled, he did not submit, and he had no *wish* to submit, for his heart was fierce, not softened by his great sorrow. He read simply to distract his attention ; and when his uncle could bring him an old copy of the "*Norges Communikator*," he was for a time content. After all, however, his chief comforter was Mitta. Sometimes she would bring her horn, on which she could play well, and would make for the invalid as soft music as the instrument was capable of giving out.

Her grandmother, the old Ammitta, after whom she had been named, had ever been fond of telling her numerous grandchildren the legends of the olden times. Mitta had loved to hear her ; and now, as she sat by Lars, either knitting or weaving the thick gay coverlets called aaklveder, so much sought after in the Vosse, she would while away the long hours with tales of the water-woman, who was surely seen gliding around the Twinde Foss as the sun sets in autumn ; or of the old warrior Jordal, who lives in a cave even now on the Yordals' Nuten, though centuries have gone since the evil spirits put him there, and whom the solitary traveller, if he be overtaken by darkness, hears blowing his horn with a hollow sound, which re-echoes down the Nærodal. She knew Sagas of the Vikings, too ; of how, in the old days, fair and beautiful islands could be seen, low and dim, floating on the sea by night ; and how, as the Vikings passed in their vessels, they beheld halls high and lordly, shining white in the moonlight, and heard the songs of the revellers inside ; and how then the sea-kings sailed away with speed, for well they knew that, should they land there, there, until Ragnarök (the end of time) they must

remain, and never see their homes and wives and children in Norseland again. At sunrise each morning, the islands, even that which was fairest of all, disappeared beneath the waves until the evening twilight came, and then again would they rise and float over the ocean waves as before; until Thjalfer the Strong sailed his ship right on to the dim shore, lighted a fire, ate food, and praised the name of the Lord; then the island remained stationary, and all the others sank and were seen no more, but this one remained, and his children live there still.

Such, and many others, were the tales Mitta would tell, and the sick young man's eyes never left her face. When she ceased, he would hold out his thin hand, clasp hers, and so fall asleep. Mitta would sit very still for fear of waking him, and would smile as she thought of a happy visionary land which some day she should step on, and find solid beneath her feet.

She was full of compassion for Lars, but nothing more. He, as the days went by, grew to love her, as the poor plant in some dark cellar loves the sun, and with all the longing strength of its imprisoned nature, turns yearningly towards the light which shines down through a distant crevice. Even so Lars watched for Mitta, and the day was sad to him when she came not. But now, since the English doctor had been, he cared no longer for the Sagas; he could think of one thing only, the words of the doctor, "If I had him in England, I could cure him." He said to his aunt and uncle, "If I could only get to England, I should be well;" and they answered, "But you cannot go; it would cost many kröner, and we have no money at all. Be content, the good Lord may take you to heaven soon, and there it matters not if your legs are straight or bent. Be content."

Lars knew it was true that they had no money; but as he lay on his chaff bed, he wondered all day long how he could get to England. He spoke of nothing else to Mitta, and from being outwardly quiet and patient, he grew impatient and complaining. He became more cross every day, so that all the neighbours kept away, and the children were no longer glad to bring him raspberries and cloudberries, but peeped through the window at him, and then quickly ran off again. Ammitta alone continued to come, but she, too, was often weary of the fretting voice and unthankful spirit of the lad. Only one motive can make such a service supportable, and she had not yet learnt that one.

She was kind-hearted, and in a way she was religious. She might dare unthinkingly to trust herself to walk on the waters if the Lord should say, "Come;" but if the waves hid Him from her sight, then she, like the apostle of old, must needs sink.

(*To be continued.*)

"Ammitta Loen stepped across the deck."

DARE TO BE A DANIEL.

THIRTY years ago, more or less, there was a boy in Scotland who would go to sea. His name was James. On his first voyage to Calcutta, he kept up the habit of praying in the forecastle before turning in to his hammock as a matter of course. He had been accustomed to do so regularly at home, and he continued regularly to do so at sea. Nobody said anything to him about it, but Bob Shearer, an able seaman, watched him.

One of the seamen was "a rough," whose name was Robert. But no sailor was ever called Robert; so, to distinguish him and Shearer, the one was called English Bob and the other Scotch Bob. One night, soon after the homeward voyage began, James was on his knees, when the eye of English Bob happened to fall on him.

"I declare," he cried, with an oath, "here's a younker praying! Did you ever?" And thereupon he flung a heavy shoe at his head with an excellent aim. Before James had time to rise, Scotch Bob had the coward by the throat, and told him to come upstairs and settle with him at once.

The result was, that English Bob got wholesomely and very soundly thrashed. That night James went into his hammock without praying. But Scotch Bob came and pitched him out. "What do you mean, you young coward? Say your prayers, like a man. Do you think I'm going to fight for you and be disgraced in this way?"

And so James never again failed to kneel before he slept, and feels to this day that his being ashamed of his Father in heaven and of the Saviour who died for him, was well rebuked by the friendly courage of Bob Shearer.

Long after, when his name had a title before it, and he was at the head of his profession, James had pleasure in finding Bob Shearer's mother, and bringing her to visit the mother who taught him to pray. James is still living, and it is from himself we have this story.

"The New Illustrated Weekly. Have you seen it?"

OUR NEW WEEKLY.

By THE EDITOR.

DEAR FRIENDS,—

Already the *éclat* of our new Illustrated Weekly, with its unique and striking title, has gone on before, and from many quarters flattering comments and hearty words of congratulation have been pouring in.

Perhaps our name does imply a somewhat lofty ideal. Be it so. Is it not well to aim high? Our new Paper is entitled "A. 1.," because we believe it will be classed as "sound, strong, and seaworthy." God prosper our new-built craft, and fill her sails with fresh, briny, bracing gales of noble purpose and principle. May she speed safely across life's ocean many a character and career which otherwise might drift upon rocks, or sandy, fatal shoals. I am not the least surprised if many of you have already exclaimed,—

"What! another Weekly!"

And not unreasonably; for our Library tables and Bookstalls groan beneath a crowd of Magazines, jostling against each other as if struggling for very existence. To launch another was a responsible step, not, however, undertaken without prayerful consideration, and now, with the fullest confidence of success. To secure this, we have determined to spare neither time, cost, nor labour.

Touching upon topics of interest both to Young Men and Young Women, we anticipate a world-wide welcome for "A. 1." It has already enlisted the hearty support of a large number of able and well-known Authors.

When we are privileged to place upon our list the following

Contributors.

R. M. Ballantyne.
Henry H. Bourn.
Phyllis Browne.
W. August Carter.
Major Seton Churchill.
J. Clifford, D.D.
Catharine Drew.

we need say very little about our future

Plans and Prospects.

We do not intend to be dull; on the contrary, my conviction is that pure, elevating reading may be made so attractive as to eclipse the fascination of what is unreal and injurious. Whilst the highest spiritual standard will be unflinchingly raised, we shall seek to fill our columns with bright, manly, incisive writing. The illustrations will be numerous and high-class, by our best artists.

Although the range of subjects which we hope to cover is but imperfectly indicated below, our General Programme will suffice to show the class of writing we shall always aim to secure for our readers.

Amongst our striking

Serial Stories

will be the following:—

"N.B.; or, His Responsibility."
By AGNES GIBERNE.
Oonalaska; A Tale of the Far North West.
By DR. GORDON STABLES, R.N.
Mad John Burleigh.
By MRS. GARNETT.
The Ghost of the Lavender Room.
By HON. MRS. GREENE.
An Exciting Serial Story.
By L. T. MEADE.
Lilian's Hope.
By CATHARINE SHAW.
Fine Gold Changed.
By MRS. MARSHALL.
Leaves from the Log of a Gentleman Gipsy.
By DR. GORDON STABLES, R.N.
Love, Courtship, and Marriage.
By PHYLLIS BROWNE.

Whilst Travel, Adventures, Biography, Science, Art, and Athletics will find their place, Series of Papers will appear in early Numbers on British Industries, Photography, Marine Zoology, the Laws of Health, Teaching in Technical Schools, Household Management, Artistic Needlework, Social Subjects, the Art of Cookery, etc., etc. Remunerative Employments for Women—one of the burning questions of the day—will be ably taken up as opportunity arises.

Practical inquiries will, as far as possible, be answered in our Crisp Correspondence Column, which we specially wish to use as a medium of communication with those in spiritual difficulty. Bible students and Sunday-school teachers will find jottings and suggestive material for *their* work, from time to time.

When we remember that OUR OWN GAZETTE has reached a monthly circulation of over 104,000, we may reasonably expect that "A. 1." will not long be far behind.

You will already have gathered that our new Paper is intended for *all;* but I shall specially aim at providing forcible Articles that will interest our Young Men. I have little doubt but they will heartily respond, by taking up this Paper and appropriating it as their own; and, above all, I trust they will find in its pages every week, some definite spiritual help; for down in every human soul, there is an unfathomable yearning, which only Christ can meet and fully satisfy.

The world on the one hand, and the devil on the other, seek to allure and enchain. But God's purpose cannot be frustrated; "the prey *shall* be taken from the mighty." How many of us have known the saving, cleansing power of Christ, and are rejoicing in the glorious liberty of the children of God! Well may we praise Him.

That many of our readers may know the same peace and gladness, is the earnest desire and prayer of

Your sincere friend,

W. Jane Mewzies.

10, *Croxteth Road, Liverpool.*

RELIGIOUS MUFFS.

By MAJOR SETON CHURCHILL,
Author of "Stepping Stones," "Church Ordinances," etc., etc.

THERE is an old story told of a shoeblack, who, having recently been brought to a saving knowledge of Christ, said that if he had only to clean boots, he would try to polish them as well, if not better than any of his mates. Though a well-worn illustration, it is by no means a bad thing to remind ourselves, from time to time, of the truth conveyed in this saying. Possibly the story has already done much good, for it is a matter of common observation, that the type of Christians—especially among young men—one meets now, are, in some respects, superior to their predecessors of many years ago. One cannot help noticing that there is a more manly tone among earnest young Christians than there used to be, and that, consequently, there is less to be seen of the "religious muff." But still, as the breed is not absolutely extinct, it may not be out of place to say a few words on the subject.

The "muff" is well known to every schoolboy. He is the young fellow who can do nothing, and is absolutely without any force of character. It would be a libel on the fair sex to say that he was half a girl, as young ladies are sometimes very capable, and put such to shame. He is, however, a relic of a bygone age, when religion and ordinary mundane affairs were unnaturally divorced from each other, and when, consequently, men of the world looked upon religion as a thing suitable only for women and ecclesiastics. The one or two manly young fellows of a family were put into the army or navy, while the softer characters were consigned to the Church, as if manliness was not considered a suitable accomplishment for a Clergyman, whereas, as a matter of fact, there is no profession in the world which so much requires followers of the *Man* Christ Jesus. In a pushing, inquiring age like this, when religion is being tested in every conceivable manner, it is much more important than it ever was, that young Christians should show to the world at large that religion does not unfit them for the duties of life.

It is frequently said that there are more "muffs" among religious people than among any other class, in proportion to their numbers; and it is more than probable that the saying has some truth in it, though there is nothing whatever about religion to turn men into "muffs." The truth of the matter is, that young fellows who have a natural predisposition towards muffishness, and have not the energy to contend against it, receive the cold shoulder from men of the world. Finding themselves unwelcome by the irreligious, they often gravitate towards those who are kind enough to receive them, and when in their ranks, they often bring a sneer from the thoughtless upon the cause of Christ. Far from being any reproach to true religion, it is perhaps the highest compliment that could be paid to the cause of Christ, to say that His followers on earth are ever ready to receive with open arms those who are the world's outcasts. To assert that there are many "muffs" among religious people, is a very different thing from the vague charge so often made by the ignorant and unobservant, that religion makes people "muffs"—an assertion which is without a grain of truth.

The whole history of Christianity gives the lie to the charge that there is anything about true religion to make men unmanly. Christianity was founded by the *Man* Christ Jesus, and His followers are commanded to be followers or imitators of Him in all respects, including His dignified manliness, which enabled Him to stand alone with a scoffing world opposed to Him. Nor was this characteristic peculiar only to the Founder of Christianity, for His followers grasped this among the many other truths of the then new faith; and we find the Apostle Paul writing to Timothy: "Endure hardness as a good soldier of Jesus Christ." The New Testament abounds with illustrations drawn from the life of the soldier, or that of the gladiator, suggesting that the followers of Christ Jesus should earnestly seek to cultivate and develop a manliness about their religion. Of this we may be quite sure, that had they not done so, they, at all events, would not have been used by God to carry the flag of truth into the very heart of the enemy's country.

Later on in the history of the world, when Christianity had degenerated, and when very false ideas existed as to what constituted a true Christian, was it not the grand old Invincible Ironsides of Cromwell who once more rescued the cause of Christ from the weak, flabby, backboneless characters who had brought disgrace upon the cause? For it must never be forgotten that the fine old early Puritans were a very different class of men from their more degenerate followers. The former were a manly set of fellows, who knew what it was to endure hardness, and to fight for their country and the cause of truth, of right against wrong, whereas the latter seemed to have been a more contemptible lot, who, seeing which way the wind blew, threw in their lot with, and called themselves by the name of, the early Puritan heroes. They sang Psalms, and picked up the phraseology of their predecessors, but they had none of their manliness of character. The fine old type of Puritans needed no hothouse of a monastery, or a convent, to protect their religion, as they were quite able to defend it against all comers.

When we come down to more modern times, we find the names of manly Christians so numerous that we could not nearly mention them all, but a few specimens may answer for the rest. Hedley Vicars and Hammond, who nobly fell in the Crimea; Sir Henry Havelock and Sir Henry Lawrence, who succumbed in the Indian Mutiny; and last, but not least, the brave hero, General Gordon, whose name is still a household word, associated with all that is noble and manly. In addition to these soldiers, there have been such splendid fellows in the navy as Admiral Sir Edward Parry; and among missionaries, men of the type of Henry Martyn and Gordon, of the C.M.S., Livingstone and Moffat, of the London Missionary Society, Judson, of the Baptists, and Bishop Pattison, of the S.P.G. Among statesmen and rulers, we have also had a good many of the type of Lord Cairns, Lord Shaftesbury, Lord Lawrence, Sir Robert McLeod.

The examples of these heroes, who have only recently gone home, seem to be doing much good, for there cannot be a doubt that there has lately been a great increase of this type of Christian. No sooner did the brave Bishop Hannington and the Hon. Keith Falconer lay down their lives, than plenty of volunteers offered to go out to fill up their gaps. There is hardly a profession in the country where one cannot now find many fine, manly young fellows, like the three brothers of the name of Studd, who are not only eminent Christians, but first-rate cricketers, and able to hold their own at all games.

Religious people will always be called "muffs," whether true or not, by a certain class of the world who dislike them; but every one should aim to be like Daniel, against whom his enemies wanted to find fault, but they could find none, excepting in the matter of his serving his God. That able statesman lived in a very trying time, and had very great difficulties with which to contend; but even his enemies were bound to admit that they could find no flaw in his conduct. The tempter found in him no weak, irresolute character, but a rock firm and immovable, strengthened by his trust in his God. He was no "religious muff," but one who had learnt to endure hardness as a good soldier, and one who aimed to excel in that to which he turned his hand; and this might be the case with many more, if each one would bear in mind the truth, "Whatsoever thy hand findeth to do, do it with thy might."

IT WAS REST HE WANTED.

YES, real, lasting inward peace. There was always something within fretting, disturbing, craving. It was not that he had done anything morally wrong. He was honest, and upright, and good-natured, and altogether a pleasant fellow. And yet, deep down beneath the surface, he was not happy. It was not because he was in debt or distress about money matters. He was a prosperous man. His tens had grown by sober, hard work into hundreds, and his hundreds were smilingly swelling into thousands. He was the envy of many.

But, in his innermost heart, there was a buried misery. It only now and then made itself felt. For he was a busy man, and business so absorbs the mind that it leaves little time for feeling. Then the laughing joys of home (for he had a merry family) lulled for a time the sad sensation within. But still it was there. He went to church regularly. He thought this was the right thing to do. The solemn service, the music, the prayers, soothed him. He found some consolation, too, in saying his prayers privately, and reading his Bible on Sundays. But still the old misery would keep coming up. Some would have tried to get rid of it by strong drink, or by gaiety; but when the effect of these has gone by, the heart is only left more wretched than before, craving for more, more, more, and ever always more. But my friend was not tempted in this direction. He tried to be good, he strove to be religious; but he was not really satisfied. He still had not *rest*. Have you, reader?

What was it that troubled him? It was not morbid feeling, nor sentiment, nor temperament. It was CONSCIENCE! Thank God, friend, thank God, before you read another line, that you have a living conscience. You might have been happy without God, if it had not been for your conscience. Some people smother their conscience, and kill it outright, and bury it out of their sight, and live happy and die happy, because they have a dead conscience. How terrible it will be, when it awakes on the other side of death, to sting and torment them for ever!

It was not so with my friend. He felt. If you had known him, you would have said he was one of the best men living, and happiest. And so he was, outside. But conscience is within. The eye of God is on the heart. The law of God has to do with the thoughts. The judgment of God is for "every secret thing." His great life-long sin was that, though he was living well, he

was not living for God. He would have lived just the same if there was no God. And he often wished there was none. But *he knew that he had to do with God.* This was the misery he tried so hard to bury.

But he found rest. I will tell you how. Jesus said, "Come unto Me, all ye that labour and are heavy laden, and I will give you rest." He came, as he thought, to Jesus; but there was no rest. He discovered there was still one sinful thing in his life, which he had not cast out. So conscience could not rest. He cast it out, and came again. But still he had no rest, until the Holy Spirit revealed to him, Jesus as the only Saviour, who had borne all his guilt, endured its penalty, and perfectly satisfied by His atoning sacrifice the demands of God's holy law. He came—he trusted—and at once he had peace. In true repentance, he had turned from sin; in child-like faith, he relied upon the death and merits of Christ. And in Christ he received perfect, enduring, gladdening REST.

WHIRLWIND REAPERS.

By Mrs. JOHN BRETT,
Author of "May Lester," etc.

"HERE we are at last! I never thought it would come true, did you, Erminie?"

"I *hoped* it would not, Gertrude."

"Ah! I forgot. In the rush and bustle of preparation, your special aversion to this particular mode of passing our time was lost sight of. "I believe we are quite near the course," said Gertrude, crossing over to the window. "Yes, we are; that *is* a delightful fact. We shall see a lot of the fun that others cannot."

"How so?"

"Why, Phil says the horses are exercised in the morning, which is a pretty sight, to say nothing of its being such an advantage."

"No advantage to us," said Erminie, looking over her sister's shoulder.

"Indeed it will, my dear; for if 'Loadstone' wins, it will put thirty pounds into my poor pocket. And by the same rule, if 'Sunflower' goes in first, I shall have to hand that amount to Phil. The advantage of being here is, that we shall get a better idea of which horse is likely to be the winner; and up to the last, there is the chance of so arranging the bets as not to lose."

"I am surprised at you and Phil," sighed Erminie; "and I do not think you ought to encourage him in betting. You cannot wonder at men, if women do the same thing."

"It is the greatest fun, I can assure you, Ermie; and I do not believe it to be a crime of deeper dye to speculate upon the merits of the horses, than it is to witness the race. Why did you come, if you consider it all so very wicked?"

"You know, Gertie, papa would have been angry if I had refused; and if not, I could neither have stayed at home alone, nor invited myself out for the week—and there is quite enough to pay for this house."

"Do you know how much, Erminie?"

"Three hundred and fifty pounds."

"Is it as much as that? But what can it matter if papa wins as many thousands?"

These sisters were the handsome and highly educated daughters of Tudor Lawson, who had recently become head of an old established city firm. Many years before he had come to the Metropolis, fresh from the country, where, brought up by a pure-hearted and gentle mother, and a hard-working Christian father, he had known nothing but the simple pursuits of a country life.

Distant relationship claimed for him an interest in the firm of "Lawson and Pierpont," accountants, and when barely seventeen, he found himself in the important position of chief clerk to the manager.

At the village school, Tudor had always been distinguished for his arithmetical powers, which here developed with a rapidity that astonished his superiors, and won for him the golden opinion of all with whom he was associated in business. The family connexion that had brought him to London, also introduced him to the family circle of the Pierponts, and but a few years passed before the distant relationship was exchanged for a nearer one, by the marriage of Tudor Lawson with Gertrude Pierpont.

As a child, Tudor had been taught to pray at his mother's knees, and through all the somewhat uneventful years of his early life, he had preserved not only the outward form of religion, but his every-day actions had been so influenced by the power of parental example, and by his personal acquiescence in the principles of Divine truth, that he carried with him into his London work, unswerving moral rectitude, which continued to flourish for several years after his transplanting into a rougher soil. But like thousands of others, who have shown fair promise of bearing spiritual fruit in the years of prime and old age, he, too, had but reached the tender age of twenty-one, when the first little withered leaf appeared that threatened the total decay of all spiritual life.

The Pierponts were a professedly worldly family, making no pretence even to the decorous custom of a regular attendance at church.

At first, these frivolous manners caused considerable uneasiness of mind to one who had been for so long the recipient of gentler influences. But the foundation on which he had set his feet, soon proved insufficient to resist the overwhelming flood of opposition that he met whenever he attempted to carry out his own convictions, and although, as a boy, much of the Word was registered on his brain, it was now but too evident that it had never been hidden in his heart. His religion was a mere custom that died out as easily as any other, and Tudor Lawson and his wife launched themselves upon the sea of married life, entirely ignoring the Divine hand that was stretched out to guide them in safety to the heavenly harbour.

It was in the Pierponts' house that Tudor Lawson had learned to gamble. At first, shocked at his own gains, and unable to devote the money won to any but charitable purposes, he shortly found the winning of them so exciting, and the possession of them so sweet, that the wholesome dread of such questionable modes of obtaining money which had grown up with him faded out of his memory, and by the time the new house at Kensington was furnished, a billiard-room had become a necessity.

From billiards and card playing, Tudor easily slipped a step further. The solicitations of some of his chosen friends lured him to the betting field. It was with a decided shudder that he took his first step in this unrighteous profession, as words of warning, spoken by his parents before he left the home of his childhood, returned to his recollection and rang in his ears. But the excitement of success in his very first venture swept away the last cobwebs of remorse that clung to his mind, and from that time, through all the years of his partnership in the firm, he indulged his passion to the full. His ventures were not all successful, and the drain upon his income was bound in time to make itself felt, until every year found him recording a still more serious deficiency.

Anxiety for the future awoke, and he with difficulty kept matters from his family. Just as he was anticipating an unpleasant disclosure of his affairs, however, Mr. Pierpont intimated his intention of retiring from business, and not a week too soon were the necessary arrangements made that rescued his son-in-law from the disgrace of bankruptcy, and put into his hand the entire management of the flourishing concern, which had seen the retirement of several partners, to whom, however, the betting fever had been a disease unknown. The ample means thus placed at his disposal cleared off his numerous debts, and enabled him to make fresh ventures upon his favourite sport.

"A run of luck" so elated him, that, contrary to his usual custom, he took a house for the week of a famous race—a luxury his wife had craved for a long time.

On the morning of the race day, the brother and sister stood together in one of the bay windows of the drawing-room, Gertrude lamenting that the days had fled so swiftly, and Erminie looking forward with deepest satisfaction to the moment when she should turn her back upon the spot.

"I would rather never see the glorious pines again, nor breathe their health-giving odours," she exclaimed, "and I would be content to stay always in the dull, brick-built streets of London, could I escape participation in so distasteful a diversion."

"*I* should not trouble your brick-built city much," said Philip, "if I could have my choice; but we business men have to endure a far more continual incarceration than you girls, and you cannot enter into *our* appreciation of the pine-woods or anything else."

"Of which I fear the 'anything else' takes by far the larger amount of interest," she answered. "Say, is it not so?"

"Maybe," replied her brother, "inasmuch as I would, if I could, be at a race every day of my life. I am contemplating arranging a complete list of them all, and making the experiment of going the round during the next year, provided, of course, that my valuable services at the office can be dispensed with for the time. It is sweeter to win even thirty pounds than gaze upon a thousand pines."

"Which you will not win to-day," laughed Gertrude, "for I was up before you this morning, and I can tell you that 'Loadstone' was never in better form at his practice; he made a little ruse of lagging once or twice, but when occasion really required it, he shot ahead easily, and came in all right."

"Poor beast!" said Erminie, "I feel quite sure he is not up to the mark in his condition, however 'easily' he may have appeared to reach the mark on the course. He is a splendid creature, but his distended nostrils and quivering body told of distress and pain."

"He will be all right by the time he is wanted," replied Gertrude.

"Do not get soft and spoil our fun at the last," said Philip.

"It may be fun to you, Philip," answered Erminie, "but it is anything but that to the horses. I came across a case in point only yesterday, which I am not likely to forget. Mamma and I had to go into the village, and sent for a fly. They were all out but one, and that was drawn by the most miserable specimen of a horse you could well imagine."

"A venerable cart-horse, was he?" asked Philip, amused at his sister's description.

"'*Do take me away,*' *she exclaimed.*"

"No, indeed! Perhaps he was once as handsome as 'Sunflower.' I wondered why the creature put his head about so much, keeping it pretty well to one side. While mamma went into a shop, I inquired the cause of the driver. He told me the horse had once been a racer, and won a prize; but in the last race he ran, the strain was so great that he lost his sight. Think of that, Philip. Imagine being forced to exert yourself so much, that the nerves of your eyes were broken by it."

"Oh, Erminie, do not talk of such disagreeable things!" exclaimed Gertrude, with a disgusted look upon her face. "I am sure the man could not have spoken the truth. And you need not take away our pleasure, if you have none yourself in the races."

"Pleasure is not a word to be used in connection with such a sport, Gertrude. It is a wicked dissipation to put money into bad men's pockets. I wish the Society for the Prevention of Cruelty to Animals would do something in the matter."

"What could they do?" asked Philip. "They tried it on a week or two ago, but it was no business of theirs, and the man got off; of course he had a right to do as he liked with his own animal, and I presume he knew what he was about."

"Yes, indeed," replied Erminie indignantly; "he must have known well enough that he was digging those cruel instruments of torture into the poor brute's sides, until there were over twenty wounds from which the blood was pouring. He was stated to be a *gentleman;* but if good birth and first-class education — so-called — can produce nothing better than a dandified demon with spurs on his heels, I would rather have the friendship of a costermonger who was kind to his donkey."

"Pray do not excite yourself too much," said Philip. "It is a practice one detests. I should despise myself if I could put on spurs; but it is the fashion to wear them at races, and cannot be helped, I suppose."

"It *ought* to be helped, or at least should not be supported by people who know better. Many another vicious practice is perpetuated in the same way, I fear."

* * * *

The grand stand was filled to its remotest corner, its occupants presenting such groups and patches of brilliant colouring, that from a distance it might have been taken for a piece of patchwork. The usual members of the royal family honoured the race with their presence, and needed no external adornment to add to the interest of their appearance.

As the moments flew by, the excitement became intense, and the occupiers of exalted positions were in a flutter of anticipation, while the people below composed a struggling mass of humanity, fighting for the best places, bargaining, betting, shouting, swearing, drinking and smoking.

The critical moment for starting came at length, and the hush of intense interest fell upon the crowds, as they pressed together more closely to get a view of the horses.

Erminie saw in every one as they flew forward, a prospective repetition of the melancholy brute which had drawn her to the village the previous day. Philip and Gertrude gazed with keenest excitement, occasional utterances of hope or fear as to the result of the race breaking from their lips. Presently, however, to the astonishment of many, the scene altogether changed. "Loadstone" fell lame, and in spite of the infuriated attempts of his rider to urge him to the goal, he gradually dropped behind with a painful limp. "Sunflower" also disappointed the myriad watchers of his progress. With all the slashing and spurring that hands and feet could administer, he, too, flagged, and a colt, almost unknown to the public, but familiar to a certain "ring," went in at an easy canter and won the cup.

In the general scuffle that commenced the moment the race was over, the wild cheering of those whose favourite had won was scarcely noticed, while the looks of despair and desperation, visible on hundreds of faces, were observed only by a few. The royal party retired, and many other occupants of the grand stand made their escape as speedily as possible from the scene of their sudden dismay. Group after group passed off, but still the Lawsons remained. In their anxious concentration of mind upon the race, they had not noticed that Erminie had fainted. It was some time before they were successful in restoring animation. When at last she opened her eyes, and became conscious of her surroundings, a shudder passed over her; and presently, rousing herself from the arms of the maid who had been summoned from the refreshment bar to support her, she exclaimed, "Do take me away; I can bear to stay here no longer. Never again will I be tempted to witness an abomination like this."

"What can you mean by such language, Erminie?" said Mrs. Lawson, who had been anxiously bending over the prostrate form of her daughter. "You were not compelled to come, but as you *are* here, you need not surely use words that decidedly imply a want of propriety in the presence of the other members of the family."

"Mamma, I do not believe it possible that you or Gertrude would ever attend a race, if you knew as much as I do about the cruelty of it."

"Nonsense, child, the horses are trained by love, and there is nothing improper in attending the races. Do you suppose so many members of the royal family and nobility would sanction them by their presence, if there was anything wrong or cruel connected with them?"

"I do not care who they are that sanction the races by their presence; I know they are shameful sports, and if the horses are 'trained by love,' they are driven to death. Look at that."

"Look at what?" asked her mother, disdainfully turning her eyes towards the spot indicated. "I do not see anything."

"I saw it come," continued Erminie; "it was slashed off the flank of that elegant creature 'Sunflower;' it fell upon a lady's dress close by you. I always knew it was a wicked amusement, although I thought until lately that the betting was the worse part of it."

"You might have been mistaken," said Gertrude; "perhaps it was only a piece of turf."

"That is easily proved, Gertie; the use of

your eyes will decide the matter in an instant."

"I am sure if I thought you were right, I would never patronise a race again," replied Gertrude, as she stepped over to inspect the object pointed out by her sister. "It is but too sadly true," she continued, as she returned, with difficulty steadying her steps, for the sight had produced a feeling of disgust and horror; and as Mrs. Lawson looked at her suddenly pallid face, she feared a second invalid.

"Really now, Gertrude, I hope *you* are not going to be ridiculous; one at a time is quite enough. And as to the races, they are not likely to be abolished because they are distasteful to a couple of sentimental girls. They are extremely fashionable sports, and, so long as they exist, fashionable people must patronise them; if they cannot, they would be better out of the world."

Only a few weeks after this, Philip spent the best part of the night in pacing wildly across the moorland, after a vain effort to square his accounts. He was fast becoming so entangled in various directions, that he had resolved on asking his father for a still heavier advance than he had ever done before. Aroused in the morning from the deep sleep into which he had fallen, he awoke to the fact that his father stood by his side. He quickly collected his wits to aid him, and was about to spring out and begin dressing, little dreaming of the purpose that had prompted the early visit; but Mr. Lawson laid a hand upon his shoulder, as he said,—

"Philip, I do not want to disturb you, as it is yet very early, but I want you to give me your closest attention. I want you also to make me a solemn promise, that you will do all in your power to help your mother and sisters when I am gone. Do you comprehend?"

"I do not know that I do quite. Gone, did you say? but you are not ill, father."

"No, no. I am well enough in health, Philip. I have been on the wrong road for many years, and what is worse, my boy, my bad example has drawn you into it as well. The terrible losses I have had from time to time *should* have sufficed to warn me from the pursuit of a course which, even as a child, I knew to be a vicious and deceptive one. Had I but followed the good example and advice of my dear parents, I should not now have to fly from home and country."

"Fly from home and country?" exclaimed Philip, springing up again.

"Listen! listen!" continued Mr. Lawson. "Only be quiet, and it may be well in the future. I am resolved to give you all a chance, but I fear nothing could be done if I stayed here. I have been so much in the hands of others for years, that I could not possibly escape from their association. Elsewhere, perhaps, I may honourably work as in the days of my youth; and it will be your duty to stand by your mother in every emergency that may transpire. I lay this upon you."

"Upon me? Why, I am bankrupt myself. I was coming to you to-day for a little cash to set me afloat, until I could get my affairs a bit straight."

"I hope you are not very deeply in, Philip."

"Not so deeply as I have been. But if I were, Chaffington races are on next week, and I am pretty sure the tide will turn in my favour. I was a fool to trust Hadley so much. I have made use of my own judgment this time, and intend doing so in the future."

"Philip, your own judgment is no better than Hadley's."

"Perhaps not, father, but at all events I should not cheat *myself*."

"I am not so sure of that. I have been cheating myself for many a long year."

Philip did not answer at first, but his father noted a grave look upon his face. He said at length, "I must say it seems rather hard lines for you to bring us all up to go to the races, and bet on the horses, and then go and leave us in the lurch like this; and I cannot see the use of it either. I think you should stay and help us out of the difficulty. I wish I had taken Erminie's advice; she always hated the races, and it is enough to make anybody hate them to find one's self in such a dilemma."

"The 'lines' are far harder for me than for the rest, Philip, because I know that our life might have been *so* different, if I had abstained from the sinful pursuits which have wrought this ruin. My deepest regret at this moment is, that I cannot immediately remove my family from the evil influences by which they are surrounded—especially yourself."

"You have not said where you think of going; I suppose that is a secret you could not trust even me with. But do you think you will be free from evil influences in *any* country—Australia, for instance, or America?"

"Going among strangers, my experience would be a safeguard," replied Mr. Lawson.

"I wish I could go, too," continued Philip, burying his face in the pillow to hide the emotion he could not check. "You do not know how I am worried. I should never have betted half so much but for the other fellows,—one cannot afford to be different from the rest."

"Have you any idea of your liabilities, Philip?"

"Yes; I think I am not very wide of the mark when I say two thousand pounds."

"That is a great relief to me," said his

"Philip spent the best part of the night in pacing wildly across the moorland."

father; "I feared it might be double the amount. If I were sure of only one member of my family standing by me, I would even now face the coming storm; but it seemed better for all parties that I should go away,—indeed, it appeared the only thing to be done."

Philip was silent, but presently, raising his head, he said, "I can assure you I am heartily tired of *my* life. If you think it would be of any use for me to promise to stand by you, I am sure I would."

"It will be a terrible crash, Philip; in all probability we shall have scarcely a hundred pounds to begin life again with. Are you prepared to be poor, and perhaps take a clerkship in somebody else's office?"

"It is not a pleasant look-out, I must confess, dad; but it would be no worse for me than for you."

A gleam of hope shone into the father's sad heart at these words. Who could say but the time might come, when not only himself, but Philip and the rest of the family, should be brought under the power of Divine love, and, with one mind, serve the Lord as they had served Satan?

The "crash" *did* come, and that shortly, but it found father and son shoulder to shoulder, doing battle with the flood of consequences that followed their folly. Everything was honourably surrendered to meet the requirements of their many creditors, and when all was settled, it was discovered that not even the hoped-for hundred pounds remained to give them a fresh start in business.

The false friends who had clustered about them in the time of their worldly prosperity, happily now gave them a wide berth, since they had nothing now, either for entertainment or speculation, and they were left in peace to plod the daily path they had too thankfully accepted, as subordinates in other men's offices.

When the truth burst upon Mrs. Lawson, her indignation knew no bounds; and although it was at her own father's house that Tudor Lawson first set his feet upon the slippery plane that had landed him in bankruptcy and ruin, she reproached him bitterly, and gathering together all she could secure of her personal property, betook herself to the more congenial society of her parents' home. Mrs. Lawson would have preferred that Gertrude should accompany her, partly, perhaps, as a palliation of her own heartless conduct; but her persuasions fell short of the mark, inasmuch as both sisters had resolved to stand by the fallen fortunes of the house.

In a small cottage in a London suburb, these four dwell together, father and son travelling to and from the Metropolis by a cheap train, while Erminie and Gertrude do the work of the house, and prepare the meals with their own hands; and as father and son now rejoice together that their prosperity is not built upon, nor in any measure augmented by anybody else's losses or ruin, so the sisters thankfully realise the fact that their presence at the races will never again give countenance or encouragement to the various frauds and impostures, upon which alone the professional gamblers of all sorts and conditions feed and fatten.

A Regular Brick.—The origin of this saying will bear to be kept in mind, and puts a good interpretation to a slang phrase. A Spartan king, when asked by a visitor, "Where are your walls of defence?" replied, pointing to his army, "There thou beholdest the walls of Sparta,—ten thousand men, and every man a brick!"

EVERY CHRISTIAN A RADICAL.

By M. Butler Gerds.

IT may almost seem to be treading on covered ground, to write a few words on what is called "the consecrated life."

Hackneyed terms are often misleading, and without any such adjectives as "Higher," "Consecrated," "Surrendered," applied to our Christian life, we may quietly glorify the Name of our God and Saviour.

We can never get any "higher" than the life and example of Christ. We know those who are "consecrated" to the world, as to their talents, and others who have "fully surrendered" their hearts to evil.

How can *we* best glorify the Name of our God? The snowdrop glorifies its Creator in lowliness and purity of life. What a precious lesson we may learn from it! Pure, spotless, in Christ; lowly and teachable of heart. When the Lord of Glory has wooed and won us, the way to glorify Him is by at once showing our change of masters.

During Mr. Moody's blessed Mission in the north of London, a large employer there, who had given himself to God at one of the services, affixed a notice to his office door the following morning, announcing to his clerks the glorious change, and saying that henceforth he intended to glorify his Lord and Master. He began with his employés, and by personal appeal and example, won many of them to Christ. He reformed business abuses; commenced an early morning Bible-reading of fifteen minutes' duration, and oh, the blessing he got!

Every Christian, every *earnest* Christian, is a Radical. Do not be alarmed; if we are in earnest, we *must* go to the root (*radix*) of the evil growths in and outside our hearts. You are a Christian, and perhaps you have to work twelve hours a day—you doubt that *you* can "glorify" the name of your Saviour. "If ye shall ask *anything* in *My Name*, I will do it"—success is sure to the "fervent prayer." So begin *every morning* at the *root*—your own heart. Get it "anointed with fresh oil" from the "smitten Rock," and give your rising moments to God. Let "no earth-born cloud" creep in; just "*rest* in the Lord, and in the power of His might." Before you step over the threshold of your room, see that your heart is at peace with all. Ask that your tongue may be used to His glory; that you may be led into no sin, and that light laughter, foolish jesting, the silly song, idle or improper reading, unbecoming dress or hair, questionable amusements, walks and talks with worldly companions, and stint of love and cheerfulness to your fellows, do not mar "the beauty of holiness," or interfere with your "doing the will of God from the heart." Then you will not measure a yard of ribbon, nor set a stitch, nor make out an account, nor explain a lesson, nor do *any*thing for *His* sake, that shall not glorify His Name. Possibility and privilege unite to make this glorifying a beautiful reality to us. Then let us begin at once by a

life and service in and to "the Name of God."

THE LOVE OF GOD.

COULD we with ink the ocean fill,
Were the whole earth of parchment made,
Were every single stick a quill,
And every man a scribe by trade;
To write the Love of God on high,
Would surely drink the ocean dry;

Though widely stretched from pole to pole.

TOLD IN A LINE.

FREQUENT Competitions, with Money Prizes.

£14 14s. in money Prizes in Our Literary Competition. See page 15.

Special feature in ensuing Numbers:—Timely Talks: "The Young Man and his Amusements;" "His Friends;" "His Business;" "His Courting," etc. See our next.

Contributors to our issue, Nov. 12:—Mrs. Garnett, Emily Sarah Holt, Thain Davidson, D.D., and others.

On the back of a post-card, please send us the name and address of any friend to whom we may post a Specimen Copy of "A. 1."

Parcels of Specimen Copies will be sent gratis to any Clergyman, Minister, or Teacher, where friends can introduce our Paper.

Wanted—Distributors in every town and village. A liberal commission, and carriage paid.

Each month we shall issue our Weekly Numbers bound as a Monthly Part, with a Beautifully Engraved Frontispiece, and several pages of extra matter. Price Sixpence.

Interesting Items, Crisp Correspondence, Reports of Christian Work, etc., etc., are always greatly valued. Address — The Editor, "A. 1.," 62, Ludgate Hill, London, E.C.

HOUSEHOLD MANAGEMENT.

FOR MARRIED FOLK.

By Daniel McCoy.

Author of "Hints on Poultry Keeping," "Window Gardening," etc., etc., etc.

I.—Choice of a House.

BEFORE undertaking this (to some persons apparently hopeless) task, it is advisable to remember the trite injunction of the celebrated Mrs. Glass in her directions as to cooking a hare, "First catch it." So with household management—our first object must be to secure a house suitable to our wants, and in conformity with our means of income, or the amount we can afford to spend upon it.

Many persons, and a numerous class they are, go house hunting (as the work of finding a suitable house is called by them), without the least definite idea of the description of residence they may require, but visit first one, and then another empty house, mounting up dozens of stairs, going over all the rooms, when they must have known they were merely wasting time, as the rent far exceeded the amount they could afford to pay, and as the locality was in no way suited to their avocation or requirements. They take endless journeys by rail and omnibus, spending money and losing valuable time, and eventually, after all their search, find themselves compelled, from necessity perhaps, to remain where they are, or to take in a hurry a house which after a time proves quite unsuitable for them.

The lesson to be learnt from this is: do everything with a purpose; enter upon the search with a knowledge of what you require, and having fixed upon a neighbourhood, in

which either from necessity or from inclination you desire to reside, visit carefully and circumspectly inspect any houses in that neighbourhood that are to let; and having fixed upon one, let a thorough examination be made of it, as to whether it is carefully drained and properly arranged in all sanitary points, such as *e.g.* a pure water supply for drinking purposes, separate from the household water supply. It is absolutely necessary to be thoroughly satisfied on these two points before becoming a tenant. And if you do not understand such matters yourself, employ a thoroughly qualified sanitary engineer to go over the premises with you. For the outlay of a guinea (the expenditure of which will never be regretted), you may have the satisfaction of an authorised assurance that you are not entering into an unsanitary dwelling. More lives have been sacrificed through inattention to these matters than are sometimes reported after an action with the enemy.

Before taking a house, it is well to be very careful to ascertain (if you are a stranger) what class of people are residing in the vicinity. It is very unpleasant, especially if your pursuits are literary, to find yourself fixed for from one to three years just opposite to a school for music, or close to engineering works. Clearly, much that is disagreeable may be avoided by a little careful inquiry.

Select, if possible, a house on the sunny side of the road, so that you may have the benefit of the early morning sun. The bedrooms occupied by children should always have an easterly or south-easterly aspect. There is an old proverb, "Where the sun enters the doctor is seldom wanted," and that it is as true as it is trite, one may readily see if one compares the sickly appearance and the debilitated constitutions of those unfortunate little children, bred and reared in noisome, sunless courts, with those living in a bright, sunny and airy, well ventilated house. Select therefore, if possible, a house facing the east with a slight inclination towards the south, but avoid by all means even a prettier looking house having a northern aspect. The apparent brightness of the house so situated will vanish at the approach of autumn; the dwelling will remain in gloom until the later days of spring, when there will be a slight glimmering of sunshine on a portion of the house during the later part of the day. With a house in the more favourable position, the rooms at the back will, during the later period of the day, enjoy the full blaze of the sun's brightness. The bedrooms in the front will by this time (having been well ventilated during the day) be refreshing and cool for the occupation of their little inmates.

It may also here be pointed out, that it is advisable that in every bedroom there should be a ventilator fixed in the chimney. It is only necessary to compare the wall paper of a room that has one of these useful fittings, with that of a room in which no such thing exists. What is the cause of the difference? Simply this, that very many of the small impurities which fix themselves on the walls of an unventilated room, are carried away with the foul air through the ventilator into the chimney.

Should you have the option of choosing papers for the walls, too much care cannot be devoted to their selection. If, unfortunately, you have not such an opportunity, insist upon papers of a light colour, such as grey, or pale yellow, or straw colour for the rooms to be occupied by the younger members of the family. Any papers of a light green colour usually contain a great proportion of arsenic, which it is needless to say has a most injurious effect upon the constitution, and therefore this description of paper must be scrupulously avoided. Those papers called sanitary are perfectly safe, and may without fear be used in any rooms. Many of them are washable, which for a bedroom is a great advantage, not only on the score of cleanliness, but also on that of health. The walls may with advantage be lightly and carefully washed about every four or five months; and if due attention be paid to the manner of washing (which should not be rubbing, but merely careful wetting and wiping dry in one direction) the papers will for a long period retain their original brightness and freshness of colour.

A great deal might be said about the various sorts and colours of papers requisite for the other rooms, but this must be left in a great measure to individual taste and fancy, bearing in mind that where new papers are to replace those at present on the walls, the old ones should be first entirely cleaned off, as no room can be considered perfectly pure or free from infection, if such a necessary precaution be not carefully adopted.

Should the rooms be small, papers with a dark ground will make them appear smaller still; and all rooms having a northern aspect, should be papered with bright, warm-looking papers, as they will have little, if any cheerfulness imparted to them by the bright sunshine that the other rooms of the house will enjoy. There are some pretty light-red papers, which would at once produce that warm and cheerful appearance so much to be desired in all rooms, and nowhere so much as where unfortunately there may happen to be an invalid.

All this should receive our strictest attention in taking a house. Trifles they may appear to be; but it is such innumerable trifles, as they may be considered by some, which in the long run will largely influence the comfort of a new home.

The amount of rent to be paid will depend materially upon the income of the intending occupier. It is generally considered that about the eighth part of the income may be expended upon the rent. An income of two hundred and fifty pounds per annum, *e.g.*, would allow of a house at thirty-two pounds a year; and as the rates and taxes are supposed to be usually about one-fourth of the rent, would cause an additional deduction of some eight or nine pounds from the income, leaving for household, personal, and incidental expenses something over two hundred a year. If the family be a small one, this, with judicious expenditure (as will subsequently be shown), would allow the family to live exceedingly comfortably; if a large one, methods would have to be adopted, and a certain amount of economy practised, which will be fully entered into under another head.

In the country, house-rent is much more moderate, generally speaking, than in large towns; and even in a town the position must be considered. The rent of a house in a fashionable neighbourhood would be quite double that of a house of precisely the same description in a suburban district. As, however, our remarks will apply principally to those persons who may be satisfied with moderate-sized houses in healthy and respectable neighbourhoods, the consideration of the higher rent in proportion to the value of the house, will receive but little attention from us.

The principal things, then, to bear in mind in making choice of a house are: not to take a house of a greater rental than your income will admit of; to secure it in as healthy a neighbourhood as by your personal observation you can discover; and be perfectly certain that it is in a sanitary condition before entering into the occupation of it. It should also be seen that all the bells are in working order, that the keys are in the several doors, that the sash lines are not almost worn through; and where venetians are fixed, that all the ladders, webbing, and cords are in complete working order. Have every necessary repair completed before entering on occupation. There may be difficulty in having it done subsequently, to say nothing of the inconvenience of having tradesmen all over the house, interfering with your privacy and comfort.

The following is by no means an imaginary expenditure, as some may be that are at times presented to us for our guidance; but is taken from real experience. There was never any stint, but on no account whatever was any waste permitted, everything that possibly could be being invariably utilised—such as bones for stock and gravies, outside and trimmings of vegetables for flavouring soups. All cold fats were carefully saved for frying purposes, and stale bread for puddings or bread sauce. The expenditure represents that of a man and his wife, with two servants, the husband's position rendering it advisable, with a view to increased income, to live in a larger house and in a better situation than the income of £250 per annum warranted.

They find themselves, at the close of their first year's experience in housekeeping, with a balance in their favour of a little over fifty pounds. If the husband's practice should increase as he hopes, it will be all sunshine whilst they keep within their limits; but should some smaller mouths come to be fed, there will be but a very narrow margin for dress, or other small requisites to calculate upon. It would be far better, on entering into life, to begin with a small house, manage with one servant, and economise from the beginning. It is but sorry work making a slow, uphill progress of recovery from difficulties. If we are careful in all things, we shall find ourselves much happier in the end.

	£	s.	d.		Income. £	s	d.
Meat, 20 lbs. at 7*d.*, say	0	12	0		250	0	0

				£42	9	8

Truly indeed a small sum for clothing, and that necessary item in all families—Life and Fire Insurance.

GIRLS I HAVE MET.

By Mrs. Skinner.

I. MISS EXAGGERATION.

WHEN I was first introduced to her, she grasped both my hands, exclaiming, "I am so delighted to make your acquaintance! Pardon me, but I feel sure you will be one of my dearest friends. I never did feel drawn to any one as I do to you." Of course I felt very gratified with her reception, thought she must be a very charming girl, and wondered why I had for so long been unappreciated. As she was speaking to some one else, I took the opportunity of looking more closely at her. She had on a very short dress, almost covered with beads; sleeves also so short, you could see her elbows; collar so high, she could hardly move her chin. Her hair was dressed in true Parisian style, but so *extremely* high, according to English ideas, that it forcibly reminded you of the woman in *Punch*, who had to stand up on a stool to reach her back hair, it was so high. At the other extremity of her figure, her heels were quite two inches high, and her whole appearance seemed to denote her love, not so much of following the fashion, but of carrying everything to the extreme limit, and even beyond that. Her speech was between a drawl and a lisp, and the number of long and strange words she used, often made me feel the need of a pocket dictionary.

A few days afterwards I met her on the Dover mail steamer. She had a friend with her to whom she introduced me, as "A lady I met—see, now, where was it? and I'm sure I forget your name. I'm introduced to such hundreds of people, my memory always fails me." Humbly I mentioned my cognomen, feeling there was little chance now of my being one of her "dearest friends." "Ah, yes," she exclaimed, "a thousand million apologies. I'm sure I deserve to be ostracised by everybody that knows me." As soon as the boat started, I retired to the privacy of the ladies' cabin, and had been there some considerable time before she came down. "It's a good thing you are down here; certainly the sight of the sea would frighten you; the waves are as high as Mont Blanc—I am sure they are; the captain's face is dreadful to look at, doom is written on every feature."

I began to feel what a capital sailor I must be, for I had felt but a gentle rocking of the vessel. She continued: "I've been examining the boats and belts; should the worst come, very few of us can be saved." I began to tremble violently,—life is so very sweet when death meets us suddenly; but the calm way in which she was arranging that wonderful hair quite reassured me. Presently I had to give her a little assistance, the stewardess being too busy to stay with her; and before I could have time to think again of the probable shipwreck, we were safe in harbour. "Oh, what a dreadful time we have had!" she said to her friend; "I have been most distressingly sick, it has taken two to wait upon me, and I feel almost dead. Oh, don't carry that portmanteau, I will;" and off she rushed up the ladder.

"She looks as if she was nearly dead, doesn't she?" asked her friend, laughing.

But I was too much grieved to think I had not realised her sad condition to reply.

The next time I met her was just outside my own house. There had been a shower of rain, and I invited her in for shelter.

"Oh, thank you. You are the dearest creature in the world. I am so wet; I feel exactly like a sponge. I am sure if you were to squeeze me anywhere I should ooze."

"Then I could only have caught the fringe of the shower, for I am only just a little damp. You must take off your jacket, and I will dry it for you."

"Oh no, thank you; it's all right. But I will just rest myself a little, if you have no objection; for I had such a crushing at the station, I really thought I should have been turned into a jelly."

"Dear, dear," said I; "you must rest a long time."

"Oh, I'm all right now; but I'm not very strong, and I have so much to do. Sometimes I am so tired at night, they have to carry me up to bed, and I have had such a cold. Last week you could not hear me say a word, and one night when I sang at a concert I almost choked to death."

"Why, how could they hear you sing?"

"Oh, somehow. I daresay that most of the folks thought I was trying to imitate musical frogs."

In the course of conversation it was discovered we had a mutual friend living some distance in the country, whom I had not heard from for some considerable time. Naturally I was anxious to hear all about her, and drank in eagerly every word.

"I think her husband is seriously ill. Poor thing, she has a dreadful time of it, for he is a dreadful man."

"What do you suppose is the matter with him?" I anxiously inquired.

"Some fibrous growth in his mouth."

Instantly I thought of cancer.

"And her child; she has only one. I saw it once—such a dirty little mite it was!"

How my heart ached for my friend! Husband ill and unkind; she, too much crushed to attend properly to her child.

"And I should think they are very poor, for I overheard him say that he had lost some hundreds of pounds."

I forebore to question her further; the picture seemed already sad enough. When she had gone, I sat down to seriously consider what I had better do.

By the next post I wrote to my friend, urging her to tell me exactly how she was circumstanced, saying that I had been told by a mutual acquaintance of her husband's illness and their sad loss.

Anxiously I waited her reply, hourly reproaching myself because I had not gone instead of writing. This was her answer: "I cannot tell who could have so misled you. My husband has had nothing the matter with him more than a slight gum-boil; this certainly checked his gaiety, and, oh, he is such a tease! Thank God, I cannot remember that we have had any losses at all; but, as I write, Jack reminds me we did lose a bad neighbour, and about a hundredweight of apples—that is all. Come and see for yourself how happy we are. We have one little darling—such a beauty, his only fault being his love of rolling in the garden. We cannot, try as we may, keep him clean."

Upon the receipt of this letter, I at once did make a visit,—not to my friends, though, but to my young lady informant.

"What an unexpected pleasure! Nothing could have given me greater joy," she exclaimed, kissing me on both cheeks.

"Wait till you hear what I have come about," I said; "my visit may be productive of good, but hardly of joy."

"You are talking in riddles, and I'm sure I could as easily fly as guess one."

"I don't wish you to guess riddles, but I do wish you to read this letter;" and I handed her my friend's epistle.

"Did you write about what I told you?" she exclaimed, her face growing very red.

"Of course I did; I could not rest until I knew exactly how my friend was placed."

"But you must have misunderstood me."

"I just took your words with their ordinary meaning, that was all. Did you not say he was 'a dreadful man'?"

"Yes; but dreadfully funny, I meant."

"Did you not say she had 'a dreadful time of it' with him?"

"I may have said so, but I meant that she was dreadfully teased by him,—nothing more. Surely you understood what I meant."

"How could I understand, unless you expressed yourself clearly, and within the limits of truth?"

"Do you accuse me of speaking falsehoods, then?"

"I'll answer that question when you have explained to me about the child and the loss of money."

"I only meant the child was dirty, and I *did* hear him speaking about losses, and of course I thought he meant money." She was nearly crying by this time. "I am sure it is very cruel of you to make these charges against me. There never was anybody in the universe so unfortunate as I am."

"Hush, hush, dear; you are only repeating what is your great failing, and which was the cause of all this misrepresentation."

"My great failing? what is it?"

"To *exaggerate*, to put 'the truth in masquerade,'—nay, do not deny it; always look your faults straight in the face; and, if you have time—I suppose you have to work very hard for your living, and have not much leisure—school yourself to overcome them."

"'Leisure,' indeed! I have plenty of time on my hands. Do you think I am some poor slave?"

"You told me you had to work so hard, that you had often to be carried to bed."

"You are a very disagreeable person, and I have always thought so from the first moment I saw you."

"And yet you told me how much you were drawn to me, and that you were sure I should be your dearest friend! No, dear, don't let anger make you indulge in further exaggerations, but do set a guard over your lips; do remember that,—

'To exaggerate is to be vulgar;
To exaggerate is to mislead;
To exaggerate is to speak untruthfully;'
For, 'who speaks not truly, lies.'"

I kissed her and left her, I knew, a sadder girl, but I hope a wiser one, for she is but—

"An unlesson'd girl, unschool'd, unpractised;
Happy in this, she is not yet so old
But she may learn."

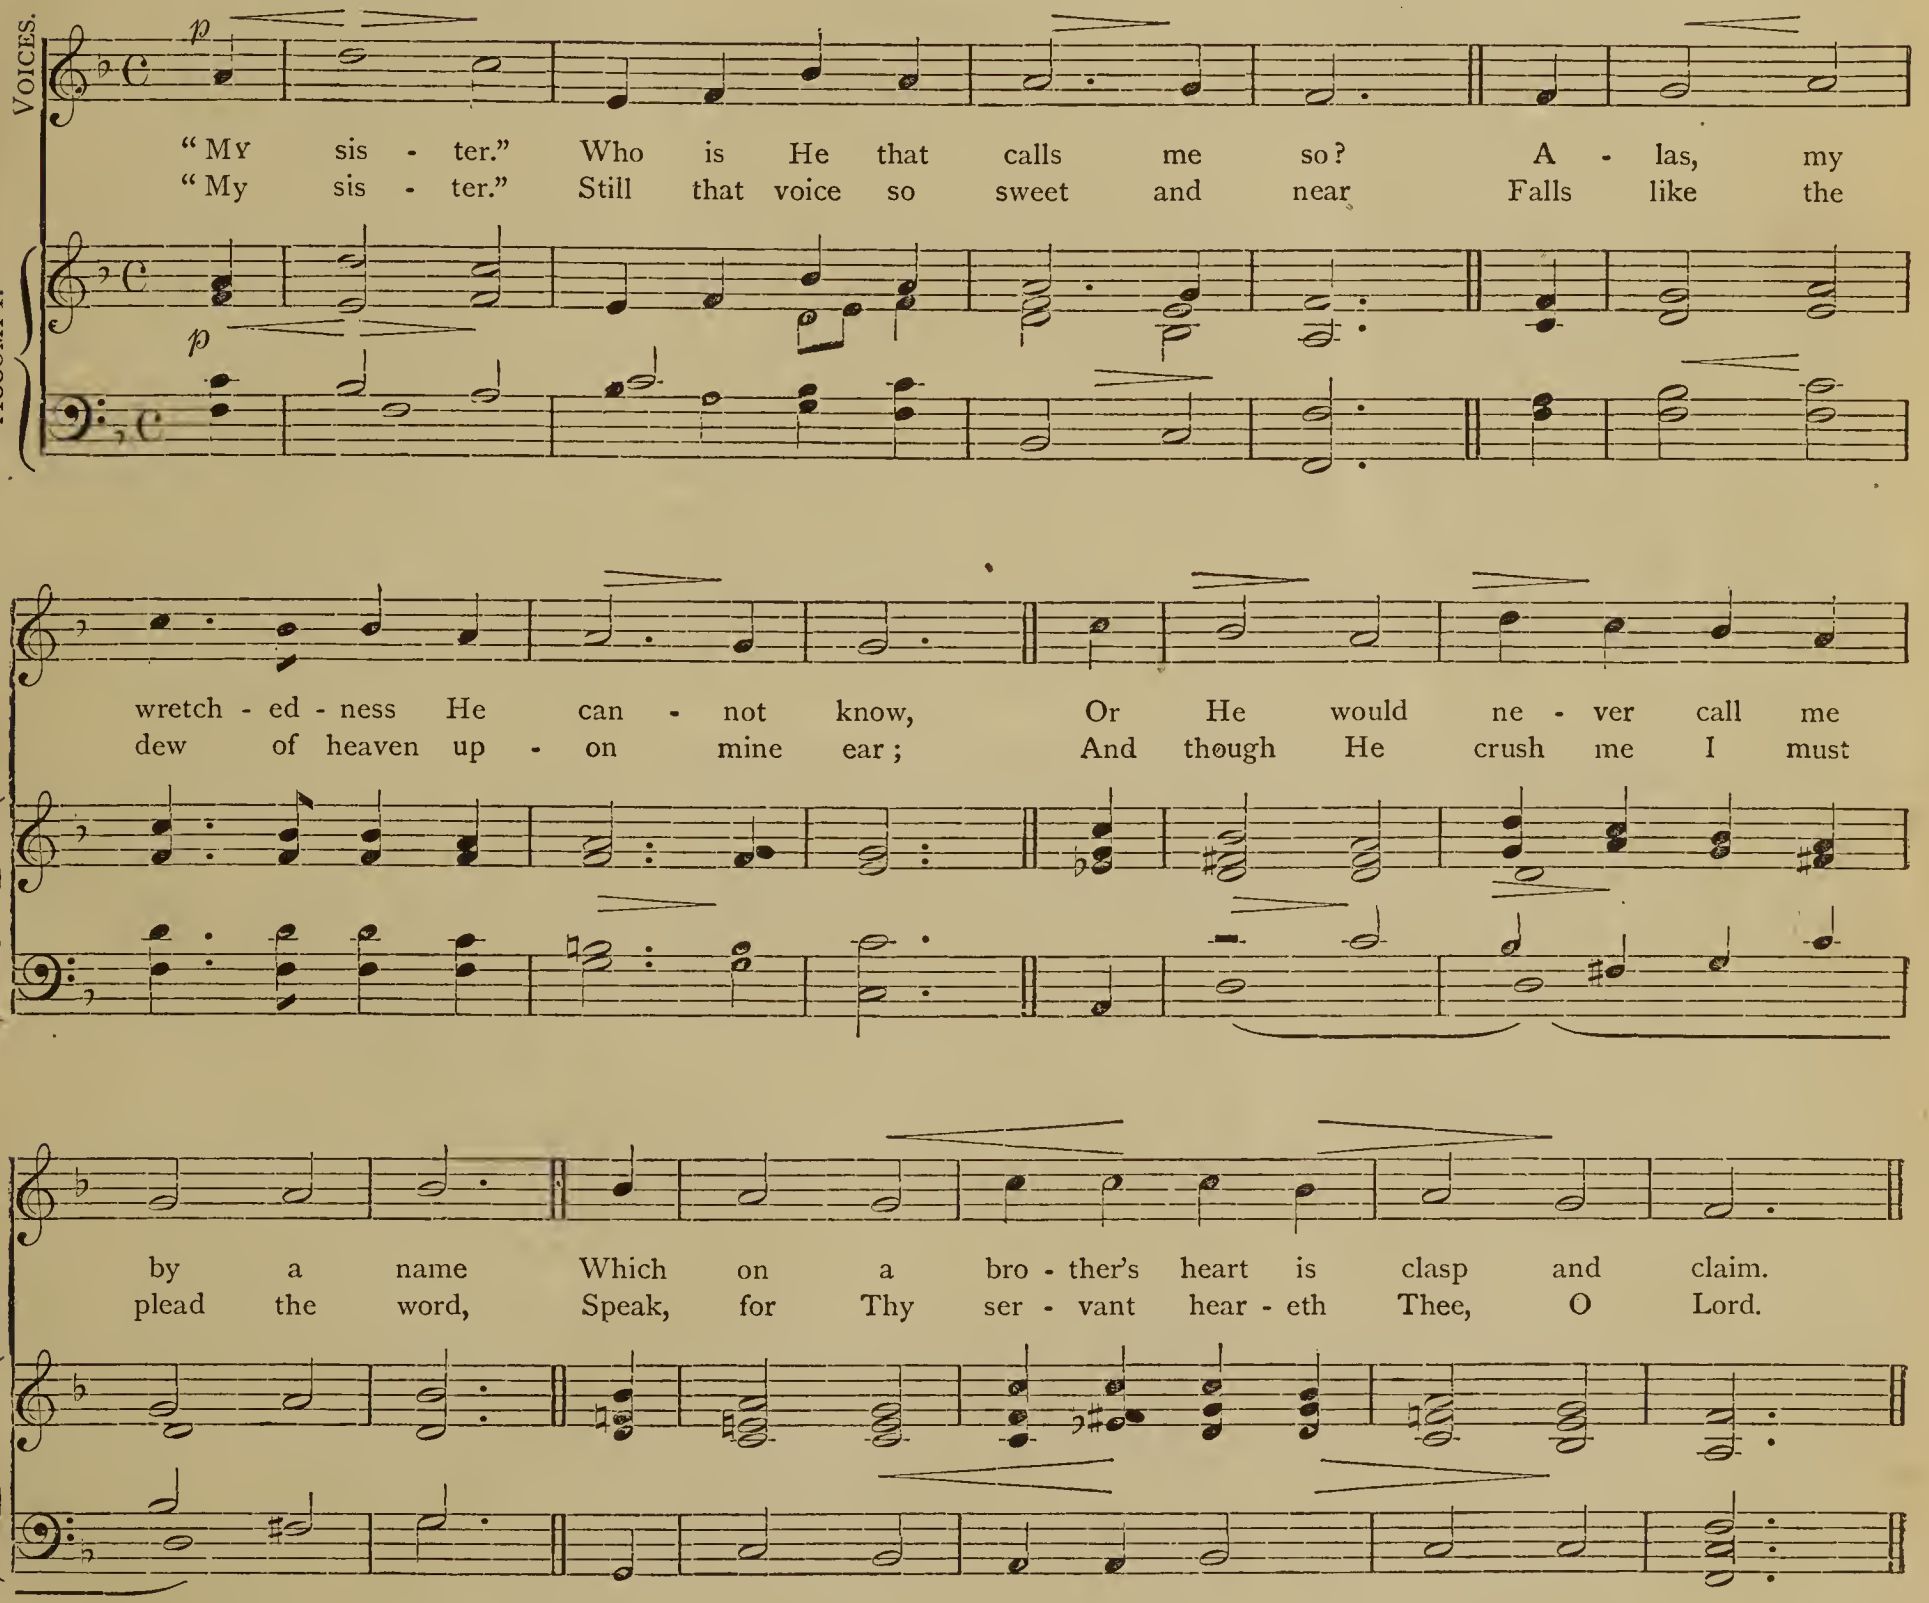
CRISP CORRESPONDENCE.

WE shall open this column as soon as our readers begin to correspond with us.

Being earnestly desirous of helping any who are yearning after soul-rest, or who may be battling with doubts and difficulties, we especially invite their confidence.

Unprofitable questions we cannot answer; but shall make every effort to reply to inquiries, and give information on all kinds of topics, when such will afford practical help to our readers.

Questions of only *personal* interest cannot be answered in this column; a fully addressed and stamped envelope must be sent, in each case, for reply.



"My Sister."—*Mark* iii. 35.

By EDWARD HENRY BICKERSTETH, D.D., Bishop of Exeter.

Arranged for Treble Voices

With feeling and expression.

Charles Vincent, Mus. Doc., Oxon.

"My sister, thou art Mine, I died for thee,
To draw thee and to win thee. Follow Me:
My blood shall wash away thy darkest stain,
My Spirit recreate thy heart again.

"My sister, all the past is all forgiven,
Fear not to lift thy trustful gaze to heaven;
And, be it but a broken struggling cry,
Let Abba, Father, be thy life's reply.

"His Presence shall thy guide and guardian be,
His tender mercy overshadow thee,
His Spirit with My peace thy spirit fill,
And make it heaven on earth to do His will."

Jesu, Thy heart of love has conquer'd mine,
Once lost, but found for ever, I am Thine:
Low at Thy feet adoringly I fall:
My Brother is my Lord, my God, my all.

(By permission.)

THE STORY OF ST. ANTHONY.

By Eva Travers Evered Poole.

ST. ANTHONY, so the story says, longed to dwell in the sunny radiance of God's presence, even while treading life's pathway. In order that he might the less distractedly and the more surely gain his desire, he withdrew himself from the daily duty and toil of a life in the great city, with the intention of filling every hour of the day with great and glorious thoughts of God. One day, as he sat lost in meditation, at the entrance to the dark cave in the rocks which he had chosen for his abode, he fancied he heard, in the light summer breeze which lifted his long locks and kissed his worn face, a voice. At the sound of that voice, he fell on his face, wrapping his head in his mantle, like Elijah of old. And the voice spoke in his ear,—"Anthony! thou art not so holy a man as the poor cobbler in Alexandria; neither art thou so well-pleasing in My sight."

Amazed, Anthony arose, took his staff, and started at once for Alexandria, eager to see and learn from the holy man.

At length he ended his journey, and after a long search, found the cobbler's stall, in a mean, narrow street.

When the cobbler—a little deformed man, with a brown face, but with the deep, shining light in his eyes that surely betokened the presence in his heart of God's Shechinah glory—saw the revered form of the saintly Anthony standing on the threshold of his dwelling, he arose and bowed himself to the earth in fear.

Then spoke out St. Anthony: "I would know how thou livest, cobbler, and how thou spendest thy time?"

"Verily," said the poor little man, "I have no great or grand doings to tell thee of. I am a poor, humble, hard-working cobbler; my busy life gives me little time to think, and I have no ability to do any great work for God. I just live from day to day as He helps me. I am up with the lark, and I kneel in prayer for myself, my family, my neighbours, and the city in which I dwell. All the day long I am hard at work, and when the dusk settles down, I sup with a thankful heart upon the little I have earned, and then I pray, and sleep. I keep me ever, by God's help, from slander and usury; and if I make any man a promise, I try my best to honestly perform it."

St. Anthony turned away, sad at heart and disconsolate, the verdict of the all-seeing One ringing in his ears—"Holier than thou! holier than thou!" And as he made his way back to his desert home, the voice of the evening breeze sighed sadly—"Alas! for the mistakes of the human heart. Alas! that that one life should be so humbly full, and the other so proudly empty."

Brother, sister, God's blessing rests on the hands that do honest toil, and on the humble hearts that uplift themselves, like the daisy flower, to the smiling face of God. No life of labour need hinder us from holy service for our God; no cares need keep us from communion with Him. Surrounded by them, our hearts may sing,—

> "Lord, I may make of cares and griefs
> Fresh stepping-stones to Thee,
> Until I reach a height from whence
> They all look less to me.
> And I can bear my daily cross,
> And lift my daily load,—
> Sure that each burden meekly borne
> But brings me nearer God."

Never wait for great and grand service for Christ to be offered to you. Be content with daily duty, for the reward is given for "faithfulness in that which is *least*, as well as in that which is greatest." By faithfulness in daily duty, we put ourselves to school for heaven. The little makes up the great; the soft falling rain that waters the earth, making the grass to grow and the flowerets to blossom, comes down in drops. The great cup of the ocean is filled by the tears of the sky; the setting of sand-gold around it is made up of single grains.

Seize opportunities; "doe ye nexte thynge;" and thy soul shall win the smile, and thy life the praise of God.

FRAGMENTS.

LET us all make sure that we *have* life, and secondly, to let that life grow *naturally*, and not to "put on." That which is "put on," that which isn't real, doesn't impress others.

I used to know a lady who invariably said exactly the right and proper thing on every occasion. I remember how every time I used to come away from her thinking, "Oh, how I wish I could talk that pious." But now I know that it is no use for me to put on solemn tones and expressions, unless they come naturally. It is a great burden to "put on" more religion than we have, and it is worse than useless. If we have God's life growing in us, we shall be natural. Those that the Son makes free are free indeed.

What a difference there is between the person who pulls out his Bible in a railway train, in order to impress the people present, and the one who pulls it out because he does so badly want to read it, that he can't help himself.

If we are willing to be exactly what God wishes, then life becomes simple. But oftentimes we are not willing, and so we are in danger of being unnatural. I have not always found that I invariably like to be what God wants me to be. Perhaps I like to blow roses when He wants me to grow potatoes. But it is no use for me to take paper roses, and sew them on, for they would be all found out as soon as some one came to pick them. God's will for us is always right. Sometimes I have been tempted to think it very inconsiderate of God to send me some special experience; and then I have found that I grew better in that place than anywhere. God knows where to place us. Consider the lilies, how they grow—just where they are planted; they do not worry about rain and sun, they just live and grow in obedience to the gardener's will. Even the resistance of the earth all around them is good for them. There would be no healthy growth without it, and they are willing to grow downwards as well as upwards.

I believe, if we trust our life to God in that way, we shan't know there is a drought when the drought comes. The spring of God's life will be within us, springing up as clear and safe as God Himself.

Let this life live in you. Refuse to let any other life live. Reckon yourself to be a Divine person, a child of God. Reckon yourself to be dead to sin, and alive unto God, and you will find it true. I don't mean that you will never sin, but I mean that the road to victory is that way.

How well I remember the first time I got victory over an angry temper by recognising that law of life. It didn't take me an hour to feel like an angel to the person I had been hating. If the Divine life is steadily recognised and used, then it will live and reign.

"MEN THAT CAN'T."

No. I.

THE MAN THAT CAN'T WAIT.

THE Duke of Wellington—so I have been told—used to say, "All things are possible to the man who waits." At any rate, the Battle of Waterloo showed that he knew how to wait, as well as how to act when the right moment came. A clerical friend of mine said, "Under God, I attribute my successful ministry to *my staying power*." He meant his power to restrain himself from acting on impulse.

Poets, statesmen, artists, reformers, merchants, preachers, missionaries, who have succeeded in their life's work, have been, without an exception almost, men who could go on for years steadily working and praying, preaching and studying, and manfully, faithfully, hopefully waiting for the hour of success. I have read the lives of men who made large fortunes by the daily increments of small profits, and I have seen that they were men who did not "make haste to be rich," but men who could wait to make their fortune. Above all, and beyond comparison, I think I can see the principle in the life of the greatest of men. I see in His life a wondrous calm, a patient realisation that each event had its own proper place in His life's mosaic, and a meeting of all impatience, from whatever quarter it came, with those words of knowledge and of power, "Mine hour is not yet come." No life can compare with His in its infinite success. All men who would attain a measure even of true success, must follow in His blessed steps. Amongst other things, they must know how to wait.

I commend this thought to young men. Most of them have an honourable ambition to succeed in life,—the exceptions are very few indeed. Where is the young man to be met with who knows aught of the competition for place and honour; of the large possibilities that lie before him; and of the demand, as real as ever, for true worth, who does not desire "to get on"?

Yet, how many are not "getting on." In a word, they are failures, to be traced to this fact—the man could not wait. Do you wish to see this for yourself? Go and talk to young men. Find out how many of them believe that real success in life is attained, in general, by careful, zealous performance of each day's allotted task and duty. Find out how many of them are feverishly desirous of eating the fruits of success, without taking any real care to sow the seeds from which success alone can spring. Success reached by leaps and bounds, is rarely, if ever, true and lasting.

That we may see this more clearly, consider some particular instances.

In *business*. We have already anticipated, to some degree, what we might remark here. Let us take one instance. What in many cases leads a young man to betting on the gaming-table or the race-course? He has been such a time in the office, say, of his employer, and he has begun to turn his thoughts to making his fortune. But he reflects with pain that he has not made much progress towards it yet. Then comes the tempter, "Why need you go on at this wretched pace? Go and bet; a lucky turn of the wheel of fortune may make you independent in a night!" So he goes; tired of the old honest slow-and-sure style, he bets, he loses, he wins. You know the rest. How often the story ends—not in golden dreams realised, but in a trial for embezzlement, penal servitude, a mother and sisters in tears

of anguish, a grey-headed father bent down with sorrow and shame. Why? Because the young man took to betting? No, but because he could not wait! That's it!

Young men in business, "learn to labour and to wait." Let not a blind haste to be independent send you to betting, to restlessness, to questionable practices, or to any of the many things in which young men give unbridled way to this impatient spirit. The road to honour is a well-beaten track. It is the way that is called "Work and wait," and the hedges thereof are "Fear thy God" and "Love thy brethren."

In *knowledge*. Why is it that most young men can tell you of a number of studies they began, but in which they never advanced beyond the very rudiments? One began to learn shorthand, but did not persevere. Another took up music, spent a little time and money in the pursuit, and then—gave it up. To-day all he has for his trouble is regret that he did not persevere. A third began French, not once, but three or four times, maybe; he is now meditating a vigorous *fifth* effort for the coming winter evenings, to be followed in due course, it is to be reasonably expected, by a sixth in the spring. He is fast developing a likeness to certain old-fashioned watches, which were known as *repeaters*. Have you not seen in your country rambles certain unfinished, ghost-like houses, that were begun but never finished? They are usually called after the owner, to whose name there is added an expressive, albeit unflattering noun, "Brown's" or "Robinson's Folly." Oh, how many of us young men have three or four "Follies" of other ilk disfiguring our past history. And why? Because we could not endure the drudgery. We wanted to grasp the gains all at once without the pains. Is there a reader of this Article, with talent and opportunity, about to give up his studies because he thinks his pace but slow? Is there one, in petulant haste, about to throw down his pen or his tool? Stop! The man who fails is the man who cannot wait. Wait a little longer, and work a little longer. If you cannot wait for success in your present position, are you likely to wait for it in another? You remember the struggles endured by Dr. Johnson, author of the famous dictionary, in his early life. You know the measure of his success. This was his motto. I commend it to you: "Go doggedly on!"

In *opinions*. I shall limit my thoughts to religious opinions, though the principle applies to all opinions. In this day, when teachers of the false often put to shame, by their zeal, teachers of the true, it is wise to take time to make up your mind. You will agree with me that Faraday was a man whom no one need be ashamed to follow; and this was a saying of his: "There are many questions about which it is the highest philosophy to keep one's mind in a state of judicious suspense." Why do young men sometimes adopt strange and soul-ruinous opinions? Simply because they "can't wait." In the Word of God, in the economy of the Gospel, are many things I cannot understand now. Perhaps I shall see them before I leave this world. Perhaps I shall not. Shall I reject them, forsooth, because I cannot understand them *now?* (for that is really what it comes to). I shall not. I can wait till God reveals them to me if He will, or does not if He will. There is sufficient plain and simple teaching there to help me in my every need, to cheer me in every dark and cloudy day, to show me my Saviour in all His love and infinite power. And as to the difficulties, well, I shall keep my mind in a state of "judicious suspense" and *wait!*

In the *conflict with sin*. I hope my readers know what this means, for "no conflict, no crown." Yet how many young men, aroused for a while, face their besetting sin or sins for a season, but in a short time discouraged, because they did not overcome at once and for ever, give up in despair, and acquiesce in their miserable slavery. Brother! is this your temptation? Are you going to lie down and give in? Shame on you! "To him that overcometh" is the crown promised. Overcoming includes not only brave and faithful conflict, which all who would win must endure, but the patient continuance in the fray, and waiting for victory. Why, the victory is sure. Do not think of retreat. Oh! stay upon your God. "Wait on the Lord, and be of good courage," for "they that wait upon the Lord shall renew their strength." Again, I say, the victory is sure to face the foe afresh. Buckle on all the armour of Light, and take for your battle-cry, "He that believeth shall not make haste."

I could write many things, if need be, on this subject of "waiting." I have written these to illustrate my opening sentiment, that the man who fails all round is the man that can't wait!

LITERARY COMPETITION.

£14 14s. IN PRIZES

OFFERED BY THE EDITOR.

For the best Short Story (5,000 words or under)	£2	2 0
" " " True Adventure (3,000 words or under)	2	2 0
" " " Six True Gospel Anecdotes (each 500 words or under)	2	2 0
" " " Science Paper (3,000 words or under)	2	2 0
" " " Historical or Biographical Paper (3,000 words or under)	2	2 0
" " " Ballad or Poem (100 lines or under)	2	2 0
" " " Set of 50 pithy extracts, sacred and secular, each not more than 200 words in length...	2	2 0

Twenty CERTIFICATES OF MERIT will also be given in each Division.

RULES.

I. In the first six Divisions, the work must be original; in Division 7, the name of the Author, and the book from which each extract is taken, must be given.

II. The Competition is absolutely open to all, but Competitors are asked to state whether they are over or under 21 years of age.

III. Each Paper sent in must have Competitor's name and address on the first page, and on the back of the last one; also the Division for which it is entered.

IV. Books of reference may be freely used.

V. Competitors may enter for more than one Division, but can only obtain one Prize. Papers for Different Divisions must be forwarded in *separate* wrappers.

VI. Stamped, addressed envelope must be enclosed with any questions about the Competition.

All MSS. will be carefully returned when a wrapper properly stamped is enclosed.

The Competition will close Nov. 30, on or before which date all Papers, with "Literary Competition," and also the Division for which they are entered, *written outside*, must be sent to the Office of "A. 1.," 62, Ludgate Hill, London, E.C.

MUSING AND AMUSING.

DOST thou love life? Then squander not time; for time is the stuff life is made of.—*Franklin.*

Authors are like asparagus: there is little good about them but their heads! *Verb. sap.*

A Norman applies to a lady, summering at Etretât, for employment. "But, my good man, I have brought all my servants with me; I have nothing for you to do." "Ah, madame, if you only knew how little work it would take to occupy me!"

Short Commons.—At a shop window in the Strand a little while ago, there appeared the following notice: "Wanted, *two* apprentices, who shall be treated as *one* of the family."

Educate a woman, and you educate a race. When you educate a boy, you *perhaps* educate a man; when you educate a girl, you are laying the foundation for the education of a family, physically, morally, and mentally.

There is an excellent rule: say nothing respecting yourself, either good, bad, or indifferent; —nothing good, for that is vanity; nothing bad, for that is affectation; nothing indifferent, for that is silly.

Magistrate (to policeman, named O'Flaherty): "When did you last see your sister?" "About eight months ago, when she called at my house, and I was out." "Then you did not see her on that occasion?" "No, sir; I wasn't there."

The sun does not wait to be prayed for before he rises, but straightway shines forth, and is hailed by all; so do not wait to do good, for applause, noise, and praise, but do it of your own desire, and, like the sun, you will be beloved.—*Epictetus.*

American Journalism. — An Iowa editor says, with gratitude: "We have received a basket of fine grapes from our friend F——, for which he will please accept our compliments, *some of which are nearly two inches in diameter.*" (The italics are our own.)

The Wrestler's Inn, at Yarmouth, is celebrated for a *jeu d'esprit* of the immortal Nelson. He was asked by the proprietor for permission to call it "Nelson's Hotel," and to place his lordship's arms over the door. Nelson gave him full permission to do the former, but suggested the omission of the latter part of the ceremony on the ground that "*he had no arms to spare!*"

Here is a good word for the women. An English statistician has discovered that married men live longer and live better lives than bachelors. Among every 1,000 bachelors there are 38 criminals; among married men, the ratio is only 18 per 1,000.

TEACHING:

WHAT IT IS, AND WHAT IT IS NOT.

TEACHING children does not mean (as too many, from their actions, seem to think) so much knowledge crammed into the little heads, to be extracted again at examination times. Education is meant to be rather the gradual training of the mental faculties, as they develop themselves, or are developed by exercise. Much that we have ourselves learnt in our school days is forgotten; the *effect* of the study only remains. Looking at school life from this standpoint, when we come to have pupils ourselves, our first object is to make a child *like* her lessons, to arouse an interest in what is learnt; and to do this successfully, a pupil must first like her teacher. There is nothing so essential to easy and right teaching, as a perfect understanding between teacher and taught; only, out of school hours, let those relations be forgotten as much as possible, and let the teacher become the sister friend, to whom all go for sympathy or advice, dropping the formal restraint of the schoolroom, only insisting on the one point of perfect obedience. Speaking of this "formal restraint" so usually adopted, which immediately forces the generally unpleasant conviction, "Oh, I'm in school!" I have myself found that almost wholly laying it aside was full of good results. The feeling, "This is a *lesson*," takes away at once much of the interest that might be awakened. If the lesson can be made to look like a pleasure, so much is gained. Of course this entails a little extra thought and work upon the governess; but worry, and perhaps pardonable annoyance, are avoided, as the work goes more smoothly, and when once the pupils are *interested*, it is easier all round.

Archbishop Whately says very truly, that "the object of all teaching is to make a boy *think for himself*." Never prompt, where a child can find out easily for herself. It is a mistaken kindness always to answer questions; a genial "Well, dear! what do you think it ought to be?" or "Turn to page so and so, and read it to me," is often a greater help, and makes more impression.

Then there is no use in teaching children when they are tired, or cold and uncomfortable. I do not mean to encourage nonsense, but there is no more use in making a child write a copy, or work a sum, while it is physically unfit to do so, than in trying to make it eat a dinner if it is not hungry. Such teaching only does harm. Mental faculties cannot be developed if the body is not in a normal condition. On one occasion, a little pupil had a very bad cold, and the table being at some distance from the fire, a dreary afternoon with no results was the only outlook; but, by sitting over the fire with books and work (it was the day for needlework), the cold was mostly forgotten, and Maude, standing on the hearthrug, read aloud as usual for half an hour, as cheerily as any child with a cold could read. Perhaps this might not always be possible; I only quote it as an instance of what a little management will do.

With children under ten, geography and history come second; obedience and moral principles are the first great object. Once engraft these, and arouse a quick perception and interest, and knowledge will be easily acquired, while there will have been a foundation laid for that which is incorruptible, and which will stand when all else fades. For those who are older, I would still urge that Euclid and Greek may never supersede that loving Christian training which, under God's grace, alone fits any man or woman to meet the temptations of life, and gives strength to conquer in the battle. Oh, if those who have children under their care fully realised this, God's world would be more what He meant it to be, and there would be less vantage-ground for the destroyer in many a young heart.

The Rev. Charles Kingsley writes: "Your business, and that of all teachers, is not to cram them with things, but to teach them how to read for themselves. . . . We want to train—not cupboards full of information (vile misnomer), but real informed women." And again to another: "In my eyes, the question is not what to teach, but how to educate; how to train, *not scholars, but men*—bold, energetic, methodic, liberal-minded, magnanimous. If I can succeed in doing that, I shall do what no salary can repay—and what is not generally done by private tutors."

Regular hours, never setting *too long* a lesson, always cheerfulness, and sometimes mirth in a schoolroom, I would earnestly suggest. Having tried it myself, I recommend it to others. It means prayer and thought and great patience, but the end is worth it all. Whether it succeeded or not in one case, let our readers judge from words written by a mother: "I think you must have a talent for teaching; you have made Grace *like* her lessons, and she used to dislike them so."

TRIED WITH FIRE.

"I will refine them as silver is refined, and will try them as gold is tried."—*Zech.* 13. 9.

"I DON'T at all like this beating and bruising," said a piece of gold that had been under the hammer for a long time, and was beaten into all manner of shapes. "I don't see the good of it, and I quite ache with knocking about so."

Heaps of gold and silver were lying about the room in different stages—some rough and shapeless, and almost hidden by earth and sand; some purer, having already been in the fire; but all had still a large amount of dross clinging to them.

They had been taken away from their former surroundings, that they might be prepared for high and earnest work in the king's service. But some did not understand this, and thought it all harshness and unkindness that put them to so much suffering.

"Oh, dear, dear," moaned the gold again, as it was put into the furnace, "this fire is worse than all; the heat is terrible."

"You seem in great trouble," said a bright piece of silver which was lying on the ground.

"Oh, I am!" exclaimed the gold. "No one knows what I suffer."

"But it will not be for long," returned the silver.

"I don't know," sighed the gold; "it often seems very long to me, and I cannot see what good it is to do me; day after day passes, and I seem no further on—the same ups and downs, the same suffering, the same trial."

"Shall I tell you a secret?" whispered the silver. "This trial is only for a while; we are by-and-bye to bear the king's likeness, and all this bruising and melting is but a preparation for it. It is no useless suffering we are bearing."

"Are you *sure?*" asked the gold, wonderingly. "How do you know?"

"Because I have been told so by one I could trust," said the silver quietly.

"I could bear *anything*, I think, if I was sure of that," said the gold.

Just then his friend was taken away to a neighbouring furnace, and he was not able to ask any more; but he thought much and long on what had been said. The days seemed long, and sometimes weary and painful; but the refiner knew what he was about, and did not try them above that they were able to bear.

After a time, the gold met his friend again, and said, "I have been thinking so much of what you said; if *that* is the end, I ought to be happy all the time, and I am not,—I cannot be glad to suffer so."

"One cannot be glad of the pain," answered the silver; "it would be no pain if we did not feel it as such; but in and through the pain, we may be glad with the thought of what the end will be, and in knowing, too, that one who cares is watching us, and will not keep us in the furnace one moment longer than is necessary."

"It is very strange, that if he cares about us, he should make us suffer so."

"Nay," replied the silver, "never think that. It is no strange thing that is happening to us. Every one who would be like the king must go through suffering."

"There were plenty of my brethren in the place I came from, who were happy enough, and yet never suffered like this."

"No," quietly answered the silver, "they were not called to such high honour."

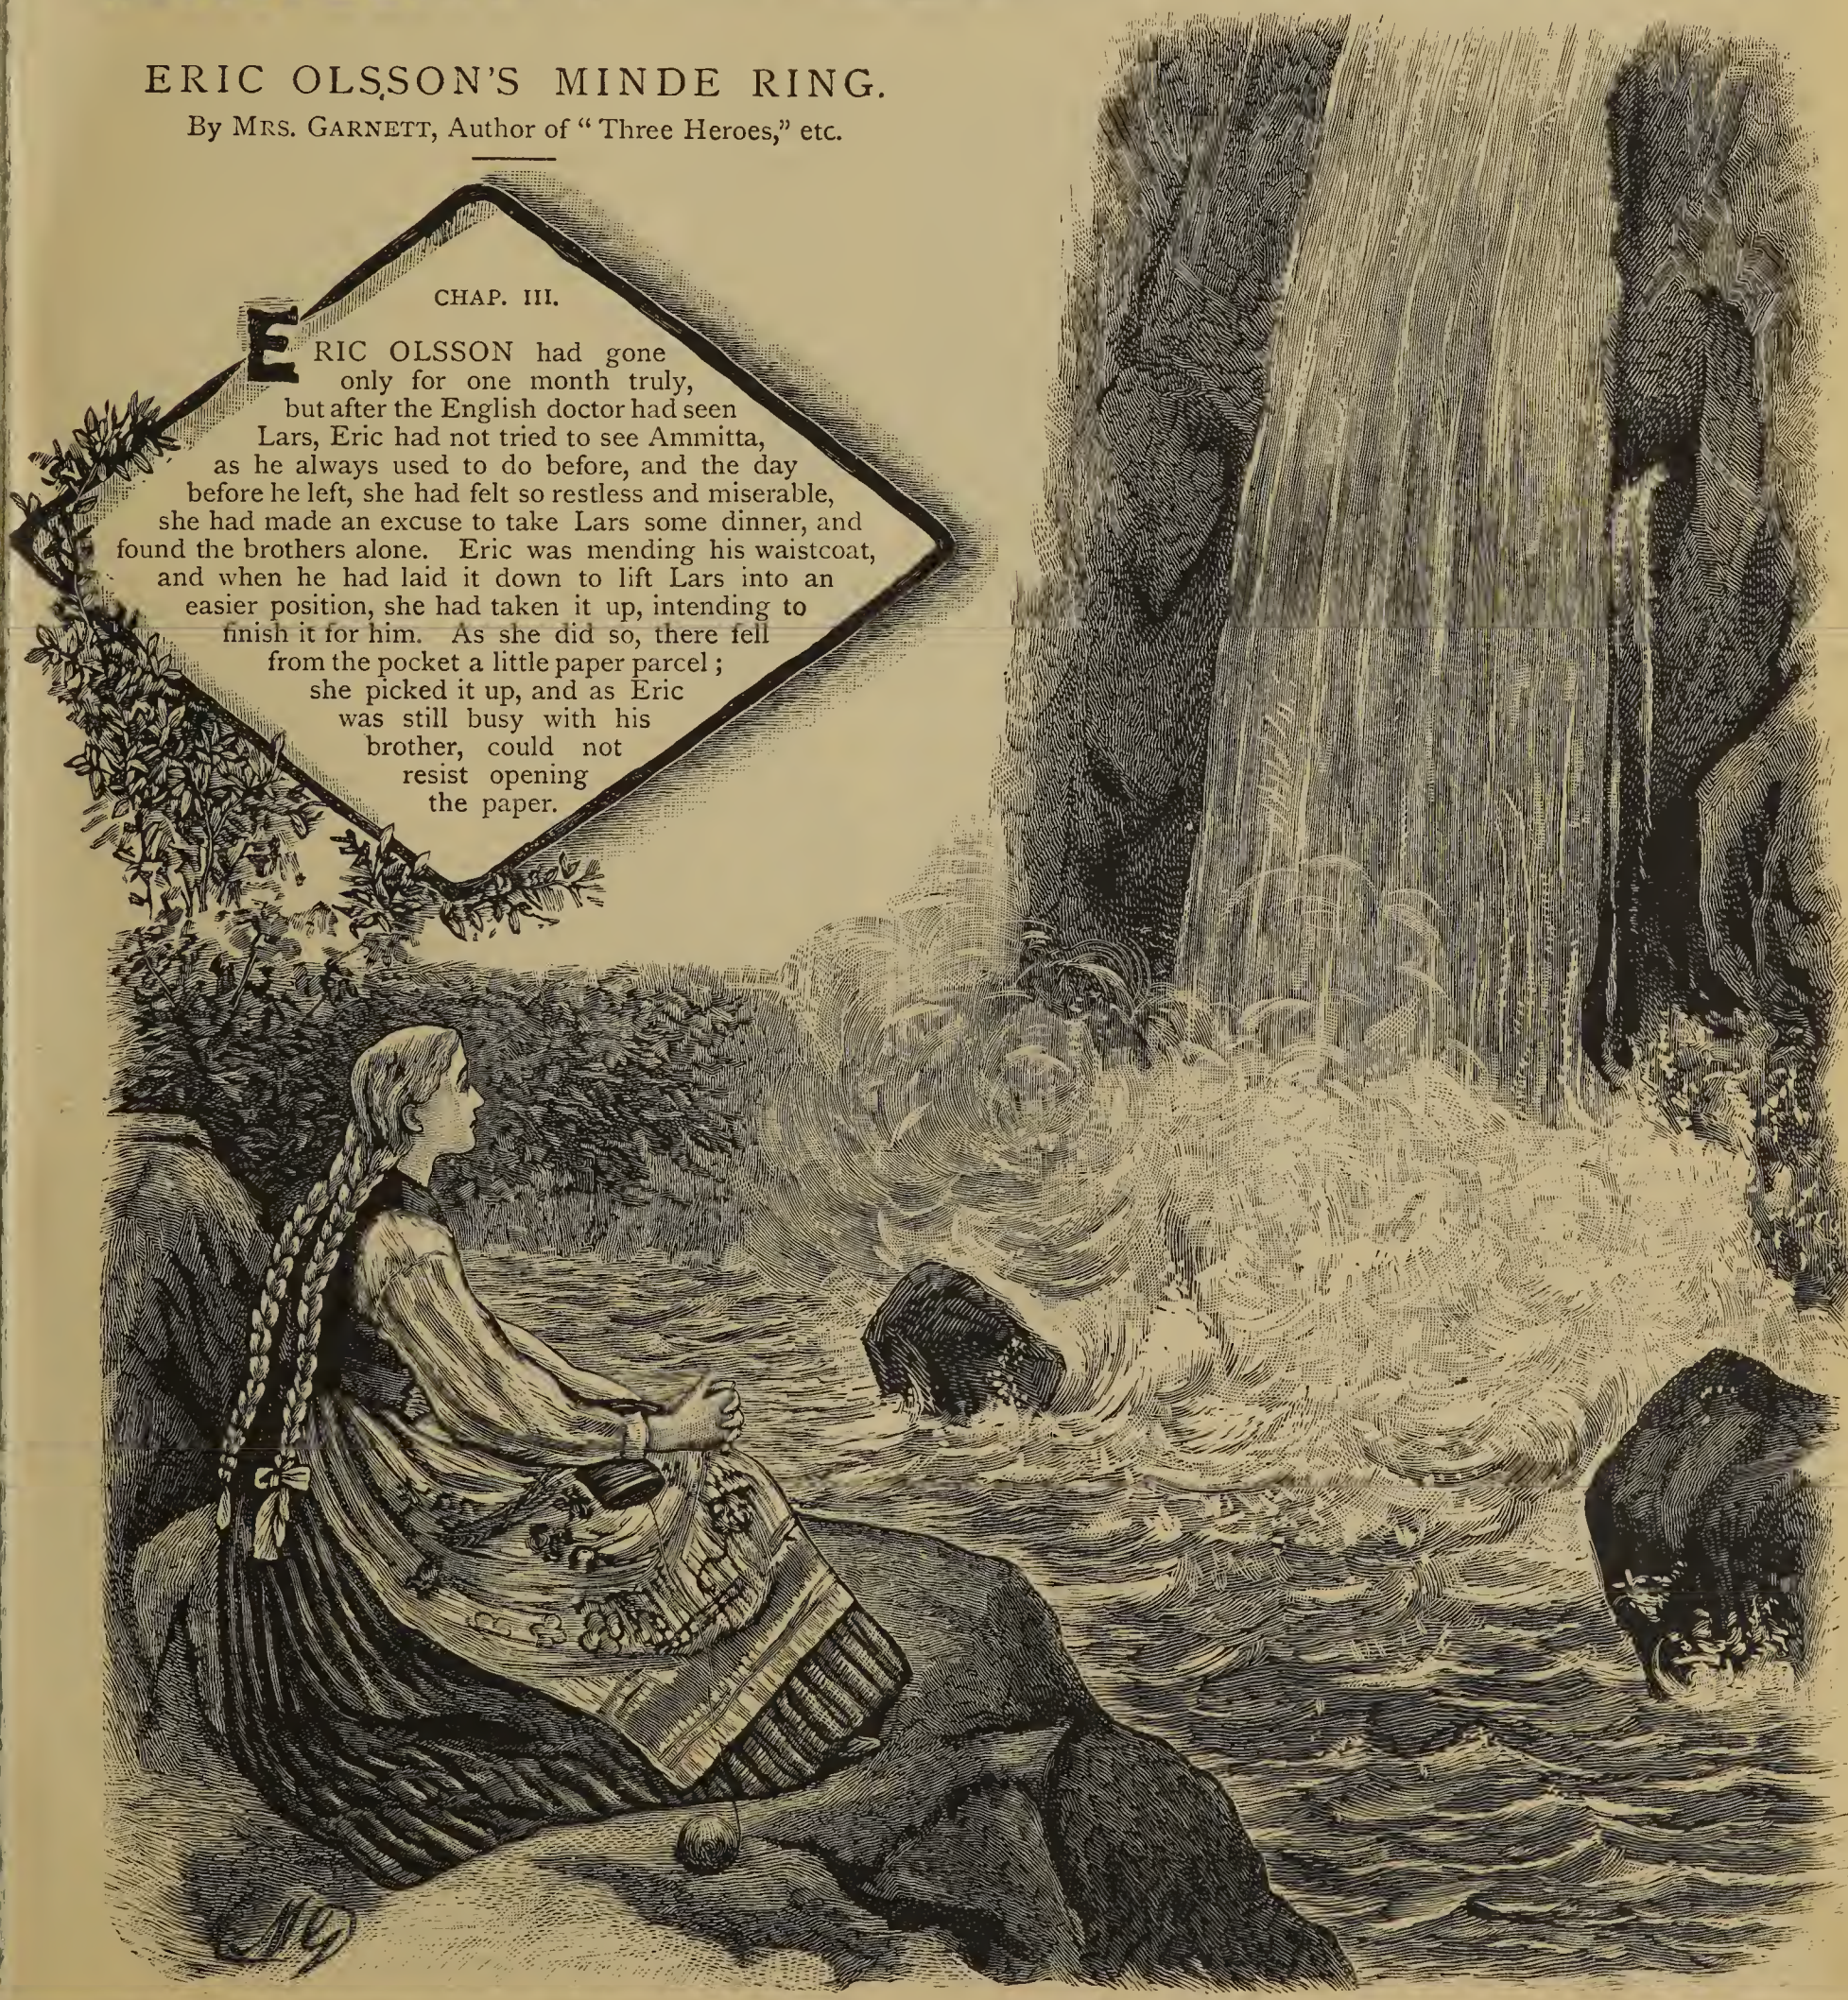
The gold looked wonderingly at his friend, and thought earnestly of what he had said—was it really such high honour? Was it really worth so much pain? And ought he to be glad *now* in that assurance? Then the end must be wondrously good, and there must be high and important service before him, to make it worth the refiner's while to spend so much time in watching him, and exactly measuring the time he was to be in the furnace.

Yes, he was sure it must be so, and he determined to bear patiently and quietly—ay, and JOYFULLY too, whatever might come—beating, bruising, melting—because of the SURE confidence that BY-AND-BYE, when all the suffering would be over, and all the dross purged away, he should bear the KING'S LIKENESS.

NOV. 12, 1887.

"A.1."

ONE PENNY.



WEEKLY—Edited by MRS. STEPHEN MENZIES.

ERIC OLSSON'S MINDE RING.

By MRS. GARNETT, Author of "Three Heroes," etc.

CHAP. III.

ERIC OLSSON had gone only for one month truly, but after the English doctor had seen Lars, Eric had not tried to see Ammitta, as he always used to do before, and the day before he left, she had felt so restless and miserable, she had made an excuse to take Lars some dinner, and found the brothers alone. Eric was mending his waistcoat, and when he had laid it down to lift Lars into an easier position, she had taken it up, intending to finish it for him. As she did so, there fell from the pocket a little paper parcel; she picked it up, and as Eric was still busy with his brother, could not resist opening the paper.

"Thinking of Eric and the ring."

It contained a "minde" ring of gold, with two golden hands thereon, clasping each other. She slipped it quickly back into its place, and neither Eric nor Lars knew she had seen it. But night after night, when the children were asleep, she used to be awake wondering, as she had done all the previous day, until her head ached and her eyes smarted, for whom Eric had bought his "minde" ring. It certainly was not for herself, or he would have given it to her; then for whom could it be? He, a sailor, would know scores of girls beside Ammitta Loen—girls no doubt in a better position than she—shopkeepers' daughters in Bergen, or even girls in England, that great, rich, mysterious land across the ocean. And she had been so foolish all these years, believing that he loved her. Some days she felt so miserable; she would take her knitting and climb the Sjerpenut, and stay there alone for hours.

She would sit with her hands clasping her knees, and gaze across the ravine at the Kils Foss. The waterfall possessed a fascination for her; she would begin looking at it, thinking of Eric and the ring, but after a time, the fall would absorb her interest, and she would grow calm, and go home comforted. She would look at the Upper Fall, that long, filmy veil hanging clear of the rocks for many, many feet, swaying and fluttering in the breeze, a dazzling, sparkling, *living* column of light; till it seemed to her fevered heart the abode of an angel who knew all her trouble and soothed it to rest. She did not put the thought into words, even to herself; but the superstition of her grandmother was in her blood, though she knew it not, and exercised an influence of which she was not aware. And yet her quiet hours on the Sjerpenut, though they soothed her at the moment, were, she was well aware, no real comfort. Day-dreams may distract a troubled mind, but they cannot ease it. Sometimes she remembered this, and bent her head on her hands and prayed; then she got comfort.

But Mitta was wrong in supposing Eric had bought the ring for any maiden save herself. In his eyes, none other was so fair, none other beloved. He was a resolute man, and knowing how the neighbours were ever on the watch for a love affair, and how mercilessly they teased, he had determined to say no word to Mitta, till he had saved money enough to take a little cottage he had long had his eye on near Bergen, and had furnished it completely; then he would go to Pehr and say, "I love thy daughter, Pehr; give her to me for the sake of thy old friendship to our father. I have the home and the plenishing; give her to me at once." And thinking thus, from time to time he had gathered things which he thought would please her, and even bought an English carpet, and a clock, and some framed, brightly coloured prints. Last of all he had bought at Anderson's, in the Kirke Garde at Christiania, the golden minde ring. This he had carefully carried about with him, had looked at it many a time when he was alone on the deck at night, and had kissed it when the stars only saw him, and the faint moon watched from the summer sky. His finger was in his waistcoat pocket, touching it as he had walked up the road to his uncle Agdur's cottage, and had seen the English doctor sitting on the grass, holding his straw helmet out for the children to fill with poppies and daisies. He had heard as well as Lars what the gentleman had said; and there had flashed across his mind the thought that his brother might be cured, but only by a great cost to himself. He was not ready for the self-sacrifice; he thrust the idea away, but it would return. Awake or asleep, the spectre haunted him; his mind could not get rid of its unwelcome companion. A voice seemed ringing in a sharp whisper ever in his ears, "Give up the money you have saved, and Lars can be cured." Sometimes it spoke so loudly, Eric would look quickly round, to observe if the others had heard the voice as well as himself. But no! Lars lay as usual on the bed, with his legs stiffly stretched out, and with his discontented face. Kirstin was by the fire stirring the gröd. Agdur lolled against the door-post, smoking his pipe. Then the sailor would start up and wander far away up the Pass; and if he by any chance saw Ammitta, instead of hastening with sparkling eyes to meet her, his face would cloud, and he would turn away.

He was glad when the time came to go back to sea. He had not dared to fight his battle; perhaps out at sea it would be easier. So a week later he went, without a word of farewell to Mitta Loen, and with such a parting glance at Lars, as made the poor lad tremble, and wonder miserably what he had done to injure and offend his brother. He cried a few quiet tears when he was alone that morning, and another ache came into a heart that was sad enough already.

It was an October morning, crisp and fresh. Half the month was gone; the yellow leaves were fluttering from the trees in Prince's Park, and the doctor, as he walked down the Stanley Hospital, thought to himself, "I should like to see the Skjervet to-day; how the limes will be blazing, and the berries of the mountain ash gleaming against that mighty background of firs; the Skafledal Foss will be a sheet of foam too." Then he met an old patient, who stopped him for a few friendly words, and his summer holiday faded from his recollection, but only to be presently recalled. "Sir," said the house-surgeon, whom he met at the door of his special ward, "you will find a young man in number four bed, who came in last night. He is a Norwegian, and the man who brought him produced this," handing the doctor his own card, with its pencilled promise of admission into the hospital. "Of course," added the house-surgeon, "we took him in; indeed, under any circumstances I should have done so; he appeared almost in a dying state from exhaustion. The leg is very much shaken; it had on a queer splint made from the backs of an old book."

"Oh, yes," replied the doctor, smiling; "I remember the choice lay between those and a rough chip."

Lars' face brightened as the doctor approached him, and he feebly stretched out his hand. Though he could not understand a word that was spoken, he watched with feverish interest the examination of the limb; and when the doctor nodded, and patted him encouragingly and said, "Don't be afraid, my poor fellow; we shall turn you out all right," he evidently understood his meaning, and eagerly exclaimed, "Mange tak!"

The doctor turned round to see Eric standing beside him. "Ah! you are his brother?"

"Yes, sir; you told us you could cure Lars, so I brought him."

"You must have found it a difficult matter?"

"Yes, bad, very bad. We had a rough night coming over, and then all day in the railway yesterday, Lars was like to die. But now he is content; he has not looked *so* for a year nearly;" and the sailor's eyes glistened as he looked at his brother. "May I stay by him to-day, sir? I sail to America to-morrow."

"Certainly," said the doctor, deeply touched by the boundless confidence the brothers reposed in him.

He was sitting that evening busily writing in his study, when the door was opened, and a servant announced: "A sailor wishes to see you, sir."

"Ah! bid him come in. Sit down, Eric. Do you wish to know what I think of Lars before you go?"

"Yes, sir, please you."

"Well, he is exhausted now; but in a week's time I shall begin to straighten the leg, and put it into proper splints, and a day or two afterwards I shall reduce the fracture in the wrist, and put it into a new splint I have invented for just that kind of injury. I have little doubt all will go well, and that in four months Lars will be as good a man as ever he was."

Eric had listened breathlessly, and now, all unconscious to himself, a sob broke from him, and two tears fell slowly down his cheeks. He opened his hand; in it was a worn purse. "This," said he, "is all I have left, four of your pounds; but I am going to America to get more. Take this, and cure Lars; I will pay more when I come back."

"My good fellow, the hospital is free; we want no pay."

But Eric replied, "Take the pounds; the money is not mine, nor even Mitta's. I gave it to Lars; I did not want to, but God made me. I cannot take it back."

The doctor looked keenly at the sailor, and thought to himself, "This man has passed through some hard mental conflict, and has won. What could it be? It has wonderfully refined his face; it was good-looking enough before, but now it is noble." But he asked no question, he merely remarked: "Well, I don't know who Mitta is, I suppose your sister; but if you two so wish Lars to be benefited by this money, I promise you to give him it to-morrow. He may want some little things while in hospital, and it will certainly be useful to him when he is discharged. There, good-bye; do not forget to call and see me whenever you are in Liverpool."

And so, with a hearty hand-shake they parted; the doctor to finish his lecture, and Eric to pass out into the gas-lighted streets of the foreign city to walk about all night, for his last shilling was gone. Many times he passed and repassed the Stanley Hospital, and gazed up at the windows of the ward where Lars lay. A faint, steady light shone through them all night long, and was reflected by a glow of peace in Eric's heart. None but himself knew what that peace had cost him. He had tried to get away from the voice of God; but God loved him too well to let him choose the evil. To give his all of happiness to get his brother cured seemed a great price, too great for his weak heart to pay. To give his love for duty seemed hard, very hard; and so it must have remained, but love, Divine Love, conquered the human.

It was when alone on the watch, that there came to him a revelation of redeeming Love, of the living Christ. He saw it then, how that to be one with Him who had given all for him—Eric Olsson, the Norwegian sailor—he must give his all in return. And he did it—yes, even the love of Mitta; his all was not too much to lay at the pierced feet of Jesus. He was tired

when he went home to Gudvangen, but no wavering thought distracted his heart. He could not rejoice, he could not sing, as some martyrs have done when they have gone to the fiery trial that was before them; but none ever walked thither with a more resolute step or a more calm reliance on God than did Eric Olsson.

He went into the cottage, where so many temptations had assailed him six weeks before, and knew that he was above them all now, and told Lars that he should go to England to be cured. His brother little knew what those quiet words cost; he received the announcement with delight. The very thought of being once again strong and well was happiness, but at the same moment a great wave of joy rolled over his heart; for if he only were well and strong, could he not tell Mitta he loved her, and win her for his wife? He remembered her tenderness to him, and all her beautiful devotion. He thought of the many hours she had sat in that dark room by his side, and he knew she had been happy there, for hers was a tell-tale face, and he read its every expression. The more he thought it over, the more sure he became that Mitta loved him as he did her. So, in the prospect of this great happiness, he overlooked the sacrifice his brother was making, and was only ready to avail himself of it.

The agony of his removal on to the steamboat at the Nærödfjord was such that, had not Ammitta Loen been near him all the time, he would have screamed. As it was, the tears rolled down his face, and he wrung his hands with the pain. But when she kissed him in their innocent, neighbour fashion, he became calm. Amongst strangers, he mastered down the pain sufficiently not to weep; but Eric he spared not to blame; and again and again his brother had hard work to suppress the angry words that rose in answer to his querulous complaints. He never did retort, but it was not in human nature to be cheerful in such circumstances, and the journey all through was a misery. Lars was relieved when his brother departed, and felt less lonely amongst the strangers he was left with than he could have supposed. Hope in the future brightened all the present.

"'Lars!' cried the sailor."

CHAPTER IV.

SHE GREW CONTENT.

It was an English April day; flying clouds, scudding rain showers, bursts of glittering, but not warm sunshine. The trees in Prince's Park swayed in their pale-green dresses, and flower-girls held up baskets laden with bunches of primroses and daffodils, to tempt the ladies gazing from the drawing-room windows. A sailor, whose clothes told of much wear, pulled his cap over his forehead, and dashed the raindrops from his brown whiskers, as he turned in at the Park gates, and walked towards one of the houses. He evidently knew his way, and hesitated not as he rang the servants' bell. The garden gate was opened by a tall, slim young man.

"Lars!" cried the sailor.

"Yes, Lars. Come in, brother Eric. See!" he cried joyfully, "I am well, quite well. The doctor has perfectly cured me."

Eric held his hands, and shook them violently; he could not speak. He remembered that night of the watch. He remembered the battle, and, with a solemn joy, God's victory; and he dreaded, and yet longed, to hear Lars say: "And I owe all this to God and you." And then, in that instant, it rushed through his heart that God was going to give him all his desire. Yes, he knew he must go on several more voyages, but no more money would be needed for Lars. He must still wait long months, maybe even years, before he might spring on the wooden pier at Gudvangen, and carry the "minde ring" to Mitta Loen. But the thought which had troubled him often before, that she was so pretty, so bright, and might before that day came have accepted a like gift from some other young man, grieved him no longer. He was sure in that moment that Mitta would wait. and that some day she would yet be his. He need not have trembled to hear Lars' next words. Lars offered no thanks; he was too proud of his straight leg and useful hand to think of anything else, or so it seemed at first.

Alas! his brother was to find that that was not all he had to think of. "Yes, Eric; for three months I lay in the hospital. Each time the leg was straightened it hurt less. In time, as the good doctor promised, it became quite well; and when I grew strong upon it, the doctor brought me here to be his servant, and a good, kind master he is, and willingly would I stay here, but for one reason."

"You like England then, Lars?"

"Oh, yes; I can speak much English now, and it is a good country; more money, better food, and better clothes; better and more of everything than in Norway. See you, Eric, I wonder that you, who have seen England so often, ever care to come back to the Nærödal!"

"Then you, Lars, will stay in England?"

"No," said Lars, blushing, and his eyes sparkling; "no, I go back to Gudvangen next week. Here are the four pounds you left for me, brother. I have enough without these; the doctor has been good to me indeed. I told him wherefore I must return, and he has given me enough to take me there, and clothes and other things besides."

"And will you not tell me also, Lars, why you return, when you are so much better off here?"

"I return for Ammitta Bersdatter. She loves me, and I love her."

Eric heard no more, though his brother went on speaking, he supposed; for when the wild rushing of water in his ears and the knocking in his head subsided, Lars' voice was still going on. "She will find many things to do here, and I, with this good place, can keep her better here than any bönder could in Voss. Oh, doubtless she will gladly come when I tell her all; but if not gladly, yet I am sure she *will* come, and willingly, for love of me. And when you come to Liverpool, you will come and see us, will you not, Eric?"

"Perhaps I will," replied he; "but take this money up again. I cannot touch it. Buy a wedding minde for Ammitta with it for me. Farewell, Lars."

As Lars took his brother's hand, he looked smiling into his face; but his smile vanished as he exclaimed, "Eric, you are ill; I will

call the doctor. You are white as the foam on the fjord, and cold as death."

"No, no," hoarsely uttered Eric; "let me go. I need only the fresh air."

Lars stood at the garden gate and watched his brother go. "How strangely he walks," he thought. "I never noticed he walked so before; but I suppose he has learnt it on the great seas."

Eric turned and waved his hand in farewell. "How wan his face looks—like the maiden of the Twinde Foss. He must have been ill in America, or had some great fright. Perhaps he has seen a water-spirit; if so, he will die. Poor Eric! He hath always been a good brother to me, giving me the best he had, ever since he was a little one. I was less, but we both were but little ones when mother died. But perhaps it is nothing; I ever had fanciful thoughts. I can dream, I can love; but Eric thinks of nothing. He has a kind heart, but that is all. He never feels much. Well, perhaps it is best so; such as he suffer but little. I have had much pain, mind and body; but both are past now." So thought Lars, as he watched his brother leave the park, and then, with a self-contented smile, he returned to the doctor's kitchen, and sat down to a good supper with an excellent appetite.

The winter months had passed both slowly and sadly to Ammitta Loen. True, the Nærödal was one long stretch of snow, and the fjord was frozen; but then, as Lisbet said, that ever happened in winter; and there was plenty of spinning and weaving to do, and the cattle to tend, and the children to instruct in reading, and writing, and the catechism. No one need be sad because the white winter was come. Ammitta did not complain. She went about her duties resolutely; but her feet dragged. She never played on the horn now. The roses had gone from her cheeks, and hollows had come there instead.

Christmas came; and for two or three weeks even the hamlet of Gudvangen was alive with preparations. The yule beer was brewed. Pehr and the boys went to the mills for the flour, and Lisbet and Mitta were busy baking for days. Fish, birds, reindeer flesh and sausage, wafers and cakes, were all, as usual, ready before the great day came. A pole had been erected before every door, with the sheaf of corn for the birds. Even Agdur's had its sheaf; for he would indeed be a poor man who could not feed God's birds at yule-tide. Then their friends and neighbours came in, and the silver drinking-cup, that had been in the cottage since the "old days," was filled to the brim, and every one who crossed the threshold drank Skal to Pehr and Lisbet; and many a young man raised it and said, "Ammitta." Some, indeed, came day after day all the thirteen days of yule and said that word; but the girl seemed not to hear; and to no one of them did she drink back. Not even to Hans Hansen, the rich bönder from the Stalheim; though the other maidens of the parish knew well he bought a golden ring at the last fair, on purpose, as he openly avowed, to give her.

When Christmas was passed, and the new year with noiseless tread stole over the land, Ammitta grew somewhat stronger. Snow was slow to depart in the ravine; but every day there appeared more bare patches, and the river boiled and foamed as it rushed down the valley.

It had been a sad winter to Mitta. It seemed to her as though in her life it would last for ever. She had loved Eric always; and now he had gone without a word or a sign, and she could not hope he would return. Indeed, she often hoped he might never do so; for she could not bear to see him bringing home the wife she had persuaded herself would be with him. She grew nervous, and feared the neighbours might read the cause of her pale face; so, in order that she might not appear so weak and ill as she felt,—for she could not sleep, and her strength was gradually leaving her,—she exerted herself to work as hard as of old. But for many an hour, far up the awful frowning ravine, where no eye could see her, she would wander in heavy dejection. One day she caught so severe a cold that she could not leave the house for a fortnight. The wool was all knitted up, and there was little to do, so she read the three books they possessed; and one of the three was the old Bible her mother had used the day Eric came home, when she was so happy. How well she remembered it!

Turning over the pages carelessly, she stumbled on the Gospel of St. John, and she read on and on, and all through it. She had often read verses, and even a chapter, but never a whole Gospel straight through. As she did so, feverishly and eagerly, the picture of the life of Jesus rose before her as it had never done before. He moved—He spoke—she heard His voice, and she was comforted, for He spoke "peace"—"Not as the world giveth, give I unto you—My peace I leave with you."

"Then," said Mitta, "if He has given me this, He will not take it away again. He knows best; I will try not to think of Eric. Lord Christ, let me be content," she added, every time she said her prayers. She still repeated the form her mother had taught her as a little child; but now for the first time she prayed. She grew content.

(*To be continued.*)

"BURIED SUNBEAMS."

BURIED sunbeams—buried sunbeams—
Far below the ground they lie;
In the deep, dark mines they're buried,
Hidden far from every eye.
Lost! oh, lost! those sunbeams brilliant
That of old-time danced with glee;
Buried sunbeams—buried sunbeams—
Who—ah, who!—can set them free?

Buried gladness—buried gladness—
Hidden 'neath o'erwhelming woe,
In a breaking spirit buried,
Lost in stillness far below.
Lost! oh, lost! those joys so gladsome
That of old o'erfilled the soul,
Who can any more restore them?—
From their graves the stone can roll?

Living sunbeams—living sunbeams—
Flash from out the winter fire,
Flicker, flash; and—flashing, flickering—
Upward merrily aspire.
Yet these sunbeams long were buried
Underneath the solid earth,
But they live again to cheer us,
They have been recalled to birth.

Living gladness—living gladness—
From the grave of sorrow dark
Rises up, with cheerful singing,—
Songs that cheer the souls who hark.
Let us learn one little lesson,
Asking God to make us wise:—
Every buried joy He gave us,
Some day will again arise.

LETTICE DOWNING.

JANE MASON;

OR,

A BIBLE CLASS JOURNAL.

By the Rev. J. HANSON, M.A.

'TIS over twenty years now, since Jane Mason gave up attending my Bible Class. Of thirty, or thereby, on the roll, she was for several years the most regular and attentive Class Member. To gauge the impression made by the lessons, I had encouraged the girls to call upon me at home; and among these personal interviews, no other gave me so strong a hope as Jane, with whom I had many conversations. Add to this that peculiar interest attached to her, as one who had never known a mother's love, and whose father, so far from recognising his *double* duty as a widower, sought enjoyment in drink, as often as he could get the money.

Jane's sudden disappearance from my class came about in this way. A new situation had introduced her to new associates. *They* did not attend a Bible Class, nor love the Gospel, and the Saviour of whom it speaks. Yet, though so open in their neglect of the great salvation, they gained a strong influence over Jane. All day long, and every day, she heard religion mocked at; nor was there in her home any wholesome counteractive to the evil. She had not yet planted her feet on the Rock of Ages, so as to stand safely in the evil day; the inevitable followed. Jane not only dropped the Class, but she must have been at pains to keep out of my way. My anxious inquiries, plied in all quarters, were fruitless. Her relatives could not, or would not, give me any information. News came at last, however, startling and painful as could be. There came a letter to me from Jane, enclosed in an envelope, the like of which I had not seen before, so many coloured markings upon it. *Jane was in prison.* "Would I go and see her?" Such was the burden of a message, short enough in itself, but which I needed a long time to realise.

The interview in prison was distressing and disappointing. The charge was *theft;* and as there had been no trial as yet, I was allowed to see her only in the presence of officials. We were confused and constrained, both of us. In answer to a few queries, however, it became plain to me that my hopes concerning Jane were blasted. Plainly she "had fallen among thieves;" upon whom she cast the blame of her crime. Her personal guilt was shortly after proved, the punishment being twelve months' imprisonment.

Jane's new associates, whom I have named thieves, taught her extravagant, wasteful habits. The simple, contented life of earlier days had but a few wants, and these easily satisfied; the indulgences led to pilfering, and *then* to prison.

This old story came up fresh on the page of memory a short time ago, when addressing, in a Female Refuge, eighty or ninety women who had all been in prison. Their singing of our most modern hymns surprised me. Where had they learned to sing them, and so well? There had been other *Janes*, then, besides mine; other teachers of young women, who had laboured, and prayed, and hoped, and—were disappointed. Speaking for myself, I knew only *one* Jane. How many others come up as a glad memory, who early gave themselves to the Saviour, and have lived so as to adorn His doctrine! It might be almost as useful, and certainly it would be much more pleasant to me to tell of such, than of Jane. But words of *warning* are needful.

"ARE YOU IN HEALTH, BROTHER?"

2 SAM. 20. 9.

By REV. THAIN DAVIDSON, D.D.,
Author of "Talks with Young Men," "Forewarned, Forearmed."

IF so, see you take good care of it. It is too precious a treasure to throw away; and once lost, is not easy to regain. "Praise God for good health," says Izaak Walton, "and value it next to a good conscience." Leave no means untried, no discipline neglected, to preserve it. Be temperate in all things, and do not overstrain your powers. Try to keep the body in the best possible condition; an instrument in thorough repair, for fulfilling the purposes of the soul.

Temperance, exercise, and rest have been called Nature's great physicians; and there is this to be said in their favour, that their prescriptions are cheap and painless. Some young men appear to think that their reserve supply of health is inexhaustible, and that they may draw upon it without damage; and so they run risks, and do foolish things, which they are certain afterwards to rue. By-and-by, when, perhaps, the constitution is undermined by long neglect or continued exposure, or overstrain, you will find that you would give the world to undo what you have thoughtlessly done.

A strict regimen and careful attention to the laws of hygiene may save you many a headache and rheumatic pain in after-days.

"Whereas young men," says Sir William Temple, "are usually in pain whenever they are not in pleasure, old men find a sort of pleasure when they are not in pain."

Pardon my suggesting that the law of health has these three letters—L for Light, A for Air, W for Water; and the more you make use of all three, the better.

Do your work in the daytime, in the sunshine if possible; we have none of it to spare; live as much as you can in the light of heaven. Many persons forget the healthful influence of daylight; a dark office, a dark workshop, avoid if you can manage it. Milton says: "The sun ripens wits, as well as fruits."

Healthful as this city is, its atmosphere must be trying to some of you who have come from the open country or the breezy hills. I pity the youth—and there are many such—who has exchanged a country home for a metropolitan lodging in a back street, whose only green thing is a sickly geranium in the window. Behind the house is a plot of trampled mud, containing, say, a swing, a puddle, a paralysed weather-cock, and a fowl house backed by a railway arch. This is the garden; and the landlady gives him leave to walk in it without increasing his rent! Well, many such a young man maintains wonderful good health, if he is regular in his nabits, judicious in his diet, and takes every opportunity of getting a blow of fresh air.

Nothing is more essential than abundance of cold water. Every care should be taken to keep the pores of the skin open, and the blood in active circulation.

The normal and healthful young man will abjure alcohol in every form, and will be exceedingly stinted in what are called the luxuries of life. Cold water puts no dimness into the eyes, nor trembling into the limbs, nor gout into the toes.

No wonder so many men, whom God made strong and healthy, look sallow and pale, when they pay no attention to diet, sit up to all hours, excite the brain with stimulants, and indulge in the use of tobacco to excess; the marvel is, they do not sooner fail, and drop into a premature grave. Remember, God will hold you responsible for any invalidism that is self-created—for any marring, through indolence or vice, of the splendid frame He has given you, so "fearfully and wonderfully made." But my main purpose is to inquire about the state of your souls.

Therefore I ask:—

"Are you in spiritual health, my brother?" How is it with you within? Is the heart right with God? Judging from your faces, most of you are in excellent bodily condition; but how many are there to whom St. John's words may be addressed, "Thy soul prospereth"?

Happily, in our cities may be seen thousands of examples of a living and vigorous piety.

We hear a great deal of the dark side of London—of its crimes, its lawlessness, its irreligion, its infidelity; but, bless God, there is another side to the picture, and nowhere on earth probably will you find brighter instances of a glowing and practical Christianity. It is no narrow, cramped, and sickly type of piety I commend to you. I believe in a religion that broadens and ennobles a man—a religion like that of the late Samuel Morley, which, springing out of an evangelical faith in the Lord Jesus, imparts to its possessor a thoughtful, large-hearted, Christian manliness. We don't want sour, dejected hermits: we want men whose religion is seen in the market-place, in public life, at the domestic hearth, and everywhere. I recently met with a curious remark that "some are too manly to be godly, and others are too godly to be manly." The writer, I suppose, was referring to a certain phase of piety which dwarfs and belittles the soul, and which, adapted for a conventual or monastic life, is not fitted for the rough, noisy, busy world. Let me frankly say, I have no sympathy with that form of godliness.

Michael Angelo one day went into the studio of Raphael, when the artist was not in; he saw on the canvas a beautiful design, a human figure in graceful attitude, but disproportionately small. He slyly seized a brush, and faintly wrote underneath one word—*amplius*, that is "larger."

So there are good men, earnest, godly men, who want largeness of conception, width of view, breadth of character; and to such I feel disposed to say, "*amplius*, larger!" Noble is the service rendered to his generation by every child of God who shows that a high-toned, fervent spiritual life is not incompatible with a robust manliness, but rather conducive to it. That was a short but beautiful prayer which Dr. Arnold, of Rugby, wrote out for his own use each morning, before he entered on the duties of the day:—"O Lord, I have a busy world around me; eye, ear, and thought will be needed for all my work to be done in that busy world. Now ere I enter on it, I would commit eye, ear, and thought to Thee. Do Thou bless them, and keep their work Thine; that as, through Thy natural laws, my heart beats and my blood flows without any thought of mine, so my spiritual life may hold on its course, at those times when my mind cannot consciously turn to Thee to commit each particular thought to Thy service. Hear my prayer for my Redeemer's sake. Amen."

But let me come, my brother, to the root of the matter. Have you yet obtained Divine forgiveness and acceptance? Knowing yourself to be guilty before God, have you felt the burden of sin, and gone to where alone you could find relief—to the Cross of the blessed Redeemer? The world's religion ends with forgiveness; God's religion begins with it. The popular and prevailing notion of a Christian life is that, if you do the best you can, maintain a fairly upright character, and offer up a fervent prayer to God, then at the last, before life closes, you will get pardon for all sin, and a passport to heaven. But this is turning the Gospel upside down. God's religion is precisely the opposite. It starts with forgiveness. Conscious of sin and the Divine displeasure, you come by faith to the Lord Jesus, pleading the merit of His atoning blood, relying on His perfect righteousness; and you are justified from all things, admitted into the Divine favour, and begin to walk in the serene sunlight of realised acceptance. With the Spirit dwelling in you, you love what is holy and true, and obtain the victory over the lusts of the flesh and the snares of the devil. Believe me, this is the first thing indispensable to spiritual health.

You will not misunderstand what I have said about breadth of character and view. A generous and catholic spirit, united with a robust and intelligent mind that is ever open to the light, must not be associated with that spurious charity so popular in these days, which spurns all dogma, and would make the platform of salvation far wider than the Rock of Ages. There is a broad teaching which I fear is only leading many into "the broad way that leadeth to destruction." I warn you against those false physicians, who are sedulously forcing upon you their deleterious quackeries. Never will they yield you true health of soul. Put away from you those baneful compounds, however sweet they may be to the palate; they may be opiates, lulling you into a pleasing slumber, but they are to be labelled "Poison," for they destroy the soul.

I beckon you to the old Gospel of the Cross, which has sweetened the life and brightened the countenance of myriads who have now passed into glory; to the faith which Peter preached at Jerusalem, and Paul at Antioch; and which the Divine Teacher Himself enshrined in those matchless words, "God so loved the world that He gave His only begotten Son, that whosoever believeth in Him should not perish, but have everlasting life."

"Are you in health, my brother?"

Why should you not be, with such an elixir freely offered you? Why should your soul be sick any more, with so effectual a medicine now within your reach?

"My life," said a distinguished Christian philosopher in the close of his days, "has been a happy one, and all I desired. The progress of years, amounting now to threescore and ten, has produced for me gentle decay. I bow before Him who is Lord of all, and hope to be kept waiting patiently for His time."

The saintly Jay, of Bath, in looking back upon his life, spent in the faith and service of Christ, said: "I have heard people say with the dejected poet,—

> 'Worlds would not tempt me back to tread
> Again life's dreary waste;
> To see the future overspread
> With all the gloomy past.'

But such language is not for me. I should not shrink from the proposal of repetition. 'Goodness and mercy have followed me.'"

Your bodily strength at the best is precarious, but the Divine Hygienist offers you a health that shall never know decay. Be content with nothing less.

WON BY WORKING;

OR,

HIS FATHER'S GOLD.

By GEORGINA GOLLOCK,
Author of "Ebb and Flow," etc.

CHAPTER I.

GERALD "MAKES UP HIS MIND TO WAIT."

THE clock ticked on loudly in the otherwise silent sick-room, marking with unfeeling beat the rapid passing of the closing hours of life. Such a dreary, mouldy room, bare of even the semblance of comfort, and pregnant with a close, damp odour, telling of ruin and decay. Fallen leaves rustled hither and thither on the flagged verandah; whilst the wind, whistling round the corner, made its way through the cracked window panes, causing the flame of the candle by the sick-bed to leap and flicker, and make weird, moving shadows on the damp-stained wall. There was a solitary watcher in the room,—a grim, sour-faced old woman, bending eagerly over the sick man, striving to catch his muttered words.

Silas Burt—"old Si, the miser," as they called him—was well-nigh done with things of earth. He lay on his death-bed, his thin hands plucking at the coverlet as they had been wont to pluck at bank-notes in the past. Restless, sunken eyes, hollow cheeks that told of long privation, unkempt and ragged locks, and a greedy, grasping mouth, that looked as if smiles of love had never played round its corners, no baby kisses coaxed it to relax the grimness of its lines.

Yet Silas Burt had wooed and won a winsome country maid to be his wife, and had known the joys of fatherhood, when she sat beside him with her baby boy on her knee. The girl-wife had bloomed in his home for only two short years; the baby fingers never again availed to unlock the sternness which settled on Silas Burt's face, from the day when the plain oaken coffin was carried across his threshold.

That had been long years ago, and in those years the hard man had grown harder and colder. Life had come to mean only *gold* to him; it alone was real, tangible, satisfying, and in search of it he had sacrificed himself and his boy. Gerald—the name was his mother's choice—never knew the happiness of home. He was kept at a cheap school, where they tried to teach him to plot, and scheme, and plan. His father bade him choose those games where skill or cunning brought him some substantial return, and the only gift—a bright, new sixpence—which he ever gave the boy, was bestowed on him because he had won a great bag of marbles from his mates. "Don't play again, Gerald," chuckled the miser, "you may lose your gains; you give me those marbles; I'll put 'em to keep. Lay 'em up, boy; lay 'em up; that's the secret of success."

Strange that, with all this training, Gerald grew up an open-handed, generous lad. Perhaps it was because he felt the exceeding discomfort of his father's mode of life; perhaps it was because his mother's frank, trustful nature was within him; perhaps it was because that mother's prayers had centred round his cradle, and that holy thoughts and high aspirations came unbidden to the lad. Be that as it may, Gerald's dark-blue eyes were free from taint of greed, and it was only because he had empty pockets that his sole gifts to others were kindly words and deeds. The miser scarce knew what to do with his son. It tortured him to think that one day his cherished hoards must fall into the hands of this spendthrift. Worse than that, a vile suspicion haunted him. Did not spendthrift sons always lay violent hands on their father's shining, yellow gold? Gerald was young and lusty, what was to hinder him from taking the gold by force? The miser had meant to keep his son beside him, but he set that intention aside, and after close bargaining, the lad was apprenticed to an architect some hundred miles away. What did it matter to Silas Burt that his only son, the heir to his wealth, endured daily persecution about his niggardly mode of life, or that the architect himself, kind-hearted man though he was, started with a strong aversion to the lad, because of the way his father had groaned and mumbled over the necessary fee?

Those years of poverty in boyhood would have crushed a weak spirit, and driven an unstable one far into vice; they only served to make Gerald Burt's strong, reserved nature, stronger and deeper; they showed him, as nothing else could have done, the hollowness of the world's friendship, the hardness of the world's heart.

Gerald loved his profession; he was ambitious, and his visions of the future were bounded by no limits of probable achievement. To make money was not his desire; his father had done enough of that. His it should be to embody glowing thought in noble buildings, to make the silent stones show out in their fair proportions his inmost soul. When his apprenticeship was over, the young man, caring for nothing but his work, accepted a post with a nominal salary under a first-class architect, that he might master every method, every technical detail of his art. At some future time he would travel, and revel in the architecture of other lands; meanwhile it was a hard struggle to live on his income, for Silas Burt would part with none of his cherished gold.

But by-and-bye, in the fore front of the young architect's visions, a little ivy-clad cottage nestled beneath his cathedral spires, and at the door stood a tall, dark-haired maiden, watching for some one,—for whom? Surely for him. As months went by, that ivied cottage grew and grew, until the cathedral spires were only seen in distant perspective in the landscape.

Love of work was dwarfed by love of woman, a new influence was breathed through Gerald's life.

Well for him that Nettie Millard was also an answer to his mother's prayers. As his reserve gave way beneath her smile, and his long-concealed feelings were laid bare, a few careless words, a little flippancy, a false philosophy of life, and Gerald would have been swept into paths of danger by his love. His nature seemed to alter, he scarcely knew himself; but Nettie Millard, a quiet, earnest, pure-souled woman, stood firm, and Gerald stood by her side. She loved him, she would be true to him; he must therefore so live as to be worthy of her. With his waking passion all his chivalrous manhood also rose; life was deeper, purer, nobler; the heights of Goodness, crowned by the figure of the one Man who has ever reached their summit, grew clearer to him than the heights of Fame.

Gerald, knowing that for some years his profession would not much enrich him, wrote a manly letter to his father, asking whether there was any prospect of his receiving an allowance which would enable him to marry, or whether he and Nettie must "make up their minds to wait." How the miser's mind worked over that unlucky sentence, which conveyed so much more to him than it really meant.

"Make up their minds to wait,"—for what? Of course for his cherished gold. So already Gerald was counting on it, watching for it, perhaps even—horrible thought!—spending it beforehand, borrowing money in expectation of his father's death. Oh! the agony of greed in which Silas Burt paced up and down his chamber, the chills of age warning him that ere long he and his money must be parted, whilst the passionate craving for more, and more, and more, seemed like a demon mocking his impotent efforts to grasp.

"'An allowance to marry on,'" he muttered. "Nay, none of that. Let him marry when he can keep his wife. Does he think I have pinched and screwed all my life to keep 'his Nettie,' as he calls her? And as to waiting, maybe, when the time comes, he'll find that if I can't keep my money, he can't spend it—ha! ha!" and the miser's laugh echoed through the dismal room. A thought had come to Silas Burt—a thought fraught with good and evil for the hero of my tale.

The candle burnt down slowly, and the grim watcher hung anxiously above the bed. Love of gold, not love of Silas Burt, prompted her eager care.

Five-and-twenty years had old Catharine waited on her master, borne his caprices, shivered in his cheerless kitchen, shared in his scanty fare; and now that she was alone with him, as the shades of death gathered darkly round, she was greedy to learn his secret, to know where he had put his gold. For the gold had gone. The great box beneath the miser's bed, which used to be so heavy with its golden store, was light and empty now. Catharine had taken its key during her master's unconsciousness, but one dismayed glance showed her that no treasures were secured by the intricate key.

The candle burnt lower; then it flared up greedily as the paper which propped it caught the flame. The glare of light once more roused the miser; his restless eyes were fixed on the woman's face; his weak lips moved; he whispered something which brought a rush of colour over her face and left her deadly pale.

Then the flame sank in sudden darkness; with one swift effort the miser sat upright, and clearly through the room of death two words rang—"Tell Gerald"—and that was all.

CHAPTER II.

NOTHING TO WAIT FOR.

OF course Gerald was sent for. There was no express train for some hours after the news reached him, so he had time to go to Nettie, and tell her what had occurred. He was saddened and startled; but his heart had never been touched by a father's love, and the strong link of sonship had been loosened by neglect. So when he and Nettie had talked a little of the dreary life and loveless death, their thoughts wandered to the future, and leaped onward in jubilant life.

"The old place is worth next to nothing, Nettie; the house is half in ruins, and the land has not been tilled for years. I do not think you would ever care to live there. Some day, when I am richer than my poor father's gold will ever make me, I shall build a house in the old sheltered quarry, on the hill above the grave-yard; such a lovely sunny spot, where all the flowers bloom earliest, and my darling will be the fairest of them all."

So they talked until it was time to part.

Catharine opened the creaking door for Gerald as he walked up the grass-grown drive. Some subtle change in her aspect struck him, but before he had time to define it, it was gone.

"I've ordered everything very cheap," said she, following him into the cheerless parlour; "'twas what the master would have liked, and 'tis best for them that's left."

The old home was indescribably dreary, and Gerald felt chilled and depressed. Bidding Catharine get him some food, he went softly to the chamber where his father's body lay. Something like a tear shone on the young man's cheek, as he stood with folded arms gazing on the sunken face, wearing, even in death, the look of unsatisfied desire. Father and son seemed nearer in that moment, though death lay between them, than they had ever been before.

Two days more, and all was over; it only remained for Gerald to look into affairs. No lawyer appeared on the scene; no will could be found, no one made an effort to dispute Gerald's claim to the whole of the miser's wealth. There were no bonds, no traces of investments,—the miser's money, if it were not all a myth, must be hidden in gold and notes somewhere,—ah! but *where?*

In vain Gerald sought. Every corner of the house was examined from top to bottom, even the very cracks in the old garden wall were pryed into, and the loose stones ruthlessly rooted out.

Catharine denied all knowledge of the hiding-place, and preserved a stolid, sulky manner, which defied all attempts to take her off her guard. The miser's dying entreaty, "Tell Gerald," had fallen on ears so enamoured of the chink of gold, that all other sounds were dull and distant; what did she care for the voice of conscience which echoed her master's parting charge, when something within her seemed to keep up a clanking of golden coin, and the yellow sheen of the sovereigns danced ceaselessly before her eyes?

A week went by, no gold was found; Gerald, who had been hoping against hope, felt his heart sink within him as he realised the position in which he was. Young, ambitious, penniless, with long years of work before his profession would provide him with a home, how could he ask Nettie to wait for him, through the brightest years of her life? Perhaps, if she gave him up at once, she would find ere long a richer man who could quickly claim her as his bride.

It was a faithless thought, and Gerald thrust it from him; Nettie was true, and would wait, but oh! the chill and darkness of those years of waiting, instead of the bright hopes of but one week ago.

Gerald's leave of absence was up. He called Catharine to him, and asked her if she would like to stay on in charge of the old house.

"I cannot pay you much," the young man said; "I have nothing but what I earn, but I can trust you to keep watch for me here, and to let me know if anything turns up."

Catharine's cheeks glowed with a deep, dark red; conscience pricked her sorely, but a gleam of sunlight darting through the window reminded her of the shining gold.

"I wouldn't stay here for worlds," was her sullen answer; "the master's ghost is sure to come haunting the place. If you're going to-morrow, I'll go next day; the old house is only fitted for bats and owls."

"What a strange old soul she is!" said Gerald, as he watched the clumsy figure disappear at the end of the passage. "I suppose she is honest, but I may as well have the old place watched; I'll find some town lad who wants country air, and will be glad to live rent free, some one to keep the place clear of tramps and robbers. There are sure to be plenty of folk hanging round, until the story of the hidden gold gets forgotten, or is transformed into a myth."

Gerald slept uneasily that night. The memories of the old house seemed to revel round his bedside, and invade his dreams. He rose at daybreak, bent on a visit to his father's grave. It was early in an autumn morning, the russet leaves sparkled with frost diamonds, and the clear-voiced birds chirped and twittered as they fed on the scarlet berries of the May. Hope rose in Gerald's heart. He had health and mental power, a clear conscience, and a true woman's love; what if he had not gold? He had things better by far. A great pity filled him for the man who had spent his life in quest of a shining plaything which brought him no peace, no rest; and as the young man's thoughts rose upwards with the soaring lark, he saw a glimpse of the golden glory, awaiting those who lay up treasures where neither moth nor rust doth corrupt.

There were two paths to the graveyard, one lay down the grassy slope, the other skirted the top of the long disused quarry, where Gerald had told Nettie he would one day build her a house. Some thought of their plans about it led him to choose that way. He stood on the edge of the steep jagged cutting, unguarded by fence or rail, and looked away to the graveyard in the plain below. Then his eyes wandered nearer, nearer, until he began to plan just where the site of Nettie's house should be. How close could it come to the sheltering cliff without loss of daylight? A little closer still—that would leave about twenty yards between, and as his quick eye measured the distance, he caught sight of *something*—a shapeless mass amongst the jagged stones below. A woman's form,—God help her! She would never move again.

With swift leaps, and long fearless strides, Gerald reached the spot; surely that shawl was familiar to him—another moment, and the dead face of old Catharine was upturned to the morning sun.

What had brought the old woman there? She must have fallen hours ago, for she was quite cold and stiff, and the candle in her lantern had burnt itself out. Could it be that she, too, had sought the miser's grave, perchance in her sleep, and slipped on the uncertain way? Gerald took a swift review of the years that were past, and in his few visits home, could remember nothing to show that there was any link of affection between old Catharine and the master she had served.

If Gerald had only known the secret that drew the woman with the miser spirit in her, to leave her bed in the silent night, he might have held a clue to his father's gold, but now that dying entreaty, "Tell Gerald," would be for ever unfulfilled; the only one who held the miser's secret would speak no more.

(*To be continued.*)

WORD ECHOES.

NEVER a word is said,
But it trembles in the air,
And the truant voice has sped
To vibrate everywhere;
And perhaps, far off, in eternal years,
The echo may ring upon our ears.

FOUNDED ON A ROCK.

By JOHN CALVERT.

WHILE spending a short time, some years ago, on the northern coast of Ireland, I visited, amongst other places of interest, the old Castle of Dunluce.

It has often, since then, presented itself to my mind—the great rock rising majestically out of the sea, and surmounted by the grey, weather-beaten walls, which almost seemed to be a part of the rock itself. It stood alone—isolated from the shore, to which it was joined only by a narrow wall, or arch, which crossed the deep, though not very wide space intervening, and formed the only means of access. There it had stood for centuries; defying the winds and waves of the Atlantic, as they had dashed, in all the fury of the storm, against it on every side.

It was impregnable—that castle—when, in troublous times, it was assailed by the enemy. On the summit of that rock no foe could reach it. While the rock stood, it was safe.

That old castle has often brought before my mind another Fortress. I have been reading of one, who, realising how dangers assailed him on every hand, spoke of a Strong Rock—a Fortress—in which alone he could be safe (Psa. 31.-71.); and I have been thinking of the many young men and young women who to-day are, like David, exposed to great danger, but who have not sought this place of safety.

How fierce the storms of tempation that often gather around us, and seem like to overwhelm us! More powerful than the waves of the ocean do they break upon us, and with a force more irresistible. Can we stand against them? No; not unless we are united to the Rock.

A little to the west of Dunluce the shore changes its aspect, and a long stretch of sand takes the place of the rocky coast-line. Had this old castle been founded there, would it have stood to-day? No. Its builders were not foolish enough to erect it where it could not stand the storm.

Much more foolish is the young man who thinks of overcoming, in his own strength, the sin that besets him. If he would stand safe and unmoved, *he must be united to the Rock*—the Rock CHRIST JESUS.

Jesus Christ, the Rock of our Salvation, has overcome the forces of sin and temptation, and in Him we are safe. In the fourth chapter of St. Matthew we read of the power that, led by the Prince of Darkness, exerted itself to effect His overthrow, but in vain. Death itself hath no dominion over Him, for He hath conquered death and the grave, and He is to-day a living and almighty Saviour.

Union with this mighty One is the secret of power against sin and temptation. Founded on the Rock of Ages, the storms may beat upon us, but they cannot prevail, because *He* is our Strength. "When thou passest through the waters, I will be with thee" (Isa. 43. 2), is His assurance to those who have rested in confidence on Him.

By the Cross of Christ—the one unmistakable Way of entrance—we gain this place of safety. Atoning blood, shed on Calvary, takes away the sin of *whosoever will* accept God's way of safety, and gives the sinner a right to the privileges of the people of God—the privilege of being kept in safety by His power; the privilege of the Holy Spirit dwelling in him, guiding and sustaining him; the privilege of being kept in perfect peace, knowing that the LORD will most surely accomplish that which He hath spoken concerning him.

Under the Sea

OR,

DIVERS AND DIVING.

By TRACEY LAYARD ROBINSON, Author of "American Social Sketches," etc.

THE art of diving is of very ancient origin, machines for enabling persons to remain under water for an almost unlimited period, being mentioned so long ago as 325 years before the Christian era, by Aristotle, the Greek philosopher. But even before this period, there must have been professors of the art, who, whether they possessed machinery of any kind or not, certainly must have been adepts in the business. Humanity will go to great lengths to possess for itself the beautiful products of nature; and so we find that as early in the history of the world as in the days of Job, pearls, which must have been obtained by diving, formed a means of human adornment and traffic (Job 28. 18).

The first trial, of which we have any authentic account, of the use in Europe of machinery for diving, was made in 1509 A.D., when a sort of diving-bell was employed. Again, in 1662, a diving-bell of some kind is said to have been used on the coast of Mull, in a search for part of the wreckage of the ill-fated Spanish Armada. These machines were probably of a very rough and incomplete character, for even Dr. Halley's machine was far from perfect. This was invented and used in the year 1716; and it is said that, by its means, it was for the first time made possible to walk almost dryshod upon the ground at the bottom of the sea.

So great, at all times, has been man's desire to witness the wonders of the deep for himself, that very many eminent scientists have given much time and thought to the invention of machinery for gratifying this desire.

In the reign of James I., a famous Dutch chemist (who, it must be confessed, was a charlatan as well as a chemist) declared he had invented, not only a vessel which might be rowed under water, but also a liquor, to be carried in the vessel, which had the marvellous property of supplying fresh air. This submarine ship was to carry twelve oarsmen and several passengers, and is actually said to have been tried in the river Thames. When the condensed air in the boat became clogged with impurities from constant breathing, the vessel containing the liquor was opened, with the result that the vitiated air was speedily impregnated with purifying materials, and served again for a considerable period. It is a pity that the constituent parts of this wonderful liquid have not been handed down to posterity. There are many places which would be vastly benefited by an infusion of its purifying properties.

In 1836, a diving-dress was invented and made by Mr. Siebe, which consisted of a waterproof dress, enclosing the whole body and limbs of the diver, with the exception of the hands and head. It terminated at the neck in a sort of cuirass, or neck-plate of metal, to which was secured a helmet of the same metal; the whole suit being rendered both air and water tight by paddings, or suckers, of leather or felt. The helmet was connected by a tube to an air-pump in a boat on the water surface, for supplying fresh air to the diver, and also possessed a valve for the escape of impure air. With very few modifications and improvements,—such as the material used in making the dress, and an improved air-pump,—this is the same dress as is employed to-day by our divers. The feet are heavily weighted, to keep the diver at the bottom, and to ensure his getting down there. He usually carries a rope, with which to attract the attention of his comrades in the boat; and is armed with a knife, hatchet, and crowbar, or any special implements his work may necessitate. His helmet is furnished with glass windows, great goggle eyes, so that he can see very well, and it is no uncommon matter in these days for a diver to remain at the bottom of the sea as long as three hours at a time.

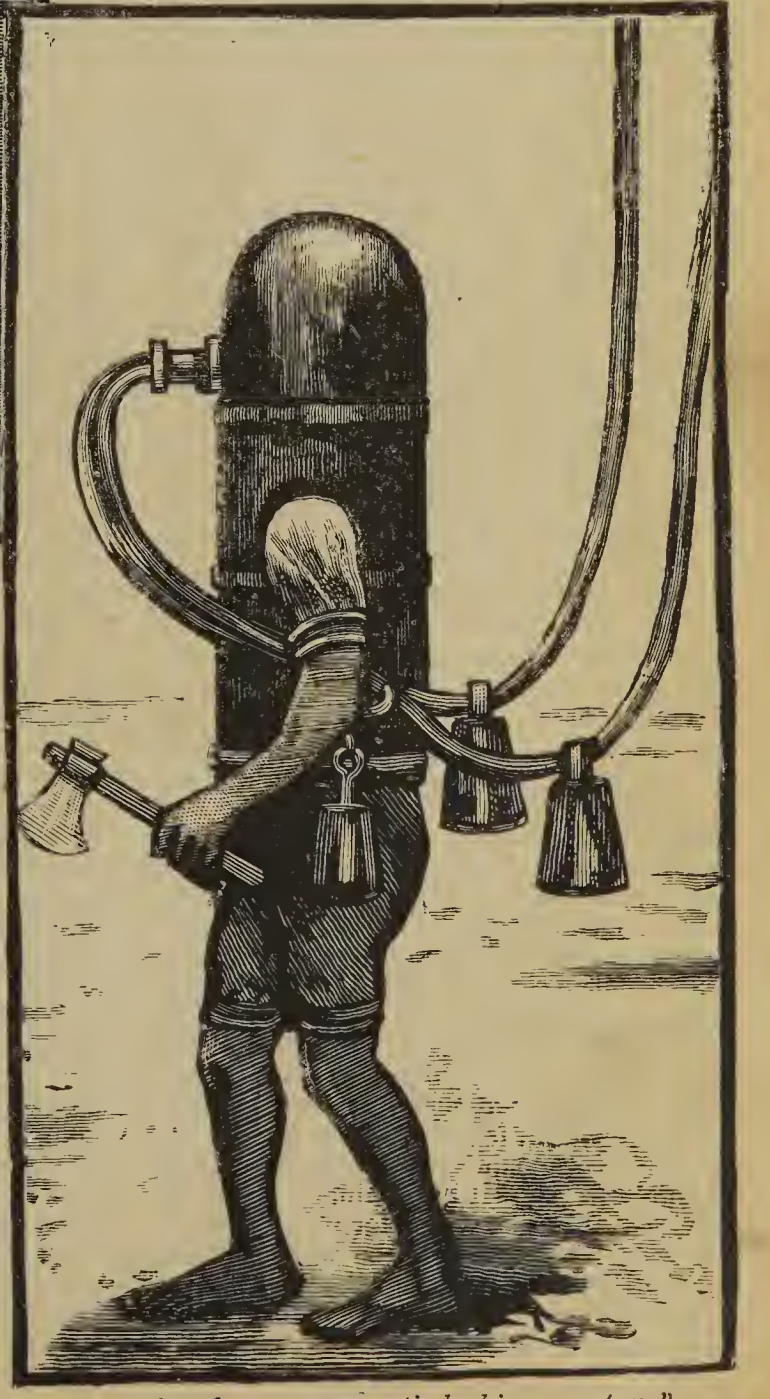
"How sponges are obtained."

The last invention of any note, is that of Mr. Fleuss, which is a sort of helmet with a mouth-piece, supplied with sufficient oxygen to last for five hours. He exhibited his machine at the Polytechnic Institution, London, in November, 1879, and before the Society of Arts in May, 1880; on both occasions fully establishing the value of his invention.

What, it may be asked, is the necessity for so much heavy metal armature in a diver's dress? Well, the answer is very easily given. The pressure of the water upon the body of a man six fathoms below the surface, is sufficient to prevent his breathing altogether—is sufficient, indeed, to crush the bones of his chest. Therefore, the powerful cuirass to which the helmet is screwed, becomes a matter of necessity, as a protection from the dreadful pressure of the sea.

Notwithstanding all this protection, a diver is exposed to terrible dangers. The twisting of his air-tube would be sufficient to kill him in a few moments, if he could not get at it and remove the twist. A slight aperture or rent in his wonderful garment would immediately destroy the waterproof nature thereof, and in a very few minutes, hampered as he is by the heavily weighted boots, the metal helmet and cuirass would be quite sufficient to ensure his death by drowning.

Strange are the many objects for which a diver is employed. Now he is sent to the bottom of the sea to search for a lost treasure, gone down in some ill-fated vessel; now to seek for the bodies of the poor people drowned. A recent development of the science of electricity has rendered it possible to employ the wondrous electric light at the bottom of the sea, so that now-a-days the diver is assisted in his researches by a brilliant illumination, which renders the ocean depths as light as the upper day itself. How



"So soon as he reaches the bottom, his search begins."

sad must be some of the diver's thoughts, as he wanders among wreckage and amidst the dead, no sound reaching him, all as silent as the grave itself! What a glorious relief it must be once more to wear his customary clothing, once more to breathe the fresh air of heaven!

I am reminded of a terrible story that was told me a short while ago by a naval gentleman, concerning a diver with whom he was acquainted. He was employed to examine the hold of a vessel which had been wrecked, the principal object of his search being a chest of gold coins belonging to the owners of the ship. He went down in his waterproof dress, and safely reached the hold; and here his risks began. He had to be very careful how he pulled after him his air-tube and his life-rope, lest they should get entangled in any of the lumber which floated about amongst the wreckage. However, for some time his progress was in every way satisfactory; and at last, to his great joy, he saw, at a little distance in front of him, the very chest of which he was in search. In his anxiety to reach it, he forgot his former precautionary method; he knocked away a box here, a chest there, and only thought of the prize he was so eager to reach. Imagine his horror and dismay when, having seized the iron-bound box, he turned to regain the surface, he found that he was blocked in, wedged in as securely as though a wall had been built by magic behind him! He had forgotten that he was under water, in his eager pursuit of the coin chest; and the boxes and packages disturbed on his way, had floated loose, rising to the roof of the hold, forming a barrier behind him. However, he did not lose his presence of mind. He concluded that life was more valuable than all the money chests in the world, so he dropped the chest, and set to work to force a passage. He succeeded at last, and regained the deck of the vessel, and was pulled up out of the sea by his comrades above, fearfully exhausted. But he only realised what a narrow escape he had had, when they told him he had been under water four hours, and that just as they felt his warning pull at the life-rope, they were about to give up pumping air to him, under the impression that he must already be dead!

One of our illustrations gives you a notion of how sponges are obtained, but this is a vastly improved method upon the old way. Until the diving dress was invented, divers sought sponges without any other assistance than their own wonderful ability to hold their breath for a considerable time, and the possession of a good strong knife.

The majority of our sponges come from the Mediterranean Sea; and formerly, the custom of diving for this useful marine plant, was considered the highest qualification of a youth, in those portions of the Mediterranean where sponges most abounded. The island of Nicaria was at one time quite famous for a curious custom connected with this business. The young girls chose their husbands according to their ability to dive. When a maiden had several suitors, she would go down to the brink of the sea, and there witness the address and courage of each; giving herself as a prize to the winner in the competition. These men used to go down naked, with a piece of sponge dipped in oil in their mouths, a bag tied round their waists, and a heavy stone tied to their ankles; and during the few minutes they were able to remain under water, would cut off and tear off

"He is far from a romantic-looking creature."

as many sponges as possible, trying their best to fill their bags. No wonder sponges were expensive luxuries in those days, for many a poor fellow lost his life in obtaining them. It is very different now, when a diver, securely dressed in his water-proof suit, with his goggle-eyed helmet, and his continual supply of air, quietly goes down and chooses and selects only such of the quaint plants as he knows will be deemed marketable, when he returns to *terra firma*.

Early in this Paper, I referred to the antiquity of pearl-fishing. It may be of interest in this connection, to give you a slight account of the method of obtaining the precious gems. Pearl fisheries exist in many parts of the world, and of course all oysters are, more or less, subject to the disease which produces the pearl. The East Indian fisheries, however, produce the finest and largest number. These hunting-grounds, if I may so call them, are situated in the Persian Gulf, at the island of Bahren, or Baharem; on the coast of Arabia opposite this island; and on some parts of the sea-coast of Ceylon, from whence, indeed, are brought the most perfect, though not the largest, pearls. The method of fishing is the same in all these places. The divers go off to the fisheries in small sailing vessels; and on their arrival at the oyster-bed, the anchor is dropped, and work is at once commenced. Each diver attaches to himself a large flat stone, six inches thick and a foot long, which serves him as ballast, prevents his being driven about by the motion of the water, and enables him to walk comparatively steadily at the bottom of the sea. He also has another very heavy stone tied to one foot, the weight of which sinks him instantly to the bottom. His hands and arms are protected with leather mittens; because, not only are the oysters fixed very firmly to the rocks, requiring considerable exertion and strength to tear them away, but also the rocks themselves are frequently jagged and sharp at the edges, and would punish the poor divers cruelly. For the purpose of more easily effecting the capture of the pearl oysters, a strong iron rake is sometimes carried by the divers. Each man also carries a large net or sack, fastened by a rope to the vessel, and fixed around the diver's neck. Into this net the oysters are thrown; and the rope is the diver's only means of communication with his friends at the surface. So soon as he reaches the bottom, his search begins; hither and thither he runs, tearing off all the oysters he sees, and trying to fill his net. Strange to say, the water is so clear in these latitudes, that the divers are able to see almost, if not quite, as clearly at the bottom of the sea as they can on land. It is not unfrequently the lot of some of the poor fellows to fall the prey of sharks and other marine monsters. They become great adepts at hiding from such enemies, dodging around a rock, throwing themselves flat on the ground, and creating a great cloud of mud; but their efforts to escape are generally fruitless; and the appearance of a shark amongst a fleet of pearl fishing-boats is a signal for much terror and consternation. It is said that some of these pearl divers can remain under water from fifteen to twenty minutes, but this is highly improbable, as it is hardly possible that any human being could stop his respiration for so long a period. It is certain, however, that they take little or no rest for many consecutive hours, jumping into the water, seeking their prizes, rising to the surface, being relieved of their burdens, and jumping back again at once. It must be fearfully exhausting work; and undoubtedly shortens the lives of the poor fellows who earn their living by this dangerous business. Now, however, since the invention of the diving dress, much of the pearl-fishing carried on is done in that costume, in which, of course, one man can do as much work, with more profit, as twelve or more could do formerly.

I do not think any Article treating of diving, would be quite perfect without slight mention of the semi-amphibious children of Malta, and of Port Said. These little things, some of them not yet in their teens, wait on the wharf-side until a vessel arrives, when they cry out to the passengers to throw them a small coin into the water. With marvellous dexterity they tumble off into the sea, never failing to find the coin, often diving below it, watching it in its descent; and as it sinks in the clear, blue water, opening their mouths and catching the coin therein. It is said that these children are like ducks; they can swim before they can walk; one of the earliest portions of their training, consisting in being left to the tender mercies of their elder brothers and sisters, who, being inclined to earn an honest penny by diving for it, repair to the wharf. The consequence is, that the baby is brought up in a sort of amphibious atmosphere, and very soon acquires as great proficiency as his brothers, and goes to work to add grist to the family mill. A friend of mine, an excellent swimmer, on his way to India, once undertook to play a practical joke on some of the boys at Port Said, in the Suez Canal. The steamship was taking in coal, and was simply surrounded by the little black boys, yelling, laughing, calling, and diving. My friend divested himself of some of his attire, watched his opportunity, and dropped overboard on the least occupied side of the vessel, dived underneath her, and came up in the middle of the little black, howling crew. The appearance of a white man amongst them quite disconcerted them; and when he proceeded, having taken his breath, to dive down and pull their legs for them, they were at first very much frightened indeed. However, some of those who had escaped my friend's delicate attentions, heard the shrieks of laughter from the deck of the steamer, and, regaining their presence of mind, began to take their revenge. In a very few moments they had so punished my friend, that he feared they would actually drown him, and he shouted for assistance from the ship. Indeed, had not a boat been sent to him, there is small doubt that the little blacks would have drowned him; for, good swimmer though he was, he was no match for them.

Good swimmers and divers have always received praise and adulation, and have often been the heroes of song and story. The diver of to-day, however, is not a particularly fit subject for poetry; he is, indeed, a far from romantic-looking creature in his dress and helmet. Modern science is making the possibility of submarine research easier and less fraught with danger every day. The electric light is sufficient, both to illuminate the darksome deep, and to frighten the monsters of the ocean; and the means now in our possession for supplying fresh air constantly, in any quantity, are so numerous and simple, that it is almost a matter of wonder that any thought of danger should exist. Very certain it is, that no hesitation is permitted to stand in the way of exploring any part of the submarine depths, when expediency or necessity arises. The depths of old Father Ocean are no longer unknown.

"HAVE YE NOT READ?"

By EMILY S. HOLT,
Author of "Mistress Margery," "The Tangled Web," "The Lord Mayor," etc.

"OF making many books there is no end." If there seemed none in Solomon's days, how much less is there in our own? In this multiplication of books—taking good books only—there is both good and evil. The former is apparent, and need not be recounted. The latter is twofold: it encourages a hasty, discursive habit of reading; and it draws the thoughts to the numerous books of men from the one Book of God.

The days of the giants are gone by. There was a time when a Bible and a *Book of Martyrs* constituted a man's library. We are apt to think that readers in those days lived at sad disadvantage. Is that so certain as it seems? When men had but two or three books, they studied them; they dwelt on them; their minds were saturated with them. In the present day, our minds seem to be saturated with nothing but a kind of literary soup, out of which a lump of something solid stands up here and there. Our memories are worse than those of our fathers; instead of being drawers containing neatly-made packages of things worth keeping, they resemble some that may be seen without going far, where Bibles and brushes, novels and pill-boxes, artificial flowers, cakes, and boot-laces are crammed together in heterogeneous confusion. As to meditation, who thinks of meditating in the nineteenth century? We alternate between long fasts and hasty gulps of moral nourishment, and then, poor foolish creatures that we are, we wonder at our spiritual dyspepsia. The real wonder would be if we had it not.

"It is impossible to tell what is true or false," said a lady one day. "Mr. Brown says one thing and Mr. Green says another (naming two of the neighbouring clergy), and really I don't know what to believe." What had she done with her Bible?

A reference to a passage in Zephaniah, once called forth from a reviewer the sneering comment that it showed how diligent the writer had been in consulting the concordance—as if the Book of Zephaniah were some almost unknown and inaccessible manuscript.

It is not many days since we were told by an orator that "Oh that mine enemy had written a book!" was "a line of English poetry." And how many persons are under the impression that "Charity begins at home," "Cleanliness is next to godliness," and similar sayings, are texts from the Bible? The Book of Proverbs was once diligently read to discover a passage, which, at last, to the surprise of the reader, was found in the Prayer-book version of the Psalms. The bet between King Charles II. and Lord Rochester as to the words "Wine which cheereth God and man," has often been narrated: the king maintaining that the words were in the Bible, and thereby proving himself to be better acquainted with the text of Scripture than all his courtiers and chaplains.

But to what condition must things have come in the present day, when a Cabinet minister can inform his audience—who seem to be no wiser than himself—that the Syrian prophet said to the King of Israel, "Is thy servant a dog that he should do this thing?" (Quoters of this passage always forget the word "great.") Had the same speaker told his hearers that the familiar

passage in Shakespeare, "To be or not to be, that is the question," was spoken by Ariel to Lady Macbeth, would the blunder have been received in the same manner? Considering, to put it on the lowest ground, that the Authorized Version is the first of English classics, why should ignorance of it be thought less disgraceful than ignorance of any other?

Things have come to a strange pass, when it is a shame to be ignorant of the words of certain great men, but to be ignorant of the words of Him who made us all—the words by which we are all to be judged—is no discredit to any one.

More astonishing still is a statement of the late Miss Havergal, to the effect that many of those who do read the Bible "waste much time in indecision, and wondering what to read next." What to read next? Imagine a man who was reading, say Tennyson's *Idylls of the King*, being puzzled, when he had finished *Enid*, what part of the book to read next!

Does not this last remark, to some extent, give the key to the situation? Have we not here the explanation of all those one-sided Christians whom we perpetually meet—those people who are always puzzled what to believe, always wanting to know if you think such a doctrine true or false, always liable to be led aside after Canon White in one direction, or Prebendary Black in the opposite? How can a man be in full spiritual health, who systematically refuses to take one-half of the food and medicine ordered for him by the Great Physician? The proportion of faith cannot be kept up on such terms. If a man will not regularly read the Bible through, but merely confines himself to picked bits and pet chapters, the result must be one-sidedness, vacillation, utter uncertainty as to what the will of the Lord is. How can it be otherwise?

I believe there are persons who confine themselves to the Psalms and Lessons appointed to be read in churches, and really know nothing of the rest of the Bible. Does it ever strike them what they are doing? They are practically saying that the Reformers (or the revisers of the calendar) were wiser than God. Yet assuredly the Reformers never meant that the remainder of the Bible should be let alone. Had they done so, they would scarcely have omitted from their calendar the only Book in the Word of God to the reading of which a separate blessing is attached.

An expurgated Bible! Can the subtlety of Satan's devices any further go?

Friends, if Christ stood amongst us to-day, with the old question on His lips, "Have ye not read?" how many of us would be able to give Him an affirmative answer? If we spoke out the honest truth in reply, what would our words be like? "No, Lord; I thought the ceremonial law obsolete. I considered the historical books unedifying. I regarded the prophecies (the minor prophets more especially) as having nothing to do with me. I thought the New Testament the important part for Christians; I found the Epistles very dry; I looked on all relating to the Second Advent as speculative and unpractical. I was of opinion that the Church ought to guide me, and therefore that the Psalms and Lessons were all that was necessary."

Christian brethren, ought these things so to be? We have one life and one Bible. Is not the Book guide enough for the life? Is not the life long enough to read the Book? They were meant to go together. Sever them, and you are at sea without a compass; and whither the waves will carry you, you cannot tell.

There are in this Book two peculiar qualities, which will be found in no other. In the first place, whenever you will come to it with an honest wish to find an answer to any question, it always has one for you; but if you come with a mind pre-convinced, and a heart pre-determined to go after your idols, it has no answer for you. Secondly, the more you read it, the more you will wish to read it; and the less you see of it, the more repugnant does the thought of it become. It is said that when the late Dr. Kennicott was engaged in writing his critical Commentary, it was his custom to have the portion of Scripture on which he was employed read to him by his wife during their daily drive. The morning after the Commentary was finished, Mrs. Kennicott said to her husband, "What book shall I take now?" "Oh!" was the answer, "let us begin the Bible."

For the man who daily gives it a passing glance, this Book has no interest to offer beyond beautiful language and archæological lore. But the man who, with patient toil, is content to dig deep, will break into diamond caverns and mines of gold—provided always one thing, that he has asked the Guide to go with him. For this Book to be studied to any profit at all, it must be studied at the feet of the living Author; it must be read by the light of the seven lamps of fire which surround the throne of God.

Friends, shall we not read the Bible?

"SWORDS" AND "HONEYCOMBS."

A STRANGE juxtaposition of ideas, certainly! And yet we are told, and on the very best authority too, that the same thing may be both the one and the other—at one time a "*sword*," at another, "*honeycomb*."

A riddle! those will say who have not the key to it. Well, perhaps it is. Will you try and guess it, or read on a little further? Yet think again of the two words, and of the different images each calls up. A *sword*—emblem of war and discord; one of the fiercest and keenest of weapons.

With this instrument of torture and death, compare the innocent substance familiar to us from childhood, *honeycomb*. Honey! the very name implies sweetness; and in this simple vegetable juice, lie healing and soothing qualities of recognised value. Now we see the full force of the contrast between these two words, *sword* and *honeycomb*. The first, death-giving; the last, life-giving. And that which these images are chosen to illustrate, that which may be (shall we not say, *must* be?) either the one or the other, is *human speech*.

In our childhood, perhaps some of us read the old fairy-tale of the two princesses; how a shower of pearls and diamonds fell from the lips of the good princess, whenever she spoke; while frogs and toads dropped from the mouth of her wicked sister. Did we ever think of the lesson that trifling story suggested? "Oh, but," you will say, "our words do not matter so much as all this!" Do they not? Hear what the Bible says about them, for we must go to the Book of books for our highest allegory, our most significant parable. "There is that speaketh like the piercings of a sword" (Prov. 12. 18); and a little further on, "Pleasant words are as an honeycomb, sweet to the soul, and health to the bones" (Prov. 16. 24).

When words mean so much as this, do you not think it would be wiser to be more careful of this wonderful gift of speech, which has in it the power to kill or heal? "But nobody was ever killed by a word," you say. I am not so sure of that; there is something—and that the best part of a man or woman,—which may be very easily slain by a word; I mean their good name. And it is well for women especially to consider this, for they are said to be the chief talkers.

And is it not true that "chatter," harmless enough at first, perhaps, is apt to glide into gossip; gossip into scandal, wherein our neighbours' lives and histories are discussed with words the reverse of charitable?

I suppose there is not one of us who has not, at some time or other of our life, been at least *wounded* by a word.

How true are Sir Walter Scott's lines:

> "Oh, many a shaft at random sent,
> Finds mark the archer little meant;
> And many a word at random spoken,
> May soothe or wound a heart that's broken."

In the last line we have clearly set forth the uses of our title-words,—the *sword* to hurt, the *honey* to heal.

We know how a chance word may impress us. We may have heard it long ago, spoken by some stranger, whose face we have never seen since; but it remains in our remembrance, fresh as when we first heard it. A word, indeed, is a little thing, but it may mean a great deal.

Think of the difference *one* word may make in a life-time. A "Yes" instead of a "No," in the hour of temptation, and many a one has paid for it with years of anguish.

Again, "Now" and "Then." What fulness of meaning lies in those monosyllables!

If our eyes were open to all the lessons they teach us, we should be awake to the realities of this world and the next.

"*Now*"—this present, with all its opportunities and duties; "*then*"—that mysterious future, when the visible things of earth shall have passed away: *now*, the time of probation; *then*, the hour when all things are judged. And so it often happens that the little words may mean the most.

I was struck with something I heard in a sermon once. The preacher suggested three rules for guidance. "Before uttering the speech that rises so readily to your lips, think," he said: "first, 'Is it *true?*' second, 'Is it *kind?*' third, 'Is it worth saying?'"

If we formed our conversation upon these lines, how different it would be; and yet, why should we not strive to render our speech not only harmless, but helpful, life-giving?

"A word spoken in due season, how good is it" (Prov. 15. 23). Ah, that word in season; that gentle speech of sympathy, when our hearts are overflowing with sorrow; that wise bit of counsel, when we are faltering in doubt; ay, even that quick, bright jest which turns anger into laughter, and, like a sunbeam dancing in a dark place, dispels gloom; have we not felt and owned its power?

There are some people with whom an hour's conversation seems to leave one nobler and better; the follies, the anxieties, the vanities of life fade out of our mind as we listen to their discourse.

We cannot all be eloquent; but the meanest amongst us possesses a power to be used for good or evil in the Divine faculty of speech—in the words which, uttered carelessly from day to day, have their echoes through Time into Eternity.

SISTER DORA.

A BIOGRAPHICAL SKETCH.

By Fanny Burton Irving.

ON January the sixteenth, 1832, the family circle of the Rev. J. M. Pattison was enlarged by the addition of his eleventh child, a daughter, named afterwards Dorothy Wyndlow. From one of her parents she inherited beauty of feature, from the other beauty of form, and this comeliness was regarded by her in later life as a talent from God, for, like "sorrow," beauty "on earth hath uses."

She passed the first twenty-nine years of her life without much incident in the quiet place of her birth, Hauxwell, near Richmond, Yorkshire, a village numbering some three hundred inhabitants, which the writer visited more than twenty years ago, but still remembers as charmingly situated and surrounded, with the river Swale at its foot, and the moors to the side, and beyond right up to Reeth and Wensleydale.

To one coming from the Babylon of London or Glasgow, it seemed a sort of English St. Helena, or place of banishment and exile; but those born on the spot, find its centre and circumference a world in miniature. Let not the dweller in towns despise our English villages, for the high court of Nature has a wonderfully elevating and educating effect, and many a noble life has had its source, like the rill of a mighty river, from a hiding-place amongst the hills.

Dorothy's early delicacy, not outgrown till her fourteenth year, prevented her from sharing the routine lessons of her sisters; but she had a retentive memory, so picked up and assimilated much information from hearing the instruction given to the others, and from her close observation of men and things. She was a bright maiden, full of fun, earning from her father the sobriquet of "Sunshine." No wonder she grew up popular, for

"Welcome as sunshine in every place
Is the good-natured smile on a good-natured face."

From the first she was persistently, though never violently, wilful. One comical instance of this is given in her biography. She and her next sister alike hated certain bonnets appointed for Sunday wear. Complaints as to their ugliness being ignored, she hit upon a scheme for their injury. One very rainy day, when Mrs. Pattison was out, Dorothy suggested to her sister that now was the opportunity to spoil the bonnets. Quick to act as well as to devise, they both put them on, and then, throwing open a window, stuck their heads well out to let the rain "do its worst upon the velvet;" then, not to hide what they had done, but to complete the operation, Dora suggested that the soaking bonnets should be restored to the bandbox. Sunday morning came; where were the bonnets? Dora replied firmly, "Quite spoiled: we can never wear them any more." They were condemned, however, to wear them; and not only on that Sunday alone, but for many Sundays afterwards, they appeared in church with the monuments of failure upon their heads. Wise are those parents who thus maintain authority and discipline in their families.

Though there was enough and to spare in her home, she was carefully trained to mend and remodel her garments, a useful art, which

"Gars auld claes look amaist as weel's the new."

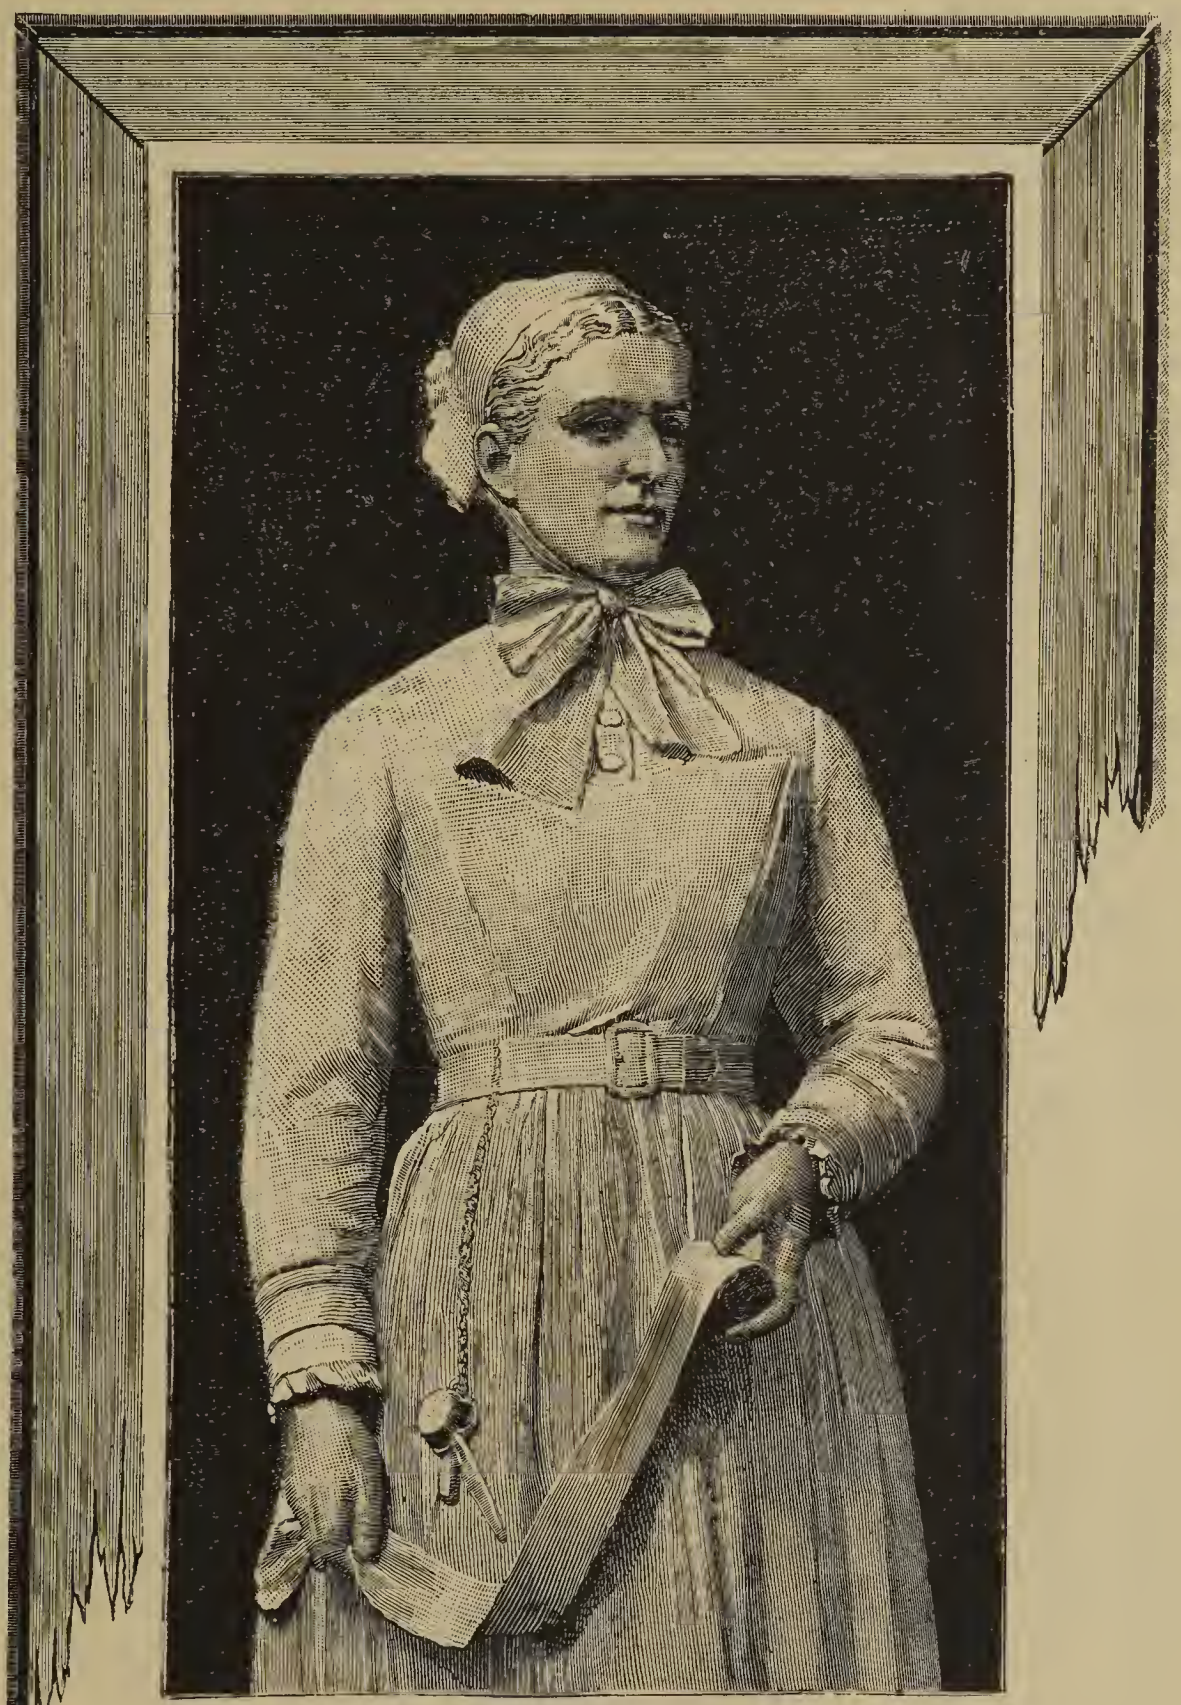
By this plan a saving was effected, and there was more of cash and kind to give away to such as needed help. By the time she was twenty, she had attained a healthy womanhood, thanks to the moorland air, equestrian and other out-of-door exercises, and the active games in which she joined her brothers. Perhaps, too, the merry heart, the love of song and music, which found its vent in the village choir, the elastic spirit, the habit of helpfulness and self-sacrifice, were factors not to be disregarded; traits such as these are full of power, creating and conserving physical health. Dorothy was also a typical Yorkshire woman in her shrewd originality, clear-headed judgments, and incisive speech, the latter tempered, however, by a sympathetic manner and address.

The account of Miss Nightingale's work in the Crimea fell like a match on gunpowder, and fired Dorothy with a desire to join the nurses. This, however, was not sanctioned by her wise father, who said that, untrained and undisciplined as she was, she would be worse than useless, adding that she had enough to employ her at home if she would only think so. At the time she outwardly yielded, but her imagination once fired, did not die out—it only smouldered in a restless silence till, after her mother's death, which took away the many duties she had performed for her, she broke away from the moorings of home, and, against her father's wishes, began to carve for herself an independent sphere.

In after-years she bitterly repented this opposition to her father, and in a letter written on her death-bed she said: "I was very wilful; I did very wrong. Let no one take me for an example;" and in her forty-first year, with ripe experiences, in answer to a friend who asked her opinion on woman's work, replied: "I feel like Balaam of old, as if I should give quite the contrary advice to what you wanted of me; to wit, you would like me to urge women working in hospitals, etc. I feel more inclined to harangue about women doing their work at *home*, being the help-meet *for* man, which God ordained, and not doing *man's* work. Then, when they have faithfully fulfilled their home duties, instead of spending their time in dressing, novel-reading, and gossiping, let them spend and be spent. I feel sure there would be more work done and less talk if we thought of laying it on the sure foundation. But a great deal is built on stubble and hay, and will have to be burnt."

Dora Pattison's new sphere took her to Bletchley, on the borders of Buckinghamshire, and she became village schoolmistress in the parish of Little Woolston. This engagement lasted for three years, and she left behind her a good name as a painstaking and energetic teacher. Though she lived alone in a little cottage, kept no servant, and blacked her own grates, she soon became known in the neighbourhood as a lady, and gained much prestige and influence, as she visited the poor and sick. Probably here, too, she learned her clever ways in the management of children, thus proving that the faithful fulfilment of work in hand to-day, qualifies us for the unknown calls of God on the morrow.

On leaving Little Woolston, she joined herself to a working Sisterhood, whose headquarters were at Coatham, near Redcar, in Yorkshire, where they also kept a Convalescent Home, and went out on works of mercy to various parts of England. On the wisdom or otherwise of this step, her father was neutral, but she knew too well that she acted without the approbation of her family. The Sisterhood took no vows, either open or secret, save that of obedience to their pastor and the "Sister-in-charge," commonly called "Mother Superior." Miss Pattison now became "Sister Dora," and, by way of training, was put through a very distasteful ordeal. She made beds, cleaned and scoured floors and grates, swept and dusted, and finally became a cook in the kitchen at Coatham. One day she sat down and cried, for the beds she had just made were pulled to pieces because they were not done according to rule, and, though very tired, she had to pick the clothes off the floor and begin her toil over again.



Thus she learned the discipline of service, and the hardness may afford a hint to those who think they are qualified to work at nursing or teaching without any apprenticeship.

In 1865, when thirty-three years of age, Sister Dora began her nursing career by helping in the Cottage Hospital at Walsall, a town of thirty-five thousand inhabitants, lying in the Black Country. After a few months in hospital, Sister Dora was recalled to Coatham. Sir James Simpson, of Edinburgh came to the Home to secure a nurse for one of his patients, a semi-crazy old lady, needing much tact in management. Not satisfied with those recommended by the chaplain, he said he would like to choose for himself; and, while being conducted through the different departments, pointed to Sister Dora (who, with tucked-up sleeves, was making a pudding), saying, "Send me that Sister; she is the one for my case."

The refusal of the authorities at Coatham, at the end of 1865, to permit a visit to her father, who was dangerously ill, and who ultimately died without seeing her, left much soreness of spirit, which widened the breach between herself and the Sisterhood, until she severed her connection with it in 1874. After this, she toiled at the Walsall Hospital incessantly, to weary down pain by labour. She had much aptitude for the work, but little technical knowledge. Speaking of herself at this period, she said: "Nobody could possibly be more ignorant than I was; I had everything to learn." She proved, however, a ready learner, and under the training of a skilful surgeon, by patient study, keen observation, much practice, attendance upon *post-mortem* examinations, delicacy of touch, dexterity and discrimination, became, after a hard apprenticeship, a thoroughly good surgical nurse. Medical cases had but little attraction for her.

The stone fitted, for the wall was soon built. In and from 1866, until her death, she proved herself the right woman in the right place. In 1868, the Walsall Cottage Hospital had gained such a high reputation, that it was found necessary to remove to larger premises, which contained twenty-eight beds, and capacity for more if occasion required it. The committee regarded Sister Dora as head of the nursing department, and entrusted to her the organisation of the internal arrangements of the new building. She was at this period thirty-six years of age, and had been qualifying for the position by several years of laborious industry. A *resumé* of her day's work may show her difficulties and her success. Sister Dora came into the wards at 6.30 a.m., and for the next hour made beds, and gave breakfast to patients. Then her own breakfast, after which she read prayers on the staircase, in a clear voice, so that all patients in the three wards could hear and join. Next, the daily routine ward work, washing up things, and dressing wounds; at eleven, the doctor went

his rounds; at twelve, there was the patients' dinner to see to—she carved and attended to the details herself. Then she read prayers in the general sitting-room to the nurses, and also to the lady pupils if there were any. The nurses' dinner followed; at table she was full of self-denial, not only sharing cheerfully the general fare, but leaving all delicacies quite untouched, so that there might be more to divide amongst the others. Out-patients, who were treated every day, were due at two o'clock; and as from sixty to a hundred passed through the rooms, the doctors were glad to hand over to Sister Dora such minor operations and dressings as are entrusted to experienced dressers in large hospitals. Her bandaging was so good, that a Birmingham doctor called his students to admire, as a model of excellence, the bandaging of a man's head that was her handiwork. Patients' tea at 5, and nurses' at 6 o'clock in the afternoon. After this, she returned to the wards, and would sing to the patients, or tell them bright, racy stories, while she washed up the tea-things. She considered herself responsible, too, for the "tone" of the wards, inducing men to wait on one another, and to be sympathetic, patient, and cheerful. By 8 o'clock, the patients had been put to rights for the night; then supper was served, and after this, Sister Dora read prayers, even when, as sometimes happened, her many duties had so delayed her, that most of the patients were asleep, for she said, "The prayers go up for them all the same." Just before bed-time came her own supper, though on Fridays and during Lent she often went without. Self-indulgence was crowded out of days so full of labour. "We ought to give up our lives for the brethren," she said, and she acted upon her convictions. Then, too, though assisted in the night work, she often rose to look after special cases, besides answering the night-bell at the head of her bed. When it sounded, no matter how weary, she would say to herself, "The Master's come, and calleth for thee," and flinging on cap, dress, and apron, would hurry down to dress the wounds, or sew the cuts resulting from drunken frays and other disorderly proceedings.

Sister Dora.

A man named Chell had his leg amputated (it had been crushed to pieces in a railway accident), and wrote that he remembered nothing about the operation except the presence of Sister Dora; and that when he came to, after the chloroform, she was on her knees by his side, with her arm supporting his head, softly, prayerfully repeating,—

"They climbed the steep ascent of heaven,
Through peril, toil, and pain;
O God, to us may grace be given
To follow in their train."

And all through the pain that followed, he never forgot Sister's voice singing those words.

On another occasion when, as the result of an explosion at the iron-works, eleven men were covered almost by molten metal, and so burned as to be more like charred logs of wood than human beings, a special strain was put on Sister Dora by the intense sympathy she felt for the agony the men endured, and for ten days she not only never went to bed, but scarcely ever left the foul atmosphere of the ward. Two men ultimately recovered; the rest sank under their injuries. Cassity, one of the men who recovered after six months' steady treatment in hospital, said: "What we felt for Sister I couldn't tell you; my tongue won't say it. It did you good only to look at her." This man went by the name of "Burnty," and it was never expected he would walk again, owing to injuries sustained to his feet; but before he left, Sister Dora sent him to be measured for a pair of boots, which she intended as a parting gift. The woman at the shop said, "Well, I wouldn't be such a softy as to think you'll ever be able to wear boots with those feet," and Cassity returned very depressed to tell his friend. She answered by saying with a bright laugh, "You'll wear out many pairs of boots, my Burnty." "And so I have," said Cassity; "she was right enough. But it was all along of *her*, who never left my burns a day all those months without looking to them with her own hands." It was a year before this man worked, and he came up constantly to be "dressed," after he ceased to be an in-patient. Truly such an instance proved that Sister Dora was not weary in well-doing, but had the grace and gift of continuance.

Sometimes she had patients who were sceptics, and she was very careful in her dealing with them, endeavouring to set before them in her own life an exhibition of living Christianity. Sundays she always tried to make bright days, and Christmas and Easter, times of happiness and rejoicing.

In 1871, the people of Walsall testified their gratitude for her many services of loving kindness, by subscribing amongst themselves fifty pounds, with which they bought a small carriage and a pony. This testimonial was presented in the hospital grounds, which were filled with old patients looking on as "sympathising witnesses." Much of her time and strength were saved by this gift, for it enabled her to get over the ground quickly, and with less fatigue, when visiting patients in their own homes, besides enabling her to give many enjoyable rides to her convalescent patients.

(*To be continued.*)

GIRLS I HAVE MET.

By Mrs. Skinner.

II. THE AMBITIOUS GIRL.

SHE was a lively, attractive girl,—a general favourite. To be in her company was inspiring; she had such a flow of spirits, good conversational powers, never indulging in vapid talk or monosyllabic utterances, and beneath all she said or did, there was such a quiet spirit of force and energy; it was like breathing mountain air to be with her. But oftentimes the mountain breeze becomes a tempest, and, in just the same way, powers of will and virtues not directed and kept in control, will work evil, not good.

Of course she was a favourite of mine too. I have a weakness, if you like to call it such, for ambitious girls, and so she often came to see me. She had always been of an ambitious character; but it was of a quiet kind, a sleeping power, till her brother won a Cambridge scholarship, and then it all awoke. He was very proud of his success, and, boy-like, rather bombastical.

"I wish I could win some honour, or have the prospect of getting on in some way," she said to him when the news was first told.

"Oh, girls are best at home; they are only made to wait on men. What could a girl do in the world?"

"They do plenty; quite as much as men."

"Well, you never will. You'll never have 'a soul above buttons.' You can chatter away, but that's all."

"Is it? Well, you will see."

Perhaps he was not speaking in earnest; they may have been words uttered for a joke or tease; but when she repeated them to me, I saw how deeply they had sunk, but never knew, till long afterwards, all the consequences that sprang from them.

"I've got some ambition as well as he; I wouldn't give twopence for a girl who had not; and now I mean to put it to some practical purpose. I do so like those lines:—

'Live
In pulses stirred to generosity;
In deeds of daring rectitude; in scorn
For miserable aims that end with self;
In thoughts sublime that pierce the night like stars,
And with their mild persistence urge man's search
To vaster issues.
So to live is heaven.'

And that's how I mean to live."

"Yes, child," I answered, "they are beautifully expressed; but very often people are led away by sentiment, and you never see any results from their 'sublime' thoughts."

"Then they are only wind-bags; but I hope I am not," she added, laughing.

How much more personal and practical my words would have been, had I guessed all the plans of her active brain.

Jealousy, anger born of grief, and a spirit of retaliation, were mixed up with her ambition; for, like a precious ore, ambition is often wrapped round and blended with baser metals; and because people do not wait to extract the good from the vile, ambition is so generally condemned. Not that the ore of her ambition was small in quantity compared to the dross. Just the contrary; it was a strong, pure force within her, only needing direction to lead to glorious results.

It was some time before the plans for the furtherance of her ambition were matured; but at last she decided to take up the scholastic profession, and reach its highest attainments. To do this, she would devote so many hours each day to private study, attend evening classes, and eventually matriculate at the London University. It should be seen that a girl, though comparatively poor, and with few previous educational advantages, could yet achieve something.

At once the plan was put into operation, and eight hours a day were spent in study. As she was an only daughter in a household where economy of time and money was by necessity strictly enforced, she was sorely missed during those hours; the mother having to sacrifice what little leisure she previously had, to filling up the gap, and many little duties had to be left undone, because there was no one to do them. The father and the boys missed the little snatches of song that so often greeted them; a brightness was gone from the home, and more often than not, a presence was lacking also. When she did appear, she seemed absorbed in herself. Sometimes she was even untidy in her personal appearance, and her old sprightly manner seldom showed itself. Gradually her health was giving way, and when she failed in some examinations, the bitter disappointment she suffered made her worse. The doctor forbid study for a whole year, and then to be "only" indulged in moderately.

There was never a word of censure or sneer spoken to her, but the very sympathy she received was like a stab to her. "They are sorry for me because I have failed—*failed!* but I *will* succeed in something else." But what was it to be? The mother never dreamt of all that was passing in her daughter's heart, but her words one day seemed like an answer to her thoughts, though it proved an unpleasant answer.

"Would you like to learn dressmaking, dearie? or would you like to go into a business? You don't seem to take to housework, and I could get extra help into the house if you had to go away."

"Oh, no, mother; don't suggest that."

To drop from the dream of being a B.A., with a splendid position, down to a dressmaker or shop-girl, was too painful! But what *was* it to be? Ah, now it had come. She would write something that would bring her success; she would become a literary celebrity, and no one should know anything at all about it till it was an accomplished fact! There should be no more public failures. Then commenced the burning of the midnight oil; the natural consequences being late rising in the morning, a bad headache, disagreeable feelings, unpleasantness in the home. And oh, the weary disappointments! Time after time did she visit the post-office to see if there was a reply from any of the editors favoured with her manuscripts. "Nothing to-day, miss," the clerk would say, or else hand her back the roll of manuscript, to find on opening, in the left hand corner of the front page, "Declined with thanks."

Once she sent a Paper to a well-known literary man, asking for his opinion of the same. He replied that it was his rule not to answer any anonymous communications, and saw no signs of excellency in the accompanying Paper to justify him in saying anything further. He would advise her to study English composition.

Indefinite enough to be humiliating. At once she threw up the idea of succeeding by the pen, and again ambition was on the lookout for other ways and means.

"I cannot think what has come over our girl," said her father. "She is not like the same being."

"No," sighed the mother, "she is not;" and she thought of the old gaiety and willingness to work, that were never manifested now.

What would be venture number three? She had often been praised in her school days for her water-colour drawings. Why should she not try to be an artist? A good thought! and at once she began. This scheme, born of her ambition, could not possibly be carried on in secret, and so the family had to know a good bit about it.

Several little sketches were done, and hung up in a friend's shop for sale, and an art school entered. Less and less attention was now paid to home and its claims. The mother grew more worn and harassed. "Get more help into the house, as you once suggested," said the daughter. The mother shook her head; she did not like to say that with the many extra expenses her daughter was incurring, they could not possibly afford to do so. Had she been earning money instead of spending it, they might have been able. Not the offer of a shilling was ever made for the pictures, and they hung in the shop till the owner kindly asked for their removal. This humiliation was followed by an unsuccessful attempt for a scholarship at the art school, and, with a despairing heart, the whole thing was thrown up.

I met her just afterwards in the street, and asked her to come for a little walk, and tell me all how she was getting on. Sitting down on a seat in the park, she told me all.

"And they seem cross with me at home," she went on. "Father says I do not help mother enough, and that I ought to either do more work at home, or else go out to work. They do not seem to sympathise with me."

"Perhaps they do not understand clearly what you have been trying to do, and so they could not be expected to fully sympathise with you. And I cannot see how possibly you could do your duty at home, and succeed in any of these prospects. I am afraid, my dear child, you have let ambition run away with your judgment. Ambition is a good servant, but it is a bad master."

"Advise me then, will you?" she asked wearily.

"I think you should try and rest a little while before attempting anything else, and afterwards we could think what you could do. But in the meantime will you think over these three little sentences: *Ambition needs to be disciplined—purified. Ambition should follow in the wake of natural abilities. Ambition, if wise, will not neglect any little duties, but will, even in the doing of them, work out its own ends.*"

"I will write them down," she said, getting out her pocket-book, "or I may forget them. Perhaps, if I had only had some guiding thoughts like these before, I should not be so unhappy as I am now."

"Do you remember repeating some lines to me a long time ago? Well, let me give you a few now. I am sure they will cheer you:—

'Few know of life's beginnings:—men behold
The goal achieved;—
The poet, when his lyre hangs on the palm;
The statesman, when the crowd proclaim his voice,
And mould opinion on his gifted tongue;
They count not life's first steps, and never think
Upon the many miserable hours
When hope deferred was sickness to the heart.
They reckon not the battle and the march,
The long privations of a wasted youth;
They never see the banner till unfurled.
Hard are life's early steps; and, but that youth
Is buoyant, confident, and strong in hope,
Men would behold its threshold, and despair.'"

"Oh, thank you. It does cheer one to find others have been equally miserable. I suppose it is a common lot to have to struggle

at the beginning ;" and a little smile peeped out at the corners of her mouth.

When she reached her own door, the smile had come right out boldly.

She was of too impetuous a temperament to rest as I had advised ; opportunity arising, she applied for a clerkship, and lost it on account of her handwriting.

"It would have been far better if you had practised your writing, instead of wasting all that time over German and mathematics," said her brother, who was just then at home.

It was a true speech, but might have been put in a kinder way.

"The way is dark, my Father," her soul cried out in bitterness. It was not till then she learnt to watch for God to direct her steps. But the way was to grow darker still. Her mother grew dangerously ill—brought on by overwork, the doctor said. And who had caused that overwork? The daughter—the ambitious daughter! Like Mary of old, a sword pierced her soul at the thought that she had so thoughtlessly and selfishly sacrificed her mother!—her dear mother, who had such a life of toil and struggle, in order to bring up her children respectably.

How she prayed for mother, nursed her, watched, waited, and struggled, I could not describe. But the life was spared, and the doctor said it was only the skilful nursing that had saved her. Why did she not become a professional nurse?

A nurse! it was the very thing she liked doing most, as she had now discovered! Why had she never thought of it before? Surely it was God's answer to her cry.

As soon as her mother was able to be left—a cousin coming to take her place in the home—she sought admittance to a training establishment, and got on admirably.

Some may think there is no room for ambition in such a sphere as that ; but there is. It is only the ambitious nurse that succeeds. My "ambitious girl" never felt there was no scope for her desires ; each day brought fresh avenues for them. She is now matron of a large establishment, and no one there excels her in delicacy of touch, firmness of nerve, and cheerful, inspiring courage. In critical cases, even now while matron, she takes her stand by the doctor's side.

When I met her, after her admission into the hospital, she said to me with a beaming face, "How good God has been to me! Instead of letting my mistakes utterly crush me, He even used them for my good."

Her brother is now an assistant schoolmaster, often coming home worried by his duties. Many times, when he sees his sister so happy and successful in her work, he thinks of the time when he so sneeringly said she would never "have a soul above buttons," and feels somewhat humiliated.

She has abundantly proved a girl *can* do something in the world when she has found her proper niche.

Shut the Door.—Dr. Charles Burney, the celebrated musical composer, had a nervous dread of draught. "Shut the door!" was his first salutation to any one entering his apartment, and it was an injunction seldom neglected. On one occasion, returning in his carriage from Chelsea Hospital late at night, he was attacked and robbed by foot-pads. As they were making off with their booty, they were arrested by the stentorian order, "Shut the door!" and as one of them returned to do so, he was captured by the doctor.

MUSING AND AMUSING.

A GOOD book is the best of friends, the same to-day and for ever.—*Martin Tupper.*

Dr. Grey, in his erudite and entertaining notes on Butler's "Hudibras," records the deposition of a lawyer, who, in an action for battery, told the judge that the defendant had beaten his client on the head with a certain *wooden* instrument called an *iron* pestle!

When the Royal Exchange was burnt down in 1838, a certain Arthur Betts kept a music shop in the Exchange. A rather witty reporter wrote the following lines in his account of the fire :—

The men of Braidwood's fire brigade,
In water to their middles,
With skill and great precision played
On Arthur Betts's fiddles.

A country farmer told a friend, who had come from London for a few days' shooting, that he once had so excellent a gun, that it went off immediately upon a thief coming into the house, although not charged. "Why, how was that?" asked the friend. "Why," replied the farmer, "the thief carried it off, before I had time to charge it!"

Liszt, the great pianist, recently deceased, was as humorous as he was good-natured. On one occasion, when he was present at a private house where Chopin was asked to play, it was discovered that the pedals of the piano had been removed. "If Chopin will play," said Liszt, "I will be substitute for the pedals." Whereupon he laughingly crawled down and pulled the pedal wires with his hands.

For general improvement, a man should read whatever his immediate inclination prompts him to, though to be sure, if a man has a science to learn, he must regularly and resolutely advance. What we read with inclination makes a stronger impression. If we read without inclination, half the mind is employed in fixing the inclination, so there is but half to be employed on what we read.—*Dr. Johnson.*

The following story, the truthfulness of which is vouched for by an ear-witness, is told of a Mrs. Malaprop, residing in a city in the Midlands :—

A gentleman was discussing with this lady the difference between cut and pressed glass ; after giving his views as to the difference, he asked the lady for her opinion. "Well," she said, after a moment's consideration, "I have always supposed cut glass to be the *real thing*, and the pressed glass *only* the *genuine article!*"

Illumination by artificial electricity is by no means so novel as many persons suppose it to be. In the year 1819, a Professor Meinecke proposed to illuminate halls, houses, and streets, by the electric spark ; and expressed his strong conviction that it would one day replace all other illuminants. He arranged a series of exhausted glasses, containing metallic spangles, at certain distances from each other, and then directed a current of electricity through them. In this manner, he produced a constant light in his apartment equal to that of the moon ; and by filling his tubes with pure hydrogen gas, he expected to more than double their brilliancy.

THE NAMES OF PLANTS.

"The chestnuts spread their leafy palms in blessing on the air,
And from their minarets of bloom, call all the trees to share."

REV. HUGH MACMILLAN.

THE meanings of the English names of many plants have become obscured, and, in some cases, forgotten. The endeavour to trace out some of these has proved a pleasant study, and a few jottings from the notes made may be interesting to our readers.

The tree whose spreading leaves Oliver Wendell Holmes likens to palms of "holy men in prayer," derives its name from its native home, Castanea, in Thessaly; "Castanea-nut" having degenerated into the every-day "chest-nut."

A great many flowers bear names pointing to a religious origin; for instance, St. John's Wort, Aaron's Rod, Sweet Cicely, and Star of Bethlehem. The mention of St. John's Wort is a reminder that its perforated leaves and healing properties caused it to be dedicated to war. Did the knights of St. John, the heralds of our Ambulance Societies, give this useful plant its name in honour of their patron saint?

Relics of Romanism still linger in the names of plants dedicated to the Virgin; "Marybuds," for instance, now commonly known as Marigolds; "Our Lady of February," an old name for the Snowdrop; and such as Lady's Mantle, Lady's Fingers, Lady's Slipper, Lady's Smocks, Lady's Tresses, and Lady's Cushion, all of which were formerly, "Our Lady's Mantle, Fingers," etc. To these we may add Lady's Bedstraw, Bead-straw or Crosswort, the successive whorls of whose leaves, placed crosswise on the stem, were formerly used by country folk as rosaries, or strings of beads,—"bedes" being the old word for prayers.

The Holy Thorn of Glastonbury is another of these plants connected with the religious ideas of bygone times. Joseph of Arimathea, having arrived near Glastonbury, was wearied out, and sat on the hill-side to rest with his fellow-pilgrims. "Then," says the old chronicler, "St. Joseph stuck on the hill his staff, being a dry hawthorn stick, which grew, and constantly budded and blowed upon Christmas Day." The writer has in her possession, pieces of the Holy Thorn gathered in mid-winter in the neighbourhood of Glastonbury, where it still grows.

It may not be known to all, that the Bracken, or Brake Fern, so common on our moors and hills, though not bearing a name of historic origin, yet carries in its stem a fancied resemblance to King Charles in the oak, when escaping after the battle of Worcester. Take a tall Bracken stem, and pull it up as near the root as you can, cut a transverse section, and you will see the pith "forming a branched figure," which a lively imagination can turn to the hunted monarch in his leafy refuge.

Can any reader of—"A. 1."— inform the writer what connection there is between the Goosefoot (*Chenopodium Bonus-Henricus*) and the "Good King Henry," whose name it commonly bears? All attempts to trace the connection so far, have been fruitless.

Have you ever noticed how many of our flower names end with the syllable "wort"? This is an old Saxon word, meaning merely "herb," and when we see such names as Butterwort, Lungwort, Silverwort, etc., we know that they mean "the herb with leaves like butter," "the herb for the lungs," and that whose leaves are lined with silver. The Silverwort (*Potentilla anserina*), with its handsome, yellow, rose-like flowers, is also known as "Prince's Feather;" the long, drooping leaves being suggestive of the ostrich feathers that form the crest of the Prince of Wales.

One of the most interesting names is that of the Daisy. All agree in deriving it from "day's eye," but two theories for its origin are brought forward. Some say that the flower was so called from its habit of opening at dawn and closing at sunset; others, that it was the likeness between the little flower, with its golden disc and white ray, and the sun—the day's eye—as pictured by our forefathers, that gave the name. Whichever theory be correct, the Daisy is a universal favourite. Poets of all ages have sung its praises. Chaucer calls it "the eie of the daie;" Ben Jonson writes it "day's eye;" and Spencer speaks of "the little Daizie that at evening closes." Mrs. Browning calls them "golden-hearted daisies," Burns, the "wee, modest, crimson-tipped flower," and the Rev. H. Macmillan writes thus concerning them:—

"The grey-haired daisies, ever young, transfigure every field,
And to the old world-weary heart, the joy of childhood yield.
* * * *
Unnurtured by the care of man, they spring forth from the sod,
The free, glad offerings of the earth, the precious gifts of God."

D. P.

THRIFT AND CHARITY.

TWO gentlemen, engaged in procuring subscriptions for a local charity, when passing a fine large house, heard the gentleman who lived there, reproving his servants in the kitchen, for extravagance in throwing away the ends of candles and half-burned lamp-lighters.

"Well," said one of the collectors to the other, "it's not worth while to stop here; for a man who is so careful about the ends of his candles, will hardly give anything for the poor."

"It will do no harm to try," said the other.

They went in, and were agreeably surprised at receiving a very large subscription.

"Sir," said one of the collectors, "the amount of your subscription greatly surprises us; for when we heard you, a few moments ago, reproving your servants for not saving the ends of the candles, we thought it hardly worth while to stop."

"Ah, gentlemen," said he, "it is by the habit of carefulness in little things that I am able to give largely to all good objects."

LITERATURE FOR OUR GIRLS.

By JOHN RUSKIN.

[We make no apology for the following extract on this most vital subject from one whose words carry profound weight. They may be known,—they cannot possibly have received half the thoughtful attention which they justly claim. ED.]

IF there be any difference between a girl's education and a boy's, I should say that of the two, the girl should be earlier led, as her intellect ripens faster, into deep and various subjects; and that her range of literature should be not more, but less frivolous; calculated to add the qualities of patience and seriousness to her natural poignancy of thought and quickness of wit, and also to keep her in a lofty and pure element of thought.

I enter not now into any question of choice of books; only be sure that her books are not heaped up in her lap as they fall out of the package of the circulating library; wet with the last and lightest spray of the fountain of folly, or even of the fountain of wit; for, with respect to that sore temptation of novel reading, it is not the badness of a novel that we should dread, but its over-wrought interest. The weakest romance is not so stupefying as the lower forms of religious exciting literature; and the worst romance is not so corrupting as false history, or false political essays. But the best romance becomes dangerous, if, by its excitement, it renders the ordinary course of life uninteresting, and increases the morbid thirst for useless acquaintance with scenes in which we shall never be called upon to act. I speak, therefore, of good novels only; and our modern literature is particularly rich in types of such. Well read, indeed, these books have serious use, being nothing less than treatises on moral anatomy and chemistry, studies of human nature in the elements of it; but I attach little weight to this function; they are hardly ever read with earnestness enough to permit them to fulfil it. The sense to a healthy mind, of being strengthened or enervated by reading, is just as definite and unmistakable as the sense to a healthy body, of being in fresh or foul air; and no more arrogance is involved in forbidding the reading of an unwholesome book, than in a physician's ordering the windows to be opened in a sick-room. There is no question whatever concerning these matters with any person who honestly desires to be informed about them; the real arrogance is only in expressing judgments, either of books or of anything else, respecting which we have taken no trouble to be informed. Life being very short, and the quiet hours of it few, we ought to waste none of them in reading valueless books. I would urge upon every young woman to obtain as soon as she can, by the severest economy, a restricted, serviceable, and steadily—however slowly—increasing series of books for use through life, making her little library, of all the furniture in her room, the most studied and decorative piece; every volume having its assigned place, like a little statue, in its own niche.

"Carefully extracting from his waistcoat a little bag——"

CHAPTER V.

HOPING AND WAITING.

AND now May had come, and suddenly the sun grew hot; the snow in three days vanished from the valley; anemones starred the grass, and the early steamers began to run. Life had awoke from its long sleep; and unknown almost, certainly unbidden, hope then came back to Mitta's heart. She even went day by day down to the landing station, and watched the steamer come in—it was an old habit.

One evening as she stood there, she heard the cry, "Ammitta Loen," and looked hastily over the passengers; there were not many, but he whom she sought was not there; yet certainly she thought she had heard her own name, and in well-remembered tones. She was turning disappointed away, when she felt an arm thrown round her waist, and a kiss on her forehead.

"Lars!" she cried, and then looked swiftly back, thinking to see his brother following him; but to her intense disappointment, Eric was not there.

"Yes, Lars! Lars strong and well, my Mitta. I knew thou wouldst be glad to see me."

"Yes, Lars, so I am; you look quite strong, and can walk as well as before you fell with the hay. Agdur and Kirstin will indeed be glad to see you. We thought you or Eric would be coming soon. Where is he, Lars?"

"He has gone back to America; perhaps, Mitta, thou wilt never see him again in Gudvangen."

"No?"

"Not if what I think comes true, but I will talk to you of that another day."

Poor Ammitta Loen! The sunshine turned pale; she heard no longer the clang of the cow-bells,

or the song of the birds; and the rushing of the river over its rocky bed sounded far away. Yet she walked on by Lars' side homewards, and answered all his questions in her usual quiet, low voice. Little Karen was the first to see them, and ran shouting to her grandmother. By the time the two reached the hamlet, all the neighbours were crowding out to meet Lars, shaking his hand and embracing him, and Aunt Kirstin weeping aloud for joy.

In the confusion, Mitta slipped away; and as she could not be alone in the cottage, she ran out behind, and unobserved climbed the mountain side. Once safely hidden behind a great grey rock, she burst into tears and wept bitterly. Eric never coming back to Gudvangen! That was all she could think of. The blow was too heavy, now it had really fallen, to permit hope to raise her head.

For some time Mitta sat crushed, and then she began to think. She told herself she had expected this, or something like it, and that she would not blame her old playmate. Surely he had a right to marry whom he would, and to stay in England if he pleased. Only she would like to hear more of him. This at least Lars could tell her when they were alone; she would ask him where Eric was going to live, whom he was going to marry, and many other questions. The thought of this conversation somewhat consoled her; but she had to wait so long for her opportunity, that it seemed as though it would never come, and her anxiety and curiosity grew terrible to bear. She constantly prayed her little prayer; yet she never, it appeared, could meet Lars alone, or for a sufficiently long time. His return to Gudvangen so straight and well was a marvel to the parish. The neighbours came bringing him presents, and inviting him to their houses. Hans Hansen made it an excuse to come down the pass the very next day with a cheese and a string of sausages; he brought, too, a tiny cask of brandivin, which pleased Agdur well.

From one farm to another Lars went for many days, being feasted and made much of at all. And the girls and young men went too, to give him a home welcome and to see each other. Lars felt himself a great man, and spoke of his experiences, and of all he had seen—of the riches and grandeur of England—with the air of a great traveller. He missed out all the sights of misery and want, such as he had never beheld in Norway, and also all the pain and weariness he had suffered, and gave the simple mountain folk the impression that in such a hospital as he, Lars, had been in, everything was pleasant, and prosperity awaited you with a welcome the moment you left its doors. Many a mother who had a sick child at home, sighed and longed to be in England.

To some of these gatherings, Ammitta Loen was obliged to go, though the neighbours laughed at the sad face she brought, and said she must have seen the Twinde maiden. She used to listen to all Lars' talk, hoping to hear his brother's name; but it seldom fell from his lips, for he disliked the remembrance of his terrible journey, and tried to forget it; in fact, he was selfish. So for many days the girl's heart ached hungrily. Lars, too, began to be dissatisfied. The exuberance of his spirits was toning down, and he began to realise in a dim kind of way, that he was farther off from Mitta than he had supposed himself to be; he therefore determined to speak to her at once. The doctor had promised to keep his place open for him for a month, but not longer, and half the time was already gone.

The English had come during the last week to the station in large numbers, and the women were busy washing for them, or helping at the two Inns. The lads and men were down there all day long, with their ponies and carioles and stolkjerres; and for hours the hamlet was left to the children and old women. Mitta was busy amongst the potatoes in her father's patch, and Lars came by and politely offered to help her. Both had at length found their opportunity. Mitta was the first to speak, for she was growing desperate. "Lars, when you first came back, you said Eric was coming home no more. Why is that?"

"No, my Mitta; I said if what happened that I wished, you would never see him in Gudvangen again."

"Well," cried Mitta sharply, "that means the same."

"Not as I mean it."

"Is he going to live in England, then?"

"I know not; but I am, and I hope you also."

Ammitta stared in surprise, but her mind was too full of one subject to give more than a passing thought to another.

"Did Eric send no word to me?" she asked at length in a low voice, turning away her head.

"No," cried Lars eagerly, seeing at last his chance; "but he sent you a minde, and he said I was to give it to you from him."

Ammitta turned swiftly; the spade fell at her feet, and her hands trembled, her cheeks glowed, and her eyes burned. Had he really sent her the golden ring with the clasped hands? Was it, after all, for her?

Lars was carefully extracting from the inner pocket of his waistcoat a little wash-leather bag. "He did not buy you it himself, but he gave me the money, and said, 'Buy a minde for Mitta, and give her it from me.'" Then it was not the golden ring! Her heart sank down with disappointment, and she silently held out her hand. Lars placed in it a pretty silver watch with a silver chain attached.

Mitta gazed at it in astonishment; never had any Gudvangen girl had such a minde sent her before. A remembrance, indeed! Who could forget, when that little voice was for ever ticking, "I sent it"? She pressed it passionately to her lips. "It lives, it speaks," she cried. Lars smiled. "In England these are very common." And then he went on talking; but Mitta heard him not, she was utterly absorbed in her watch. She put the chain round her neck, and restored the watch and key to the little leather bag, and then hid it within the bosom of her bodice. She would not hide the chain; all the world should see it lying shining on her white chemise; but the watch, its little voice should speak to her heart alone. She picked up her spade, and went on with her work, her face shining with happiness. Eric must love her to send *this!* Lars touched her arm. "Then, my Mitta, you agree; I see it in thy face."

"Agree to what, Lars?"

"Well," cried Lars, pettishly, "hast thou listened? Have I not been telling you that we must be married at once and go to England without delay, or I shall lose my place with the good doctor?"

"And who are you going to marry, Lars?"

"Now, Mitta, you are laughing at me! Who else but you, whom I have loved so long, and who loves me?"

This was indeed to be a morning of surprises to Ammitta Loen. She leaned on her spade, and stared in blank astonishment.

"I love you, Lars! No, I do not love you."

"Oh, Mitta, do not say so. Think how you used to sit by me for hours last year; how you used to talk to me, to play to me on your horn. You loved me then, when I was so ill, so you must do now, when I am well and strong, and going to be a rich man. You *must* love me; I have been sure of it so long."

"You were sure without reason, Lars."

"But think of those days when I was ill; you loved me—yes, you did."

"I was sorry for you," the girl replied in her soft, low voice; and then she burst into tears and ran away home.

Lars was very grieved, and yet more angry. He had been so sure, so certain he should take Ammitta back to England as his wife, that he felt now injured and unsettled by her refusal to meet his wishes. Yes, Lars was very angry; and the more he thought on Mitta's refusal, the more angry and less grieved he became. He told himself all *his* plans were settled,—and then he asked himself, what right had *she* to upset them? He had loved her right well, and here she dared to tell him, that all the time she had only pitied him. Was he not worthy of love? Her pity had been a long insult. Another day he would assure himself he had acted nobly in going so far, and suffering so much to get cured. For had he not done it mostly for her sake? and she ought to be grateful. He almost wished he had never gone. No! hold! Not so. He was glad he was well and strong. Plenty of the girls about would be glad to have him now, if not Ammitta. He would let her see that others thought more highly of him.

And so, for the following week, he paid attention first to one girl, and then to another; but Mitta never seemed to notice it at all. When she met him, she spoke kindly to him, and had a very happy face. The dimples had come back to her cheeks, and her merry laugh could be heard again, as she chased her brothers on their ponies up the pass. Little Karen again begged rides on her back, and Lisbet Loen said to Pehr,—

"Our Mitta is herself again; I feared she was going off in the green sickness, she has become so silent and weary all the winter. The summer air has done her good."

"The good Lord keep her so," said old Ammitta. "She goes to the sæter with Margrit Jens-datter on Monday, and that is ever the best place for a maid. It is not well for them to have too much pleasuring."

So Mitta was very busy: the milk pails and churns, the iron pot, the cheese mould, the frying pan, and coffee pot, all had to be packed. Salt, bread, bacon, and the bed and clothes, all had to be put in bags, and slung on the horse; and then Pehr, Margrit, and Mitta set forth; the girls blowing their horns, and carrying some salt in their pouches to tempt their cows on, and the animals following in a wavering string, tinkling their bells, and cropping the grass by the wayside.

That last morning, Lars came to Mitta again, and begged her to change her mind, and come with him to England instead. He spoke to her of the crowded streets and the beautiful shops; but she shook her head and smiled, as she told him she loved the solitary mountain better, and that she could not leave Norway. At length he ceased to urge her; he saw her heart was not in his hand, and so he kissed her, neighbour fashion, and left her.

After all, Lars loved himself better than any one else in the world, and such natures soon find consolation for any loss. It is those who live out of self that feel most keenly and enduringly. So Lars left Gudvangen. Shortly after, Mitta departed to the sæter, and on the whole, in anything but depressed spirits.

The minde he had brought Mitta from Eric had caused quite a storm of wonder in the parish, and several maidens told Lars they would be well pleased to have a like one from himself when he returned to England. "We should never forget you *then*," they said. But Lars said they must remember him without such a costly "minde" as Ammitta's watch.

Towards evening, there glowed a saffron tinge in the sky. Clouds hung still and heavy over the city ; a thunderstorm was brewing.

All the afternoon, there lay on the corner bed a man moaning, and partly unconscious : he grew worse as night came on. The storm broke towards midnight, and they put a screen round his bed, the lightning flashes were so vivid ; but neither they nor the crashes of thunder disturbed him.

"I think, sir, he will go towards morning," said the nurse to the house-surgeon, as he made his last visit for the night.

"Very likely," answered the doctor, looking at Eric ; "but you can call me if necessary."

The nurse sat down behind the screen, and wall, he opened his eyes for the first time, and whispered in English, "It is too hard, I cannot do it." Then he again became unconscious, and the dull moaning went on.

At ten o'clock the two head-surgeons came round the ward, attended by the house-surgeon and some students.

"The dock accident is still alive ; he must be a very strong man," remarked the house-surgeon.

"Oh, the man you mentioned as brought in yesterday ?"

"Yes, the same, sir."

The screen was moved away, and the gentlemen stood closely around the bed.

Mr. —— started. "I know this man; he

"Just then, they saw two figures approach across the plain."

Mitta was glad to get away from all the gossip. Her watch was a beloved companion, and she loved the tick, tick, of its little voice better than any music, for it spoke to her of Eric, and she would, when alone, draw it from her bosom, and listen to its voice. She was at peace, a fuller peace than she had ever known before. God had been so good as to let her know Eric loved her. She would wait ; it might be he would come back. Anyhow, God knew best. He loved her, and she would wait. His will was best.

CHAPTER VI.

FLOTSAM.

It was very hot in the accident ward of the Stanley Hospital. The sunshine was reflected on the walls ; there was not a breath of air coming through the open windows. watched the patient. He was a sailor brought up from the dock on a stretcher. His foot had slipped as they were "tying-in ;" he had fallen a great height, and only just missed going over the side into the Mersey. As it was, he had broken his arm and fractured his skull.

The dull moaning went on all night ; but when the morning broke, the sailor was still alive. The nurse was struck with his face ; he was young, he could hardly be five-and-twenty ; and yet his brow was lined by suffering, but not, as she well knew, with pain from the accident, of which he was probably unconscious. Whatever that sorrow had been which had marked his past life, the remembrance of it troubled him now. A few times he muttered some words of entreaty in a foreign tongue, and just as the early sun shone in, and touched the opposite is a Norwegian, the brother of that young man with the bent knee and that obstinate Cole's fracture, Mr. ——"

"Ah ! I remember now, sir, seeing him. I thought I had done so somewhere. Yes, he is a fine young fellow ; his name is Eric Olsson."

At the mention of his own name, the patient opened his eyes ; a flicker of recognition passed over them as he saw the doctor, and then they closed again. After that day, the doctor took special interest in the corner-bed patient. It seemed impossible that he should recover at first ; and even when he began slowly to mend, again and again he had feverish attacks which retarded his recovery, and threatened his life. Considering his great strength, his fine constitution, and that he had to some degree recovered from an accident which would have killed most men

on the spot, these sudden relapses rather puzzled his friend, and set him thinking.

Eric was never impatient, and he even looked happy, as the chaplain read the Bible to him ; and when he spoke to the sailor of death, and bid him not to be afraid, for if it should come Christ would be with him, the Norwegian answered with a little smile,—

"I fear it not ; I fear rather to get better. Yes, I fear it ; He will be with me, I would rather say, 'Farewell,' and go to Him."

"That hopelessness, that absence of even a desire to recover is not natural, and is keeping him back," thought the doctor. "The chaplain does not seem to have found out the reason ; I wonder if I can ; I know his home."

So one day, when the sailor was stronger than usual, his friend seated himself by his bed, and began to talk to him of his beautiful Norway ; and seeing the sailor's eye brighten, he spoke of the Nærödal, and then of Gudvangen. Instantly the smile faded, and the patient's brow contracted with the lines of pain which always preceded a relapse ; so the doctor changed the subject, and spoke of Lars. He told Eric what a capital cure his was. "And," said the kind doctor, "he owes it all to you ; you have probably been the means of saving his life. You certainly have saved him from being a useless, suffering cripple."

The pain passed out of Eric's face, and a look of great peace came there.

"I hope you will soon do us as much credit as he does."

"I wish to thank you much, sir," said Eric, humbly, "but know not how."

"Why, by getting well, man."

"I do not wish that, sir."

"Why not?"

"I cannot tell, sir ; but it would be best if it ended here—best for me a great deal, and for them."

"You should not say so ; life is a good thing."

"I used to think so, sir ; but I have had enough. I want to die—please God," he added reverently.

The doctor left him, and found next day that Eric had passed a restless night. The day following he tried another plan.

"Lars will be back next week, and he shall come and see you, Olsson."

The sailor started.

"Has he been all the summer in Norway?"

"No ; he went in May, but he returned and remained with me until the very day of your accident. It is strange that it should so happen ; but he went then with my partner to Scotland for the month of September. Mr. —— has some fishing there, and as Lars is useful on a river, I lent him to him for six weeks."

"Is his wife here?" asked Eric, turning away his head.

"Certainly not ; he has no wife. He went back to Gudvangen to exhibit himself, and I think try and induce some young lady of his acquaintance to return with him. I told him it was a foolish idea. However, I was saved any further trouble, for she would not consent."

The sailor feebly raised his right hand, and covered his eyes ; the doctor went smiling away.

"A noble fellow ; I fancy we shall have no more relapse."

"So!" Eric thought, "He has given me all, this life as well as the other. All, all are His ;" and in this great peace he rested and grew well.

It was the first week in October. As far as the eye could see, stretched a vast undulating tableland. To the north were seen the crests of high mountains covered with snow ; far away to the south were distant valleys, indistinct and dim, looking like mere scratches. Near by, the ground was covered with thin grass, moss, and heather plants. The plain was interstretched with streams of pure water, generally rushing through a mossy, many-coloured bed. The sæter house stood here, only a little stone hut. The two girls had finished their day's work, and at the end of the week Pehr and the boys would come up, and the cattle would be taken down to Gudvangen. The goods and the summer's produce of cheese and butter would be conveyed home also, and the sæter would be closed for the winter. Margrit and Ammitta now could rest ; the former was embroidering with beads, cloth for the front of a Sunday bodice, the latter knitting thick winter gloves. Just then, in a pause of their work, they saw two figures approach across the plain.

In that boundless solitude, the least movement attracts attention, and to eyes accustomed to its vast distances, it is very easy to tell if the distant object is a mounted traveller or one who comes on foot. Presently, as they approached nearer, Ammitta exclaimed, in a tone of amazement, "They are two men walking."

"They are travellers, then, and will doubtless stay the night, Mitta ; what can we give them to eat?"

"Nothing new, I fear, little Margrit ; there is not much bacon left, though we have plenty of cheese and butter, as thou well knowest, seeing that between us we have made it all."

"Yes," answered the other girl, laughing, "and for the same reason I know there is fladbrod ; besides, there is some coffee and much cream."

"And in the big stream the net is set, and some trout may be in it ; but you will not think it worth while to go so far, Margrit ; for if one of them is Jan Hemsen, he has been here more than once before."

Margrit blushed violently. "Nevertheless," she replied, "I will go and see if any trout are taken. It is a shame to waste good food."

The girls went smiling into their hut, and put on their newly-embroidered bodices and gaily-coloured stockings. Then Margrit ran out, a basket in her hand, and Ammitta went to the door to watch her. She saw one of the men, who was rapidly nearing the sæter, quit his companion and cross the upland at an angle to meet Margrit, and then to accompany her in the direction of the river. But who could the other stranger be? *He* was coming towards the hut. Mitta's heart gave a great bound, and then stood still. Yes! it was he, thin, worn, changed, but her own Eric at last!

In another moment both her hands were clasped in his, and he was looking into her eyes. He had intended to say many words ; but that one look told him much. He only said, "Mitta, my little one, dost thou love me?" And she, throwing her arms about his neck, cried, "Thou knowest it, Eric."

Ah! yes, so it was. Rooted by the storm where only faith can rest and be at peace, having found their Redeemer when they were in bondage, now in the freedom and sunshine they ever grow closer together, knowing that no sorrow can take from them the joy He gives, and that death itself is but a pause—not a discord—in the eternal melody.

THE END

LIVELY TALKS.

No. I.

THE YOUNG MAN AND HIS AMUSEMENTS.

By M. Butler Gerds.

WHAT an old-fashioned saying—"May the evening's amusement bear the morning's reflection!" But it is as much needed now-a-days, as in the time when George the Third was king, and the true Englishman, proud of his birthright and his loyalty, drank the toast to king and country with all the honours, and was generally found, in the chill hours of the early morning, lying helpless under the table! But then, you say, that was in the time of the "three-bottle men"—temperance is the fashion to-day, and so the exhortation is not so fit.

Is temperance *in all things* the fashion? Not a bit of it. We have only to ask some young men—"How do you spend your evenings? What do you do with your spare time?" and we shall soon see something the reverse of temperance and moderation. Do not think it an intrusion on your manliness that, whoever or whatever you are—whether you are engaged in business or in study ; whether you reside in city or suburb, we ask you the plain question : "Where and how do you spend your evenings?"

"You must have some sort of amusement," you naturally say ; but you say it self-excusingly, and as if the quality were dubious. Of course you must ; but that question being settled—*Where do you go for it?*

To the *theatre*. To the *bodega*, or wine-shop. To the *card-table*. To the *gambling-house*. To the trashy, flashy *music-hall*. To—well, God knows *where!* Oh, may your mother be spared the knowledge that the son of her love has come to *this*, what in her purity she cannot dream of, nor even understand. But we will look, one by one, at the sources of your amusement.

The *Theatre*. Now, honestly, did you ever learn anything there that has given you a desire to live a pure life, and that has helped you to live it? The *Bodega*. Did you ever find yourself healthier, your mind clearer and stronger, your heart the better, for a night spent in the wine-shop? The *Card-table*. Have you ever experienced any twinges of conscience that your laundress, perhaps your landlady, maybe your mother, has had to know the want of the money you have lost there? Or has it come with the morning's reflection, that this sort of amusement costs self-respect too dear, let alone the temptation it is to you to use your employer's cash, and the hole it makes in the quarter's salary or the week's wages? This is putting it on the lowest platform. The *Gambling-hell*. Has this ever left an ugly scar in your memory the next morning? Have you not sometimes felt, after extra losses, that after all, the other fellows now and then put on the wrong "card," or do a bit of dirty "jobbing," and why should not *you?* *You*, who were once so upright, and it has come to this!

The *Music-hall*, the place where they sing and say things, which at first made you look round, to see that nobody you really cared for was there ; but by-and-by you got used to it, and you laughed with the rest ; and what with the smoke and the drink lulling your conscience and muddling your brain, you got to like it, and you spend most of your evenings there now. Why "NOW?" Have not added years brought added

strength? Fresh resource? Nobler aspirations? And you confess, as so many of us have had to confess, that they have not. You have gradually grown away from home and home influences, and you perhaps regard your mother as old-fashioned, and your sisters as "slow" or prudish. You are seldom in your place in the house of God on Sunday, and you are frequently late at the office or shop in the morning; while the Bible that was, maybe, your mother's gift, is never read *now*. The long walks you used to take, and out of which you were growing quite a naturalist, with your bits of botany or entomology; the museum or art gallery you visited with such delight and profit; the public library, the garden, know you no more. And you are sorry as you think about the wasted time; and you see that sturdy fellow, Jack Robinson, holding his head so much higher than yours in the world, because he is so downright in his intention to make life worth living, and to climb to the top of the tree, if he can.

But cheer up! Right about face! and you will see that, knowing your temptations and besetments, we want to show you a way out of them. We know quite well that when your day's work is done, the devil is rampant; he beckons you to the recreation your nature seeks and needs, and you do not know that it is *he* who calls you, and you go. Where? Ah, you have learnt to your cost. You have found that it is possible to *be* innocent, but impossible to *become* so; that first steps in sin lead down to the bad; and you are sick of self and sin—tired of being continually *amused*, and weary of the smiles and speeches of the wanton.

Now is the time to resolve that you will never, henceforth, spend your evenings in such a way as to hinder your meeting God in prayer before you retire at night, or facing your mother's anxious, conscience-smiting eyes in the morning. "How *shall* I spend my evenings?" you ask. Well, be very chary of young men's Clubs and Debating Societies, which *often* draw away from home, and as often are but seminaries of Satan, initiating their members into unprofitable pursuits, ensnaring them to atheistic principles, and making them familiar with the taste of forbidden fruit.

As to books, no one should spend his spare hours with a book that rouses or prompts the lower passions of his nature, or that teaches doctrine contrary to the beauty of holiness, the strength of purity, the truth and power of love, and the folly of sin. "He that has light thoughts of sin can never have right thoughts of God," it has been said; and you know of Sir Galahad:—

> "My strength is as the strength of ten,
> Because my heart is pure."

The Great Author writes: "Keep thy heart with all diligence, for out of it are the issues of life." Keep the *heart*—the citadel of your being, the spring of all your life—keep *that* strong, physically and morally, and body and brain will be all right, as a natural consequence.

Join a Cricket Club. Many of the doubts and temptations that have clamoured for a place in your life during the pauses at the desk, behind the counter, or at the bench, will be bowled or batted away in the healthy atmosphere of the cricket-field.

If you can, get a ticket for some good library. Always set aside a sum from your earnings for good books; and good books now are as cheap as, often cheaper than, bad ones. Let your choice of authors lean to those who will help you to an acquisition of knowledge, rather than to light amusement. A mind that craves continually to be amused, must be both small and weak, and is not likely to grow. Seek the refined and refining companionship of your sister's friends. A young man is to be pitied who has no women friends. A good woman, or women, in your life, will act as a stone wall between you and the battering-ram of temptation from within and without. Choose, then, a good, pure girl, with whom you may spend some hours of pleasure and real profit. She will not discourage an early engagement, if you are strong and healthy, and willing to make a home for her some day. And you, supposing you have no home but your lodgings, will be saved from yourself, and perhaps from much sin, by this means.

Do not forget the Young Men's Christian Association in your neighbourhood. Those splendid Institutions have saved thousands of fellows like yourself from loneliness, and moral and physical shipwreck. Call upon the Secretary; he is sure to welcome you, and to introduce you to those of your own age and position. You will speedily find that you have fallen among friends, whose robust and cheery society, and whose warm welcome plainly say: "Come thou with us, and we will do thee good."

Get, as soon as you can, into the society of a Christian Church. You have no idea what a help you will derive from the firm grip of your Pastor's or Bible-class teacher's hand, at the close of a happy Sunday. It will send you about your work on Monday with the feeling that Christianity is not only *safe*, but *happy*. Christ meant our joy to be *full*, as He Himself said, and the Christian man or woman has a source of joy and strength to resist temptation, that the world cannot know or touch.

Then there are classes for evening study. You ought to know something of Physiology—a study full of the deepest interest to you as a man, since "the proper study of mankind is man," and it will help you to an appreciation of, and desire to retain, your health. Music, French, German, Greek (New Testament), Natural History, Chemistry, Literature, History, Drawing, Algebra—these, and many other bracing studies, will open up a new field of thought for you, and lead you out into nobler paths; and there ought to be always something of the kind going on at the Y.M.C.A.

But, above all, remember that God has made you in His own image; and that God-likeness is exemplified in purity, truth, love, obedience, faith, and hope.

Lastly, do not forget that, just as the figures which you set down every day in your employer's ledger, will at last represent to him his financial *status*, so will the results of your evenings appear in your face and character; as sunshine, and a beautiful mosaic, where all is in rich harmony—or as bitterness, and useless, contemptible rubble. You are your own architect; which is it to be? And the answer seems to come to us: "God helping me, I will build for a blessed eternity!"

The True Christian is a Christian in everything. Sundays and Saturdays it is all the same to him; the same girdle fastens his working clothes as his Sunday garments; his actions at the counter dovetail into his utterances at the prayer-meetings.

Belief.—A man without a belief is like a ship without a rudder, which lies like a log in the trough of the sea, the sport of every wind, and tossed to and fro by every wave.

WON BY WORKING

OR,

HIS FATHER'S GOLD.

By GEORGINA GOLLOCK,
Author of "Ebb and Flow," etc.

CHAPTER III.

ARCHITECT OR MAN.

OF course the death of old Catharine kept Gerald a day or two longer on the spot. His evidence was needed at the inquest, and though he longed to run up to town to see Nettie, his finances did not warrant such an indulgence. The inquest was as futile as inquests mostly are, and a verdict in accordance with the lack of evidence was returned.

At the back of the court-house, a tall, thin-faced man had listened intently to every word the Coroner had said. Abner Holt always had a keen eye to chances, and he felt convinced that neither sleep-walking nor sentiment had led old Catharine to the quarry edge. He felt sure that some prospect of definite golden gain had been in view, and what she had missed he might yet acquire. So when Gerald, sick at heart, strolled out into the fresh, bracing air, Abner followed him, and laid a dirty, claw-like hand on the young man's arm.

"Well, my man?" said Gerald, almost harshly, for he was in no mood for conversation just then.

"You'll want some one to have an eye to the old place, sir. I'm no fool; I don't mind ghosts, and I'll ask no wages. A room in the house yonder, and a bite of grass for my goat,—Abner Holt wants no more, except what he earns by an odd job now and again."

Gerald looked closely at the man. He was gaunt, unshaven, repulsive, not a caretaker commended by his looks, but the young man felt a sort of sympathy with such social Ishmaelites this morning.

"All right," said Gerald; "keep tramps off the place, and obey any orders I send you. I'll run down sometimes when you don't expect me, so you'd better keep straight."

Thus Abner Holt began to keep watch and ward over the miser's house, and a busy time he had at first. The village boys hung round the scene of old Catharine's death. A sort of mysterious charm drew them thither, almost against their wills, and they stood in knots of three and four, peering guardedly over the fatal brink. Abner dispersed them once or twice, but after one awesome night, there was no further need for him to do so. The boys had a bonfire, and when the last embers had burned low, an adventurous spirit suggested a moonlight visit to the quarry, "to see if old Catharine was about." And *old Catharine was.* Their visit was an unexpected success. They approached the quarry from below, with outward laughter but inward fear. On the top of the cliff a shadowy white figure shone out for an instant, emitting a ghostly light; then, as it vanished, a low moaning cry echoed amongst the rocks, and was followed by a dull, heavy thud, as of a soft body falling from a height. With blanched faces the boys told their tale, and henceforth the place was deserted. Stray passers-by arrived in the village from time to time, telling with trembling voices of the spectre they had seen; so the ghost was recognised as sole possessor of the quarry, and became a gruesome threat for naughty urchins in many a village home.

Meanwhile, Gerald and Nettie had to face the problem of life. It was just possible, if he gave up all his ambition, all his lofty ideals, all his dreams of fame, that he might get a situation which would enable him to marry within six months. But so much was involved in that giving up. The man's heart was in his work, and he felt that to him God had given a power, a talent, which it behoved him to use. Where others gave labour, he could give thought,—would it not be unworthy degradation of his nobler nature to stoop to humble, drudging work, because it meant money, love, and home? It is a problem many have to face, and at first it baffled Gerald. Nettie saw clearly enough as it seemed to her.

"I could not love thee, dear, so much,
Loved I not honour more,"

she quoted, looking proudly into her lover's eyes: "Gerald, I will not clog your footsteps. God has given you a great talent; you must not degrade it from love for me. No, we will wait. Stay on where you are; master your art. I could not bear to see you harassed by uncongenial work."

Ah, Nettie! Nettie! unselfish as a woman, but as shortsighted too! You never saw that it was Gerald's heart, nature, character, that needed to be strengthened; while you thought of Gerald Burt the architect, God thought of Gerald Burt the man.

Of course Gerald loved you all the more for your unselfish ambition for him, but the problem held another and better solution than yours.

"Fine evening," said a thick-set, cheery-faced man, brushing against Gerald in the entrance to the architect's office one day. "Governor in?"

"I believe so," said Gerald; "but he is specially engaged just now. Can I take a message?"

"Well, I'm up a tree. Business got too big for me; can't be in two places at once. Want a good foreman, if I can get him. I'm not a company man myself, and don't take somehow in the select villa business. Too many ladies come poking round, asking the rent. I want a well-set-up, stylish sort of fellow; plenty of push and energy, you know; able to keep the men at work, and have a sharp eye to my profits, but with more lacquer and polish outside than plain 'John Smith, Builder and Contractor,' can show. Think he knows such a fellow?" And plain John Smith jerked his thumb in the direction of the architect's private office.

"I think he does," said Gerald slowly.

"Good pay for a good man, and I'll treat him as my equal," said the builder. "Call again in case the governor's got a chap to suit."

Frankly Gerald told his employer how matters stood with him. The great man looked up at first abstractedly from his plans and estimates, but soon the human interest kindled in his face, and when Gerald ended his story, the two men were standing hand in hand.

"Look here," said the successful architect, "you take that berth. I had five years of hard struggle in my boyhood, and it taught me to bear success. A talent—and you have one—cannot be wasted in honest work. I believe God means you to put off your broadcloth, and take your place as a working man. Obey Him; and when He wants you to be an architect, you may be sure that He will open the way."

That afternoon, with never a word to Nettie, Gerald made his engagement with "plain John Smith."

CHAPTER IV.

JOHN SMITH'S FOREMAN.

MRS. GERALD BURT was a fresh and restful sight for a busy man who came home tired at night; and Gerald needed a rest. The building business was trying, to a man who felt as real pain in working up plans for cockney architecture, as a musician feels in listening to a fiddle out of tune. Plain John Smith was as good as his word, and treated Gerald as his equal. He little knew how Gerald hated himself for the pride that made it almost torture to be so treated. When John Smith spoke of "My foreman here, friend of mine, you know," Gerald felt ready to deny the charge; but he knew how kindly the patronage was meant, and he struggled hard to hide his distaste. As to Nettie, she really took John Smith into her heart, and treated the vulgar, kind-hearted little man to such bewitching smiles one day when he came to the house, that he told Gerald his wife was "a little beauty," and he "a lucky dog."

Nettie watched her husband with wise and wifely eyes. In her heart of hearts she thought that his solution of the problem, though it had differed from her own, did him more honour than if he had drawn out plans for a second St. Paul's; but she saw how real the daily struggle was, though with a woman's quick sympathy, she noted that Gerald preferred to be left unpitied as to his daily life.

How the new work was transforming the man! No time for ambitious dreams in the pressure of each day's business; yet Gerald was conscious that his talent was not lost—not dead, but sleeping, in the healthy slumber that knows a glad awakening by-and-bye. He learned many of the secrets of life in his work amongst the men; his sympathies were deepened and quickened, and his intellect became capable of far grander and higher work than before, through the discipline which expanded his moral powers.

The builder's men almost worshipped him. At first they looked on him as a "fine gentleman," and rather resented his polished manner and courteous ways; but by degrees they found out—as British workmen always do—the real nature of the man. Gerald kept them close to work: not five minutes was wasted, no "jerrying" was allowed; and a badly done job or forgotten order brought down a rebuke so swift and stern as not lightly to be forgotten. But the men knew that he did his own work well, and had a certain dim perception of what it cost him. They saw that he asked them to do nothing which he did not do himself. So one day, in the dinner hour, when Gerald stood up amongst them, and spoke a few manly words about the curse of drink, the men knew that he had his own pledge card in his pocket, even before he held it up for them to see. They followed his example readily enough, and from point to point Gerald led them on, till the living power of Christ was felt in many a heart, and more than one man who had been going down hill, set his face upward, towards God and heaven.

Gerald felt none the less a gentleman because he was "the equal" of plain John Smith, and Nettie, though her one servant was young and inexperienced, managed to keep the tiny house, and all its appointments, as dainty and fresh as could be.

The builder's business throve. Here and there he found deserted lots of land for sale, on which his enterprising eye, in anticipation, beheld rows of neat villa houses rising, "to be let." He was a keen-witted man, and his investments turned out well. He had neither kith nor kin, and he took a wondrous fancy to Nettie Burt. When Gerald went off to visit some distant "sites," John Smith would drop in to tea, and many a laugh had Gerald at Nettie's quaint mimicry of the builder's uncouth ways.

But John Smith had an eye to business in it all. "Dull work leaving money to hospitals, or folk you don't know. Better get the thing straight. If Burt likes to sign a contract with me now, I'll go halves in profits, and leave his wife my half when I die."

Burt would not "go halves." It was one thing to wait till the way opened for him to pursue his art, it was quite another for him to pledge himself to renounce it for a lifetime, and to take the builder's gold.

"I'm thankful to have my work, sir," he said; "but I tell you the honest truth, I only mean to stick to it till I see my way to become an architect without starving my wife and my child," for Gerald Burt had now a blue-eyed baby Gerald in his home.

John Smith was angry at the refusal at first, but by-and-bye he settled down into the old friendly ways, and seemed to forget the uncertainty of his foreman's plans.

"Burt," said he one day, "do you know ———?" and he named the pretty rural spot where Gerald's old home lay. "New railway runs close by; want to pick up sites."

"I believe I could supply you with the best in the place, sir," said Gerald. "I have a bit of land not good for much, but it lies high, has a south aspect and good shelter."

"Sounds likely," said the builder. "Run down with me to-morrow?"

"With pleasure," said the young man; "you shall have the place at your own valuation, ghost and all. Only, if you come across my father's gold, I must claim it."

"Right, man, right. Hour of trains?"

"One goes at 9 a.m.; will that suit?"

"Quite. Burt,"—it was seldom the builder made a joke—"Burt, tell Mrs. Nettie to give you a bag, in case we bring back that gold."

PART I.

EXPLANATORY AND HISTORICAL.

THE miracles of unenlightened and superstitious ages are the every-day commonplace events of our time, and but too many are apt to receive them as they do other familiar things of earth, air, and sky, unthinkingly, unfeelingly, without either reverential wonder or inquiring thought.

Only the studious and the curious can realise the progressing fulfilment of that glorious promise which tells us, that "there is nothing hidden that shall not be known." As, one by one, new births dawn upon them, how strangely *great* men are, and yet how *small*. We are dwarfed into almost unrealisable insignificance by the very gifts which magnify our consequence most grandly. Our pride and self-respect increase gigantically as we are permitted to draw near, nearer, and yet nearer to the Great Giver, Whose gifts demonstrate none the less our own utter unworthiness and insignificance!

Take, for instance, sunlight. To the ancients it was something beneficent and beautiful, but impenetrably mysterious. They knew it gave the leaves and flowers, the clouds and skies, their glorious colours; that as a source of illumination it gave them vision; as a source of heat in the summer, it ripened the fruit of the earth to supply them with food; loving them, benefitting them, delighting no one knew how or why. Full of strange wonderings and reverential gratitude, they saw it come and go with the rising and descending sun, which became, therefore, the object of their love and worship, their god; the greatest of many gods, originated in like way.

The tiniest beam of sunlight, piercing some very small circular aperture, may be analytically separated into its component parts if it enters a darkened chamber. Hence we have what the learned call *dioptrics*, a term of Greek origin, meaning refraction or bending. It is so applied because each ray, or part of that beam, bends at an angle, and may thus be separated, investigated, and experimentalised with. Intercept this beam of sunlight with a piece of white paper, and where it falls, you will recognise a brilliant disc of colourless light. Place between the aperture and the light a three-sided cone of glass, usually called a prism, and, instead of that shining white disc, you have a band of rainbow colours, which introduces you to another phase of optical study, called, again from the Greek, *chromatics*. All the colours you see in nature or art are thus produced. The dyer is working out his experiment in dioptrics when he applies a new dye, mechanically or intelligently, and so is the painter when he thinks he is only dealing with pigments on wood or canvas. The chemist who prepares the dye, or discovers the pigment, does the same; and so does the optician who manufactures the lens for a photographer, and so does the photographer himself, when he shuts out of his dark room all the rays of light that are not red or yellow. Why?

The reply to that question takes us at once to the great principle that underlies the foundations of photographic art. In red or yellow light there is little or no chemical power, and photographs, contrary to common belief, are *not produced by light;* they are produced by chemistry, or *actinism*, another Greek term. It is the actinic, or chemical parts or rays of the sunbeams, with all their relative degrees of power indicated chromatically, or by their colours, that produce on glass or paper the light-conveyed images (reflections) erroneously termed photographs, another Greek term, compounded of photo, or *photos* (light), and *graphy*, to write or delineate. The light which formed the picture in the dark slide of the camera, must not again reach it until the photographed image is *fixed*—that is to say, rendered no longer sensitive to the chemical action of light, and this is, therefore, done in the red, or yellow, or non-actinic light.

If a glass plate, with a surface sensitive to actinic influence, is exposed to images reflected through the lens in a camera which does not exclude every other ray of chemically active light, the resulting photograph will be what is technically termed "fogged," that is, nearly, or quite, obliterated. Photography is, therefore, the art of chemically fixing the image, or pictures, thrown by a lens upon a surface sensitive to chemical action in a *camera*, which is merely *obscura* (Latin for a dark chamber).

The history of photography belongs to the Jubilee years of her most gracious Majesty the Queen. It is one of many wonderful discoveries which will render the fifty years of Victoria's reign memorable through coming years. It was in the year of her coronation, 1838, that the eminent French scene-painter Daguerre, aided by Niepce the chemist, and Chevalier the optician, discovered the process of producing photographs, named after him the Daguerreotype. It was a beautiful art, years ago abandoned in favour of different modifications of it, all destined in their turn to give place to improved processes, the latest being called "Medry." I am old enough to have practised nearly all of them. My first dark chamber, or camera, was a cigar box, my first lens a spectacle glass, and there are some famous old practitioners of the art still living, whose beginnings were not a bit more ambitious, some of them being my personal friends.

The artist, optician, and chemist blended their efforts, but the former was the most persistent experimentalist, the most fervently hopeful, and the most energetic; the lives of each belong to history, for each was in his way a remarkable man; but it was because each was thoughtful and investigative, that success crowned their united efforts.

Niepce, writing to Daguerre, when both were using the apparatus made for them by Chevalier, said:—

"We are occupied with the same object in view, we should find an unequal interest in our mutual efforts. It will give me pleasure to hear that your new experiments with the improved camera have been as successful as you hope they will be. I am most desirous of knowing the result; and, should my offer be a fair one, I shall feel flattered in placing before you the result of my researches of a similar nature to your own."

The secret of Daguerre's superior success was his use of the iodide of silver, in which Niepce, despite his superior chemical knowledge, did not believe; and five years before the Daguerreotype was a pronounced triumph of world-wide fame, Niepce the chemist died.

In our next Paper, we shall have something to say about the apparatus.

(*To be continued.*)

"THE CRY OF THE SONS OF MEN."

"WE are weary, we are laden,
We have wandered far astray;
Let us taste the sparkling waters
Flowing by the grassy way.
Let us pluck the clustering berries;
Luscious grapes hang overhead.
Take our ease, forget to-morrow,
Banish thought and banish dread."
Still, ah, still amidst the pleasures,
Comes the ceaseless cry of pain,
"Who will give us rest and quiet?
Who will give us peace again?
We have tried each flowing fountain,
Broken cisterns all to find,
Who can soothe the weary spirit?
Who the broken heart can bind?
We can find no peaceful shadow,
And no mighty rock can see;
Come, ye mountains, come and hide us
From our sin and misery."
Only silence mocks their sighing,
Mocks them in their bitter woe.
"Tell, oh, tell us," still they're crying,
"Unto whom, then, can we go?"

"THE CRY OF THE SONS OF GOD."

"Children we, yet pilgrims, strangers,
Wanderers in the desert bare,
Lead us, Lord, to verdant pastures,
Lead us to the meadows fair.
We can trust Thee, we can love Thee,
We are Thine for weal or woe;
Sons of men! why will ye linger?
Unto whom else would ye go?
He it is, in blood-stained raiment,
He who erst from Bozrah came,—
Jesus Christ, the King, the Saviour,
Ever and for aye the same.
He, the Light to guide you heavenward,
He, the Fount in barren ground;
Living Water, Heavenly Manna,
All in all, in Him is found.
'Hark!' His loving Voice is saying,—
'I am come, the Prince of Peace.
Hush that mournful, bitter wailing,
Sons of men from murmurs cease.'
Hear Him! Ah, our best belovèd,
We will follow, lead us on;
Time is fleeing, Life is fleeting,
And the day will soon be gone."

"THE LIGHT OF THE WORLD."

Softly, as the breath of Twilight,
Like a whisper through the grass,
Fell a footfall, faint, so faintly,
Through the shadows seemed to pass.
Draweth nearer. Will they hear Him?
Sad He seems, and all alone.
Hush! He cometh, calling, calling,
And He seeketh for His own.
"Come, ye wayworn, wandering children
I have sought you far and near;
I am come to soothe the weary,
Come the broken heart to cheer.
Would ye taste the crystal waters?
Would ye feast on Heavenly Bread?
Follow Me, and in My footsteps
Sweetly, safely ye may tread."

THE APPEAL OF THE SONS OF GOD TO THE SONS OF MEN.

"Sons of men, why will ye linger?
Day is fleeing, night is nigh!
See! He passeth, softly, slowly,—
Sons of men! why will ye die?
Still He waiteth, still He calleth,
Through the mists and shadows dim.
Unto whom else are ye calling?
Unto whom, if not to Him?"

S. H. Knapp.

"The only other occupant of the house."

ACHEE PAN;

OR,

"TOPSIDE GALORE."

CHAPTER I.

ACHEE PAN, I must inform my readers, was a Chinese gentleman, living in the noble city of Pekin, in the year 1301.

He was by trade a china merchant; that is to say, he made various articles of china-ware, which he sold for as much as he could get from his customers.

Achee Pan was thin and wizened looking, with small, twinkling eyes, which he generally half closed when looking at you, a most splendiferous pigtail, and a very old and coffee-coloured costume, which shaded off harmoniously from his tea-coloured visage. By this time, my readers, you will see that the hero of my story was neither big, handsome, nor noble; but, better than all these, he was clever, and as "Necessity is the mother of invention," he often astonished himself by some particularly clever piece of ingenuity; and as "Brevity is the soul of wit," he invariably chopped his sentences into as small pieces as he possibly could; when once Achee Pan said "No," neither the lords, ladies, Ministers of State, courtiers, nay, even the great Emperor, Chusee Chan himself, would have been able to make him change his mind. He lived in a little back street on the north side of the Palace of Chusee Chan; and day by day the courtiers, Ministers of State, etc., etc., saw Achee Pan studiously working away in front of his little window, making pots and vases, and a variety of curious articles.

The length of Achee Pan's pigtail was a great marvel to many, for it exceeded that of the Emperor himself, though it was doubled up at the end, so that no one should know its length; for to wear a pigtail longer than the Emperor's was considered a capital offence in China.

Early one sultry morning, Achee Pan was sitting in front of his little window, painting a very elaborate dragon of many colours on a beautiful sea-green vase. It was very difficult work, and as soon as he had finished the head of the dragon, he heaved a sigh of relief, and, getting up, retired to his little back room. There he began to groan, and rock himself backwards and forwards.

Why he did this, will need a little digression to explain to our readers. A few weeks before my story began, Achee Pan made a very bold investment indeed; which, however, promised to bring him a good amount of gain. All was going on well, when one morning, news went abroad that the venture had proved a myth, and all the unfortunates who had embarked in it were ruined.

Achee Pan, as I have said, had invested a large amount; and to get the cash, had borrowed from an old Chinese merchant, whom he had promised to pay in two months from the date on which he lent him the money. You can imagine his feelings! Three hundred taels to pay, and not a brass pic to help him to meet it!

Now the character of my hero came out in its true light; when others succumbed, many putting an end to themselves, and others leaving the country, Achee Pan, strange to say, smiled as serenely, and worked as assiduously, as before the disaster.

Inwardly, however, he felt a crisis was coming; and his face grew thinner and more wrinkled, and changed from its tea-coloured hue to one more like the coffee-colour of his dress. There was now only a week to the day when he must pay his three hundred taels, and he was well-nigh at his wits' end; for though he had worked literally night and

"'Achee Pan!' roared the great Babul."

day, he had only succeeded in getting one hundred together. He knew what was the penalty for debts like that—death. But sooner than be executed in the barbarous, degrading method of the Chinese, he determined he would destroy himself; and, as a last resource, should all else fail, he had bought a little packet of poison for rats, which was carefully hidden away in a corner of a funny old chest. On this old chest was seated the only other occupant of the house, viz., one of the ugliest cats imaginable, which went by the name of Ranky Chou.

Upon this unprepossessing animal, Achee Pan bestowed all his affections; and it, in return, was devoted to its master. It would sit for hours purring contentedly by his side, while he worked away at his pottery-making.

who had collected round the door to see what was up. "Achee Pan!" roared the great Babul, in a voice of thunder, holding out a large roll of parchment, "put this proclamation in your window immediately, by the orders of her Most Gracious Celestial, All-powerful Chinese Highness, or your pigtail shall be chopped off;" "or your pigtail shall be chopped off," yelled the courtiers; "or your pigtail shall be chopped off," shrieked the mandarins and Ministers of State in chorus; "or your pigtail shall be chopped off," squealed the ragged boys insultingly. Then, without another word, off went the great Babul—off went the courtiers, mandarins, Ministers of State, and little ragged boys, with their pigtails on end, as fast as they could go down the street.

His Imperial Highness, and thus prevent such a dire calamity from falling on the Chinese Empire, shall receive—

10,000 Taels."

After he had thoroughly mastered the meaning of the above, Achee Pan went quietly indoors.

What a glorious chance! 10,000 taels! Life, liberty, happiness, lay before him in his grasp, if only, if only he could think of something that would amuse His Celestial Highness!

Ah, but there lay the rub, if, well,—

"If ifs and ands were Achee Pans,
There'd soon be amusement for Chusee Chans."

Two whole hours did our hero sit in a brown study, every now and then muttering, while

"'Nod!' cried the Emperor to the Empress."

Now, seeing its master's despair, it quietly left its place on the old chest, and, perching itself on Achee Pan's chair, it commenced softly to rub its head against his arm, in token of sympathy.

"Poor Ranky Chou, you would help me if you could," said Achee, soothing it. "Miaou, miaou!" said Ranky Chou, in a dolorous voice. "But it's of no good," continued its master, "I shall have to give in sooner or later. Topside galore!" he exclaimed suddenly, jumping up. "What's all that row about?" for there seemed to be a babel of tongues in his little shop.

"Achee Pan, Achee Pan!" cried a stentorian voice; and Achee Pan ran quickly out to see what the matter could be. There stood the great Babul, the Emperor's favourite courtier; there stood ever so many of the other courtiers, the Ministers of State, the mandarins, besides a whole host of little ragged boys,

"Topside galore!" exclaimed Achee Pan, when he recovered his breath.

"Miaou, miaou!" said Ranky Chou, as he watched his master unroll the huge proclamation, which was soon fastened securely on a board and hung up in the window.

That being done, Achee thought he would like to read what was written thereon, which he accordingly did; and for the benefit of my readers, I will translate the words so attentively read by Achee Pan:—

"By order of Her Imperial, Celestial, All-powerful Chinese Highness, the following proclamation is made:—

"That, whereas His Imperial, Celestial, All-powerful Chinese Highness lieth at the point of death, for want of something better to do, all amusements being utterly unable to cheer him, or divert his mind: the Man, Woman, or Child who shall, within two days, invent something novel enough to amuse

Ranky Chou uttered a plaintive "Miaou!" at intervals, to assure his master of his great sympathy.

At last Achee Pan got up, and, with stern resolution depicted on his visage, approached the chest, and took up the fatal phial of poison. Then he went to the little cracked looking-glass to take a last look at his withered, yellow face, before he bade adieu to it for ever.

He stood and gazed, with the glass of poison in his hand, and then slowly nodded his head, as if saying, "Good-bye, Achee Pan; good-bye to all your greatness." Then a sudden frenzy seized him, and, with almost a yell, he (don't be shocked, dear readers! Achee Pan was only mortal after all)—he—he—actually—put out his long tongue and nodded his head violently! Then, suddenly the phial was dashed from his hand, and he began to jump and caper about,

exclaiming, "Topside Galore! Topside Galore! Topside Galore!" grinning and beaming all over the while. Ranky Chou was hugged in a most affectionate embrace; and then down sat Achee Pan, and worked away assiduously and mysteriously, without ceasing, for the rest of the day at his pottery making. What caused this change in his plans you shall presently see.

CHAPTER II.

INSIDE the palace of Chusee Chan, all was gloom and dismay; the courtiers, Ministers of State, mandarins, all went about on tip-toe, hardly speaking above a whisper. The court physician, the great Babul, the Empress, and some of the ladies-in-waiting, who were in the room where Chusee Chan lay on his costly bed, hardly moving, eating nothing, never speaking—in fact, dying for want of something to do—kept wiping their eyes and using their salts bottles in preparation for the terrible event, which would leave the great Empire of China without a ruler.

The court physician had declared that morning that his Imperial, All-powerful, Celestial Chinese Highness might linger on for three days at the most. That was all, unless something could be found to amuse him, and thus take his thoughts off himself. Tick tack, tick tack, went the watch of the court physican, as he gently felt the Emperor's pulse.

"Weaker and weaker," he replied, to the anxious inquiries of the Empress, who stood patiently beside the bed.

Just then, there was a stir outside. The great Babul angrily strode out of the room to see who dared to intrude at such a time. He returned soon and whispered to the court physician, who whispered to the Empress, and then said, "Her Imperial Celestial Highness desires that the man may be brought in and try his plan."

The great Babul made a low bow and went out again. He soon returned, followed by a little, withered, ugly man carrying a small box under his arm, also a curious-looking bundle. He took no notice of the Empress or ladies-in-waiting; but at a sign from the court physician, approached the bed. He motioned for a little table that stood near to be brought to him, and then he carefully undid the box, and took out a number of little Chinese figures in white ware, with long pigtails and red caps. These he placed very carefully on the table; then, giving it a little shake, he set them all a-nodding—nodding their little heads; and lo! they each put out a long, red tongue, and waggled it about in the very face of the Emperor himself! But his All-powerful, Celestial Highness lay with closed eyes, unheeding all that passed round him.

Then Achee Pan seized the bundle, and a terrific "Miaou! Mi—a—o—u! Mi—a—o—u!" resounded through the room.

The great Babul, the court physician, the Empress, the ladies-in-waiting, rushed at Achee Pan, and, seizing him roughly by the arms, began to drag him from the room; when Chusee Chan, who had started violently at the noise, and, of course, opened his eyes, seeing the little figures nodding, nodding, nid, nid, nodding, called out "Stop!" Like magic they let go of Achee Pan, and, to their great amazement, saw Chusee Chan looking fixedly at the little figures. Achee Pan, finding himself free, approached the table, and, giving it another shake, set them all going faster than ever. Wiggle waggle, wiggle waggle, went the long, red tongues. Nid nodding, nid nodding, went the little heads, and the Emperor smiled—yes, smiled, then laughed!

"Topside galore!" said Achee Pan quietly to himself.

"Nod!" cried the Emperor to the Empress, great Babul, court physician, ladies-in-waiting, and courtiers, "or your pigtails shall come off."

At this awful threat they all began; Achee Pan doing it best of all.

"Quicker! quicker!" cried the Emperor, and on they all went; but Achee Pan did it quicker and better than all.

For one whole hour did Chusee Chan keep them nodding. Then he released them, and asked for something to eat. "He is thaved!" lisped the court physician. "He is thaved!" lisped the Empress, great Babul, and all the others; for, not being up to such a new-fashioned game, they had, poor things, bitten their tongues so dreadfully that they could hardly speak; and for a week after, they had such stiff necks, that they could not turn their heads right or left. But the Emperor's life was saved; and Achee Pan was quite ready to nod all day long—stiff neck, sore tongue, and all, for he had saved the Emperor's life, and his fortune was made.

From that day, Chusee Chan got better and better; and the rage for the little nodding figures, which got the name of "Achee Pan," was so great, that all the potters were employed in making them.

Achee Pan got his ten thousand taels, and, like an honest man, paid his debt.

Besides this reward, he was made a chief mandarin, and had apartments in the palace. Being a sensible man, he now had his pigtail shortened by two inches, so that he might not offend the Emperor by his too lengthy appendage.

Ranky Chou was not forgotten either. He was made an "I. C.," that is, "Imperial Cat," and wore a gold collar. He was petted by all the court; for, had he not roused the Emperor by his terrific "Miaou," Achee Pan's efforts would have been in vain.

Now, my dear readers,

"Here endeth the story of Achee Pan,
Who saved the life of Chusee Chan;
Who had a cat called Ranky Chou,
That roused the Emperor with its mew.
Whose pigtail was so elongated,
That, as we have before related,
Our hero was obliged to lop it,
For fear the Emperor should chop it.
So now farewell to Chusee Chan,
To Ranky Chou, and Achee Pan,
Whose motto was 'Topside galore,'
The English being 'Excelsior.'"

CLOTHES FOR A BUTTON, NOT BUTTONS FOR CLOTHES.

HE was undeniably a very ragged man. His clothes were scarcely more than shreds, and they fluttered restlessly in the breeze. A benevolent lady came forward. "My poor man," said she, "you are in a sorry state. Step into my kitchen, and my servants shall put some buttons on your coat; it has not one left."

"Thank you, kind lady," said the man, glancing ruefully at his rags, "but matters are gone too far for that. Buttons can do nothing now for my coat. However," he added, brightening up, "I have one nice button in my pocket—it would be a great thing if you could *give me a coat for it.*"

The lady took the hint.

My friend, what is your request? Are you seeking for buttons to hold your rags together, or are you just bringing your worthless button for a new coat?

BRITISH INDUSTRIES.

No. I.

THE MANUFACTURE OF CARPETS AT KIDDERMINSTER.

By HENRY H. BOURN.

NASH, in his "History of Worcestershire," says: "Kidderminster means a church standing upon the brow of a hill, and the water running under it; *Kid* signifying, in the old British, the brow of a hill; *Dwr*, water; and *Minster*, a church." Certainly, the commodious and beautiful church, in which Richard Baxter preached for many years, stands on a hill, and the river Stour flows at its base.

On entering the town from the railway, a visitor is struck with the beautifully designed drinking-fountain, surmounted by an illuminated clock, having three dials; a statue erected to the memory of Sir Rowland Hill, to whose enterprise, as of course all know, we are indebted for the Penny Postage and the Post-office Savings Bank; and another statue, which has been erected in the Bull Ring, to commemorate the devoted and successful labours of Richard Baxter. The house in which he resided is in High Street, and has his name on the front in large letters, followed by the date, 1641.

Kidderminster has been a manufacturing town nearly four hundred years. By a statute of 1533, it was enacted that no person should make, or cause to be made, within the county of Worcester, any manner of woollen clothes, except in Kidderminster and four other places which are named. In Baxter's time, weaving was the principal employment of the people; their manufacture, in all probability, being linsey-woolsey stuffs.

In his "Life and Times," Baxter says: "My people were not rich; there were among them very few beggars, because their common trade of stuff-weaving would find work for them all; and there were none of the tradesmen very rich, seeing their trade was poor. The magistrates of the town were, few of them, worth £40 per annum, and most not half so much; three or four of the richest thriving masters of the trade got but about £500 or £600 in twenty years, and it may be lost £100 of it by an ill debtor."

The remarks made by the notorious Lord Chief Justice Jefferies, during the trial of Baxter for "seditious and scandalous teaching," in a book which he had published, supports the opinion that the staple trade of the town, at that time, was linsey-woolsey stuffs.

The trial commenced on the 30th of May, 1686, when Pollexfen, who had undertaken Baxter's defence, remonstrated against the stopping of Nonconformist utterances, and received the following treatment at the hands of the Chief Justice.

"Pollexfen," said Jefferies, "I know you well; I will set a mark upon you! You are the patron of the faction. This is an old rogue, who has poisoned the world with his Kidderminster doctrine. Don't we know how he preached, 'Curse ye Meroz; curse them bitterly that come not to the help of the Lord, to the help of the Lord against the mighty'? He encouraged all the women and maids to bring their bodkins and thimbles, to carry on their war against the king of ever-blessed memory. An old schismatical knave, a hypocritical villain!"

Pollexfen having besought his lordship to allow him to say a word for his client, boldly maintained that the things which had been said did not apply to the character of Mr. Baxter; and went on to state that King

Charles would have rewarded him with a bishopric when he came to the throne, if he would only have conformed.

"Ay, ay," said the furious judge, "we know that; but what ailed the old blockhead, the unthankful villain, that he would not conform? Was he wiser or better than other men? He hath been, ever since, the spring of the faction. I am sure he hath poisoned the world with his *linsey-woolsey doctrine*."

It appears to have been about the year 1735, that carpet-weaving was established as a branch of industry in Kidderminster. At first, the Scotch, or flat carpets, without a pile, were the only ones made; but in 1749, cut carpets were introduced. At the present time, the leading productions are Royal Axminster, Chenille Axminster, Brussels, and Tapestry carpets and rugs, many of which cannot be surpassed, even if equalled, in any other part of the world.

In the history of carpet-weaving, as in that of the production of nearly all other textile fabrics, the time arrived when the home industry passed away, in consequence of the introduction of steam power, and the almost necessary adoption of the factory system. The social and moral evils, which are the fruits of factory life, may be considered in another Paper.

The increase in the number of carpet-weavers throughout Great Britain, appears to have been confined exclusively to Kidderminster and its neighbourhood; where, in 1861, the number of men and women employed was 1,673, and in 1881 it was 6,659.

It is impossible to give, in the space allotted to this Paper, a description of the entire process of carpet-weaving. There are, however, certain processes which demand more than a passing notice. In making Tapestry carpets, the pattern is printed on the warp from a cylinder. To the uninitiated, the strange admixture of colours before the weft is "shot," may be somewhat bewildering. How it can be possible for the warp to finally resolve itself into patterns of taste and beauty, can only be known to the artist who designed the pattern, and under whose instructions the cylinder was engraved.

The well-known Brussels carpet has its pattern made in the loom. To accomplish this, the Jacquard machine is called into requisition, an ingeniously contrived piece of mechanism, placed at the top of the ordinary loom, which, by a series of perforated cards, artistically arranged, lifts and depresses the warp just when and where required. As a shuttle is required for each colour in the weft, it sometimes happens that there are as many as from two to ten, twelve, or even fourteen different colours. An ingenious mechanism connected with the power-loom supplies the right colour when needed. In forming the loop in Brussels carpet, the warp is passed over a wire, which is afterwards knocked up by the "slay." The wire is next removed by an automatic action of the loom, catching it in an eye made for that purpose, drawing it through the entire width of the piece being woven, and placing it behind a few others, which are removed and replaced in turn, so long as the loom remains working. If it is a velvet pile, or Wilton carpet or rug which is being made, a small cutter is attached to one end of the wire, by which all the loops are cut as it is drawn through.

Another important branch of carpet-weaving, and one which differs from all others, is the manufacture of Chenille Axminster, and Royal Axminster carpets and rugs. The initial process in making these goods, after sorting and dyeing the wool and spinning the yarn, is the preparation of the design. After the design has been approved, it is worked out to its full size, and divided into so many "shots" to the inch; the number of "shots" varying according to the qualities of the carpet.

The Chenille Axminster carpet is made of strips of chenille cord (which have been prepared in hand-looms) as a pile or weft, upon a chain of jute or other suitable material. The pattern is given out in narrow strips of various colours, so that the operatives may see what number of "shots" of the different colours is required for producing the design of the artist. Sometimes two or three of white, black, blue, or green, or some other colour will suffice; at other times a dozen "shots" of one colour may be requisite. On leaving the loom, these pieces are passed through a cutting machine, consisting of a number of cutters, fixed on a cylinder, which revolves with considerable rapidity. After being divided into strips, and properly arranged and numbered, the chenille cord is ready for the carpet or rug weaver. In passing through several factories at Kidderminster, we were surprised to find so much of the work performed by females, although not to the same extent as in other manufacturing districts. Before entering some of the workshops, we could hear, above the thud and rattle of the looms, some of Sankey's hymns being sung. On one of the looms I noticed a few verses about the "precious blood of Jesus," written with pen and ink.

A few minutes' observation of the patent power-loom, will at once suffice to convince any intelligent person of its superiority to the hand-loom; not only with regard to the quantity of work produced, but also, and more especially, with regard to the correctness with which each pattern is completed. In these looms, the fur or strip of chenille is fed on to the machine continuously; the whole action being automatic, excepting that of combing the strip of chenille into its proper place by the attendant. It is very interesting to watch the precision with which the feeder stops, while the machine still continues working, so as to allow the exact time required by the operative for using the comb.

About fifteen yards can be made on one of these looms a day, whereas only about two yards can be produced on a hand-loom.

We cannot omit referring to the process of "reading in" the patterns for Royal Axminster carpets. To effect this, a number of bobbins, each with its separate-coloured wool, are arranged in a frame; the bobbins in some cases being twenty-seven inches in width, and the number of threads gathered thereon amounting to 190. Each "shot" of the pattern is arranged on its peculiar bobbin, which is numbered to correspond with the design. The number of threads varying from 135 to 190, great care has to be exercised by the operatives in their selection of the threads, so that they may exactly repeat upon the bobbins the line or "shot" of the pattern, which is fastened opposite their eye to serve as a guide. The bobbins are next taken to another room, and placed on an endless chain, connected with the loom; the length of the chain representing the length of the pattern to be produced. The chain revolves when the machine is put in motion, and the bobbins are brought in contact with the warp; the "shot" goes across, and is knocked up by the "slay." The length required to be taken from the bobbins is cut off by a sharp knife, which moves backwards and forwards automatically. The knife, before cutting the thread, pulls it to the length required for the next operation, by means of a cam raising the bobbin. On some of the machines, as many as 200 bobbins are carried by the endless chain on frame-work overhead. In consequence of a mechanical arrangement, by which the threads are placed on the bobbins, it is impossible for them to get shifted from their proper place, or for any slip to be made in the pattern.

We saw three men employed at one loom, on which they were making a carpet of elegant design, measuring about 18ft. by 14ft. Although the cost of producing such carpets is considerable, the high price which many of them fetch makes their manufacture profitable.

The operatives of Kidderminster present a favourable contrast to those in some of our manufacturing towns. The comfortable houses in which many of them live—the occupants not unfrequently being the owners,—the Co-operative Stores, the Carpet Weavers' Association, the Building Societies, and deposits in Savings Banks, speak of their thrift. Intemperance, it is true, has many victims, but the counteracting influences are powerful; the result being that, notwithstanding the increase in the population, the social and moral condition of the people is far superior to what it was twenty years ago.

"DO *YOU* TAKE BACK YOUR EMPTIES?"

A True Anecdote.

"HAPPY Tom," one of our Christian carters, went to the yard of a large warehouse the other day to wait for a load. There were other carts waiting, too, and plenty of men about. Tom wanted a word of prayer; he longed for it as definitely as some of the other men longed for a smoke. So he turned into a shed, where he had, strictly speaking, no call to go, and had a few quiet moments alone with God.

"What are you doing in the yard?" said the foreman to him sharply, as he came out.

"Waiting for a load, sir," said Happy Tom.

"What were you doing in that shed?"

Now it is an easy enough thing to stand up and testify in a Meeting, with the Chairman's sympathising eye upon you, and some brother in the background ready to say, "Praise God"; but it's another thing for a man to speak out amongst ungodly mates, and especially to a foreman whom you know not to be a Christian.

Happy Tom was silent for a moment.

"Come, what were you doing in there?" repeated the foreman.

"Taking back 'my empties,' sir," said Tom.

"What do you mean?"

"The Lord Jesus Christ, sir, filled me with a blessing this morning, and I just went back to Him now. I'm His 'empty,' sir. When my employer gets packages from here, he uses the goods, and sends you back the empty cases to fill again; that's the least I may do to Jesus Christ. 'Twould be real dishonest not to bring His 'empties' back, and say thank you for what I'd got."

The foreman was silent, but he thought "there must be something in it, after all."

Tom's load was ready, and he marched out of the yard at his horse's head, the light on his face showing that the Lord Jesus did not take long to "fill the empties" which were brought back to Him.

SISTER DORA.

A BIOGRAPHICAL SKETCH.

By Fanny Burton Irving.

(*Continued from our last.*)

IN 1875, a terrible epidemic of smallpox broke out in Walsall. It was found an insuperable difficulty to get the people to go into a hospital, erected on the outskirts of the town for the emergency, until Sister Dora came to the rescue, by writing to the Mayor, and offering to leave her own work, and go to the epidemic hospital to nurse the smallpox patients, for any length of time that might be necessary ; she feeling a conscious pride, in the knowledge that the masses of Walsall would use the hospital without hesitation if she were there. Her offer was gladly and gratefully accepted. Her work began at once ; and before she had been there half an hour, seven patients arrived. The wards were two in number, planned for twenty-eight beds, entirely bare, but capable of division by means of sliding doors, so that the bad cases could be isolated. The windows were iron-barred as a precaution against the vagaries of delirious patients. There were day-rooms for convalescents ; a combination sitting and bedroom for the nurse ; another small room for the porter, as well as a small dispensary. Entirely separate, stood a laundry, mortuary, a disinfecting oven, and a stable for the ambulance. For the work required on these premises, together with nursing, etc., she was, as Bishop Selwyn styled her, "the one-horse chay," having no help save from two women who came from the workhouse, to share with her the loathsome washing of clothes and bedding, and an old porter, kind in his way, but whose weakness for drink often caused her to be left alone the whole night with the dead and dying. From letters she wrote at this time, we cull the following :—"I have got two 'critters' from the workhouse—one so helpless that I have to do the work for her ; the other sits up at nights, so can do no more. One man is so delirious, I cannot keep my eyes off him, or else he's out of bed. Then I have a baby a *year* old, and another younger, and they are so cross ; they keep up music night and day." A few days later she wrote : "A woman is very delirious ; she tried to escape last night ; it took the porter and myself to hold her down. That fellow is very good ; he scrubbed the kitchen floor early this morning to save me. You would laugh to see me washing my babies. Poor things ! They are smothered in pox. I am obliged to put them in a warm bath. They are getting quite fond of me ; but they do make washing. We have all that to do besides the night-nursing, so you may fancy ! I am writing this while waiting for my potatoes to boil." On the tenth of March, at the end of a letter to a clergyman, she says : "I have got a servant, the plague of my life. It *is* good to have some cross, so I take her as such." Again, "My Irishwoman (the servant) walked off this afternoon, and went drinking, actually in the middle of washing. Some people came to tell me she was drunk. She and I must part company to-morrow ; we cannot be so disgraced." On the twenty-seventh of March : "I have not had a creature to do a hand's turn since last Thursday week. I wish you could see how clean the place is. I am getting quite proud of my cooking. The porter here is an old soldier, and he is so helpful ; always lights the kitchen fire and does the range." Again, in reference to cooking : "I only wish I had known something of it before I came here. I like it, but I do not feel master of my business."

Probably some are ready to ask whether this Phœbe-like woman, who was a succourer of so many, had no faults ; and also to wonder what became of her work at the cottage hospital, while she devoted herself to the smallpox cases elsewhere, especially as it involved exactly a six months' absence from the former. To err is human ; and Dorothy Pattison would have been more than this if she had been sinless. "She left the cottage hospital," says her biographer, "pretty much to take care of itself. No special orders were given to the nurses, nor was any one of them actually placed in charge." She was unwilling that any one should "even temporarily be entitled to occupy her place," and more than once she exhibited a jealous dislike to any worker who showed special ability. This caused her to gather inferior assistants ; and while she was away, she seemed more desirous to be greatly missed than that her place should be well filled.

In the last letter Sister Dora ever penned, she referred to this besetting sin, this love of being first. Probably this fault was nurtured by the unfortunate circumstance that, with few exceptions, she passed the most of her life in the company of her social and mental inferiors, and this is always dangerous to the highest development of the best gifts.

Evidences of her interest in holy things was shown by her efforts to induce waifs and strays to attend the special services held at Walsall. On the first night, lay-workers were exhorted to bring people to the service ; and on the second evening, Sister Dora appeared in church with a following of thirty or forty people.

After the second Mission in 1876, when the town was asleep, two of the Missioners were guided by Sister Dora into one of the worst "slums" of Walsall, where the inhabitants turn night into day, "loving darkness rather than light, because their deeds are evil," and straightway began a midnight meeting, to be followed by many others for fallen women. Then, during the evenings of the Mission, she asked permission to hold a meeting for cabmen—a class of men in whom she felt deep interest. Every cabman in Walsall came to her meeting, except one who was compelled always to be on duty to fetch passengers from a certain train exactly at the hour of her class. This man went almost crying to tell "Sister" why he could not come. One of the cabmen, an old patient, told her she was always to send for him when she wanted a drive, and he would drive her anywhere at any time for nothing, adding, "Stop, Sister ; there's only one way as I won't drive you, and that's away from Walsall."

In 1876, the ward into which the victims of the Burchill's explosion had heen received became hopelessly infected. Case after case of erysipelas declared itself, wounds refused to heal, and finally the whole hospital seemed to be impregnated by the poison. It was found necessary to transfer the Cottage Hospital to temporary premises, while a new building was erected. Only a very unsuitable house of three storeys was obtainable at the time, and it only held ten or twelve beds. Those cases that could not find room within the walls of the temporary "Maison Dieu," Sister Dora visited at their own homes. It was at this period (winter of 1876–77) that for the first time in her experience she began to find a difficulty in lifting weights. Previously, her old night nurse had often said to her, "Sister, let me carry that bedding, or those coals for you," and she would reply, "No, I am stronger than you are, and I want to save your strength ;" then, picking up the load, in her easy fashion, she would carry it off. Now there was difficulty in these things, and as the inconvenience became permanent, she consulted a medical man with whom she was on terms of personal friendship. He examined her carefully, and discovered the existence of a disease, which, he told her, must ultimately be fatal to life. Surgical aid might have prolonged her days ; but, as the result was always uncertain, after a short mental conflict, she determined to permit the disease to take its natural course, and pledged the doctor who examined her, neither to reveal the nature of the complaint, nor the fact of her consultation with him to others ; giving, as a reason, that she would be urged to lay aside her duties if her condition were known, and she was wishful to continue them as long as possible.

She worked harder than ever, and wrote to a friend, who was, of course, entirely unaware of her condition : "I grudge every moment I must spend in taking care of this body ;" and again, "I fairly grudge myself the time which must be spent in sleep." Her labours became so severe, that the committee desired her to allow them to get her extra assistance, so that she might not kill herself with overwork ; but she declined every offer of this kind. From six until between ten and eleven o'clock at night, she was driving about to visit such as, from the limited accommodation of the temporary building, could not be received into the hospital. Her chief happiness seemed to lie in ministering to the most miserable, and in telling them of a Saviour.

To one who tried to copy her labour of love, she said, "When you want to lead any one to Jesus, remember you must point, and take care not to stand in the way yourself."

One night, in passing Marsh Lane, Sister Dora saw an awful fight going on, even the police not venturing to interfere. She plunged through the crowd, stood on a high door-step, and began in her usual fashion, entreating, exhorting, and flinging well-aimed raillery at the combatants. They stood for a moment like two furious bull-dogs, and then again rushed upon each other, urged on by the sympathetic cries of the crowd. In a moment, Sister Dora had quitted the door-step, and had thrown herself between the wild animals, holding them each back, with an arm which either of the men could have broken as easily as he could have snapped a tobacco pipe. Such an appeal was all-powerful ; the fight was at an end, and no one ventured a word of disrespect or insult. How few understood that the almost superhuman energy of her toil was caused by the thought—ever present to her then—that the night was at hand !

At the close of the year 1877, she invited all her old patients to a Christmas dinner, at her own cost, in the temporary hospital, and made a bright, joyous, mirthful time for all the visitors.

In June, 1878, Sister Dora went away for a fortnight's holiday, and as, immediately on her return to Walsall, typhoid fever broke out in the hospital, it was found necessary to close it, so she was again set at liberty, for the new building could not be ready until October. Without giving any sign of her mortal malady, save that she could not walk so far as she formerly did, she went first to visit some nieces in the Isle of Man, and then, in autumn, to the Paris Exhibition, especially to inspect the wonderful appliances and operating instruments which were shown there. At the end of September, she stayed in London, to see and study Professor Lister's

treatment of wounds, with a view to the employment of his method in the Walsall hospital. All this time her own disease was rapidly developing; and at last she found herself unable to conceal her intense suffering, so travelled alone to Birmingham to consult her doctor, Mr. Crompton. The fatigue and hurry of the journey brought on such serious symptoms, that he thought she could not leave her hotel alive; but she would not hear of any plan save that of being taken back to Walsall, to "die amongst her own people." Accordingly, she was removed in the doctor's carriage. On the 7th of October, she wrote to a clergyman from the hotel in Birmingham, saying, "I have been laid up here since last Thursday, carefully nursed by strangers. I am going to Walsall, if able to be moved, to-morrow. They have taken a house for me near the new hospital. There is only Mount Calvary to climb by the ladder of sickness. I can join in the words of our beautiful Prayer-Book, 'Render unto Him humble thanks for His fatherly visitation.' Do pray, dear brother, that as my pain increases, so may my faith and patience."

From the time that she took up her abode in the little hired house, she never left her bed; her suffering continued to increase; coughing, sickness, and exhaustion set in, and the joy at first experienced in hope of speedy relief by death, gave place to much depression, and Sister Dora realised the "shadow" in the valley. Still, in intervals of agony, she at times proved so wonderfully cheerful and like her old self, that few suspected the intensity of her suffering, and it was hoped she might be well enough to be carried to the new hospital, to declare it open. As this could not be, a silvered key, in a velvet case, was sent her by the Committee, with the request that she would give it into the hands of the Mayor, and thus empower him to open the new building in her name. On the sixth of December, Sister Dora's last earthly anxiety about her beloved hospital was set at rest by the arrival of her successor, a lady called Sister Ellen, in whom she at once felt perfect confidence, and from whose kind attentions she derived much alleviation in her pain. "Oh," she exclaimed once, after she had been put into a comfortable position, and had her wound dressed by this lady, "if my patients can only be nursed like this, I shall be *more* than satisfied." On Monday, the twenty-third of December, she suffered extremely, and early on Tuesday morning she said: "I am dying; run for Sister Ellen." Mrs. H—— tried to soothe her, saying, "Our blessed Lord is standing at the gates of heaven, to open them for you." She answered, "I see Him; the gates are open wide."

When all human efforts had been exhausted for her relief, she said, as they stood watching her, "I have lived alone—let me die alone;" repeating, "let me die alone," till they were forced to leave her, one friend only watching through the half-opened door. For some hours she lived on. All pain seemed to have left her; and about two o'clock in the afternoon, the anxious watcher only knew by a slight change of position that Sister Dora's life was gone.

"The memory of the just is blessed." Sister Dora's is preserved to future generations by the history of her life; by a Convalescent Home erected in her honour at Milford; and the marble statue, unveiled at Walsall eight years after her death, *the first statue ever publicly raised in England to a woman not of royal birth.*

THE END.

HOUSEHOLD MANAGEMENT.

FOR MARRIED FOLK.

By DANIEL MCCOY,

Author of "Hints on Poultry Keeping," "Window Gardening," etc., etc.

II.—FURNISHING.

HAVING made choice of a house suitable for ourselves, the next most important point is to furnish it.

The manner and style in which this is to be done must necessarily depend upon the means at our disposal. The expense to be incurred in furnishing will be proportionate to the size of the house; but in any case it is to be hoped that the purchase of furniture has been seriously considered, previously to commencing to settle in life, and that a sum of ready money is in hand for the purpose.

Should such provision not have been made, it is to be feared that the future existence of the family will be very much less bright than it might otherwise be, and the comforts will probably be greatly interfered with. This is certain to occur, either if money be borrowed for the purpose of purchasing furniture, and a bill of sale given on it, or if the furniture be obtained on the hire system.

The former expedient should never in any case be resorted to, as the interest on the money advanced, and the payment of instalments, would cause a constant drain on the income, and in the end most assuredly result in a seizure of the goods, and in loss of position to the unfortunate borrower. Let this be an axiom to intending furnishers, "Never borrow money on a bill of sale for the purpose of furnishing the house." Rather be satisfied for the first year or two to occupy cheap apartments. Save money, and when a certain amount has been saved, place in the bank of the nearest Post Office, until one hundred pounds has accumulated. For that sum, sufficient useful furniture and necessary articles can be obtained to commence housekeeping with, which, if economically conducted, will enable you, periodically, to purchase some other article of furniture, which, if not absolutely a necessity, may perhaps prove something to make the rooms look more comfortable.

The hire system is adopted by many, but unless persons have a stated income, difficulties may arise in paying punctually the several instalments. When this happens, although payment may have been punctually going on for some length of time, perhaps up to within a few months of the date, and the hirer is hoping to look upon the furniture as his own, a failure takes place in the periodical payment, a legal claim is made, further expenses are incurred, which he is even more unable to meet, a distress warrant is issued, and the furniture sold or carried away, leaving him with an empty house, as a bitter example of the folly of trusting too much to the grand benefits (all on the side of the dealer) to be derived from the tempting advantages offered by a highly-coloured advertisement.

Supposing then, that you have funds in hand sufficient for your wants, do nothing hurriedly, but visit several shops, where at times, especially after the season is over, very good and handsome furniture (called second-hand, in reality as good as new) may be obtained at sometimes one-third or even a less proportion of the original value. It is a mistaken notion that things will be got cheaper by purchasing all that is required at one establishment. Go about, use your own judgment, or, if you prefer it, take some experienced friend with you, who will assist you in the judicious selection of the necessary articles. If, however, expense need not be considered, an order may be given to some well-known firm of upholsterers, who will fit the house up from kitchen to attic, without trouble, but not without a very great additional, and, it may be added, unnecessary outlay. This method also entails a risk of want of that taste, which is scarcely ever to be found in a house entirely furnished by upholsterers alone, without the delicate and chaste eye of a woman to regulate the choice.

Great care should be exercised in selecting furniture, and in arranging it in the house, avoiding crowding too much into one room, or purchasing any which is quite disproportionate to the size of the house. With good taste and proper judgment, a house may be made to look far prettier at a small than at a great cost.

The first part of the house to be furnished is the passage or entrance hall. An umbrella stand is an indispensable article, and a very simple and cheap one can be made by placing a drain-pipe in a saucer of the same material, to receive the water from the umbrellas. If the pipe be covered with coloured cretonne, drawn together tightly round the upper part, and allowed to hang so as only just to clear the top of the saucer, an economical article of furniture is at once provided. A small table is very necessary if the passage be wide enough, and should that not be the case, a slab of wood on a hinge will be found most useful for a great many purposes.

A very pretty addition to any entrance may be made, by having two narrow strips of wood, about two inches wide, fixed on each side of the wall, about five or six feet from the front door, reaching to about an inch from the ceiling, on which a longitudinal piece should be fixed. On this, some cheap curtains may be fastened, nicely looped back, making a sort of second entrance. It gives the dullest looking passage a bright and cheerful appearance; and if the curtains in the autumn and winter time be made of a cheap, warm material, much cold wind may be kept from entering the house—the curtains, when drawn, being kept from flying about by having small, round pieces of lead sewn into the hem at the bottom.

If it be possible, a small stand for flowers should also find a place, which would, during the winter months, by having a few pots of chrysanthemums on them, give a still more cheerful aspect to the entrance hall or passage.

The floor-cloth may be of linoleum or painted canvas. The former has a warmer appearance, and lasts much longer than the latter. A good door mat is indispensable, as, without this useful article, the furniture, such as carpets, would soon be destroyed.

In choosing carpets, the size of room should be considered. A large pattern in a small room will make it look smaller still. All very gaudy colours should be avoided. One of the best wearing and most lasting, is that carpet on which the various shades of brown are introduced. This may be had of all textures; but, of course, on the amount of money to be expended, must depend very much the quality that can be purchased. Very pretty, good, and long-wearing Brussels carpets may be had, the price varying according to the number of threads of which the carpet is composed. Some are six-thread,

and these are generally very expensive ; but a four or three-thread carpet will last a very long time if it be carefully swept. When it is quite worn out, it is useful, as it is very frequently used as the foundation for floor-cloths. A cheaper description of carpet is that called tapestry ; but as it does not wear so well as the Brussels, it proves in the end more expensive.

As rooms are now nearly all stained for about a foot or so round the sides, it is a good plan to purchase a carpet of a square shape, for not only is the cost materially reduced, but the carpet will be more easily made available for another room. A Turkey carpet in a dining-room is much to be desired, as they are peculiarly soft to the tread, and are warmer to the feet than the other varieties. When, moreover, it becomes shabby, it may be made to look almost as good as new by clipping, or by being shorn by an upholsterer.

Crumb cloths made of linen are almost indispensable in a dining-room, as they prevent the destruction by spots and stains of a handsome carpet.

In the bedrooms, strips of carpet are generally thought the best ; but in a best bedroom, a small Axminster is a handsome, although an expensive luxury. There are, however, very pretty squares of carpet now made, moderate in price, most suitable for bedrooms. These should not be nailed down, but allowed to be loose, so as to enable them to be very frequently taken up and shaken.

The stair carpet may be either of Brussels —which looks very handsome, but is expensive—or Kidderminster or Dutch, which are much cheaper, but which wear out very shortly. Many people adopt the plan of purchasing a cheap stair carpet, and, after it has been down some time, of covering it with a cheap floor-cloth, which looks very bright, and is soft to the tread. Linoleum is also at times used as a covering for the stairs, and if a good coating of thick brown paper be placed underneath, it feels nearly as soft as a carpet. It may be had of very bright, warm-looking colours, with a castellated bordering, which looks well on any staircase.

Now as to the necessary articles of furniture in a dining-room. First and foremost is the table ; this may be either of oak or mahogany, and oval or oblong in shape. It should be of a good width—never less than four feet —and of the extensible form, so that extra leaves may be introduced when necessary. This is an article of furniture which may often be purchased at a moderate price second-hand ; and good furniture of this description is very much better than some of the new rubbish that is very frequently seen advertised as "cheap dining-room suites." Six good chairs, and an easy one— if there be sufficient space—and a side-board ; or if the room will not admit, from its size, of this useful article of furniture, a "dumb-waiter" must take its place.

The curtains should be of a warm tint for winter — muslin curtains underneath the thicker material, which may be had of various sorts. Nothing, however, looks better than claret-coloured rep.

A few flowers should be in a vase on the sideboard, and also a few plants in pots in the window.

Where the dining-room is large, two easy chairs may be safely placed in it, and also a comfortable sofa. In the dull Winter evenings, many a cosy chat may be had after dinner. It is then the family home is appreciated more than ever ; and the knowledge of this fact adds greatly to the pleasure of the good housewife.

COMMON SENSE ABOUT ATHLETICS.

By a Consulting Physician.

BY the term "Athletics," I must be understood to mean any or all of the various forms of muscular exercises, adopted with a view to increasing the strength of the body, and consequently improving the health. The word includes something more, however, than such mild forms of exercise as walking, driving, or even riding on horseback. Either of the latter may be pleasant enough, if only for this simple reason, that they are enjoyed in the open air. But they have no direct tendency to develop muscle, nor to bring the body into that perfect form and shape which, undoubtedly, nature intended upright man should possess.

That such form or shape is—greatly owing to the terrible struggle for existence in towns and villages—the exception and not the rule, is no reason why those who have it in their power to do so, should not endeavour to attain to it. All the more so, too, when they remember that health and beauty are in a great measure synonymous terms.

Nor must it be forgotten that the *mens sana*, the calm, collected, and intellectual mind, is most at home, if not oftenest found, in the *corpore sano*.

One can actually feast one's eyes and ears on such a combination of intellect and manliness as that presented, for example, by my dear friend, the late Mortimer Collins ; and from that of Professor Wilson, of Edinburgh, as I was recently told by a pupil of his. That gentleman must have seemed a very King Saul amongst his compeers.

"He was all a hero to us," says his pupil. "How well I mind him, as he used to stride across the quadrangle, appearing to shake the earth at every step, his bonny light hair floating over his shoulders."

Now the class of athletic exercises which are of most value to young women, remember, as well as to the men, are happily those which give the greatest pleasure to the persons engaged in them, and include lawn-tennis, rowing, touring on foot in mountainous countries, or by the sea-shore, and —with some restrictions as to ladies— tricycling.

For men only, we have various games that require not only strength and swiftness, but quickness of eye and skill—notably, cricket, football, golf, or curling. Added to these, we have also such out-door sports as running, leaping, vaulting, and—though unfortunately confined to the brawny, wiry sons of Caledonia—throwing the hammer, tossing the caber, and putting the stone.

Now, neither individually nor nationally, can we pretend to despise the good effects of athletic exercises ; for that country whose sons excel in the field at home, will be the hardiest and bravest, when they have to meet the foe abroad.

Athletics give strength and suppleness to the soldier. They engender confidence, and this is the parent of pluck, and pluck, too, of an enduring kind. It is bull-dog tenacity ; it is "*grit ;*" it is "*stay*," and couples with the splendid audacity which is characteristic of the British Army. It is the "grit" and staying power which make us triumphant in every land the sun shines on. Do not talk to me of courage, if grit does not go along with it.

I can promise that those who go in for Athletics judiciously, but with hearty good will, shall be rewarded before many months are over, with a store of strength and fund of good health, such as they never had before.

I have in the last sentence used the adverb "judiciously," and I have used it most advisedly, as you will see if you read on.

Do I advise, then, young men or women to choose the kind of athletic exercise they think would suit them, in the same way as they choose a hat or bonnet, and forthwith put it on ? Such a course would indeed be the reverse of judicious, for it would be dangerous. The vast majority of the younger generation of the present day is a working majority. Yes, and the work they have to do is, for the most part, far from wholesome. It is work that wears the body, bleaches the face, and whitens the very blood, so to speak ; and the hours of day and week are, alas ! too long. While it wears and tears the body, it saddens the mind. To take an individual—say from behind a counter—and put him to such hard work as even cycling is to an amateur, would be to endanger his health, or even his life itself. For, mind you, in such a case, it is not the muscles only that are weak and flabby, but such vital organs as the lungs, the liver, the kidneys, and heart, to say nothing of the blood-vessels of the brain itself.

Now, hard spells of athletic work or sport would send the blood in a rush to these weakened organs, and what would be the result ? Why, something of the following nature : enlargement of the liver, with derangement of all its functions ; stretching of the right side of the heart, which might result in permanent and irreparable injury, or mischief to the tiny cells that time could never repair.

This is just the place and time, methinks, to address a word of warning anent cycling in childhood. I am sorry to say that I seldom take a spin myself, on any beaten highway, without meeting or passing some boy or girl struggling along on a tricycle many times too heavy for its years. I am not much of an advocate for allowing children to cycle under the most favourable circumstances, but to permit them to mount, and go perspiring along dusty or muddy roads, on dusty, heavy machines, is positively not only cruel, but a crime on the part of those who own them. Just think of the possible—nay, the probable—after-effects : injury to the spine, injury to the joints ; in some cases bent bones, or, worse than all, a dilated heart, which may mean years and years of wretched life, and an early death at last.

Think of it, parents, I adjure you ! He who talks to you is not only a medical man of some experience, but one who has ridden the cycle for fifteen years, and knows exactly what it is, and what it is not.

From what I have already said, then, about work-a-day men and women, it will be readily guessed that I recommend some intermediate treatment to be adopted, before going into any kind of exercise to which the term Athletic can be applied. I certainly do. I wish those who are not over-strong to creep before they walk, and walk before they run. Even clerks and shop-keepers, whose iron steeds were their truest friends the Summer before, must not mount their cycles in Spring, and try to do the journeys they did in Autumn.

I will now take a supposed case. Here I have a young man of about twenty or a little more, who is engaged nearly all day at work in a shop that might be more healthy, were it better ventilated. He has, however, his evenings to himself, and at least a half-holiday every week. Can *he* do anything in the

way of athletic exercise to make himself stronger?

I examine him, both heart and lungs, and I find him free from any illness constitutionally; but his arms are not those of a blacksmith, nor are his legs at all like a Highland soldier's, and a very little exercise would make him pant and perspire.

What can I do for such a case? Why, quite a deal. Health won't be hurried, you know; but if this young man will follow my advice, I guarantee that in two months' time he will be, not only stronger, and far more muscular, but will have better blood in his veins, and a happier, more independent look in his eyes and face.

But before he begins regular gymnastic exercise of any kind, he must—positively *must*—undergo a kind of preliminary training. You will observe that my patient in this instance is not fat; if he were, I should have to melt him down considerably, for no one man's skin can contain much muscle *and* adipose tissue on the same day and date. No, he is lean, and he does not look overwell fed either. He tells me that he has not a great deal of appetite at any time, and that he never was a big eater. We who see him can easily believe that. How does he spend his days? Well, he does not get up until he has barely time left to hurry over his breakfast and be off to his duties. Then dinner is not much of a meal—it is more of a scramble; and after supper he feels but little inclination to go out, or if he does, it is merely to "loaf around"—the slang is his, not mine,—meet a few friends, talk, smoke, and perhaps go in for a game of bagatelle or billiards, or take a turn down the town. Then to bed. And so on all the week till the Sabbath comes—a day of rest; too often made a day of utter lounging, and uselessness to either body or soul.

But this young man has some spirit, so he makes a good patient. I commence by insisting on his getting up at seven o'clock in summer, and half-past in winter. I insist upon his having a cold—or tepid, if he is very weak—sponge-bath first thing. The tub has been put there the night before, with two handfuls of ordinary sea-salt thrown into the water.

Then five minutes in the open air, and so in to breakfast, which must be substantial. The appetite at first must be encouraged by a bitter infusion of quassia, with ten or fifteen drops of tincture of iron in it to each dose. This is to be taken before each meal. The breakfast should be oatmeal porridge, or eggs and bacon, fish, etc. He must live as well as possible, and have meat once a day, with a good allowance of vegetables. He must sleep on a hard mattress, with no more covering than is necessary for warmth. His bedroom should be very well ventilated. He ought to take a good, quick walk at mid-day, and a long one every evening, no matter what the weather is. He should get some one to join him in this *régime*. It is far easier for me to train a pair than one. Then he must abjure bad habits of every kind, and he must cultivate a pure mind, thus he will be ready for the next stage of healthful muscular development in about three or four weeks.

Come on, then. Here we are at the door of a gymnasium. He must join the class for exercise in the evenings. Stay, though! he says he really cannot afford it; that little advance in his salary, which he had more than half-expected, has not come yet. Well, never mind. I, his trainer, am not going to be discouraged, so he needn't be. Of course I should have preferred his joining a class, but we go straight away home, and on our way we call at an ironmonger's, and purchase a pair of dumb-bells. No, not that pair—they are too heavy. These, please, because you can lift them with ease. And notice that the bells open, so that as one gets stronger, he can weight them. Lying there is another form of dumb-bells, with a long rod uniting them. These are excellent, being used with both hands. Now, with these dumb-bells I must have my patient—my man, I may call him now—take exercise for fifteen minutes before breakfast, and for at least half an hour regularly every evening.

If my man were a lady, then, instead of dumb-bells, I should probably recommend the india-rubber chest-expanding bands. They have a handle at each end, and are drawn out while the arms are being slowly extended in every possible direction, to bring into play the muscles of the chest or body. The exercise should be taken in a court, or exceedingly well-ventilated room, preferably with the windows wide open.

Without drawings, it is impossible to give the exact movements of dumb-bells, or chest-expander exercise, and so it becomes almost a *sine quâ non* that the man or lady has one lesson from some qualified teacher. The exercise, however, must be carried on regularly and slowly, day by day, increasing the length of time each day, if possible. It should never exceed the bounds of fatigue, but be just on the verge thereof. It should make one perspire freely at first; but after a time, when the muscles begin to harden, there will be little if any of this.

When using dumb-bells or band, the dress must be loose and light.

In the next Paper I will take my pupil a stage further, and introduce him to the practice of athletism in a more extended sense.

(*To be continued.*)

BRIEFS.

THE MAYOR OF ARGONIA, KANSAS.—In the Spring of last year, when the time came for the election of the Mayor of Argonia, little or no interest was shown in the duty by the citizens of the town, until two days before the election day, when, no candidate having been proposed, a Meeting was called of the Women's Temperance Union, and a candidate for the mayoralty and five council men were nominated. Early in the morning on election day, a publican, for a joke, got some tickets printed with the names of the five Council men proposed at the Women's Meeting, but substituting a Mrs. Salter's name for that of their candidate for Mayor. The friends of Mrs. Salter hearing of this, went straight to the house, where they found her busy at the wash-tub, and obtained her consent to serve, if elected. They then set to work, and before the setting of the sun, Argonia had elected a woman to be the chief person in a population of about five hundred, with the magnificent salary of five shillings a year!

THE TOBACCO HEART.—Out of twenty young men who competed for a West Point cadetship at Westfield, Mass., ten were rejected by the physician because they had the tobacco heart, "brought on by cigarette smoking."

There are 430,000 married, and 370,000 unmarried, men in Paris.

BRIGHT POKER, ESQ.

By EDWARD BUTLER.

I AM the Bright Poker. I live in the drawing-room. As I have nothing to do, and need not work for my living, I may be described as a gentleman. It would be correct to address me as Bright Poker, Esq. I move in the best society. My intimate associates are the Honourable Mr. Shovel and the Very Reverend Long Tongs. We are all kept bright at the public expense. The Very Reverend Long Tongs has a curate,—the Rev. Short Tongs. Mr. Shovel has a servant named Coal Scoop, and I have a Working Poker. Curate Tongs (rather, Rev. Tongs, as I sometimes call him when I am spiteful), with my own brisk little factor and Scoop, do all the work. In revolutionary times, when democratic boys come home from school, we three principals are sometimes rudely set to work; but the indecency of this behaviour is always speedily rebuked by the conservative authority of the household. I have even heard the master of the house jeering at us as ornamental vanities; but I know my position and sound value better than he does. Why, if you were to banish me and the Honourable Shovel and Very Rev. Tongs, think what a dangerous precedent you would set! I defy you to venture on it! You daren't! You would shake the foundations of the Constitution. Establish the principle that those who do the work should have the pay, and where are you? Not a vested interest would be safe, and where would Britain be then? In realms political and realms ecclesiastical, could you bear to dispense with me and my relations? Many Christians of the greatest respectability come to put their feet on my fender, who are too superfine to be thrust into the fire of political strife. They share the cooking that is done in that fire, but they are careful to separate themselves from agitation and other Working Pokers. How could you affront their tender and ornamental feelings?

There is a point in which I am superior to my human analogies. I am above the meanness of stirring the fire exactly at the moment when the company gather round, and the coals are all ready to deliver a glorious burst of flame, which will call forth rapturous encomiums. I let the Working Poker do the business to the last, and get the credit. You don't. If an agitation be got up about a burning question of the period, your Bright Pokers hover about, waiting to see if the question is burning enough to make a grand blaze, and then they come and hustle the Working Pokers, and give a few graceful, ornamental flourishes at the coals. At the last great meeting which you hold on any question of the day, you adorn the walls with placards, informing the public that the chair will be taken by Bright Poker, Esq., and the meeting will be addressed by the Very Rev. L. Tongs, the Honourable Mr. Shovel, and other influential gentlemen. I always know when the hard work is over, and the glory beginning, by seeing these gentry trotting eagerly to the front.

Abilities.—It is not great learning, great abilities, or great talents that win the day; but these in moderation, with the steady determination to succeed. The man who uses his one talent well, gains far more than he who has twenty talents buried in a napkin or carelessly frittered away.

DARKNESS, DAWN, AND DAY.

A STORY OF THREE SNOWSTORMS.

I. Darkness.

THEY could not go. Twelve miles across a bleak moorland, in the darkness of a winter's night, when snow was falling thick and fast, hiding many a familiar landmark, and filling with its treacherous, yielding mass, many a rut and hollow; even for his pretty Maude's first ball, Mr. Brenton would not run the risk. So old Brown, who had known "Miss Maudie" since she was a baby, was told that his fine pair of bays might rest in their warm stables that night, and Mr. and Mrs. Brenton and Maude settled down as best they could; though ordinary evening occupations seemed flat and meagre, after the high expectations they had formed.

Maude was too sweet-tempered a girl to be sulky, or to make those around her unhappy, because the weather was bad; but when she went to her own little room that night, and saw the dainty ball dress, with its soft white satin folds, her heart sank more than a little, and something very like tears gathered in her eyes.

Sitting in her own low wicker chair before the bright fire, Maude had a long, quiet "think." One by one all the household went to rest, till there came the last sound of all, the locking of her mother's door—a sure sign that no one was up or about. Maude was quite alone, save for her busy thoughts.

It was too bad that the snowstorm should have come to spoil her very first ball; no wonder she felt put out about it! She pictured all the gay scenes on which she had dwelt in fancy for weeks past; now they had vanished into nothing. How thoroughly dissatisfied she felt,—not a bit of interest in anything, not a morsel of energy or vigour for either work or play! But in those silent hours, the conviction forced itself on her mind, that all her restlessness did not arise from the snowstorm; there was something behind. Maude owned to herself that there was some yearning as yet unreached, some void unfilled, some want unsupplied, which even the ball, with all its fancied brightness, would not have set right. She was thoroughly vexed with herself. What more could any girl desire in the way of pleasures and possessions than *she* already had? One by one she counted them up, and told herself she had simply everything; but the *want* remained, and she could not deny the fact. Surely it was possible to be satisfied; surely the Creator had not given man a craving which He did not mean to supply; somehow she must find it all out. She had heard some one say that *religion* alone could satisfy the heart, but she was not quite prepared to go in for that yet; she would try everything else first.

So Maude Brenton mused till long past midnight, and at last closed her eyes with the puzzle still unsolved, while the snow fell thick and fast on the face of the sleeping earth.

II. Dawn.

A YEAR later. It is early morning, and again the snow is falling on moorland and village street. The tall, gaunt trees bear ghostly white shrouds, where summer greenery once had been, and a bitter wind drives the soft flakes almost fiercely through the air.

It was a wild morning for any girl to be out, but down the village street came Maude Brenton, wrapped in warmest furs, and struggling with a great umbrella, which gave but slight protection from the whirling snow. On her arm hung a strong, roomy basket, from beneath the lid of which a white cloth peeped out, telling of soup or jelly, or some such kindly gift for those in need.

Maude had long tried to find an answer of her own to that question which had puzzled her on the night of her first ball. More pleasure she had tried, more excitement, more dress, but they only made the craving worse.

Only one thing remained — religion, so she made up her mind that she would turn to that; she would try good works, and give up all such pleasures as dancing, except just now and then.

Maude did nothing by halves. The village folk were poor and rough, but she plunged eagerly into work amongst them. On two afternoons in the week, she went from house to house, exhorting the people to be regular at church, and to use every means of grace within their reach. She started a Penny Bank and a Clothing Club; she had Cottage Meetings, where she read to the people of thrift, honesty, and cleanliness; she gave up more than half her allowance to buy things of which the poor were in need; and she let no stress of weather keep her from her post.

Indeed, Maude was rather glad when this bad snowstorm came, just as she started on her mission, in the grey dawn of a winter's morning. It made one feel so good to go on an errand of mercy under such unfavourable circumstances. Her father had heard her as she passed his door, and had expressed grave doubts as to the wisdom of her going out at all on such a morning; but Maude had lightly set them aside. It was self-denial, she told herself, to go out in such heavy snow, and self-sacrifice must surely bring her happiness.

So on she went, till she came to the end of the street, and raised the latch of Widow Wilson's door. The old woman still lay in bed, shivering in the fireless room; but before long, Maude's skilful fingers had set a bright fire sparkling in the grate; the basket yielded up its store of comforts, and with a cup of hot tea in her hand, she sat down by the bedside for a chat.

Widow Wilson was very infirm and weak, but to-day it seemed as if her mind was in a worse state than her body. Maude's attentions scarcely soothed her at all, so at last the girl read the Psalms and Lessons for the day. The sweet Bible words seemed only to make her worse; she tossed from side to side, and at last cried impatiently:—

"I've nought to do with words like those; I'm a miserable sinner; pray for me now, Miss Maude."

Maude opened her Prayer-Book, and kneeling reverently by the bed, read the beautiful words of the General Confession in a low, solemn tone; but when she stopped, the woman said anxiously:—

"There's more, far more than that. 'Tis the storm that makes me wild, for I drove my only boy from me, and made him hate the name of home, and now he's far at sea, with none to say a word to him of God; and if he's drowned, I'll have to answer for his soul!"

Again Maude turned the leaves of her book, and read the "Prayers for those at Sea," but still the woman was not at rest; she seemed to need some word for herself, some personal confession to a personal God. And Maude was dumb; she had never prayed aloud; she worshipped God, but she did not know or love Him; how could she lead the soul, in its agony, by a path which she knew not herself?

"I'll send the Clergyman, Mrs. Wilson," she said, as she rose to leave; "he will know how to help you."

"I s'pose he will," answered the woman, "but I thought those that knew *anything* of God could say a word to Him for a sinner like me. Send the Minister, quick, Miss Maude, for my sins weigh on me like lead."

Poor Maude! Her heart was very heavy, as she trudged home through the snow, after she had left her message. What was all her "religion" worth, if she could not use it to comfort a soul in sorrow? Was the power of soothing bodies all she had gained by her work? If so, her peace was but a shadow, that could not stand face to face with the stern realities of life. For a time, "religion" had seemed to fill the void, but now the old heartache had come back, worse than before. As the cold snow clung to her tired feet, Maude realised that the darkness of her heart had only changed to a cold, grey dawn; that, for the warmth and brightness of the day, something more was needed, which as yet she had not got.

CHAPTER I.

A LITTLE SPARK MAY KINDLE A GREAT FIRE.

THERE was going to be a great cricket match between the rival villages of Allandene and Oaksworth. Quiet, drowsy little places both of them, and evidently considered of little account commercially, for railway trains held proudly aloof from them—ignored their existence, in fact. From Allandene, on a still night, you could just hear the distant roar of the wheels, subdued into a sound like falling water, by the woods and hills that intervened. But that was all.

To live at Allandene was like being back again in the middle ages, for here was no telegraph wire and no reading room, and it is currently reported that the post-mistress often forgot the day of the month.

To know, then, that the good folks of Allandene were content with their life and mode of existence, only proves how little one needs in this world to make one happy. The place itself was pretty enough in all conscience—pretty in its very quaintness and rusticity, and pretty in its wealth of foliage that embowered it more than half the year round. To be sure the roads were not over-well paved, but this was probably an advantage rather than otherwise, for spring and autumn rains had formed little courses for themselves on the slopes, and every horse about the place knew precisely where to secure good foothold when snow and ice were underfoot. The cottages seemed quite independent of each other, for, while it pleased one to face the street, another chose to turn a cold shoulder towards it, while a third thrust an elbow, so to speak, half-way across the road. This latter had an eye to business, and contained a shop window. But each cot could boast of a garden, and the owners vied with each other in the usefulness and beauty of their plots.

Better and more modern cottages there were in the outskirts; but the one peculiarity that every house in or around Allandene held in common, was the beauty of the roses and climbing plants that bedecked, ay, and hid its walls. To see the trailing roses in June was worth a king's ransom.

And it is in the month of June our story opens. If you had sat for an hour under the two great elms in front of the "Dew Drop" alehouse, on the eve of the cricket match, you would have heard talk of nothing else.

"Allandene's goin' to win, Bill," said Gossip Gray, putting his pewter on the bench.

"Ay, neighbour, that we be. When we've got two such lads as Spencer Rae and Godfrey Dennis, what's to hinder us?"

"Nothing whatsomever."

The two young men thus proudly alluded to were the sturdy, handsome sons of neighbouring farmers and brothers-in-law. Gentlemen farmers they were called, because they owned the broad acres they tilled.

It is almost needless to add that Godfrey and Spencer were friends, as well as cousins. Neither had reached the age of twenty-five, so they were not beyond the time of life when one takes delight in every sort of county sport and game; but if on the cricket field, or on the adjoining lake in winter, they vied with each other in feats of agility, such a thing as jealousy or chagrin had never yet found place in their breasts. What added materially, perhaps, to their friendship, was the fact neither had a brother. To Godfrey's only sister, who was a little older than either, they were always "the boys;" and whether they went to church or market, mill or fair, much surprised indeed would Maggie Dennis have been to have known that the one returned without the other. Such, then, were the pleasant relations between them.

There was no great plenitude of what is called society in the neighbourhood. The country was somewhat rough for hunting; and although there was a sprinkling of county families in the district, they never mingled with either agriculture or trade, and when they wished to be gay, they imported their friends from afar. So, with the exception of the doctor and the clergyman and old Mr. Neil, few visitors found their way to the farm of the Dennises. That is, be it remembered, at ordinary times. But the farm lay in Yorkshire, and at the Christmas season, it was good to be there. Perhaps, however, the happiest time of all the year was the shooting season, for then active fellows from town were sure to be down to trudge the moors with Godfrey and Spencer; and as they always returned with splendid appetites, the dinner in the evening was one of the events of the day. Godfrey Dennis's life at the old farm from childhood to youth, and from youth to early manhood, had been a very uneventful one. His mother, who loved him as the apple of her eye, hoped that he would in course of time lead to the altar some buxom Yorkshire lass, and simply settle down as before at the farm. Such a thing as even a year's separation she never would have allowed herself to think about. But the turning-point in Godfrey's history appeared to have arrived when the Neils came to the village.

No one knew why the family had come to bury themselves here, of all places in the world. To bury themselves was evidently their intention, for at first they would neither court their neighbours' acquaintance, nor be courted by them. Had it not been that they were Irish, and pretty well to do in the world, uncharitable rumours might have gone abroad concerning them. But being Irish would account for anything; besides, they went regularly to church, and were good to the poor.

It was at church that Godfrey first saw Rosa Neil. It was really a case of love at first sight; and this is not to be wondered at, for not only was she beautiful, but her beauty was of a stamp, the like of which he had seen but seldom, if ever. The Neils lived in a large and lovely cottage on the outskirts of Allandene. Godfrey made more errands past the house than, perhaps, were necessary. Sometimes his heart beat faster as he caught a peep of Miss Neil on the lawn; sometimes he found the old man leaning over the gate, and got into a habit of lifting his hat, and saying, "Good-day."

But acquaintanceship went no further for months. It is doubtful whether Godfrey did not wish that old Mr. Neil might tumble into the lake while he was by, or that Miss Neil might get chased by a bull while he was near to intervene. But no such event happened, nor seemed likely to happen. Nevertheless, the fact that Mr. Neil one Sunday tripped on the matting in church, and only saved himself from falling, by tumbling into Godfrey's arms, proves that everything comes to him who can wait.

Now, Godfrey hated tea-parties, or "tea-shines," as he phrased it, with a hearty hatred; but he never dressed with more care to go anywhere, than he did on that first evening he was invited to quaff the cup that cheers without inebriety, at the cottage of the Neils. Of course Rosa was there, and during the evening she played and sang for him sweet old Irish ballads, that made poor, love-struck Godfrey's soul sink in sadness one moment, and mirth dance round his eyes the next. I wonder if Mrs. Neil noticed the young man's look as her daughter sang! She must have done so, for she was Scotch, and a very observant body, to boot.

But white-haired, kindly faced old Neil sat in his high-backed armchair, with his hands clasped on his knees, and seemed to doze.

It was at the conclusion of that most pathetic song, "The Wearing of the Green," that he raised his eyes to Godfrey's face.

"You like that?" he asked.

"It is very, very beautiful, sir."

"Bless you for saying so! Let me see,—your name is Dennis. Why, there must be Irish blood in your veins!"

"My grandfather came from Ireland."

"Enough, enough," said the old man. "Shake hands; we are friends from this minute."

Godfrey had hard work to suppress that big sigh of satisfaction, or rather, to make it inaudible.

"You must know my sister Maggie," said Godfrey to Miss Neil that night, as he bade her "Good-bye." "You will come and see us, won't you?"

"Well, yes; I think I can get papa to take me over. Good-night."

Her hand lingered but a moment in his; and what a wee one it felt in his big, brown paw! and what a thrill the touch sent through the great, foolish fellow's heart!

He was half-way home before he stopped short, and, slapping his leg with his open hand, "Bother it all!" he said, half aloud; "did I say good-night to the old couple? For the life of me I can't recollect."

But he had done so all the same.

Maggie Dennis was a very sweet girl, and a very sisterly girl, too, and Godfrey was delighted to notice that she and Miss Neil took to each other from the first. The acquaintanceship, moreover, soon ripened into genuine friendship. And Godfrey soon came to call Miss Neil by her Christian name—Rosa. Such a sweet name he thought it, that he used to murmur it in his dreams.

Truth to tell, Rosa had at first thought honest Godfrey, with all his manly beauty, just a trifle lacking in refinement; but she soon turned to esteem him for his genuineness and worth, and to—well, it must come out—to love him.

If Godfrey had all a Yorkshireman's courage, he had also a considerable deal of shyness mixed up with it, so that it was months after he felt that Rosa reciprocated his attachment, before he summoned up pluck to ask her if she loved him. The answer was a very brief one, but just as sweet as brief, and he never asked her the question again; he was not like some men, who keep pestering the loved one with the same query over and over again; no, once was enough for honest Godfrey.

"Yes!" What a tender and beautiful word! So thought Godfrey, as he stood with Rosa that evening in Spring by the banks of the romantic A——. "Yes!" Why, it was the key that opened the door

of a new world to him! He had not known that he had lived before. Life to him now was a joyous existence. He felt part and parcel of all the light and beauty he saw around him. He understood now why the birds sang so sweetly in bush and copse; why the leaves expanded in the sunshine; why the flowers were painted in such radiant colours; why the trees nodded and whispered in the spring winds, and the glad brooklets went singing through the glens. Love—love—love ruled all.

In his intercourse with Rosa, Godfrey seemed now a changed, a happier, yea, and even a gayer man; he laughed more, he said cleverer things, and made wiser remarks. If ever he had a sorrow, it now seemed lifted off and away from his soul for ever, leaving only his pure and joyous nature beneath. He was never so happy, of course, as when with Rosa; he never did anything but think and dream about her when absent. He felt delighted that she seemed to take an interest in all he did; that she listened attentively, even when he discoursed on reaping machines, or the last new thing in chaff-cutters; that she seemed to be as fond of horses, and all other domesticated animals, as he was; that she laughed so bonnily and looked so charming that he longed to kiss her, when she found herself the centre of a vast, corn-expecting multitude that had gathered round Godfrey, coming at his call, as if by magic, from every point of the compass,—fowls, turkeys, ducks, geese; cackling, chanting, quacking, gobbling, flying, running, waddling, tip-toeing; a babel of discordancy, an ocean of feathers, and all on account of Godfrey.

Now, this manly Yorkshireman had it on the tip of his tongue at that very moment to say to Rosa, "Will you be a farmer's wife?"

The position in the centre of that sea of feathers was, methinks, eminently suited for asking the question that would have made them one for life.

Pity Godfrey hadn't done so. What a saving of future sorrow it would have been! But no; the words hung fire. There was something semi-ludicrous in the situation, he thought. He would wait till they were alone together, with not even turkeys and geese to look at—alone in some romantic spot, at some romantic time, and then——.

Godfrey did not think fit to tell his cousin Spencer about his attachment to Rosa; it was too sacred a thing to speak about, even to his nearest and dearest. But Spencer knew all, notwithstanding, and so did Maggie Dennis.

Spencer was often in the company of Miss Neil. (N.B.—She was "Rosa" only to Godfrey, but her lover was never jealous. Why should he be?)

Now, I have not said yet that Godfrey had a fault, nor that Spencer had either. But who in this world is without his pet failing? Godfrey, as we know, had a little Irish blood in his veins, and there were times when it would surge upwards in quick passion, then fall back, leaving his soul as placid and unruffled as usual. Spencer was a tease,—a dangerous fault at times; but so much did the young men love each other, that never in their lives had they been known to quarrel.

Well, the eve of the first cricket match had come round. The village of Oaksworth was many miles away. The young men sent on their bats and gear, and meant to ride over next morning.

They met at the cross-roads, both light-hearted and happy, both mounted on their powerful half-bred chargers. The day was bright and still, and you might have heard their laugh half a mile away—heard the spiriting sound of their horses' hoofs as well.

Clucketty — clucketty — clucketty. What joyous music it is, whether your horse is leading you to a hunt, or scents the battle from afar!

Clucketty—clucketty—clucketty. Old women in wayside cottages heard the sound, and ran out to wave the "bonnie lads" a kindly good-morning, for they were favourites everywhere.

Clucketty — clucketty. Somebody else heard it, too. A sweet young girl stands by a gate to throw her lover a little bouquet as he passes. She has tied a pebble to it to give it weight. Well she knows he can catch it.

Clucketty—clucketty. Nearer and nearer, and now he is here.

One—two—three. The little bouquet has left her shapely hand. Her bare, well-rounded arm is prettily exposed as she throws it; her slender figure is seen to advantage, and the love-light is dancing in her eyes.

Alas, for the horse's unlucky step, though! For Godfrey misses his catch, and the flowers fall to the ground. Next moment, Pluto, Spencer's noble Newfoundland, stops in his run, takes the bouquet gingerly up, and comes bounding with it to his master's saddle.

Spencer bends down. "Good dog!" he says. Then, with a nod and a smile to his discomfited friend, he detaches the pebble, and quietly places the bouquet in his own button-hole.

Oh, unlucky flower!

Oh, too faithful Pluto!

CHAPTER II.

JEALOUSY.

A MOMENTARY frown darkened Godfrey's features, but, like a cloud-shadow on a landscape, it passed away, and all seemed bright and clear again. He set spur to his horse; Spencer followed suit. From canter it came to gallop, and reins were never drawn until they found themselves at Oaksworth.

The village was *en gala;* a flag fluttered from the portico of the "Jolly Ploughboy;" strings of them hung here and there across the street. To the right, one bright red one, in better condition than the others, was seen high above the greenery of the great elm-trees. That flag was unfurled in Squire Briggs's park, where the match was to be held; and even as Godfrey and Spencer dismounted, borne along on the summer air came the strains of the hired band.

Yes, Oaksworth looked gay enough; the little boys and girls were in fine form, and brimful of expectancy. Nearly a score of dogcarts and gigs stood on the green, and the landlord of the inn was fussing and fuming about in his white shirt-sleeves, hardly knowing where he should stable so many horses.

Half a dozen cricketers surrounded the men from Allandene, and even Godfrey—the affair of the flower all forgotten—was laughing and talking as loud as the best of them.

There was one thing about which the Oaksworth team appeared sure enough, namely, that they would win. There was one thing the men from Allandene deemed as certain as sunrise, namely, that *they* would be the victors.

The field was very gay when once the match was fairly in full swing. It was a pretty sight altogether—the greenery of the grass, and tall, swinging elm-trees, the white tents with their wee red flags, the bright dresses of the ladies, and last, but not least, the men themselves. There was a merry group, too, on the terrace, in front of Mr. Briggs's hall-door, for to-day this match 'twixt Oaksworth and Allandene seemed, to the onlookers, of more than national importance.

A very quiet field it was at most times where the play was at present going on, and it was quiet enough to-day, the stillness being only broken now and then by sound of bat 'gainst ball, or the shouts of encouragement, clapping of hands, and wild excited "Bravos!" of the onlookers.

The day wore through, and the match went merrily on. Towards "time" it was close enough, and when the wickets were drawn, lo! Oaksworth was victorious.

They could afford to be magnanimous. They could afford to group round Godfrey and Spencer, and congratulate them on their good playing. This congratulation was a two-sided sort of an affair, because if Allandene had played well, all the more honour to Oaksworth, who had thrashed them.

But Spencer knew, though he did not say so, that Godfrey was not in his usual form, and that he had not played well—for him—but wildly.

"Isn't he well, I wonder?" he said to himself; "he doesn't seem in form at all."

Honest Spencer! he had forgotten all about that unhappy flower which still remained in the button-hole of his coat.

Godfrey was dull and moody after the play, but this was put down to his chagrin at having lost the game.

He shook hands with "the fellows," but he hardly smiled. No, he would not stay to dine; Spencer might if he chose.

This last was said somewhat pointedly, at which his friend marvelled much, as well he might.

"No," said Spencer; "if you go, cousin, so, of course, do I."

Away they went homewards at a canter. Well, there is something so exhilarating in the very motion conveyed to one on horseback, that the most sorrowful heart must become gay while riding. Godfrey soon seemed himself again, and was presently chatting as gaily as ever.

They now reached one of the loneliest and wildest parts of their route; here the road sweeps downwards, then goes level some way, and once more rises through the opposite wood of light-green oak, and drooping, silvery birch.

Godfrey slackened speed here, and the two walked along for some time in silence, till near the bottom of the ravine.

It was very still down here—only the soothing ripple of the brooklet that came right out of a hole in the hill, fell downwards in a silver cascade, then formed itself into a tiny river, and went rippling away under the Gothic bridge. Only this, the fluting of a blackbird, and the soft wind whispering through the birch leaves.

"Oh! by the bye," said Godfrey, all at once, "how well that flower becomes you!"

"I really had forgotten I had it."

Godfrey bit his lip, but made no reply. He would not have forgotten he had it.

"He's jealous," thought Spencer. "I'll tease him a bit, just to try him, then hand him back this foolish flower."

"It was a thoughtful attention to me on Rosa's part," he said with a smile.

Godfrey gave him one quick glance from under his lowered brow. To hear even his cousin call *his* darling by her Christian name sounded to Godfrey worse than sacrilege.

Had Spencer only known now the fire he was kindling! But he did not. Surely some demon was urging him on to destruction.

"To you?" gasped Godfrey.

There was a moment's awful silence, broken only by the clatter of the horse's hoofs, then one word broke from Godfrey's lips:

"Never!"

He was a little ahead of Spencer, and as he gave this fierce, passionate cry, he reined his horse suddenly, and raised his clenched fist towards his cousin's face. He did not strike him, but his jealous passion needed some vent.

Spencer started back in amazement at the threat, and his horse, mistaking the purport of the action, gave a sudden start, and swerving aside, tripped on a projecting tree root, and flung his rider to the ground.

The young man lay motionless, and the frightened horse went galloping homewards.

(*To be continued.*)

LIVELY TALKS.

No. II.

THE YOUNG MAN AND HIS BIBLE.

By M. Butler Gerds.

SOME time ago, a Clergyman, a very good man, wrote to a young fellow who had been recommended to his notice by anxious friends: "Come and see me on Wednesday evening, at 8.30, and we will have a talk *about the Bible.*"

Do you think young Brown went? Not he! He sent word to his would-be friend: "I do not want to talk *about* the Bible; talking *about it* has put me all wrong."

And we quite appreciate his definition. So we are not going to talk *about* the old Book. The atheist talks more *about* the Bible than most people, but he neither gets nor gives any good thereby. We want to talk *with* the Bible, and *from* the Bible; for we want to show you that it was written for *you*, and that it belongs to *you*.

Now, a book may alter the colour and tone of your whole life. A much-loved and eminent Bishop of the present day, tells how he read a book, lent to him by a bad companion at school, and though fifty years have elapsed since the reading of that book, the poison, the vice in it, has never left his memory. It comes to him sometimes when he stands ready to proclaim the Gospel of Christ, and just as he begins to speak, he is hindered by the remembrance of the awful things he read in that book. He can never forget it.

And it was of a certain book that an Italian nobleman once wrote: "If I had read that book earlier in life, my whole life would have been altogether a different thing."

The late Charles Dickens came suddenly into the company of two men of his acquaintance, one of whom had a godly mother. They were comparing their atheistic opinions, and one of them began to use blasphemous language, and to rail against the Bible. "Stop, man!" cried the author of "David Copperfield." "Can you dare to breathe such words about *your mother's Book?*" "*Your* mother's Book!" And yet you never read it; you regard it as out of date, and very narrow in its views; but hear what it says about yourself, and then you may change your opinion, as many have done, and as you would wish to do, if you felt you were illiberal, or illogical, or unjust. "Wherewithal shall a young man cleanse his way?" (Psa. 119. 9.)

It is a question that becomes more pertinent every day; the tricks of trade; the seductions of sense; the strain upon every faculty; the competitions that run so closely one upon another; the demands of society; the voices within—all these have to be faced and met; and you sometimes feel that, single-handed as you are, life is too much for you, and you *give in.* But stop! You are *not* single-handed; He that is for us is greater than he that is against us, as we have proved in the midst of fiery temptations. How shall you meet this question, this need that you *know* exists in your life, the need to cleanse and to mend your "way"?

"By *taking heed* thereto." Oh! you have done that! You are tired of making resolutions and breaking them. Yes, but this time you are to do it "*according to Thy Word*," the Word of God. *How?* "The blood of Jesus Christ, His Son, *cleanseth* us from all sin" (1 John 1. 7). This is a truth that cannot fail you; it needs no recommendation, as it is for *you.* But, TRY IT.

Now here is a young man quite different from the former: "The young man said unto Him (Jesus), All these things have I kept from my youth up: what lack I yet?" (Matt. 19. 20.) This young man could say that he had kept the whole of the moral law; it seemed to him there was nothing standing in the way to his possession of eternal life; but Christ gauges the depth of his profession. "If thou wilt be *perfect*,"—never mind what you think of yourself, there is still another test, and it is the test of *love*, the eleventh Commandment, as dear old Rutherford called it—"one thing thou lackest," only one, but without it all the rest were dead: "Take up the cross, and follow Me" (Mark 10. 21). "And he was sad at *that* saying, and went away grieved."

Yes, this young man's principles were choked by his purse—he was rich. And are not there many like him? They would follow Christ, but it involves cross-bearing, the giving up of some darling sin, and they cannot bear the test. The highest morality, without God, is but self-flattery and vainglory; and the principles that are so high in the Church, but which split at the door of the counting-house, show "there is something rotten in the state of Denmark."

And is not half-heartedness a miserable thing? There is a very fine fellow spoken of in a few sentences in the Old Book (Num. 14. 24; Josh. 14. 9, 14), and his name was Caleb. Three times does God commend this man. "Caleb . . . who hath *followed* Me *faithfully*." "He hath followed Me *wholly*." "He hath followed Me *fully*." What a testimony! Evidently his heart was right with God: he was one of the sort to whom only an out-and-out service was possible.

Look at John Hampden; his conscience and his principles worked together; he could easily have paid the pitiful little tax, but it was an unlawful one; and, looking at the principle behind it, he set aside all personal interest, and laid down his life for conscience sake.

There used to be an apple-tree at Rickmansworth, whose boughs hung over the church wall; fine, promising, covered with bloom in the spring, *but they never bore any fruit.* Why? Upon getting at the root, it was found to touch the clay of a sewer that ran along outside the church wall; and whose stream, as Summer advanced, sank, leaving only the dry clay. This is a picture of your half-hearted young fellow—he goes to church on Sunday, and he knows all the service in his *head;* but his *heart*-root is in the world, and so he never brings forth anything but leaves.

If there is one portion of the old Book, more than any other, that is specially written for *you*, young man, it is the Proverbs. You will see there, every phase, every temptation, every struggle of your life, set forth as in a mirror. What a picture of one part of your (perhaps) career you will find in chapter 7. You see yourself in the seventh verse, "A young man void of understanding;" or, as it is rightly rendered in chapter 6. 32, "Void of *heart.*" The Latin for heart is *cor, cordis*—giving the first syllable of the word "*cour*age," heart strength.

As you see the young man here, he is a very contemptible creature. After his business of the day is over, just in the dusk of the evening, he hastens along the street; and when he gets to the corner, he looks shiftily around, and then suddenly darts into a house. Follow him! Compel him to come forth. Tell him that she who abides there has "cast down many," and "many strong men have been slain by her;" for "her house is the way to hell, going down to the chambers of death!" Too late! "With her much fair speech she caused him to yield;" he is gone, and he "knoweth not that it is for his life!"

Oh, perhaps this poor young fellow is like *yourself.* We need not mince words. We know that the "flattering lips" and the "impudent face" that often "lie in wait at every corner," are a temptation and a snare; but your Father "is able to succour them that are tempted." Let that poor, painted thing alone. A Hand is held out to you, a Voice is calling you—*you*—YOU! Listen! surely you hear it; it speaks your very name, and though it is so loud, it is very full of hope and love. Yea, though you are in the very coffin, near the grave of doubt, darkness, and despair, you *must* hear it:—

"Young man, I say unto thee, ARISE!"

And you jump up, and look around, and oh, the strength of it! You hear that same voice saying: "Him that *overcometh* will I make a pillar in the temple of My God." You are roused out of yourself. Something in the words, "a pillar"—that which is a support in the building—opens up new hopes. You look into the face of Him that speaks, and you see that it belongs to One Who "was in *all points* tempted like as we are, yet *without sin.*"

It is some One, then, Who knows all about you; no need to be afraid. He knows *all*, and knowing all, He still calls you; for He *needs* you as a pillar in the Church, to testify "what great things the Lord hath done for you." Then "come boldly" to Him; for you will find mercy, and that grace which shall help you in every time of your need; the grace that overcomes and conquers, and the grace that has called so many of us into God's hope and light. Read through the second chapter of the Hebrews, and the last verse will tell you how it is that He is able to so specially help *you.* If any of this chat, with the Bible open before us, has been of help to you; if it, in any way, has shown you that it is a book for *you*, you will not hesitate to read it.

Friendship.—A very needful help in a man's life is wise and profitable friendship; acquaintances can be had in plenty, but to have one with whom to converse, take counsel, or retire, is a wonderful stay at all times. Better one wise friend than fifty acquaintances—a brother in every sense of the word—one able to advise, suggest, rebuke, restrain.

GIRLS I HAVE MET.

By Mrs. Skinner.

III. MISS DIDN'T THINK.

I HAVE often met her; have not you? She has a happy, attractive face, and is a general favourite; yet people treat her like they would a strange dog on a summer day,—warily, watchfully, always at a safe distance. Why? Because she is not to be trusted. "You can depend upon her for nothing," said a friend one day, in a grieved tone. "Oh, yes, you can," said her companion; "you can depend upon her for forgetting everything." Oh, the things she would do, and the things she would not do! all because she "*didn't think.*" Letters often remained in her pocket for a whole week before arriving at the post-office receptacle; to give her messages to deliver was like essaying to carry water from the well in a sieve; some invitations would be forgotten till it was a day too late; continued explorations had to be instituted after articles whose place of deposit was quite forgotten; she would go out on a cloudy day without an umbrella; give baby the scissors to play with; place a burning lamp in the kitchen fire-place; pass jokes with a lately bereaved friend;—all because she "didn't think."

"But why *don't* you think, child?" asked her mother, almost in anger.

"I suppose it is not in my nature," she answered carelessly; "and besides, thinkers are scarce as gold, and I am only like a great many other people."

"Two sinners don't make one saint, supposing you are like a good many others."

One day I ventured to copy out the following paragraph from Mr. Ruskin's writings, and sent it to her by post:—

"In general, I have no patience with people who talk about 'the thoughtlessness of youth' indulgently. I had infinitely rather hear of thoughtless old age, and the indulgence due to *that.* When a man has done his work, and nothing can be in any way materially altered in his fate, let him forget his toil, and jest with his fate, if he will; but what excuse can you find for wilfulness of thought, at the very time when every crisis of fortune depends on the chances or the passions of an hour? A youth thoughtless—when the career of all his days depends on the opportunity of a moment! A youth thoughtless—when his every act is a foundation-stone of future conduct, and every thought a fountain of life or death! Be thoughtless in any after years rather than now; though, indeed, there is only one place where a man may be nobly thoughtless—his death-bed."

"Ah," she exclaimed laughing, the next time I saw her, "I knew the handwriting." (She always took scoldings good-naturedly, and forgot "lectures" quickly). "But you made a grand mistake in choosing that paragraph; the lesson it was intended to teach rolled off me like water off a cabbage leaf.

"I was afraid it would," I replied, with something like a sigh. "Still, I am glad that you have remembered the nature of it."

"You are making another mistake now. It is not because my nature is so hard, that I will not receive good when sent me; but because the whole of that was written evidently for *young men*, and I have not the honour of being a lord of creation."

"The lesson is for both sexes, and the necessity of fulfilling it equally binding."

"Oh! I don't think so; and my thoughtlessness, which is really not so great as you imagine, will never produce much damage."

"You certainly cannot be sure of that."

"You do not think I would let my thoughtlessness do any one serious harm?"

"Not if you *thought first*, but then—

> 'Evil is wrought by want of thought,
> As well as want of heart.'"

"Oh, well, I cannot help it; I suppose I shall be 'Miss Didn't Think' all my life."

"I do hope not; but till you see the *danger* of it, and that it is growing upon you, and make up your mind that you *will* think more, it will continue the same, if not worse."

"Do you think those three things would make a cure of me?" she asked, laughing.

"Yes."

"Then I'll try and remember them, in case of an emergency; but I'm afraid I shall forget."

And the emergency came.

The time had come for their summer holiday. After the usual discussion as to where they should go, Hastings was decided upon, and Miss Didn't Think was instructed to write to a friend who kept a boarding house there, giving the date of their intending arrival, and stating that, if they did not hear from her within four days, they would understand she would be at liberty to receive them. The four days passed,—no letter. In high glee the children began to count the hours till their departure.

The mother, mentioning the fact that they had not received the reply, reminded Miss Didn't Think of her forgetfulness. "I must not tell mother," thought she to herself; "she would be so cross. I will write to-night." But she did not even do that.

Two days later on, something reminded her again of it. "It is too late now," she concluded to herself, "I need not say anything about it; there are sure to be plenty of lodgings."

The next day they started. A cab, loaded with luggage and human beings, drove up to the door of a boarding house opposite to the sea at Hastings, and Miss Didn't Think, followed by her mother, alighted, for once filled with anxious thought.

The landlady came to the door, expressing her astonishment.

"But you had a letter from us, had you not?" asked the mother, feeling alarmed.

"No, I have received no letter."

"That is strange; it was sent. You surely can take us in, though?"

"I am so sorry, but I really cannot. Had I known you were coming only three days ago, I could have done so easily."

"Oh, dear, whatever shall we do! Can you recommend us to any place?"

No, she could not; but, at her advice, cabby drove them slowly about from street to street, and wherever there was a card up with "Apartments" on it, and it looked at all a likely place, there they made inquiries.

At last they settled to take certain rooms, tired of the weary hunt. It was a nice-looking house *outside*, and as they hoped to be out of doors most of the time, it did not matter so much that inside was dusty, musty, and fusty; at least, so Miss Polly Didn't Think reasoned with her mother.

I met them all next day in the Happy Valley, but neither Miss Didn't Think nor her mother looked very happy; evidently they had not yet caught any inspiration, in spite of the sea, the sunshine, the glens, and the niggers.

Sitting on the grassy slope, I was told the story of the missing letter, and given a very graphic description of the new lodgings.

Day after day I watched for them, but not seeing them again, I called at their lodgings.

"I don't know if you can see them, ma'am; one of the children is very ill," said the girl at the door.

"Then I must see them," was my emphatic answer. And I did.

"Oh, I am so glad you have come!" exclaimed the mother. She was standing by the bedside of her sick child. "Look at my Ally, my poor little Ally! She has caught the dreadful complaint, all through coming into these wretched rooms!"

"How can you know that?"

"The girl let it out that there had been a case here before, and the doctor says there is no doubt of it. If I could only know where that letter had gone to! We should never have come here if it had arrived all right, and then my child would not——"

"Oh, mother! mother!" interrupted Polly, who was standing by, "don't say so. She might have caught it at the other place if we had gone there, or even at home."

"Yes, she might, but not at all probable. I will certainly find out all about this letter. Did you post it yourself, or send some one else?"

She told me afterwards that she was tempted just at that moment to tell a lie; she had already acted one. It seemed minutes before she spoke. The mother was bending over the child, trying to quiet it.

"Why don't you answer?"

"Oh, mother! mother! Forgive me!"

"Do you mean to say you never wrote it?" the mother asked, in a choking voice. "Then, if she dies, *you have murdered her!*"

My pen almost fails me.

* * * *

The child died,—

> "And softly from that darkened room,
> Two angels issued, where but one went in."

* * * *

The next time I saw her she was standing by her sister's dead form, with hot, dry eyes, "face to face with her crime."

"I murdered her!" she moaned; "mother says so. Oh that I could die too!"

"My poor, poor child! God will forgive you, and so will your mother in time; this awful trial may make you one of God's own thoughtful daughters."

"Thoughtful? oh, if only I had listened to your cure thoughtfully! Thoughtful? I shall never lose the thought, I killed her, while I live."

Feeling that to be alone with God and the dead were best, I left her, with the prayer on my lips, "God comfort her."

For weeks the mother could not bear her presence. But when she learnt, through many long, dark hours of wrestling, that from the loss of one child she might gain a nobler nature in another, and that our Father is able to bring good out of evil, then she folded her sorrowing child in her arms, whispering, "We will help each other, darling. I would not have Ally back if I could; she is better yonder."

She is Miss Thoughtful now. Bright hours came again, but she will carry a sad remembrance ever with her to the grave; they are scars which never fade.

Slightly altering our national poet's words, I would say—

> "Girls!
> Go to your bosoms;
> Knock there; and ask your heart what it doth know
> That's like this sister's fault!"

COMMON SENSE ABOUT ATHLETICS.

No. II.

By a Consulting Physician.

ACTING upon the supposition that very many of our readers are to be found amongst the classes who have to earn their daily bread, in towns and cities, under conditions the reverse of healthful, I, in my last Article, advised a kind of preliminary training, before going wholesale into the practice of athletics.

Let me briefly repeat that, for individuals so situated, labouring all day perhaps in dusty offices or in badly ventilated shops, it would be highly dangerous to commence taking exercises of the kind I shall now enumerate, without first using means to get the state of their health above *par*. Therefore I counsel living, for a preliminary fortnight or three weeks, in strict obedience to the golden rules of health, and afterwards commencing with the dumb-bells, or chest-expanding belts, or both. When the muscles are in fairly good form—though they need not be of great size—and fairly hard, and one can go up a long, steep stair without any fatigue of legs, then he or she may commence some form of athletic exercise, with well-grounded hope that it will prove beneficial, and, if kept up, lastingly so.

Training, now-a-days, is simply the development of the body to the highest pitch of perfection to which it can safely be brought, by judicious food, proper hygiene, and well-directed exercise.

We have now got to consider, what are the best kind of athletic exercises for general adoption ; the choice of these must, to some extent, be left to the person himself. They ought, of course, to be looked upon as a means to health, without which no sense of real enjoyment in life can be hoped for. While practising these, the home exercise of dumb-bells must not be intermitted ; for this not only prepares the body for what is to follow, but keeps up the strength and ensures that staying power, without which all exercises are merely wearinesses long drawn out.

Walking is a branch of athleticism which is, happily, within the reach of all who have the use of their limbs. There is no primary outlay to be incurred here ; we require to purchase neither horse nor cycle ; we have "shank's mare." God meant man to be a motive animal, and He made him so. Before adopting walking, however, as an athletic exercise, one must consider first how much time he can devote to it daily, and at what hours, or time of the day, is he freest to go in for it. Then he must form his resolutions and act thereon, with a determination that nothing should interfere with.

The best times of the day for walking are —the morning, a short spell before breakfast ; the early part of the afternoon, before dinner ; and the evening. Ten minutes to a quarter of an hour should be enough in the morning, half an hour before dinner, and an hour and a half to two hours in the evening.

It is injurious to digestion to walk after a full meal, and after the exercise is finished, a quarter of an hour, at least, should elapse before sitting down to table.

Presuming that you are in fairly good form, you may commence by doing the morning and before-dinner spells briskly, but not sufficiently so to cause fatigue ; and in the evening, when the chief exercise is taken, it is best to walk steadily on to your journey's end, taking now and then little rests if you find yourself at all tired. You may increase not only your distance every evening, but your rate of speed, and this should be varied now and then with a spurt of running. The dress should be woollen, loose, and light ; the cap should be easy, but not too closely fitting. The ordinary cricket cap has two advantages, it sticks on the head and is not heavy ; but it is not wholesome, it thins the hair, and is no sun-guard, but quite the reverse. The straw hat is far better for walking in, and if the sun is strong, a cabbage leaf will afford ample protection. The shoes ought to be easy and moderately strong, and never allowed to get down at heel, or on one side of the sole.

Walking on the cinder-path is good exercise, but it is monotonous ; and as all exercises must be pleasurable to be healthy, road-pedestrianism is to be preferred.

Furthermore, the direction should be varied every evening, and you should try not to come back by the same road. After some weeks of good, un-intermitting, hard pedestrianism, you can take spells of walking against time. Four miles an hour is fairly good work, five is excellent form, six few can do, nor is it necessary to health.

On Saturday afternoon you should do your long-record spell. You may then give yourself something akin to a good tiring, and if, when you come back, you have a cold or tepid bath, a good rub down, a cup of coffee, and supper afterwards, you have made good progress towards the standard of health.

Rowing.—This is a species of athletics which is not only most enjoyable, but which exercises every muscle in the body. It is just as suitable for women as for men, but to do real good, you must keep up the strength of muscles in your private gymnasium at home,—I mean with your dumb-bells and belts, etc., and you must row regularly, now and then going in for a bit of a spurt, taking care, however, neither to capsize, nor to catch a crab.

Cricket and *Lawn Tennis* are both athletic exercises, but unless you belong to a Club you cannot be constantly at either, even in Summer, and are obliged to fall back on walking, to keep your training up.

American bowls is an excellent exercise game ; so is ordinary bowls, and even good, old-fashioned skittles.

I must now say a few words about that chief of wholesome exercise—*Cycling*. I want to be as practical as possible. Surely it is too late in the nineteenth century to require to speak a word in favour of this manly and pleasurable method of progression.

I do not believe that there is one individual in the street, who meets the wheelman going whirling away towards the country, after, perhaps, a day at the desk, who does not envy him.

Men under forty may choose a bicycle, but the tricycle is suited to *all ages over fifteen*. The first thing to be done is to catch your hare,—buy your machine. I believe this can be done on the hire system, though it is the dearest plan in the long run, and probably, by the time your cycle is paid up, it is used up ; for you can hardly expect to get the very best article in the market in this way. It is far better to buy right out, pay ready money, and claim your discount.

The front steerers are best and safest ; you should have one "coupled up," so to speak, that you may have your legs well under you. You save power thus, and it does not tire one so easily.

Your machine should have all the latest improvements in ball-bearings, etc., and it should be as light as possible, consonant with strength,—for it is a regular roadster you require, not a racer. You must have a gong or bell.

Having bought your cycle, you should take the greatest care of it. It is a useful and a willing horse, and never tires, so long as you do not let it get wet about the joints, and keep it well oiled up. Stable it every night, and if it has been running, dry it well.

Before you start out for a ride, clean it up a bit. A dirty or muddy cycle looks lubberly in the extreme. See also that all your nuts are firm and secure, and that you have in your leather cycle pouch your oil flask and spanner, rag, etc.

If going on a tour, you should carry a knapsack, if a bicyclist ; and if a tricyclist, a waterproof-covered basket, which should contain, for perfect comfort on the road, a change of under-clothing, with two pairs of stockings ; a pair of slippers ; a good umbrella ; a very light waterproof coat or cape ; a thin, warm muffler ; collars, cuffs, and front, and extra shirt studs ; writing materials, and a favourite author or two, to read by the wayside, or when taking your ease at your inn ; some good tea,—the only stimulant one should use on the road, and last, but not least, a tiny tin *multum in parvo*, by means of which you can not only make your tea, but boil an egg or fry a rasher, by the roadside.

I forgot to mention the lamp. Get one that will not bob out when you go over a stone, and do not forget the matches.

The cycling tourist's clothing should be warm and easy without being heavy, and both head and feet should be well cared for.

How to ride.—Do not be in a hurry at the start. Time was made for slaves. Sit erect, unless you have to bend over the handles in doing a hill. Let the feet and legs do the work, and do not keep the body swaying about ; a scare-crow would look better on wheels than a wobbling rider. Let the body be erect, the shoulders thrown back, and the chest well expanded. Have your seat or saddle neither too high nor too low. Breathe through the nose ; a shut mouth catches no flies—nor *colds*.

Beware of rushing hills. Have breakfast before starting on a tour, and do not ride when the sun is extremely hot.

These few hints may be of use to beginners. Experience will teach all else.

In conclusion, let me remind the reader who is wisel bent on going in for athletic exercises, fo. health's and pleasure's sake :

I. That exercises which are entirely devoid of pleasurable excitement are of no more value to you, speaking physiologically, than the treadmill is to the convict.

II. They must be gone into gradually as the strength will bear them.

III. That if not kept up regularly, day after day, about the same hours, they had better be left alone entirely.

IV. That diet and hygiene must be studied.

V. That all out-door athletic exercises, such as walking, riding, or rowing, should be backed up and supported by the use of dumb-bells, chest expander, or Indian clubs at home.

Light.—A rusty shield prayed the sun and said, "O Sun, illumine me with thy rays." The sun replied, "O Shield, make thyself clean." It is vain for man to cry out for light from God, until he has first been washed in the precious blood of Christ.

MY TOPAZ RING.

By Lina Orman Cooper,
Author of "Aunt Tabitha's Trial," "We Wives," "The Cathedral Cave," "Charity Moore," etc.

OW beautiful it is, —my topaz ring!

Three exquisite yellow stones, almost as big as hazel nuts, set in a triple frame of pale gold. It has a curious, old-fashioned setting: a perfectly plain band of the precious metal, which is surrounded with a rim of little beads. A very beautiful ring, as every one says, and worth a good deal. Its intrinsic value is something great; but its chief merit in my eyes, and in those of my mother, is its intimate connection with olden days. The framework is now broken and worn away, but I can remember when it was perfect and complete.

My mother never wore it, and I, Ermyntrude Grey, was nearly eighteen before ever I caught more than a glimpse of it.

Then, one day, in an old jewel box, I came across it. It was my mother's case, and in it she kept her few treasures. Poor mother! they were not many. All her things had been lost in that dreadful Mutiny before I was born. So she had no childish relics or girlish mementos stored away, such as I had after I was married. In that jewel case there was only—first, the topaz ring, and next to it a gold bracelet set with turquoise, a crystal cross my father once brought her from Normandy (perhaps I may tell the story of that crystal cross one day), a black locket containing a bit of my dear father's hair, and a watch and chain that he used to wear.

I took up the topaz ring, and eyed it with much pleasure, but I did not dare slip it over my finger till mother said: "Put it on, Ermine; I intend that you shall wear it in future."

Almost solemnly, for I had a sort of reverential regard for all my mother's "things," I toyed with it, and I believe my face flushed with pleasure, for mother said,—

"I had no idea you were so fond of finery, little daughter, or you might have had the ring before."

My cheeks grew still hotter as I listened, but I made no remark. It was no love for trinkets that made me feel so shy about the gift. I knew the topaz ring had a history (I had heard bits of it before), and I did not want to wear it until I knew whether good or ill "luck" went with the "talisman," as I foolishly named it in my thoughts.

Mother took it out of my hand a little stiffly, and was about to put it away, but I stopped her.

"Dear little ma'amsey," I said, "will you put it on for me?"

She smiled faintly. Then she took my left hand in hers. Only once since have I had a ring placed on my finger as solemnly as my mother drew on the topaz one.

Next she said: "May the God of her fathers bless my Ermine. May this ring be a token that she will follow Him all the days of her life."

Of course I was proud of my topaz ring.

When I went to my usual classes that same afternoon, I made it flash in front of all my schoolfellows' eyes. How they admired it, and envied me! How consequentially I informed them that it was a family "heirloom." Alas! in those days I did not care to adorn myself with the "ornament of a meek and quiet spirit," but I thought far more of the wearing of gold, and of putting on of apparel (1 Peter 3. 4).

That evening mother called me to her side. I went, reluctantly enough, not knowing what was in store for me.

"Ermyntrude," she said, and I knew something unusual was coming. Mother never called me by my full name except on state occasions. "Ermyntrude, I am going to tell you the story of your topaz ring."

A thrill of proud possession seized me. Mother said *your* instead of *my*. So that beautiful, glittering, yellow thing was really my own! I am ashamed to say I was so much occupied in admiring the glinting lights of the stones on my finger, that I failed to see how my dear mother was trembling. After awhile, however, I drew my stool close to her knee and flung my arms around her.

It was a sad tale enough, and, young as I was, I was old enough to understand some of the pathos and melancholy of it.

"I have never told you, Ermyntrude, how I met, and—and—*lost*, your father. I am going to lift the veil to-night. I was only your age, when to the quiet country Rectory in which I was reared, came a young soldier. He was very handsome, dark-eyed, curly-haired, and tall, with all a lad's enthusiasm about his profession. I need not tell you how—but when Ensign Grey left the village, he carried away my heart with him. Our engagement was recognised. Indeed, he left on my finger this topaz ring. Some years passed away, when news came from India that the Ensign had become a Captain, and was ready to welcome me as his bride. I went out, and we were married." My mother's voice broke a little. "It was from a friend's house, and in it we were made heartily welcome on our return from our short honeymoon. Jack was born, Ermine, and we were so happy together and with him. It was not to last. About a year and a half after our marriage, strange rumours began to be circled about. They said the blacks were growing more uppish and insolent every day. We, in our happy youthfulness, did not care. At last word was brought that a 'Chupattie'—you know the story of it all, Ermine, from reading it in history—had been handed into the village. Very soon after our men mutinied. They said the Captain had bid them bite cartridges greased with animal fat. This was an insult the Mussulmen and Hindoos could not put up with. But it was all an excuse. We were sitting at dinner, Jack playing at our feet, when an old 'ayah' rushed forward, and intreated us to fly for our lives. I was not very strong at the time, and your father waited to help me to a place of comparative safety, before he went to call out his men. I never saw him again. They say he found all in a state of mutiny, and that his death was instantaneous. I fled on wildly, almost unconsciously, with Jack in my arms. *He* had told me to go south, and I obeyed instinctively. As we left the compound, however, I looked back and saw our dear little home in flames. That is how it is, Ermine, I have no treasures or relics or mementos. They were all destroyed that night. The only thing I saved was the bracelet on my arm (I was dressed for dinner) and my topaz ring. We met many a terrified party, and I joined myself to one I knew. It consisted of three persons, the Major of a neighbouring regiment, his young wife, and her baby. Strapped to the cart in which lay the girl—she was nothing more—and her child, was the infant's black nurse. Major King had taken that means of preventing the woman from deserting the child. Alas! it was of no use. In the darkness of that terrible night she managed to escape, and the baby was dead when we arrived at a place of safety."

My mother shuddered as she spoke. I implored her not to tell me more. All the gleams died out of my topaz ring, as I tried to think of the dreadful scenes it had witnessed. But she went on.

"Four months afterwards, Ermine, *you* were born. I wanted to call you *Marah*, but the friends who were round me would not consent, and they gave you your fancy name. I am glad of it now. God in His goodness has taken away the *bitterness* of life, and I would not wish to be continually reminded of the past. Every year brings me nearer to the eternal union with *him*, my husband, who gave me the topaz ring, and every hour proves to me that, in spite of all seeming, 'mercy has followed me all the days of my life.'"

My mother had always seemed a wee bit stern and stiff to me. My dear mother! After she had told me her sad story I did not wonder at it. It was only marvellous that the springs of her affection had not altogether been dried up, instead of perennially flowing placidly and calmly and evenly towards her children. I had also imagined that she thought more of Jack than of me. Now all my jealousy melted away.

It was no wonder that it took some years to make her willing to look upon her *Manasseh*, and to "forget" the past; still longer for her to recognise her *Ephraim*, and become once more "fruitful" in the land of her affliction (Gen. 41. 51, 52).

Thus the first lesson taught me by my topaz ring, was the faithfulness of God to my fathers. Another, and a nearer one, I was to learn soon.

* * * *

My mother and I lived together, and by ourselves (except when Jack was with us), in a lonely old house perched on the shore of a northern loch. We were not very far from a large town, but we had to cross the lake in order to get to it. Consequently I was a very tolerable oarswoman. Ever since I could remember, I had regularly to row myself over to school every morning and back again every night. At first my mother used to be frightened, and always sent Richard, our old man-servant, with me. After a time, however, my attendant gradually dropped off, and I went alone.

It was some six months after I became the proud possessor of the topaz ring, that, one day, as my mother and I were walking on the moor overlooking Loch Diamied, we saw a boat, our boat, pulling into the creek under the house.

It was an unusual thing for any one save myself, or Jack when he was at home, to use the old tub, and we were surprised to see a stranger tie it up to its post and make across to where we were standing. I suppose our figures were clearly defined against the sky—mother in her mantle and bonnet, as neatly

"Neat and trim as ever, with his hair brushed smoothly from his brow, his collar and necktie scrupulously arranged, his cane in his hand, his coat over his arm, but with a curious, perplexed look in his brown eyes."

and nicely dressed as if we were walking on the Brighton Esplanade, and I with my rough hair modestly (mother made a great point of the veil) covered with a bit of gauze, and my hands gloved with chamois gauntlets —for the stranger never hesitated which way to come.

I often thought mother far too particular in her ideas, but I must confess I felt glad that I was robed like a lady, when I saw the gentleman walk towards us. We have often laughed over it, he and I; ay, and grown grave over it, too, many a time! For that sunny afternoon walk proved to be the most eventful one of our lives.

My dear mother suddenly trembled, and leaned for support on my shoulder. Then I heard her say,—

"Is it possible? Major King?"

Ah! her memory had flown back to an Indian jungle, and she was once more following a bullock-cart along the unused track. For the face before her was a *fac-simile* of the one that had helped her that terrible night so long ago. The lapse of years was forgotten; so, too, were her own whitening hairs.

For now once more she leant with Major King over the little dead baby. Once more with him, she searched in vain for traces of the Captain who had gone towards the little home so ruthlessly being destroyed, and had reached a more enduring home by a quick and fiery way. Once more —— But the curtain rose as our visitor doffed his hat.

"Not Major King, Mrs. Grey, but his eldest son, Leonard."

They had a great deal to talk about that summer night, as we sat in the blue room in the gloaming. Leonard was so glad to hear about his step-mother, and of his father's brave devotion to the forlorn widow. Somehow we never felt strangers, though I sat apart from the rest, twirling my topaz ring round and round, and letting the gleams of the dying sun flash upon the pure saffron stones. Sometimes I thought I noticed Leonard looking at it, and pride in my beautiful possession grew into a very strong feeling.

The week that followed was one of the happiest in my life. I was going to say *the* happiest, but I refrain. Days and months of such calm, settled joy have since gone over my head that have equalled, if not overstepped, even that week. We boated together, and walked and read together. I believe my dear mother was so taken up with thoughts of former years, that she never noticed whither we were wending. I sometimes saw Leonard look at my ring in a sort of queer, eager fashion. At moments I even thought he seemed to covet it; but we never spoke about it until one lovely evening.

I had shown him most of my particular haunts—the Gull Island and the Beech Wood, a mallard's nest in the tangle of weeds on the borders of the mere, and I know not what. This evening I undertook to row him to the Wizard's Cave, and we set out with much merriment. As I took my place at the oars, I pulled off my gloves, and there was my topaz glinting in the sunlight.

The most eventful walk of our lives.

Now, I had promised my mother never to go on the water with the family heirloom on my finger. A few moments only would have sufficed to run back with it. But vanity suggested another plan.

"Here, Leonard," I said (the Mr. King had been dropped at the beginning of our acquaintance), "please keep my ring for me. It is a very valuable one; but it happens to blister my palm if I row with it."

He took the ornament from my outstretched hand in an abstracted way. Then he examined it with a dark look on his face. I waited for him to make some remark upon its curious workmanship, but, without saying a word, he put it carefully into his waistcoat pocket.

That row was not such a success as our others had been. The Wizard's Cave was just as beautiful with its wealth of hart's tongue and polypoli curtaining each side. The impudent crayfish, with their long feelers and thick pincers, were as quick as ever in crawling away backwards under our feet. The glory of the sunset was just as superb as any other night, but, somehow, there was a constraint between us.

We both felt it. When I made an early movement to return home, Leonard sighed deeply with relief.

It was a silent pair that locked the boat at the little pier, and a very silent pair that walked up through the pine-wood to our house. As we neared the door, I held out my hand carelessly.

"I may as well have my ring back now, Leonard, please."

I shall never forget the look that came over his face as he put in his forefinger and thumb to extract my treasure.

It was gone!

"I have lost it, Ermine," he said, in a harsh, strange way. "I am afraid I can never replace it."

"Indeed you never can," I cried incoherently. "The family heirloom! Nothing so precious could ever be bought."

"I am very sorry, *dear* Ermine," he said, once again, turning out every corner of his pockets. "Particularly as you prize it so."

Mother was standing just inside the bay window of the drawing-room, and heard our voices, of course.

"What can be the matter?" she queried, stepping outside. "Is anything wrong, Ermyntrude?"

I had to tell her. Leonard was silent, as if overwhelmed with the misfortune; but he said at last, when I had finished speaking and there was an ominous silence for some moments,—

"I will buy the handsomest ring I can get in London, Mrs. Grey, if that will make up to Ermine in any way."

"*Nothing* can take its place," answered my mother stiffly. "But it is Ermine's own fault in a way. She disobeyed distinct orders by wearing it on the water."

There was only one chance. The ring might have been dropped in our walk up from the boathouse. It was getting quite dark, so Leonard went off for a stable lantern, and mother put on her bonnet.

"You stay at home, Ermine," she directed. "I must try and find your father's ring."

As the two gradually drew out of sight, I threw myself on a sofa in a tumult of tears. I had lost what money could never replace. One of my mother's only treasures. My topaz ring!

What should I do?

It was only quite lately I had begun to believe in a prayer-hearing God. Only quite lately that I had learnt to put my trust in a loving, heavenly Father; but, as I lay in the twilight with my face hidden in my hands, I seemed to hear a gentle voice: "Whatsoever ye shall ask in prayer, believing, ye shall receive. *Whatsoever*, Ermyntrude Grey."

It seemed almost profanation to me then (though since that night I have learnt that nothing is too small, as well as nothing too hard, for the Almighty) to mention so worldly a thing in prayer. But once more the words came, "*Whatsoever*, whatsoever."

"Dear Lord,"—it was a childish, untaught prayer, but it came from the depths of a heart really distressed—"if Thou dost hear, and canst answer prayer, let them find my topaz ring."

There were a hundred chances to one against it. The night was dark and the gravel thick. The sand and rocks on the shore of the loch were deep and many. The water near the banks was full! What did it matter to me! God had said "*Whatsoever*," and I believed His word.

I had taken off my hat and lighted the big lamp. I had made the tea, and was getting weary of waiting, when I heard steps outside. No need had I to *ask* about my topaz ring. Mother's face was beaming, and Leonard's voice joyful, as they came up the slope.

"Found! found!" he shouted, the gloom all gone from his brow; "on the edge of the pier, Ermine. It was almost a miracle."

So it seemed to be. In taking the key out of his pocket to lock the chain, he had pulled out the ring. It had rolled to a tiny ledge, only two inches in width, and lay there; stopped, I most firmly believe, by the Finger that has put bounds to the sea, and by a Voice that says to the waves, "Thus far shalt thou come, and no farther."

Mother left the room to take off her bonnet, as she said, but the topaz ring was in Leonard's hand. He held it there wistfully, and I felt constrained to speak.

"I knew it would be found," I said abruptly, for it required a severe effort. "I had no doubt of it."

"Why?" queried Leonard, in not unnatural surprise. "Because you are always fortunate, or because it was valuable to you, Ermine?"

"Neither one nor the other," I answered, with my face flaming and tears in my voice; "but because I asked God, and *He* could not break His 'whatsoever!'"

I do not know how it was, but a moment afterwards Leonard King was at my side, and my head was drawn to his breast while he put on my finger the topaz ring.

"Wear it," he said, kissing the hand he had asked for, and I had given him, "until I can send another to take its place."

So that was the reason all the time of his blackness and silence and wistfulness. Unconsciously, I had worn the family heirloom on my engagement finger, and it had been a cause of great anxiety to Leonard.

My dear mother did not seem so surprised as I anticipated when she came back into the room. I think Leonard must have been speaking to her as they searched together for my topaz ring. She only kissed me and whispered, "God bless my darling."

But what a merry party we were round the tea-table that night! How, instead of "glaring" at my beautiful ornaments, Leonard watched every flash and glint of my topaz ring! How he managed to save my hand from doing any hard work! How he contrived to touch it now and then needs not to be told. Only, at the end of that long, happy evening, I clasped my two hands together between Leonard's, and side by side we thanked a prayer-hearing God for granting us our heart's desire.

It was not very long after that the topaz ring gave place to a diamond hoop; and, not many months later it, too, had to retire to make room for a certain plain gold band that I wear still. That wedding ring has three words in old German letters, engraved inside, "Mit unser Gott," but not less visible to me is the motto to be seen on my topaz one. For once more it was to prove, with God's blessing, a teacher to me.

Our new home—Leonard's and mine—was in the heart of the great metropolis. It was a wonderful change to me after my peaceful, lonely girlhood on the shores of Lake Diamied; and I was anxious that my mother and Jack should profit by it. At this time Jack was idling about at home, not having made up his mind what profession to follow. So I took it into my head that it would be a good thing to have him up on a visit, and give him time to look around.

Leonard did not quite approve. He thought it would be better if Jack were to decide first, and *then* take a holiday. However, he let me have my way, and the boy came up to town. Perhaps it was my being a matron, or perhaps women are really older for their age than men, but somehow I looked upon Jack as a mere lad. He is in reality my senior by rather more than a year, but I patronized and petted him as if the reverse had been the case.

Leonard was away all day at business, and I liked to have some one about me, so when my dear mother wrote and told me to urge the choice of a profession on Jack, I neglected her wishes. "If my brother went away now, I should feel very lonely," I said to myself, and week after week put off the evil day. Alas! that I did not notice how the old words were being verified:

> "Satan finds some mischief still,
> For idle hands to do."

Jack began to go out and stay late at night. He began to be less and less attentive and brotherly to me. He began to be cross, and heavy-eyed, and fractious. Leonard did not notice it. When he came home, the boy was brisk and cheerful. How should *he* know that after he had gone to bed the lad could let himself out, and not return till the small hours of the morning?

Then he began to borrow money of me. At first quite small sums, that I could easily spare from the housekeeping, but gradually his demands grew bigger. I bought cheap tea, and inferior candles, and sandy sugar, and American meat, until even my long-suffering husband began to complain. I had weakly given a promise to Jack that I would not "tell on him," and perversely felt myself bound to my word. So I excused myself to Leonard by saying I had not been out marketing myself lately, but that in future I would see to things better. As he kissed me, and declared his Ermine to be the dearest wife and best housekeeper in the world, I longed to tell him all, but mistaken fealty to my brother sealed my lips.

Now I had to tell Jack determinedly that I would give him no more money. He listened with downcast brows.

"I tell you what it is, Ermine, I *must* have some money this week. It will be the last I ask you for. Give it, like the dear sweet girl you are."

Flattery always had an immense influence on me, and I gave him what he needed.

It is needless to say it was *not* the last time. Gradually *things* were given instead of coin of the realm. Nearly all my girlish trinkets were one by one handed to him, and then there came a pause.

I had nothing more to part with.

I shall never forget that day. Jack, with his boyish face flushed and angry; I in tears, and a great horror before us. For—when I utterly refused to supply him with anything more—my brother told me if he had not the money to replace the sums he had *borrowed*, he would be taken up as a *thief*.

My mother's son! The only representative of a long and honourable line of ancestors a *felon!* The words burnt into my brain, and I sank into my chair gasping.

Then I rushed upstairs to see if there was anything more I could spare. My watch and chain?—that was far too necessary to me. My diamond brooch?—Leonard would surely miss that, and ask me what had become of it. My amethyst bracelet?—it was the only ornament I had to wear on state occasions.

Hopelessly, recklessly, I turned over every corner in the velvet-lined box, and there I saw my topaz ring! I had not worn it for some time, as one of the stones was loose, and the bead setting a little broken. Leonard would never miss that, and Jack must promise only to pledge it, so that it would not be lost for ever.

For one moment I stood with it—my father's ring—in my hand, undecided. Then I heard Jack's footstep go across the hall, and the latch sound in the door!

Downstairs I flew. There was my brother. Neat and trim as ever, with his hair brushed smoothly from his brow, his collar and necktie scrupulously arranged, his cane in his hand, his coat over his arm, but with a curious, perplexed look in his brown eyes.

"Good-bye, Ermyntrude," he said, bitterly, "you will never hear of me again."

How could I help it? The next moment my topaz ring was in his hand, and he was gone.

Of course I expected him to return. Did he not so promise when I gave him the family heirloom?

But I was disappointed.

Leonard was very gentle and patient with me. After his first burst of indignation against Jack, he set his brains to work to find out about him.

The story was easily read and told.

The boy had got into a fast, gambling set. Night after night he had plunged deeper into the mire, until—I can scarcely write the word—he took what did not belong to him—the monies of a certain club of which he was treasurer, to pay his "debts of honour."

My poor mother! Never since the day when she had given me my topaz ring had I ever seen her so moved. All stiffness, and coldness, and stateliness was laid aside, as she bowed herself to meet the blow laid upon her back. My father's death had been a great, a terrible sorrow. But *there* was no dishonour, while *here!*

"*Whatsoever*"—the old lesson connected with my topaz ring was again to be indelibly imprinted upon my heart.

In answer to our impassioned, fervent

prayer, Leonard came into my room one day with something in his hand. A something, battered and broken, with one beautiful stone gone, and the others dim with dust —my topaz ring!

He had recognised it in a broker's window as he passed on his way to the City, and had immediately redeemed it. Better than that, by its means he had been enabled to trace Jack. The man behind the counter said it had been left in pledge by a young fellow not so very long before. From his description, my brother was recognised.

I need not say how we found the prodigal in a far country feeding on husks. How the cry of his unworthiness made us take him back to our heart and home. How we trust that he has, indeed, arisen and gone to his heavenly Father, and received forgiveness.

Leonard has acted nobly through it all. No word of reproach has he uttered for my want of wifely trust and confidence in him. Only, the other day, when he brought me my topaz ring, with its lost stone replaced, and its bead setting carefully mended, he said, gently,—

"Never forget, Ermine, that I am your best friend on earth. Let us have no secrets in the future, dear."

My topaz ring is gleaming on my finger as I write. My dear mother is opposite me, nursing her first grandchild, my precious little son. Jack is toiling away, reading up for the Bar, and Leonard is smiling at me as I look up.

"Don't forget the firstly, secondly, and thirdly, Ermine."

And I will not.

I have learnt three lessons.

One of trust in the goodness of God to my fathers.

One of restfulness on His own promised word to me.

One of implicit confidence in Him to take care of mine.

The unconscious teacher in the Almighty hands has been—

MY TOPAZ RING.

"IS IT RIGHT?"

OUGHT Christians to practise Sunday travelling?

Over 200,000 railway, tram, omnibus, cab, and steam-boat men are kept at work in Great Britain alone, during the day which God has appointed for their rest!

Why encourage Sunday trading in omnibuses, and at railway stations, more than in drapers' or grocers' shops?

God gave to all mankind one day in seven for rest; and man has no right to rob his brother-man of his heritage and birth-right!

The sadly prevalent habit of Sunday travelling is not merely left unattacked by most Christians, but it is Christian people who largely practise and encourage it. Surely it is time for them to awake to the fact, that by using public conveyances on Sunday, they are depriving thousands of men of the day which God has ordained for their rest; they are taking the father from the family, on the one day when surely he should be in its midst; and, above all, they are injuring thousands of souls, not only by keeping the omnibus, cab, and railway men from attending the means of grace, but by making them *dislike religion, which is so much the cause of their seven days' toil.*

"I the Lord love judgment; I hate robbery for burnt offering" (Isa. 61. 8).

AN OLD ROMAN LETTER.

By the REV. CANON DOBBIN, M.A.

THERE is a picture in the Manchester Exhibition, which cannot fail to arrest the attention of every one who has a soul to admire the beautiful and true. A fair young Christian girl is apparently being led away to execution by some Roman soldiers. The story of her fidelity to Christ is so graphically told, that you can almost fancy you see the crown of martyrdom already encircling her brow, while the brightness of the coming glory lights up her face with a radiance not of earth. Close beside her, stand the marble images of the gods, which they seek in vain to make her worship, and right in front of them a tripod, with a brazier full of burning coals, the smoke of which is curling up towards heaven. Only let her cast a few grains of incense on that sacred fire, or lay a proffered garland upon the adjacent altar, and all shall be well. Her life and her liberty shall both be restored to her. But no! Though the bystanders evidently pity her, and the eager looks of the flower-filleted Vestals beseech her to comply, she stands immovable, though not unmoved, for a sweeter Voice than theirs keeps all the time repeating in her ear: "Be thou faithful unto death, and I will give thee a crown of life."

As one gazes at this picture, he cannot help recalling to mind the celebrated letter sent by Pliny the Younger, Proprætor of Bithynia, to the Emperor Trajan, concerning the Christians. And as that letter is an interesting one in itself, and moreover, one of the few contemporary Pagan records that shed light on the early history of the Church, it may not be amiss to give a translation of it *in extenso*, premising that it was written probably about the year A.D. 108, and certainly not later than 117, when Trajan was succeeded by the Emperor Adrian. The letter, which is taken from Pliny's "Works," lib. x., epist. 97, is as follows:—

"C. PLINY TO THE EMPEROR TRAJAN, GREETING.

"It is my custom, lord, to refer to you all things concerning which I am in doubt. For, who can better either direct my indecision, or instruct my ignorance? I have never been present at judicial examinations concerning Christians; therefore I know not what is wont either to be punished or inquired into, and how far. And I have felt no little uncertainty, whether there be any distinction made as to age? or whether those of howsoever tender years differ nothing from the more mature? Whether pardon be granted to repentance? or whether he who has been a Christian at all, gain nothing by having ceased to be one? As to the name itself, even if it should be free from crimes, whether the crimes attaching to the name be punished?

"Meanwhile, in the case of those who were accused to me as Christians, I followed this plan. I interrogated them personally whether they were Christians. If they confessed, I interrogated them a second and a third time, threatening punishment. If they persevered, I ordered them to be led to execution. For I felt no doubt, whatever the purport of their confession might be, that stubbornness and inflexible obstinacy ought to be punished.

"There were others of the like folly, whom, because they were Roman citizens, I adjudged to be remitted to the city. By-and-bye, in the handling of the matter, as usually happens, the charge extending itself, more cases turned up. An anonymous bill of indictment was put forth, containing the names of many who denied that they were Christians, or had been. When, repeating after me, they called upon the gods, and with incense and wine supplicated your image, which, for this purpose, I had ordered to be brought in with the images of the deities; when, moreover, they reviled Christ, none of which things it is said they who are really Christians can be compelled to do, I thought they should be discharged. Others, named by an informer, said that they were Christians, and presently denied it—that they had been indeed, but had ceased to be, some three years before, some more than three, and not a few even twenty years before. These all worshipped your image, and the images of the gods, and reviled Christ.

"But they affirmed that this had been the sum either of their offence or error—that they were accustomed to meet together on a fixed day, before light, and to sing responsively among themselves a hymn to Christ as God, and to bind themselves with an oath, not to any wickedness, but that they would not commit theft, nor robbery, nor adultery, nor break faith, nor deny a deposit when called upon. Which things being finished, that their custom was to depart, and to come together again to take food, in common, however, and of a harmless kind. But that even this they had ceased to do after my edict, in which, according to your commands, I had forbidden their fellowship meetings to be held. Wherefore I believed it to be the more necessary to inquire, even by torture, from two female slaves, who were said to be ministers, what the truth was. But I found nothing else than a perverse and extravagant superstition, and so, having adjourned the examination, I hastened to consult you.

"For the matter appeared to me to be worthy of consultation, especially on account of the number of those imperilled, for many of every age, of every rank, and of both sexes also, are called in peril, and shall be called. For the contagion of that superstition has spread, not only through the cities, but villages also, and country parts; yet it seems to me capable of being put a stop to, and corrected. At least it is well known that the temples, but lately deserted, have begun to be frequented, and the sacred rites, for a long time discontinued, to be renewed, and victims to be sold everywhere, of which, up to this, scarcely a purchaser was to be found. From which it may easily be conjectured what a crowd of men may be reformed, if there should be a place of repentance."

There are several things in connection with this letter worthy of notice. For instance, the striking evidence it affords of the historical truth of Christianity, and that on the part of an independent witness, called upon to deal with it in a judicial way. If Pliny had been a Christian, it might be said his testimony was not altogether unbiassed, and therefore should be received with caution. But now there is no room for such an objection. He was, we know, a heathen, a man of high position and attainments, an official of the Empire, charged with the government of one of its provinces, and therefore weighted with all the responsibility attaching to such a post. His letter, then, may be looked upon as, to all intents and purposes, a state document, nearly coeval with Christianity itself, and of the utmost value and authority.

Well, what does it tell us about the Christian Faith? Within about eight years after the beloved disciple John, the last of the apostles, had gone to his rest, it represents Christianity as an existing fact, of a very real and substantial kind, in the world. It tells us, moreover, that the religion of Christ had spread so widely through Bithynia,—and we have no reason to think it was singular in this respect,—that not only the cities, but even the villages and country parts, were full of it. So that Paganism had been almost driven out of the field by the onward march of the victorious gospel. How are we to account for these undeniable facts? how explain this marvellous progress of a faith so perilous in its profession, so exacting in its morality, and so naturally uncongenial to the pride of man? Was it by the sword it was

spread? No; the sword was against it. Was it by deceit or fraud? Nothing could be more abhorrent to its disciples. Was it by allurements of wealth, or pleasure, or ambition? None of these things were even thought of in connection with it. Nay, it was by the sacrifice of them, that men were called upon to take up their cross and follow Christ. The only rational way in which we can account for the existence and wide diffusion of Christianity throughout the Empire, at such an early period, is simply this, that it is historically true, founded on the facts it professes and proclaims, and with respect to which it has never wavered,—the life and death, and resurrection of the Lord Jesus Christ.

And when we bear in mind the importance of His resurrection, as the great fundamental Article and evidence of our Faith, taken in connection with the equally essential fact of His atoning death, it is surely a matter of deep thankfulness that this Letter abundantly confirms both; for it represents the Christians as meeting together for worship round the *Lord's Table*—the memorial of His death—on the *Lord's Day*—the memorial of His resurrection, that being undoubtedly the "fixed day" to which it refers. And these memorials could never have been established at the first, nor perpetuated ever since, unless the facts on which they professed to be founded were absolutely true, and capable of resisting every test.

There are some other matters of interest here, which we shall briefly notice. What a beautiful and simple picture it gives us of the worship of the primitive Church!—its members meeting before the dawn, not so much through fear, as because it was "very early," when the Lord arose; because, too, they would fain devote to Him the first fresh morning hours, while the dew was yet upon the grass; for they were no sluggards, those disciples of the olden time. They were up before the lark, carolling their matin song, singing a hymn to Christ as God. We are sometimes told that the doctrine of our Lord's Divinity was an aftergrowth in the Church. But how can this be? for "in the beginning was the Word, and the Word was with God, and the Word was God"—the very same truth that we have here exemplified in holy chant and psalm. Observe again how soon the Church found out the power and use of music, as the expression of her new-born joy. She could not help bursting into song, and ever since, in times of revival and reformation, it has been the same. It was Luther's hymns that shook the Papal throne, and we all know what an important place the service of song holds in modern mission work; so that to sing the Gospel, is felt to be almost as helpful as to preach it.

It may appear strange to some, that the Christians should be represented here as binding themselves by an *oath* at their meetings, not to commit any wickedness. But the explanation of this is not far to seek. The solemn celebration of the Lord's Supper was looked upon as an ordinance so sacred, and so binding, that it came to be regarded as possessing all the sanctity of an oath; and hence the name "sacrament" was given to it, for *sacramentum* was the oath of the Roman soldier, promising fidelity to his commander; thus teaching us that as good soldiers of Jesus Christ, we, too, are pledged to fight manfully under His banner against the world, the devil, and the flesh. And it speaks well for the pure morality of the Gospel, as well as the blameless lives of its early followers, that after the most careful judicial investigation, no crime could be laid to their charge but that of "obstinacy,"—in other words, adherence to their convictions and fidelity to their God. Oh that we may be as consistent and faithful as they! Some of them, it is true, under the pressure of persecution, denied their faith and reviled Christ (1 Cor. 12. 3). But the majority of them, we would fain believe, remained steadfast and proved themselves to be what Pliny here describes as "real Christians," worthy of their sacred name.

And now, as we began with a picture, let us end with one. Our author himself is the painter. Look at those two female slaves in the hands of their tormentors! What have they done that they should be so cruelly treated? their tender frames racked and tortured by unfeeling men, insensible alike to pity and to shame! Are they conspirators against the state, suspected of some dark and treasonable design, the secrets of which must be wrung from them by agonies of pain? No, they are two poor harmless women, ministers, or deaconesses, of the new faith, who never did any wrong to any man. And yet the might of the Roman Empire, in the person of one of its most refined and accomplished administrators, thinks it no disgrace to enter into barbarous conflict with them, for the purpose, it is alleged, of eliciting the truth. And the truth we know was elicited, at the same time that a noble testimony was borne for Christ; for those two servants of the Lord, not slaves, but free, whose names we know not, but whose record is on high, strong in the power of Divine grace, triumph over all the assaults of their adversary, and oblige him to confess, "I found nothing but a perverse and extravagant superstition," which, rightly interpreted, means a devotion he could not understand, a piety he could not fathom, a faith whose only limit was eternity, whose only aim and end was God.

"COULD *YOU* SAY IT?"

A True Anecdote.

A FEW months ago, a policeman lay dying. It is sad enough to see a woman die; it is sadder still to see a fine fellow of six feet two lying helpless as a baby, while the Shadows of the Valley close slowly in.

Sergeant S—— was a silent man; even his wife could give us no clue to the state of his soul, and though he let us pray with him, and read to him, he never said a word. Soon it would be too late to ask him the plain question, for the power of speech was leaving him.

A young girl who had often been with him, resolved to find out. The truth had been put before him so often—had he grasped it? He knew death was near—was his calmness only the result of extreme bodily weakness, or did it spring from a firm and steadfast faith in the finished atoning work of the Lord Jesus Christ?

Gently, winningly, the fair young girl besought him to tell her if he could face, without fear, the thought of meeting God? With an effort, the man broke through his reserve, and with a light of peace, almost triumph, on his wasted face, said simply,—

"Safe, POSITIVELY safe!"

A few days later, he *was* safe with his Saviour in heaven.

Straight in the face of death, which might come to-morrow, could *you* say, "Safe, *positively* safe"?

WON BY WORKING;

OR,

HIS FATHER'S GOLD.

By Georgina Gollock,
Author of "Ebb and Flow," etc.

CHAPTER V.

A CAPTURED GHOST.

PLAIN John Smith's keen eye saw the advantages of Gerald's suggested sites. Then and there he made an offer for them, which the young man knew to be unwontedly large. Somehow, when it came to the point, Gerald was very loth to part with the spot, but the builder was quite content to get the quarry plot, and to leave the old house untouched and unpurchased. So, only repeating his proviso about the hidden gold, which John Smith agreed to with an incredulous laugh, Gerald gave his assent to the proposed purchase. The moment matters were so far arranged, the builder began to fidget lest he should lose the next train back to town, whilst Gerald lingered longingly, gazing on the well-remembered scenes.

"See here, Burt," said his employer, looking for the twentieth time at his watch, "I'm off. Never trust these country trains. You go round, and take notes for your plans for these villas. Come up late; see me about it to-morrow. Dare say you'll like a look at the old house again—might find that gold."

"All right, sir," said Gerald; "I should like to have a word with the man I have left in charge."

"By-the-bye, Burt, I'll put *you* in charge here when the works begin. Mrs. Nettie will enjoy the country, and you can look out yourself for that gold."

Gerald laughed lightly. "I don't expect to find it, sir," he said; "but who knows? Yes; I should like to take charge for you down here. The country air will be grand for Nettie and the baby."

Two hours later, Gerald stood again on the doorstep of his father's house, and knocked loudly for admittance.

Abner Holt came slowly from the rear, with a hungry, watchful look, as if he suspected every one, and thought every one suspected him.

"Master Gerald!" he said blankly. Then, "Come round by the back, sir, if you want to get in. That door hasn't been opened for months. A nice, lively time I have of it in this place. Bats and mice and rats, that's the company, except for an odd owl. They say the old man walks, but I don't believe it, and I don't care if he did."

By this time Gerald had reached the kitchen, and leaving Abner behind him, strode on into the dreary house. An idea had suddenly come to him. If he was to take charge of the builder's works, why should not he make a corner of the old house cosy and habitable for his wife and child? At least it would be better than country lodgings, and he knew that Nettie would approve of the plan.

He called Abner to him.

"I think I'll come down myself, and drive out the bats," he said. "These four rooms are in fair order, and will look well enough when they are clean. You find a woman to-morrow to scrub them out. Light good fires, and get the place well aired."

"You're not coming to live here?" asked Abner.

"What if I am?" said Gerald. "They're going to build some villas in the quarry plot,

and my wife and I will live here, while I superintend the works."

"The quarry plot!" and Abner's dark face grew darker.

"Really, my man," said Gerald, losing patience with him, "one would think you were owner of the place! Why not the quarry plot?"

"There's a ghost there."

"Rubbish! It had better not cross my path," said Gerald, turning on his heel. "At any rate, the ghost can't break the contract."

"There'll no good come of building there, mark my words," croaked Abner anxiously, following close behind his master. "Take an old man's warning, Mr. Gerald;" but Gerald was gone.

Four weeks saw the quarry plot measured into squares for houses, its fair green sward disfigured by grimy sheds and piles of materials for building.

Gerald, Nettie, and the baby were at the old house, cosily settled in the most weather-proof of the rooms. Abner, lean and unshaven, haunted the men at their work, and told such awesome stories of the quarry and its visitant, that some of the least stout-hearted began to wish they were well through so unpleasant a job. Gerald overheard him descanting on his favourite topic one day, and instantly forbade him, on pain of dismissal, to approach the workmen again.

That night, two of the builder's men, returning late by the lower path from the village, heard a faint, unearthly cry, and looking up, saw the white shadowy figure of old Catharine at the edge of the cliff.

Some one else saw the figure too. Gerald had also gone to the village on some errand for his wife, and was returning by the hill-side path. He was close to the quarry edge when he saw the "ghost."

Abner's whole attitude had made Gerald suspect him of some underhand intention, and he quickly decided that, for some purpose of his own, the man must be personating Catharine. Resolved to capture whoever was in this ghostly guise, Gerald hastened silently onward, and as the two frightened workmen were hurrying out of sight of that figure on the cliff, Gerald approached it from behind, and laid a firm, detaining hand upon its shoulder.

Abner—for it was he—uttered a shriek of terror, which sent the blood curdling through the veins of the ghost-seers below, and then sank at Gerald's feet, entreating mercy. The young man looked so stern, so unrelenting, as he stood erect in the fitful moonlight, that Abner fairly cowered before him.

For a few moments the silence was only broken by Abner's inarticulate whimpering. Then Gerald spoke.

"What is your object in all this mummery? Speak the truth, Abner Holt."

"Oh, sir!" gasped Abner, "I'll make a clean breast of it all, only don't be hard on me."

"Come home, then," said Gerald sternly, "and tell me all."

Slowly Abner, his long white sheet trailing over his arm, and his blue-glassed lantern in his hand, followed his captor to the miser's house.

Gerald entered by the kitchen, not wishing to alarm his wife, and lighting a candle on the table, locked both the doors.

"Now tell me all," said he, and Abner began:—

"I knew something special took old Catharine to the quarry, and I guessed twas the gold. As like as not, the old man told her his secret before he died. I found *that* in the quarry, sir;" and going to an old box in the corner, Abner drew out a remnant of the well-known coat, which "old Si the miser" had worn for years and years. There was no mistaking that peculiar faded brown, with the slight red thread crossing it here and there. Gerald's cheek deepened in colour as he held the piece of cloth in his hand.

"You found this? Why did you not bring it to me?"

Abner began to whimper again.

"Never mind that, man; go on with your tale."

"I made sure, Master Gerald, that the gold must be in the quarry. That's what made me act the ghost to keep people away; but never a coin have I found in all this time, and now those builder's men will make away with it all."

"Don't judge them by yourself," said Gerald. Then he left Abner without further reproach, and, with the fragment of cloth still in his hand, went and told his wife.

Nettie grew very thoughtful over his tale. "Gerald, I almost hope we shall never get that money; it seems to cause nothing but misery and sin. How thankful I am that you have owed nothing to it; its terrible infection has not tainted you!"

"Yet the money that has been a curse might be made a blessing if rightly used," said Gerald. "How strange it will be if this building work leads to the finding of the missing gold. I must have a word with the men about it to-morrow."

"At any rate," said Nettie, looking proudly into her husband's manly face, "lack of gold has not made you one whit less well worth loving. You are nobler now than you ever were."

"I scarcely think you are an impartial judge, little woman," said Gerald; but in his inmost heart he owned that such wifely flattery was very sweet.

CHAPTER VI.

AT LAST!

GERALD told his men the whole story next morning, and the two who had been previously relating their experiences of the night before, had to endure not a few good-natured jokes at their expense. Carefully, as they went about their work, the builder's men watched for any trace of previous excavation, any stone beneath which a box might lie, any suspicious-looking cranny into which the treasure might have been stowed.

Each time plain John Smith came down, he made inquiry whether the gold had been found, but the answer was always the same. As the foundations were finished, and the neat proportions of the villas began to appear well above ground, Gerald's expectations failed. For him there was no golden road to his ambition,—the free pursuit of his art. Slowly, step by step, he must climb the ladder in daily, toilsome work.

He bent his head, and was content. The man who had grown strong enough to govern others, had learned the higher strength of a yielded will. God knew best. If the earthly life-time must pass in uncongenial labour, there was still the full fruition in the life beyond.

But oftentimes, when we least expect it, the yielded will has fruition in this life, as well as in that which is to come. Gerald had learned the lesson; the Master's hand made haste to turn to another page.

Athwart the dark background of greed for gold, of angry passions and unhallowed desires, comes a fair-haired baby boy, laughing in childish glee. Mother had promised to take him for a walk to look for "pitty f'owers." So out into the summer sunshine went Gerald's wife and child. The baby boy had a grand ball to play with, a gaudy, many-coloured thing, and he raced after it to and fro.

They would go to look down on father at his work, Nettie said, and she took the upper path by the quarry edge. "Boy" reluctantly gave up his liberty when the edge was neared, and was held firmly by his mother's hand. Gerald, looking up from below, saw them, and came to join them for a while.

The three stood together, just where Gerald stood when he saw the *something*, that had been old Catharine, lying crushed below. He and Nettie were silent. The silence ill suited "Boy." He seized his painted plaything, and with his free hand flung it from him. Gerald sprang to stop it, as it rolled to the quarry edge, but he was not in time. On, on hurried the ball, its patches of red and blue showing clearly as it sprang from rock to rock; then, near the bottom of the quarry, after one long bound, it disappeared from sight. It must have fallen into a hole, and Gerald thought he could trace a dark square opening. It was only about twenty feet from the ground, and fairly easy of access from below. That naughty "Boy," who was bearing his mother's reproaches with smiling mien, should have his plaything back. In five minutes Gerald was at the foot of the cliff, and mounting towards the ball. But in climbing upwards, easy as was the way, Nettie saw that he missed his footing, and almost fell. Little wonder. Fluttering on a stiff bramble that crossed his path, was another weather-stained fragment of his father's coat. He climbed on again, and reached the hole into which "Boy's" ball had dropped. He took it from the crevice, and felt what lay below—it was a box with iron clamps.

Gerald had found his father's gold! An hour later, amid a crowd of the men, he stood above the opened box. The neat rows of bags showed that the miser's hoard was worth finding indeed. One bag they opened, and "Boy" plunged his chubby hands into the shining pile. No one checked him, for, after all, "Boy's" ball had a large share in the discovery.

There is little more to tell. John Smith growled a good deal at losing his foreman, but he made his will in Nettie's favour all the same. Gerald rebuilt his father's house; the villas had spoiled his plans for the quarry plot. While the old builder saw to the carrying out of the contract, Gerald took his wife and child abroad.

Abner had been sufficiently punished by his humiliation, and the failure of his hopes, so Gerald kept him on till he died.

Nettie is now a comely, middle-aged matron, with tall daughters around her, and "Boy," her only son, is a young architect, who bids fair to make his mark some day. Gerald is a grave, true-hearted, earnest man, foremost in every effort for good amongst his fellows, and gifted with a strong, quiet influence which is widely felt. He has gained his ambition, and stands well to the front in his profession. He knows that but for the miser's hoard, he could never have been an architect; yet, as he recalls his life, he feels that the best things in it, ay, and the best things in *him*, have been won by working, and not by his father's gold.

THE END.

THE JUBILEE GIFT OF THE QUEEN OF HAWAII.

By C. F. Gordon-Cumming,
Author of "Fire Fountains," "A Lady's Cruise in a French Man-of-War," etc., etc.

CONSPICUOUS amid that gorgeous throng of Kings and Queens, Royal Princes and Nobles, who gathered around our own Empress-Queen, on the day when the thanksgiving of the whole British race was represented by the solemn Service in the stately Abbey of Westminster, stood one whose rich, copper-coloured complexion plainly showed how far she had travelled in order to bring her congratulations to her Royal sister. This was Queen Kapiolani of Hawaii, that remote group of isles which we, in this country, so unwarrantably persist in calling "The Sandwich Isles," in honour of an English peer of the last century.

Even amid such magnificent surroundings, this dusky Queen, and her sister-in-law, Princess Lilino Kalani, stood conspicuous by the richness of their robes of dark material, heavily embroidered with gold, and their resplendent diamonds, glancing in the sunlight. At other festivities, these ladies appeared attired in the height of Parisian fashion, in tight-fitting bodices, and high bonnets; but on the day of the great Ceremonial, by special request of England's Queen, they adhered to the graceful sacque, flowing loose from the shoulders, which is the form of civilized garment which was introduced into Hawaii by the missionaries who, less than seventy years ago, induced the islanders to assume any raiment worthy of the name.

This sacque (worn by our grandmothers, and reproduced in our modern tea-gown), with the addition of "*leis*," which are simply ropes of flowers, strung together so as to form large necklaces, continues to be the national costume worn by all the women of the Isle, with the exception of such as present themselves at Court. There the ladies vie one with another in the magnificence of their American or Parisian costumes—gold-embroidered white satin, with very low cut body and short sleeves, finding especial favour with very fat, brown chiefesses; while sweeping trains, and ostrich feathers, complete the correct costume for the Buckingham Palace of the North Pacific. The modern traveller, witnessing some Court ceremonial at Honolulu, at which the King and his courtiers wear handsome American uniforms, resplendent with gold lace and orders, while the Queen and her ladies appear in the full Court dress I have described, finds it hard to realise that these and the reverent worshippers in the Cathedral church, with its beautiful choral service, and decorations of fragrant tropical flowers, are, in truth, the self-same race which received Captain Cook with such unsavoury divine honours.

Difficult, indeed, it is to believe that only so brief a time has elapsed, since the dusky maidens of Hawaii swam out to meet the wonderful foreign ships, veiled only by their long tresses, having from prudent economy left on the shore their scanty robes of bark cloth,—a material only suitable for show and sunshine. Till within the last four or five years, we could hear strange stories of those days from the lips of eye-witnesses, in the person of some of the noble old "Fathers" (as the pioneer American missionaries were endearingly called), who could tell of their first arrival in the Isles in A.D. 1820. Previous to this date, the Hawaiians were worshippers of all manner of hideous gods, to some of whom they offered human sacrifice. Now the present generation only know of idolatry from the very few idols preserved in the Museum at Honolulu; indeed, they would require to come to European museums to study the mythology of their fathers.

In the long list of Queen Victoria's Jubilee gifts, we read that the Queen of Hawaii presented a piece of her own work, in the form of a beautiful wreath of glossy, golden feathers, mounted on rich blue plush, set in a frame of gold, with the Royal Arms of England and Hawaii on either side, and an outer border of royal blue, set with golden stars. Each star had eight points to represent the eight isles of the group, which only eighty years ago were united under one ruler, by the strong-handed King Kamehameha. This very significant feather-wreath was surmounted by a royal crown and cushion, set with tiny diamonds. To those acquainted with the brief history of the Isles, this combination of blue plush and diamonds and golden stars, with those precious yellow feathers, is strangely characteristic. For in the old barbaric days, when the mark of distinction of the highest chiefs was to wear a war-cloak and helmet of feathers, this particular yellow feather was reserved for the sole use of the King, who alone had the privilege of wearing a cloak of the glossy, golden treasures; though the Queen and Royal Family had the right to wear a *lei* or necklace of these precious, dainty gems.

The bird which yields them is the Oo, or Royal bird, a species of honey-sucker, peculiar to certain mountainous districts of these Isles. It is a glossy, black bird, and these tiny golden feathers lie underneath the wing, one on either side. As each bird only yields two, the slaughter of these innocents involved in the making of one royal robe was pitiful. The value of such a cloak was inestimable, in fact, it was a priceless heirloom; and though His Hawaiian Majesty now appears in full American uniform, the feather cloak of the great Kamehameha is still worn as the coronation robe, and at the opening of Parliament it is spread as a symbolic covering on the throne. It is eleven feet in width, and five in length,—one sheet of lustrous gold.

But only think of the number of birds represented by such a garment! We need not wonder that the birds are now very rare, though their capture for the annual feather harvest no longer involves their destruction, as was the case in olden days. Their protection is due to the great Kamehameha I., whose wise thought was shown in small things as well as in great. He foresaw the speedy extinction, not of the goose which laid golden eggs, but of the bird which supplied the regalia of the Isles. He therefore commanded that the bird-catchers should henceforth catch the birds alive, and set them free when they had plucked the two coveted feathers. So now, cunning fowlers go up to the mountains frequented by the Oo, and set up baited poles, smeared with very adhesive bird-lime. On these the birds alight, and are captured, robbed of their precious little yellow gems, and then set free again. The feathers are only an inch long, sharp-pointed, and very delicate. Five sell for six shillings, so it is evident that at this valuation the royal feather cloak is as costly a crown jewel as could be worn by any sovereign. Certainly so much human labour was never expended on the setting of any precious stone. About a thousand feathers are required even to make a necklace, which, when finished, certainly does not suggest the labour involved, as it only looks like a round rope of frayed-out silk. Many humble imitations of the royal *lei* are made of small, round, yellow feathers, which, though soft and silky, are very inferior in value to the sharp-pointed royal feather.

Kamehameha's great war-cloak is said to represent all the feathers collected by eight or ten successive chiefs. When the great Conqueror had welded all the Isles into one kingdom, he collected all the small cloaks and necklaces, and had them made into this one splendid robe. Unfortunately a good many red feathers of the Mo-mo have been interwoven with the golden Oo, which detract somewhat from its glossy perfection. This is the only royal cloak now existing in Hawaii. Being the most valued possessions of the Crown, they were from time to time bestowed on greatly honoured foreigners, being intended by the Island King as a gift to some far-away monarch, whose ambassador the traveller was assumed to be. Thus one of the true royal cloaks was given to Bruce, the Abyssinan traveller, and is now in the possession of his great grand-daughter, Lady Thurlow. During the King of Hawaii's visit to England, about five years ago, he made anxious inquiries about this precious gift, which he expected to find safely treasured in one of the royal palaces. But alas! such gifts, though priceless to the donor, are not always fully appreciated even by the recipient, still less by his relations in Britain. Sad to state, this strange garment from the far distant Isles, after hanging for many years amongst other curious foreign draperies, in an old country house, was finally stowed away, and so neglected, that, when at last it was once more brought to light, cruel moths had made their homes in it, and almost destroyed it.

Another of these treasured vestments had descended to the late King Lunalilo, as an heirloom from his mother's royal ancestors. It was six feet square, and when the beloved young King died in his prime, and lay in state at the palace, he was laid on this priceless cloth of gold, which was wrapped round him as a kingly shroud. "He is the last of our race," said his weeping father; "it is his." So the cloak, which, according to Hawaiian estimate, was valued at about twenty thousand pounds, was buried with him who alone was entitled to wear it.

This feather work involves much patient skill, each feather being fastened separately with a loop of fine string, so that the inside of the cloak resembles a closely woven net, while on the surface, the feathers are laid as smoothly as on the living bird, forming a beautiful fabric. The garments thus produced were only worn on very ceremonious occasions, and the rank of the wearer was denoted by the length of his cloak. Some only reached to the waist, whilst others trailed on the ground. The inferior chiefs wore short cloaks, made of the long tail feathers of the cock, the tropic-bird, and the man-of-war bird, with only a border and a collar of little red and yellow feathers. Other mantles were made of white feathers, with coloured feather borders, or a pattern of bright feathers on a groundwork of purple or glossy black.

Amongst the birds which supplied varied feathers for non-regal cloaks, were the purple parroquet, wild duck, and wood-pecker; the latter yielding green, red, and yellow plumage. This sort of work was found on all those isles of the Pacific which were peopled by

the Maori race. The gods of Tahiti had feather covering. Captain Cook records that, in the Friendly Isles, the King's son wore a cloak of red feathers. Neat little coronets of closely-laid scarlet feathers are the only trace of this art which I saw in the Fijian Isles; but in New Zealand, the feather cloaks which are worn by chiefs are very handsome garments.

There is, however, one application of this art quite peculiar to Hawaii; namely, singularly perfect helmets of purely classical form, strangely resembling those of the old Greeks. They were worked over a strong frame of wicker-work,—strong enough to defend the head from a sharp blow. On this foundation, the glossy, golden-hued feathers were so closely laid as to resemble burnished gold. How this peculiar head-dress came into existence is a matter for wonder, as it seems very improbable that it could have been of spontaneous Hawaiian growth; it seems possible, however, that in some forgotten age, these Isles may have been visited by Spaniards, whose cloaks and helmets would naturally excite the envy and admiration of the ingenious islanders.

Another curious Hawaiian use for feathers, is the manufacture of the tall feather brushes called *Kahilis*, symbols of honour, denoting the high rank of the owner; but to irreverent foreign eyes only suggestive of gigantic bottle brushes, the brush part being composed of a long cylindrical basket, about a foot in diameter, and from twelve to fifteen feet in height. To this are attached the feathers, which are generally black or rose-coloured, though some Kahilis are made of peacocks' feathers, and some of parrots' and other tropical birds brought from other isles. These are of all colours—purple, blue, green, black, white, crimson, and scarlet; but of course the most precious are those made of the sacred red Mo-mo, and the golden Oo. When a member of the Royal Family dies, all the great chiefs send their family Kahilis to be ranged around his coffin, just as, in England, people sometimes send their carriages to represent themselves at a funeral. Many of these stand permanently at the feet of the coffins, and at the entry to the royal Mausoleum at Honolulu. Here there is a beautiful little stone chapel, on a hill overlooking the town, offering one more point of curious contrast between the civilized Christian isles of the present day, and the Hawaii of fifty years ago. Then the burial place of the Hawaiian Kings was a wooden building thatched with dracœna leaves, and enclosed by a strong fence; the posts of which were carved in the likeness of hideous gods, with eyes of pearl shell, and wide mouths armed with sharks' teeth. Many of these were grouped all about the place, some beneath shady trees, some on high posts, others on jutting rocks overhanging the sea. There had been a wholesale destruction of idols in 1819, but these guardians of the Royal Tomb were spared, and left to calm decay at the mercy of sun and rain. In those old days, the funeral of a high chief was the occasion of a wild Saturnalia of drunkenness, hideous dances, and every sort of discreditable orgy, accompanied by bloody sacrifices to the idols. At the funeral of the great Kamehameha I., no less than three hundred poor dogs were thus offered to the gods.

Altogether, it must be allowed that Hawaii has good cause to rejoice in the amazing progress she has made in all civilization within one short half-century.

LEONARDO DA VINCI.

By Eva Travers Evered Poole.

"Who would not live for Jesus,
Rejoicing, glad, and free?
The music of a ransomed life
Is all He asks from thee."—E. T. E. P.

WHO has not heard of the immortal painter, Leonardo da Vinci, whose pictures, carvings, and sculptures still delight thousands? Who has not bowed in awed rapture before the Divine Face that beams from the canvas of the "Last Supper"? His artistic genius and gifts were rich and rare, but the beauty of his soul was richer and rarer still. He lived in Milan, the grand old city of Italian story, and the peasants there still tell the tale of his life amongst them. In one corner of the market, dealers were wont to sell cages of beautiful birds caught in the wild forests of Italy, or freshly stolen from the soft, warm nest. Leonardo might there be found day by day, buying from the peasant lads their fluttering, frightened prisoners. These ragged, barefooted peasants used to watch for his coming, sure of a certain sale, and smiling at the great painter's craze. No matter how often they supplied him, he for ever wanted more.

Follow Leonardo as he makes his way through the thronged market-place, with cages in his hand and under his arm. The chattering peasants smile and point after him, as he passes out of sight. On he goes, until he reaches the pleasant fields and hedgerows, and then, tenderly, gently, with a holy joy irradiating every feature, he sets the birdlings free!

Oh, the ecstatic trills of regained liberty that rain like soul-music in the summer air, carolled by the birds of the wild wood as they float in the blue liquid ether of the sky! How sweet the notes, and calls, and twitters! and sweeter still the echo in Leonardo's soul. He stands, watching with pleasure the swift-winged birds enjoy their liberty again.

Our hearts cleave to this man. His skill, his magical genius charm us even less than the winsomeness of his tender heart, that is stirred to its depths by the helpless fluttering of a tiny prisoned bird. Leonardo da Vinci preaches the Gospel to us.

God—the great Artist, the Sculptor, the Carver, the Genius of the universe—is revealed to us in His word as restless even in the rest of heaven, while souls of men, like caged birdlings, are being bought and sold in the mart of sin. He is not content, although the creation of His own hands surrounds Him, while man remains a prisoner. Yet He might be. The stars of heaven crown Him, the flowers of earth garland His footsteps, the soft foam of the storm-wave fringes His garments, the floating beauty of the cloudlets form His chariot, and the many-voiced praises of His majestic creation herald His progress through the spheres.

But God was not content. He left His kingdom and came to the haunts of men; He paid a price for the prisoned souls He met there; He was made the mock of devils, yet He cared not. And day by day, one by one, the precious souls He has bought are set free—let out by His own hand, let out into life and liberty.

There comes a joyous day when the fluttering soul ceases to beat against the prison walls of the enwrapping flesh, and, loosed by the hand of God, it finds itself redeemed, liberated, free, to know henceforth no more of earth, and so much of heaven. All its craving is to soar higher, higher; all its powers are spent in praise.

Weary soul! art thou restlessly striving against sin? Are the fetters of the flesh eating into thy very heart? Cravest thou to know freedom? The gentle voice of Jesus speaks to thee, saying: "If the Son shall make you free, then are ye free indeed. And ye shall know the truth, and the truth shall make you free."

Believe that He hath bought thee, "giving His life a ransom for many." Let Him liberate thee, and when He bids thee take note that the prison door is open, and invites thee to taste the sweets of freedom, avail thyself of His permission, and soar out into the liberty of the Gospel and into the clear, shining light of the grace of God. Let thy life be praiseful; show by thy gladness how much thou lovest the Great Heart that pitied thee, and wrought thy redemption.

DARKNESS, DAWN, AND DAY. A STORY OF THREE SNOWSTORMS.

III. Day.

WHEN she reached home, her mother met her eagerly in the hall.

"Come in, Maudie," she said; "you will never guess who has come. Roger Harford!"

Maude's pretty face turned pink. Roger was an old friend of hers, and it was no slight pleasure to see him again.

There he stood by the fireplace, a tall stalwart fellow, with keen, clear-cut features, and a resolute mouth.

He advanced eagerly to meet Maude. "How cold you are!" he said. "What a morning for you to be out!"

"Maude lets nothing interfere with her good works," said her mother, who, much as she in private inveighed against Maude's indiscriminate outgoings, would let no one say a word against her child.

Half-longingly, half-sadly, Roger Harford looked at the sweet, unsatisfied girlish face. Maude Brenton was very dear to him, but he dare not—simply *dare not*—ask her to be his wife, until he was sure about one thing. As he looked at her, he saw that she was changed; her former careless gaiety was replaced by thought; the merry eyes had a softer light; and yet—he could not feel sure that Maude had chosen his Master to be her Master too.

Maude was despatched to get off her wet clothes, and when she came downstairs again she found Roger in the middle of an animated sketch of his life in town. Hard work in a city office all day long, and hard work at night in the slums amongst the poor and outcast. Maude felt that there was a fresh link of sympathy between Roger and herself. But what was the difference? There was a ring about his words that found no echo, only a voiceless longing, in her heart. Roger was *satisfied*, and she was not.

Long in his room that night did Roger Harford pace to and fro. How he longed to let Maude know that he loved her, and to ask for her love in return. Did not this change show that she cared for better things? If she were linked to him, would it not lead her to decide definitely for Christ? Only after a long and prayerful struggle did Roger conquer the wild longing which had well-nigh overmastered him. The morning star had risen before he went to rest.

Next day he feared he would never be able to meet Maude calmly, and say good-bye, but that effort he had not to make.

The result of Maude's walk in the snowstorm was a bad, feverish cold, which kept her a prisoner in her room for many days. The girl was very unhappy; the hopes on which she had built for months had crumbled to the very dust; she had nothing to grasp, nothing to depend on, nothing which felt "sure and steadfast." But no one dreamed that Maude, who was "so good," could possibly need a word of loving counsel; every one looked rather to her for advice and consolation. So the weary days dragged on, and Maude's grey dawn nearly darkened again into utter night.

A fortnight later, another snowstorm came. It was a great year for snow, folk said, as they gathered round their blazing fires. "That hateful snow," thought Maude, as the first white flakes fluttered past her window; "but for it I should have gone to my first ball, and never have thought of religion at all. At any rate, if that second snowstorm had not driven Widow Wilson into such a miserable state of mind, the day I got my cold, I should not be so wretched now."

But this third snowstorm had something in store for Maude. Nellie Dalton, the village doctor's daughter, was on her way home that very day, and just as she got out of the train at the little wayside station, down came the snow, so fast and thick, that her short-legged Shetland pony could scarcely draw the trap. By the time she got half-way to the village, just at the Brentons' gate, further progress became impossible, so Nellie claimed the shelter of the stable for her shaggy steed, and a warm welcome from hospitable Mrs. Brenton for herself. The moment the snowy coat and hat were hung up to dry, Nellie ran upstairs to Maude's room, ready, as is every girl, for a long chat with her friend.

"Why, Maudie," she cried, "how wretched you look! You have had a bad cold."

Maude's only answer was a burst of tears.

"What is it, darling?" cried Nellie, kneeling by Maude's chair; "surely something is troubling you!"

"I thought I was so religious," sobbed Maude, "and it isn't a bit of use. I am just as unhappy as ever, and there's nothing else left for me to try now. I can't bear to think life is all unhappy. I'd much rather die than live, always feeling I wanted something I hadn't got."

"I'm always satisfied," said Nellie, softly.

"I know you are," said Maude, raising her head, "and I can't make it out. Your father isn't half as rich as mine, and you can't do half as much good; I suppose it's your nature to be happy, and mine to be wretched. Roger Harford looked just as happy as you do; I suppose he has the same kind of nature. I'm glad, at any rate, you and he are not so wretched as I am."

Nellie shook her head.

"Well, what is it, then?" asked Maude, almost angrily. "I've tried everything, even religion."

"I know you tried religion," answered Nellie slowly, "but I don't think you have tried Christ."

"Whatever do you mean?" exclaimed Maude.

"It's just this—you have been believing in religion as a *thing*, instead of believing in Christ as a *Person;* you have loved good works, and sought to satisfy your soul with them, instead of with the goodness of Christ. No *thing* in heaven or earth can satisfy you, and no *one* but Christ. Oh, Maudie darling, if you once see Him by faith, if you once touch even the hem of His garment, if you once get even a glimpse of His matchless glory, you will be satisfied; *but not till then.*"

Maude was silent, but the tears gathered slowly in her eyes.

"You will find Him when you seek Him with all your heart," said Nellie softly, and then she left Maude alone, that she might come face to face with Christ.

* * * *

Before the snowstorm had spent its fury, the Sun of Righteousness Himself had turned Maude's Twilight into Day; the peace which she had missed in the Darkness of pleasure, and the Dawn of good works, had become "perfect," past all understanding, in the light of Christ's forgiveness, and the sunshine of His smile.

Roger Harford came down again for the New Year. One glance at Maude's sweet peaceful face showed him that the Light has risen on her life. A few words put things in train with Mr. Brenton, who had pretty well guessed how the land lay, and then it only remained for Roger to settle matters with Maude herself.

It did not take him long.

* * * *

Two busier workers than Roger Harford and his wife are not easily to be found, and as to Nellie Dalton, she is up and down at their house, almost exhausting the shaggy pony with his frequent drives to the station to start her on her journey, or bring her back to be the solace of her father's scanty leisure hours.

So all our story ends in the light of day.

My sisters, ask yourselves, as you stand at the end of another year, "Is it Darkness, Dawn, or Day with me?"

REST.

WHAT a comfort it is to lie down on one's bed at night after a trying, wearisome day! The longer the bed and the softer the couch, the more perfect and refreshing is the rest. "Tired nature" well knows what a sweet restorer is sound sleep on a good bed, where every limb and joint finds rest.

What a bed is to the tired body, Christ is to the weary soul. He indeed gives rest, satisfaction, comfort, peace to the burdened heart in all its anxiety and sorrow.

To know that sin is forgiven, that heaven is secure, and that nothing can separate us from the love of God, this is rest and peace indeed. Just as the body throws itself on its bed, letting the whole weight be borne by the couch; so the soul that throws itself on Christ, letting Him bear all the burden of the heavy heart, finds distractions gone, fear vanished, sorrow fled, because sin is buried, and peace with God secured.

CHAPTER III.

A SUDDEN FLIGHT.

GODFREY then flung himself from the saddle, and kneeling down, raised his friend's head and shoulders in his arms. He had fallen against the hard bank, and lay on his back. There was no blood.

"Spencer, Spencer, are you hurt? Spencer, speak—speak to me."

Godfrey hurriedly felt his wrist. There was no pulse

there—never a flicker that could be distinguished. He lifted an eyelid. The pupil was all dilated, the blue of the iris almost hidden by the centre black. It was horrible!

Hardly knowing what he did, he rushed away to the brook for a hatful of water, wishing, praying, hoping against hope, that he might see a movement, though only the slightest, in his friend when he returned. No, no; there he lay, so still and quiet. Godfrey dashed water in his face. No movement. He once more felt his wrist—no flicker yet, and the hands were getting cold.

The great dog stood whining by, occasionally licking his master's hand or face with a quick, nervous motion.

Godfrey's horse stood quietly on the road, only looking round; the blackbird still fluted amongst the oaks, the brooklet sang, and the wind went whispering through the birches. No sounds save these.

"Speak, Spencer, speak. I've slain my brother!"

With something like a howl of anguish, with all hope dead in his heart, Godfrey threw himself on his face on the sward and sobbed. He was aroused shortly by the rattle of horse's hoofs on the road, the sound coming momentarily nearer. He started to his feet. It was only poor Spencer's hunter coming back, but it roused Godfrey to some kind of action. He patted the animal, then turned its head once more homewards.

"Go, poor beast," he said, "and break the news at home. *I* can ne'er return."

He drew his friend a little off the road—albeit the damp sweat dropped from his own brow as he did so—and covered him with a light dust-coat which he took from the pommel of his saddle.

Pluto lay down beside his master, casting but one more wistful glance at Godfrey as he tremblingly mounted and rode away.

It is a physiological fact that men in the state of mind in which Godfrey now was, are no more accountable for their actions than a baby with a rattle. A complete revulsion of the nerve-cells appears to take place—the will is entirely in abeyance; it is, for the time being, swamped.

Was he about to seek safety in flight? He hardly knew. He felt one thing acutely enough—that his punishment was almost greater than he could bear. If he was going to fly, it was not that he feared death; that to him now would have been a blessed relief, a relief he felt he did not deserve.

Scarcely knowing what he did, he clapped spurs to his horse, and went tearing along the road towards Allandene.

The doctor's house was in the nearest outskirts. The servant came to the door when he bent from the saddle and knocked. She started back in affright at Godfrey's wild and haggard appearance. Yes, the doctor was in. What had happened?

"Tell him," he said with the calmness of despair, "that my cousin Spencer Rae has been dashed—hurled from his horse, and lies in Robin Hood's Dene, and—and I fear that he is *dead*."

He was off again ere ever the good old surgeon could reach the door.

Where now? Should he see Rosa? Never again. And never again would he see father, mother, nor sister, nor darken with his terrible presence the door of their—not *his* now—innocent home. Such were his thoughts.

Men who have slain their fellow-beings and fled, have said that so great did the horror of their situation and state of mind feel, when in hiding, that it was a positive relief to give themselves up to justice; and that when the prison-doors were at last shut upon them, they heaved a deep-drawn, sobbing sigh, akin to that which a child gives when just recovering from some recent grief.

Godfrey's first thought was suicide—(he was not altogether mad, however; he knew there was a beyond)—his next, to give himself up. That would, indeed, have been a relief; but a luxury he did not deserve. He turned his horse's head southwards. If they took him—and he determined to do no skulking, no hiding in woods,—then well and good. If, on the other hand, he was spared, he would seek exile in a foreign land, and the wilder and more savage it was, the better. Even he, wretch that he was, might do good.

Do good? He? He felt he had made a mistake in even thinking the words.

"Oh! oh!" he groaned aloud, and on and on he sped. The village is soon left far behind, and hills and woods and streams. In the evening sunshine the road can now be seen stretching in an even, almost level line, for miles and miles towards the south. They are on a Yorkshire wold—partly moorland it is, partly stunted grass, or short heather, on which sheep are feeding that raise their heads to gaze in semi-alarm as horse and rider dash wildly past. Five miles at the very least he must have ridden along that straight and stony path. But the pace told on the trusty steed at last. He half limps now and then, while in his gallop his feet kick the stones; he is foam-flecked and snorting; so, in mercy, Godfrey draws rein and dismounts.

The sun is nearing the horizon, sinking down and down like a great blood-orange in the purple haze. There are the whirring notes of the grouse among the green heather, and a linnet is trilling its soft, sweet evening song perched upon a bush of furze; now and then a great beetle goes droning past in awkward flight, otherwise it is so quiet upon this wold that he can almost hear the song of the midges.

The broad sward on each side of the road is a mass of wild-flower beauty, and the air is laden with the odour of thyme.

Godfrey leans wearily against the saddle; all the beauty of the landscape is lost upon him. He hears nothing, sees nothing; his eyes are turned groundwards, his thoughts inwards. At last he starts from his painful reverie, gives one hasty glance around him, pats his steed, and remounts.

Onward again at the same break-neck pace. But the wold seems to have never an end. Dusk-shadows are falling; the last rook has passed overhead on its way to the distant woods, and bats are flitting around.

If he could come to an inn now, he would rest his steed for the night. Ah! yonder is one, a solitary house at the corner of cross-roads. He slackens speed, and pats his horse on the neck.

A flat sign hangs from a post near the door. He casts a glance upwards to read it before dismounting,—

"*The Gibbet Inn.*"

A shudder of something like horror passes quickly through his frame.

He cannot stay here.

At this lonely spot, in this dreary wold, the bodies of malefactors used, in days gone by, to be hung in chains.

"A beautiful evening, sir." It was a cheerful voice, and it came from the other side of the hedge that surrounded the little garden.

But Godfrey heard it not, nor heeded it.

"Strange," muttered the landlord to himself. "There is something wrong there."

Then he went inside and closed the door.

CHAPTER IV.

"HE'LL LIVE, I *THINK*."

In less than ten minutes after Godfrey left, old Dr. Wight, having with his own hands put his horse to the trap, was rattling along towards Robin Hood's Dene. His boy, who had been gardening, had arrived at the last moment, else the kindly-hearted medico would have driven off without him. There were occasions when he had to drive with speed, slow though Allandene was, but he never remembered making such haste before, for Spencer Rae was one of his chief favourites.

He did not give the good horse time to walk down the steep hill into the hollow or dene, but trotted him along at the risk of the animal's knees and his own neck.

He was very much surprised indeed not to find Godfrey before him. But here was no one,—only the great Newfoundland sitting by his master's side, and howling as if his poor heart would break. There really is something very affecting in the grief of a faithful dog.

But the doctor thought no more about Godfrey then, but proceeded at once to busy himself with his patient.

No pulse, apparently; eyes much dilated; all precisely as Godfrey had left him.

"Dead," said Dr. Wight, solemnly.

The doctor's boy was wonderfully soft-hearted, and he now began to cry.

"Stay, though," continued the doctor, putting a hand on Spencer's breast; "there still is warmth about the heart,—there still is hope. Run, Tom, as fast as legs can carry you, to the keeper's cottage yonder, and procure assistance to carry the poor gentleman. Stay—tell them to get boiling water ready."

The stalwart keeper and his assistant were soon on the ground, and, wrapped in rugs, Spencer—whether dead or alive, none yet could say—was gently borne to the cottage.

He was put into a warmed bed—the keeper's own—bottles of hot water were placed at his feet, a little tea poured down his throat, and to the doctor's inexpressible joy, soon after, a small thready pulse began to flicker at the wrist, a slight flush danced over the cheeks, and a little sobbing sigh escaped the lips.

Ill news flies apace.

In less than two hours, the farmers, Dennis and Rae, were at the cottage. But Dr. Wight would allow neither indoors.

Even big Jack Wingfield, the keeper, was banished from his humble cot. He had to take his supper out of doors, and for this night, at all events, would have to curl up with his cow.

"Could the doctor give any hope?" That was the question both fathers asked. But the doctor did not care to answer it. He had sent his boy home for "things," and he himself would stay here till poor Spencer was out of danger, or——

He did not finish the sentence, and Dennis and Rae betook themselves to a distance, to sit on a stone, and try between them to solve the terrible mystery.

The burning question was: "Why had Godfrey fled?" But there was no answer to it. A thousand and one conjectures only ended in leaving the matter as much a mystery as ever. But all joy and happiness had clean gone from those honest farmers' hearts for ever and a day, or so it seemed.

The sun went down; the sky became a darker blue, and the stars shone out, with a melancholy crescent of a moon, so that there

was hardly light enough to see each other's faces. The owls hooted in the woods, and now and then flew darkling over their heads between them and the stars.

Then they despatched the assistant keeper for a huge bundle of straw. Behind that rock they meant to make their bed for the night.

About eleven o'clock the doctor came quietly down, with a brighter look on his face.

"Yes," he said, "I have hopes that with great care and careful management——"

They would not let him say another word; each farmer wrung one of his hands.

"Oh! God bless you, doctor, for that," said Rae.

There were tears trickling over his brown face as he spoke, though none could see them in the starlight, for he dearly loved his lad.

Down they lay shortly after this, and in a few minutes were sound asleep.

Morning broke grey and lazily over the wooded hills, but soon the fog lifted, and there was evidence of the advent of a bright and beautiful day. Hours before the sun had lit up the higher clouds with gold and crimson, the blackbird and mavis burst into song. This was a sign for the bats to get under the bridges to hang in dark corners, head down, till eventide, and for the owls, glutted with the blood of innocents, to hide in the darkest thickets of spruce. The sun rose; the wild scabious, bent groundwards by the night dews, raised its head to the light; the convolvulus, pink and white, untwisted its petals; the bee, that had been overtaken by the darkness, and slept all night on a fragrant thistle-top, dried its wings and prepared to fly; and every flower or hedgerow, bank or sward, awoke to be wooed by the joyous sunlight.

Rae touched Dennis lightly on the shoulder. He sat up, bewilderingly rubbed his eyes, and gazed around him.

"Just such another day as yesterday," he murmured, hardly knowing what he said. Then, as the recollection of where he was, and why he was here, stole over him, his face fell.

"Heigho!" said the poor man; "just such another day as yesterday, but how different!"

"We know not, Dennis, what a day nor an hour may bring forth."

"Ah! doctor," added Rae, standing up; "you look a bit haggard and worn. Have you slept?"

"No."

Rae was almost afraid to ask the question next his heart, but the doctor required no inquisition.

"Better now," he said; "but he has had a sad night. Out of danger? Oh, my dear sir, no; but go home. Go home with this comfort in your heart, that I will do my best for your son. Go with a cheerful countenance, and send his mother here, and, if possible, his cousin, Maggie Dennis. We will need them both. I have made arrangements whereby they will have the whole cottage; for Spencer, even if he gets round, cannot be moved for weeks. Send every comfort you can think of for the ladies. I myself will see to Spencer."

"And I cannot even see my son before I return?"

"It will be better not to."

"Amen," said Rae.

An hour afterwards, Dennis and Rae were in Allandene. Rosa Neil was at the gate. She seemed to be looking for them, or for some one, and looked pale and scared.

"Oh," she cried, "what has happened?"

"You have seen no one? You have not seen Godfrey?" said Dennis.

"No," she replied; "is he not at home?"

Farmer Dennis's heart gave a big uneasy thump. It felt like molten lead in his chest—both heavy and pained. Had Godfrey gone anywhere, it would surely have been to the Neils'.

"I know not," he answered. "I know nothing. It is all a mystery, a terrible mystery. My nephew has fallen from his horse. But the question is, why has Godfrey gone?"

There was no answer to this. There could be none.

Dennis and Rae parted at the cross-roads, at the very spot where yester-morn, so lightsome and happy-hearted, their sons had met. They shook hands, but neither spoke; perhaps they dared not trust themselves to. Then each went on his own weary way towards his house of mourning.

One nurse from each farm—Spencer's mother and his cousin Maggie—were speedily established at the keeper's little cottage in the dene.

At first sight of her son, Mrs. Rae was nearly heart-broken. How still and quiet he lay! he who but the day before had been so full of hope and gaiety. The last time she had heard his voice, he was trolling a song that rhymed with the clatter of his great horse's hoofs, as he went cantering past the dining-room window to meet his friend. He had smiled, and kissed his hand to her, as he rode away. She remembered this, aye, and not this alone, but every word and look of her boy for long months before.

The first day wore slowly away, and evening fell. Mrs. Rae and Maggie sat beside the little cottage window, where the sunshine was shimmering in through the petals of the crimson geraniums. They sat quietly knitting, and spoke in whispers,—the mother ever and anon giving an uneasy, wistful glance towards the bed where the restless sufferer lay.

If she had one earthly comfort still remaining, it was to talk of him; to tell Maggie little domestic anecdotes of his early days, of his sayings and doings, of his love for herself and his obedience to his father—a thousand little odds and ends taken from the storehouse of a mother's memory.

"And ah!" she exclaimed that evening, as she laid aside her stocking with a sad sigh, "there he lies, and something tells me I'll never hear his voice again."

"Don't say that," said Maggie, repressing with difficulty an inclination to burst into tears. "Don't speak thus, aunt; your boy will live and be a comfort to you yet, for many a long year."

"Hush! hush! Maggie, niece. We are all in the good Lord's hands; but the best are always taken first."

Dr. Wight was blunt, and honest, and outspoken.

"No improvement." That was his verdict when he came, not five minutes after Mrs. Rae had finished speaking.

"Ladies," he added, "you'll go to bed. Not a morsel of good you'll be if you sit up. Only in the way. I'll be nurse again to-night, and I hate women-folks fussing about me. They are no good at a pinch. Obey orders, there's good ladies."

Grief and sorrow are wonderful narcotics, and this is but another proof that all things are wisely ordained. Both Mrs. Rae and Maggie slept soundly till far into the morning. Morning in the *rural* sense is meant, but it was seven o'clock before either stirred.

Dr. Wight had been to their door to listen a dozen times at least, but he would not wake them—not for the world.

When the two came into Spencer's room at last, they found the doctor sitting reading beside the geraniums. Raising his hand, he whispered, "Hush!" but there was a smile on his face. That smile gave hope, and his words gave joy. He took Mrs. Rae by the hand, and led her away out of doors, Maggie following on tiptoe.

"What a lovely morning! What heavenly weather!" he said at last.

"Yes, doctor; but that is not what you took us out to tell us. My son is better? He will live?"

"He'll do. He'll live, I *think*"—he put a good deal of cautious emphasis on the last word—"*if* he has proper nursing. I'll leave him soon now, to your care, and mind, no noise, no fuss, no sentiment, no expression of feeling, good, bad, or indifferent. You quite understand? Treat him for the time being as if he were a stranger. His life depends upon your strict attention to my orders. And if you don't obey, I'll—why, I'll send you both a-packing, and import a trained nurse from Leeds."

(*To be continued.*)

CLOUD-DRIFTS.

THICK clouds hung o'er the moorland,
Like floating airy isles;
And huge vapours capped the mountains,
And hid the sun's sweet smiles.
The river's roaring torrent
Was dashed to fleecy foam,
And all around seemed cheerless,
And I was far from home.
A stranger in that Highland scene,
A child, forsooth, in years and mien,
I could not see behind the scene.

A vivid flash of lightning
Illumed the darkness round,
And peal on peal of thunder
Now made the echoes sound.
And oh! I felt so wretched
Upon that lonely moor,
Till the mountain mists ungathered,
And the rain began to pour.
And then the sun sent forth his rays,
His genial warmth and steady blaze,
Whilst I upon his face did gaze.

But soon sweet strains of music
Came from the clouds above,
Like the symphony of angels
From the palaces of love.
A tuneful lark was soaring
Above their darkened pall;
He saw the sun's sweet glances
And th' blue sky over all.
Sweet songster! thou mightst well be bright,
For thou could'st see his glorious light,
Whilst I had nought but clouds like night.

That sweet-voiced lark hath taught me
Through years long past and gone—
Oft when mental clouds oppress me
And I think I am alone—
This lesson: that my Father,
With ever-loving care,
Beyond the cloud is smiling,
Though I cannot see Him there.
So, like the lark upon the wing,
My Father's praise I, too, would sing,
And trust Him e'en for everything.

WILL H. ROSS.

"BRING BACK THE COLORS."

OUR MONTHLY TALK.

BY THE EDITOR.

DEAR FRIENDS,—

I hope frequently to have the pleasure of a personal word with you at the beginning of the month, and you will allow me—will you not?—to imagine that we are face to face for a few moments, for a real, earnest talk.

Many of those who read our Paper are followers of Christ; but how few of us openly confess His Name, and so walk as to *adorn* the doctrine. We do love the Lord, but "secretly, for fear of the Jews." We wince under the scoff or reproach of mates; we retreat under the fire of the enemy's guns, instead of holding the ground by an unblushing confession of Him whose name we bear. Christ wants different stuff from that in His soldiers,—think you not? Men ready to stand right out on the Lord's side,—yes! even though they stand there alone. A British regiment was once quivering beneath the heat of the enemy's fire, and the Commanding Officer feared that the day was lost, and his men would be annihilated. "Bring back the colors!" was the reluctant order, as the young ensign, with the gallantry of English discipline, stood to his post, and stood alone. "Bring back the men to the colors!" shouted the heroic young standard-bearer. The enthusiasm of his pluck and daring nerved afresh his dispirited comrades; the broken lines closed up once more, and with a mighty plunge, the men rushed forward and recovered the day.

May I add yet one more incident? A young fair-faced soldier of but eighteen years lay dying in a military Hospital. "Poor mother," said he to the friend beside him, "tell her not to fret. I love Jesus; I put all my trust in Him. Tell my sister to hold out faithful, I want to meet them in heaven." He then committed to his friend's care his pocket-book and several keep-sakes, to be sent home. Then they sang together—

"There is a fountain filled with blood."

And the dying lad so responsively ejaculated: "If *he* (the dying thief) could trust Him, I can!" A short time after, Mr. W—— was sent for again. "He wants to see you." The memorandum-book was asked for, and from it three photographic pictures. They were held up one by one. "Dear mother," said the lad, as he pressed it to his dying lips—"dear mother; good-bye; how I wish I could see you; but I am going to die in G——." The tears flowed fast as he sobbed, "Good-bye,—Good-bye."

The next picture was his sister. "Good-bye; only be faithful." And another kiss was printed on the glass.

There was yet another picture. He gazed at it with unutterable tenderness and unsuppressed emotion; no name was uttered, but he kissed it again and again. Mr. W—— bent down and whispered: "This is hard." "Yes, it is hard," said the dying lad,—"I would like to go home; but I am content." That closing midnight scene can be better realised than described.

Only Christ, and the enjoyment of assured pardon through His precious blood, can give such calm tranquillity in the presence of the King of Terrors. And we must meet Him, too,—though probably not on the battle-field. If Christ be ours, in days of vigour, He will be ours right on through days of suffering, down into the dark valley, and across the river, where we can hold no hand but His. Oh! the blessedness of thus knowing and trusting Christ; of sheltering our guilty, sin-defiled souls beneath the fountain of the blood that cleanseth from all sin. Perhaps you are inwardly yearning for this deliverance? If so, rejoice. The Deliverer Himself is beside you. His boundless compassion allures you; He would even now lay you on His own shoulder, and bear you to His fold, rejoicing. And what doth hinder? Anything on *His* part? Lack of love, lack of power,—*anything?* Nay, verily; He is able to save to the uttermost them that *come*.

Will you not rise up quickly and come to Him? For "him that cometh," saith Jesus, "I will in no wise cast out." Do you ask: "What is it to come?" I give Christ's own exquisitely simple definition: "He that cometh to *Me* shall never hunger; and he that believeth on Me shall never thirst." So, "believing" is "coming." A journey without one step! Only to trust Him, just where you are, and as you are.

It is such a grand thing to have the great question of salvation settled. No more halting, doubting, fearing—but calmly resting on the faithfulness of Him who cannot lie.

If I refuse Christ,—what, I ask, can the world give me, or what can the Devil offer? Only an aching, unsatisfied heart; a broken, disappointed spirit, anguish of soul, hopeless despair, and eternal woe. Beloved friends, choose ye this day. Blessing or cursing; death or life? Surely, you *will* choose life, even Him who is the Life.

You will remember what a privilege I esteem it, to be able to help any soul nearer to Jesus. If doubts and difficulties beset your spiritual life, or if you are seeking the Saviour, will you not write to me and let me share your anxiety and help you, through our Correspondence Column, or by personally replying to any letters? No greater pleasure or reward can be given than to be allowed to share the spiritual difficulties and perplexities of those who are seeking the Kingdom of God. By the help of the Holy Spirit, we shall hope to meet these, and you do not need the assurance that they will be regarded as confidential.

I have to thank many of you—and young men amongst the number—for some very hearty words of appreciation of our Paper. Day after day, I am cheered in what is undoubtedly arduous work, by these testimonies; and thus stimulated, one finds infinite pleasure in trying to make our Paper as helpful, profitable, and attractive, as may be possible.

To those Clergymen, Ministers, and other Christian Workers who have distributed Specimen Copies, we are sincerely indebted; nor less so, to a large number of young men, who amongst their fellow-workmen and Bible-Class mates, have taken up our Paper with a determination to make it a success. The steady, we may almost say,—rapid way in which each week's circulation is increasing,—tells with what happy results.

Let me add that I specially rely on my young men friends to use the many opportunities *they* have for circulating "A. 1.;" and will you pray that God will use it week by week to convey many a message of strength and cheer? Its columns are open for the ventilation of difficulties—for answers and inquiries, and for practical suggestions on any and every topic of interest to young men. I want our young men to claim this Paper as their own, and put it to every possible use. "To do good, and to communicate, forget not." How little have we thought of "*communicating*" as a definite responsibility! If we have received help or light, either directly through the Holy Spirit's teaching, or through experience in the Lord's work, let us feel it incumbent upon us to impart to others.

With affectionate Christian remembrance,

Believe me,

Ever your true friend,

M. Jane Menzies

10, *Croxteth Road, Liverpool,*
December, 1887.

GABRIEL PAUNCEFORTH'S BOY;

OR,

"S'POSE YOU BELIEVED IN GOD?"

By M. BUTLER GERDS.

JOHN GREY had been wholly unsuccessful in obtaining in Old England the position he desired in life, so he decided that he would go to the New World, and see if he could not do something there. In New York he set about work at once; and as he had a couple of thousand pounds to start with, he closed with what seemed in every way a tempting offer. Papers were signed and agreements drawn up, and he found himself in partnership with a man thirty years his senior.

For six months matters went on splendidly, but one fine day, when he reached the office, he found the door locked, and a written message posted up that the Firm was "suspended." This was a very cool announcement, and it had the effect of nearly freezing poor John. After making inquiries, he found that his "partner" had been trading under false pretences, that he had fled to escape justice, and taken the two thousand pounds.

For four months John did all he could to find him, but without success. At last, to keep himself from starving, he took a clerkship at ten dollars a week; but finding, after a time, that this would not do, he resolved to try his fortune out West.

With all his worldly possessions in his hands, he was pacing the depôt on the day of his departure, and looked, as he felt, very wretched. Not one consoling thought came to him; and how should it, when he knew not the only Source of true consolation? He stopped in his walk, exhausted by his thought, put his baggage down by his side, and wiped the moisture of nervous fear from his brow. As he did so, he saw a kind-looking, happy-faced young fellow watching him with pity in his searching glance. Their eyes met, and they were obliged to nod—John Grey in a hopeless kind of way, the other with an honest smile as accompaniment. Presently the stranger came up. "Pardon my speaking, but I think we are both bound for the same place. Can I be of any use to you?"

John was in a bad mood. He looked at the shabby clothes of the other man, and for a moment judged him by them.

"Any use?" he said, repeating the words. "No one can be of any use to me now. I have not an office to offer anybody, and not a cent by the side of that."

The stranger did not wince—did not heed the *words;* he was looking at the abstracted, miserable face before him.

"Sir," he answered, "that is not the way

in which I offered to help you. I do not need work nor cents ; but surely if one is entitled to speak to another in brotherly sympathy, I, more than any other man, should be, seeing your misery.

John was touched ; the shabby clothes were forgotten. He saw before him a gentleman in heart and speech. "Forgive me," he said, "I *am* miserable, and so hardly noticed your kind words ; but no one can help me now."

"Ah, we never know what even a seemingly chance word may do. I heard you tell the booking-clerk to give you the cheapest ticket he had. I said the same thing myself in this depôt five years ago, and I thought then, as you do now, that there was no help for me anywhere. I saw no prospect of anything good ; and so, though I am a stranger to you, I asked for the cheapest fare to-day, that I might travel with a man who is, as I once was, wretched."

The cars were coming in, and he stooped to lift John's baggage. "Stop!" cried its owner ; "let me show you my card. I have been in partnership with a rogue, and am taken by some for as great a rogue as he ; though I am more wronged than they."

"Are you John Grey?" interrogated the stranger, a surprised joy discovering itself in his tones ; "then you are more than ever in need of my help. Come, the cars are in."

The two hastened to get seats, and were soon on their way in the most crowded part of the train. Here they began to converse ; and as they sped on towards the place that was the home of one, and the destination of both, Grey opened his heart, and confided all his trouble to the other man. The stranger listened with the keenest interest, then he asked,—

"Did you ever make a partner of the Father of all men?"

"No. What do you mean? I do not like the sound of it." And John's lip curled, half contemptuously, at the idea.

"Just this," replied the other man ; "five years ago, when I came out, I believed in neither God nor man, and a young fellow who helped me to dig the ground on which my home stands now, startled me one day as we were driving the first posts in, by asking me, 'Say, master, s'pose now you b'lieved in God, what would you do? 'Twould make a power o' difference in this yer plot!' I boxed his ears, and told him to mind his own business, and he coolly answered that just now I was his master, so my business was his. I was rather tickled at the notion, so I answered his first question. 'If I believed in God,' I said, 'I suppose I should be reading the Bible, and not troubling to build houses ;' and then I made a bit of a mock of all religion, and ended by asking the boy if he preferred Psalm-singing and such-like to anything else."

"I suppose he said he did?" interpolated John.

"No, not a bit of it. He said Psalm-singing had its place, like everything else, but what he liked best of all was to know that he had made the Lord his active Partner, for he knew that the business would always go well. As he dug twice as much as I did, I thought there was something in this, and I admired his freedom from cant. 'What difference will it make in the plot?' I asked. 'A mighty deal,' he said ; 'if you was the Lord's, this land 'ud be His, and He'd just make it grow splendid ; and you'd lose them wrinkles, 'cause He'd take all the responsibility.'"

But John Grey did not understand this sort of talk ; so he yawned, and looked tired, and said in a business tone :—

"But there is nothing practical in all this kind of thing."

"Oh yes, there is," said the other ; "because I put all my concerns into that boy's Governor's hands. And they have been there ever since. It has been such a plaything, that though I was not worth ten dollars then, I can command fifty thousand now, and more to follow."

"How is it done?" asked Grey, looking more interested.

"This way : You get a peep of your own vile heart ; you soon find that its value is *nil*, but Somebody thinks that it is so precious that He lays down His life for it. This is so wonderful that you feel you had better make it over to Him, which you do. You have now, practically, given *yourself* into the keeping of Another. When a man gives himself, he generally gives all else along with such a bad bargain ; that's what I did."

"I'm still no wiser," said John coldly.

"Then you shall be. I was as despondent as a man can be, when that boy's words woke me up to the real cause of my despondency. I saw it as plainly as I see you. Some men are honest to all but themselves, but I felt that I must be honest with myself, and so I told the boy I was going to try his Master. But as I knew I was a sinner, not fit for such a Master, I made Christ my Saviour, and I rejoice every hour that I did so. That boy is head man now over most of my concerns ; but I am wanting a head clerk. When you have seen my place, perhaps you will be induced not only to keep my ledgers, but to put yourself under my Master. At any rate, I hope so."

All this time the stranger had kept his name a secret, and when John asked for it, he said, "Oh, wait till you get to Kingsville ; you will soon know."

He named such high terms to John, that the latter mentally resolved, whatever the position involved, that he would accept the clerkship. The shabby man began to read a penny Gospel Tract, and when John said : "Have you got a fellow to that?" he drew one out of his pocket, and handed it to him without a word.

At last Kingsville was reached, and there was a buggy at the depôt to meet the travellers. John did not hear the jolly looking driver say, "Ah, you've found him, sir!" or he might have been puzzled ; nor did he hear the reply, "Thank God, yes, I have, Steve," or he might have been more mystified still. They drove through several plantations, then over a splendid acreage of farm land, and at last reached the offices, and then the house of the stranger. John looked everywhere for a name, but could not see one ; he was growing curious. In an interval, being alone with Steve, he asked : "What is my host's name?" "He has not told you, sir? Well, I guess he's longing to do it, and I'm sure he won't keep you long, sir."

At last John and his new friend stood together in a spacious office. The shabby clothes were doffed ; the proprietor of the fine estate and the profitable business looked what he was, a comfortable, thriving gentleman of the best commercial circles.

"What have you thought of my offer?" he asked.

"I accept it, whatever it involves," replied the other.

"Good ; will you kindly sign this agreement, and then we will get some dinner. I know it is waiting."

"Gabriel Paunceforth!" exclaimed John, "the name of the man who ruined me, body and *soul*, I was going to say!"

"The same. I am his son. I have searched for you for two months. I have prayed for you ever since I heard your name in connection with my father's. Part of my prayer has been answered—I have found you ; and I believe all my prayer will be answered ere long. I shall never rest until you are restored financially to the position in which my father found you ; I have placed two thousand pounds to your credit, and ——"

John could hear no more ; he sank into a chair and sobbed, and there Gabriel Paunceforth left him for a quarter of an hour. At the end of that time he returned. John sprang to meet him. "God bless and reward you!" he exclaimed fervently ; "you have filled my heart with gratitude and hope, and you have made me resolve to seek your God ; for a religion that can turn out such a man as you *must* be worth having, and I am going to try it." He put his recovered money into the Paunceforth business, and worked hard to repay so great a benefactor as Gabriel ; he took only half the salary that was offered him, and felt well paid at that ; and last, but not least, he gradually came to put himself into the keeping of the eternal God, his Saviour, and rejoiced Gabriel's heart by making a public profession of the same. Exactly one year and one day from the time they met, and five months after Grey became a Christian, the two men changed their business relations towards each other, and entered into partnership as Paunceforth & Grey.

"There is but one thing in which we do not unite," said Gabriel one day to John.

"Name it," said the latter, "and it shall no longer be so."

"Pray for my poor, erring father," answered Gabriel sadly.

"Ah, then we are not alone, even in this, for I have prayed for him, as you did for me, for the past two months."

Three months after this, they heard from Valparaiso that Gabriel Paunceforth the elder had died in a public hospital there ; and on inquiry, they found that an Englishman visiting him daily was assured of his repentance and forgiveness in Christ. They paid all his debts in full, and John never felt happier than he did on the day when he went to New York, and satisfied, one by one, the claims against his late partner.

And Steve, the boy who sowed the little seed in Gabriel's heart? He got the notion that the Lord *would* have him to be a missionary, and everything seeming to point that way, Paunceforth & Grey sent him to College for three years, and when he left, the board of directors said they had never turned out a more satisfactory missionary than the Rev. Stephen Eames. He left his mark behind him, and he took it with him to Western Africa.

Gabriel Paunceforth never forgot his words to him in the house-plot ; he always declares that that was his first sermon, and all the congregation was converted!

Our first Monthly Part, with striking Frontispiece, now ready of all booksellers, 6d.

Specimen copies of —"A. 1."— will still be sent, carriage paid, to any Clergyman, Minister, or teacher, who can dispose of them to advantage. We heartily thank those who have thus promoted our circulation.

OUR ENGLISH BIBLE.

By the Rev. Canon Taylor, D.D.

(*St. Chrysostom's, Liverpool.*)

THE English Bible is a translation of a book, or a collection of books, originally written in languages long since dead; viz., Hebrew and ancient Greek. Those composing the Old Testament were written during a space of about 1,000 years, from B.C. 1500, to B.C. 400. They were written, as we believe, by inspired men of God, from Moses to Malachi. The New Testament was written from A.D. 40, to A.D. 90 or 95. The books of the Old Testament are thirty-nine, written by Hebrew Prophets; those of the New Testament are twenty-seven, by inspired Apostles. Thus the entire collection of separate pieces amounts to sixty-six. They are written in every variety of style and literature. They are historical, poetical, doctrinal, ethical, parabolical, and prophetical; but the grand subject is one throughout,—salvation by the incarnate Son of God,—redemption through His precious blood,—regeneration and sanctification by His blessed Spirit.

The earliest portion of the Bible was written some 3,500 years ago, the latest 1,800 years since; 1,500 years therefore elapsed between the production of its earliest and its latest portion. Some thirty different men were engaged in its formation. They were of all ranks and conditions, kings, princes, peasants, priests, ploughmen, fishermen, and tax-gatherers. But the marvel of the Book is, that the 66 books make one Book, pervaded by a marvellous organic unity of design and subject. Why is this? Its real Author is God. The Book is a miracle, and nothing can account for it but a Divine Authorship.

The Old Testament was translated into Greek about 270 B.C., and this edition is called the Septuagint. It was the work of some learned Jews in Alexandria.

The New Testament consists of history,—*i.e.*, the fourfold biography of Christ, and the Acts of the Apostles, or history of the early Church; of the 21 Epistles or letters of the Apostles, and of the Apocalypse of St. John the divine. Copies were quickly made, and translated into the other languages of the time. The earliest versions were the Peschito, or Syriac, and the Vetus Latina, both in the 2nd century; the latter became the basis of the Vulgate of the 4th century. There was an early translation of the four Gospels into Gothic, by Ulphilas, Bishop of the Goths. It is at present in the Library of the University of Upsala, and is called the Codex Argenteus.

The English version of the Bible began in some early Anglo-Saxon fragments, notably those of Bede, the monk of Jarrow, in the 8th century. He translated the four Gospels, or nearly so, for he died before they were quite complete. Feeling his end approaching, he told the youth who acted as his amanuensis to write quickly. "Master," said the youth, "there is yet one sentence wanting to complete the text." The aged monk gave it to him. "Master," said the youth again, "it is finished." To which the dying man replied: "Yes, it is finished; it is well." And then, putting himself into an attitude of devotion, he breathed out the doxology: "Glory be to the Father," etc., and passed away. King Alfred produced a Saxon version of the Psalms, and some other portions. But the great work of translating the whole Bible into English was first accomplished by John Wycliffe, Rector of Lutterworth, *circa* 1370. Of course it was all in manuscript, and we can well imagine what a laborious work it was. He was one of the Reformers before the Reformation. In this sense he was before his time; but he sowed the seed, and to some extent disseminated the light of the pure Gospel, so that he has been well called "The Morning Star of the Reformation." He excited the opposition of the hierarchy, and of those who loved the old superstitions, and though he escaped actual martyrdom, he suffered much persecution. Forty years after his death his bones were dug up and burned, while his doctrines were denounced, and his Bible condemned, by the ecclesiastical authorities.

William Tyndale, in 1526, was the first who translated the New Testament from the *original Greek*, and he had it printed.

Wycliffe's work was not from the Greek, of which he was probably ignorant, but from the Latin vulgate; and it was, as stated above, in writing. But Tyndale drew from the original fountain, and gave it to the world by the printing press. He was a graduate of Oxford, priest and tutor, but he was also one of the early Reformers. Luther's great movement was already stirring the heart of Germany, and its pulsations were being felt in England. One threatened him with the displeasure of the Pope. "I defy the Pope," was the reply; and he added that, if he lived, he would make "the boy who followed the plough know more of the Bible than the Pope and all his doctors." He had to fly to the Continent, and then at Cologne, Worms, and Antwerp, he carried on his work, and sent the printed volumes to England. They were bought up by the Bishop of London, and publicly burnt at St. Paul's, in the vain hope of stopping the circulation. The only effect, however, was to enable Tyndale to bring out a better edition, with valuable corrections.

He was betrayed at Vieford, near Brussels, strangled, and then burnt. His last words were; "O Lord, open the eyes of the King of England." (1536.)

A few years after Tyndale's New Testament, Miles Coverdale, of Cambridge, monk, priest, and Reformer, translated the whole Bible into English, out of German and Latin. This was the first version of the whole Bible *printed* in English, A.D. 1536, the year in which Tyndale was martyred.

In 1537, Matthews' Bible appeared. This was an edition published by John Rogers, the first martyr in Mary's reign. The Old Testament of this edition was translated by Tyndale and Coverdale, the New Testament was that of Tyndale. It received the Royal licence through the influence of Cranmer, and in 1538 was ordered to be set up in churches for the people to read. The name "Matthews" was assumed. Cranmer's "Great Bible," so called from its size, was a revision of Matthews' Bible, superintended by Coverdale. It was published about 1539, by the authority of the Archbishop.

The Geneva Bible appeared in 1560. It was translated at Geneva from the original Hebrew and Greek, by Coverdale and others; it was a very valuable edition, much in favour with the English refugees.

The Authorised Version appeared in 1611, by order of James I. Seven years were occupied in its translation, and the forty-seven divines engaged in the work were divided into six companies; two at Oxford, two at Cambridge, and two at Westminster. It received a final revision at London. This work ranks first amongst the English classics.

It has been in undisputed possession of the field for the last 270 years, and in my judgment is destined to hold it still. The Revised Version of 1881 will never supersede it. In some few particulars, no doubt, it is an improvement on the old translation; but thousands of alterations have been perfectly needless, and are, in my opinion, puerile in the extreme. It met with severe criticism from Dr. Wordsworth, the late learned Bishop of Lincoln, and has been absolutely pulverized by the Dean of Chichester, Dr. Bingon. Still, every student of the Bible should have a copy of it, for comparison. It will sometimes cast light on the authorised rendering; but one cannot but feel that in their efforts after literal accuracy, the translators sometimes sacrificed the grand old Saxon idiom, to which we have been accustomed; *e.g.*, "The lamp thereof is the Lamb," reads very tamely compared with the noble rhythm, "The Lamb is the light thereof." So also the description of John the Baptist, as "the lamp that burneth and shineth," instead of "he was a burning and a shining light." And the alteration is the more to be regretted, as the original word in both cases is not a lamp, as in Rev. 4. 5, but a light.

In reviewing the history of our English Bible, we see that the earlier efforts were made under great difficulties, by poor men like Wycliffe, Tyndale, and Coverdale. Truly other men laboured and suffered in the face of great opposition, and even persecution; and we have entered into their labours. They were, however, helped by the providence of God, in the revival of literature in the 15th century, the study of the Greek language, and the invention of printing, whereby copies were multiplied, and the cost of production marvellously cheapened. The price of the New Testament in Wycliffe's time was about £3, equal to £40 of our money. Now we can buy the New Testament, beautifully printed, clear and distinct, for one penny!

The influence of the Bible on the English nation has been wonderful. It has moulded, indeed I may say it has made, England, and formed the national character. The Reformation of the 16th century is inextricably bound up with the English Bible, and the recognition of the Bible as the Divine rule of faith and practice has established the principle that it is the right and the duty of every person to have, read, and study it for himself. This principle necessarily produces, so far as it is practised, habits of intelligence, piety, and self-reliance, and a feeling of direct personal responsibility to God.

A few words, in conclusion, as to the personal use of the Bible.

1. I would recommend the help of an "Introduction" or "Companion to the Bible."

2. Read the Bible daily, using it as a Book of devotion, for the purpose of prayer and praise. St. Paul's Epistles supply the former; the Book of Psalms the latter. Above all, read the life, sayings, and works of Christ, the Life of lives.

3. Remember its great object and subject. Its object, to make wise unto salvation; its subject, Christ and His Redemption.

4. Diffuse it, as the best defence against infidelity and superstition, the surest bulwark of order and freedom.

5. Never allow any, as far as you can prevent, to undermine its authority by rationalistic interpretation, or to overlay it by sacerdotal assumption.

6. Claim the right to have free and unimpeded access to your Father's message, in His own words.

THE OLD VIOLIN.

By E. H. KNAPP.

CHAPTER I.

"And inspirations that we deem our own,
Are some Divine foreshadowing and foreseeing
Of things beyond our reason and control."
—LONGFELLOW.

THE sweet, pathetic strains of one of Mendelssohn's Lieder floated through the concert room, entrancing the large audience with its wistful pleading. At length the last note, prolonged till it seemed a whisper, died away in the silence, and then the clapping of hundreds of hands, and the thunder of applause, resounded through the room again and again, until at last the successful player reappeared. There was no withstanding such an appeal, and once more he played, so they said afterwards, as he had never played before, an impromptu. Sadder and sadder grew the music, until it seemed as if the heart were broken. It was a Lebewohl, unpublished, the production of the moment. No applause followed; it seemed as if a wave of sorrow had passed over all. Tears were in some eyes that night.

Herr Räume, the successful violinist, retired immediately afterwards. He knew the feelings he had stirred; he knew that the silence then was worth all the thunder of the former appreciation.

He was an elderly man, tall and thin, with snow-white hair, which waved over a broad, massive brow. The expression of his face was sad in the extreme. He looked, and he was, a broken-hearted man; for though genius and fame were his, his only son, neglecting the genius which he had doubly inherited from his father, had disappointed all his hopes, and, like the Prodigal Son, left all and gone into a far country, where he wasted his substance and talents in a life of idleness and dissipation.

Conrad Räume had run away when seventeen, with a companion whose influence over him had always been for evil. His poor father, young in years, but old in the trouble which ages in so short a time, was left in the old city of Leipzig, to live lonely and unloved, studying the art which made life worth living to him, and trying to hope for the best. "Watch and wait" was his motto, and day by day he prayed for his erring and dearly loved son, who had lost a mother's care when too young to know anything about it.

In the house where he lodged, lived a widow lady, with an only girl, who had grown up with Conrad as a sister, and now all she could do to comfort the poor father, she did. Esmé was passionately fond of music, and had one of those sympathetic natures, which know so well how to enter into others' joys and sorrows. Herr Räume, when playing that night, felt that Esmé, who was there, would understand his meaning, and each note seemed to tell her that hope was dying. Very sad were her thoughts as she quietly walked home with her mother.

"How ill Herr Räume looks, mother," she said, as they went slowly through the crowded streets; "he gets worse and worse; they say that he is dying. I heard Carl Trinken telling his sister so to-night, when he was playing that lovely impromptu. Poor man! poor man! that wicked Conrad has broken his heart."

When they reached home, they found Herr Räume there. "Esmé, my child, I want to see you," he called out, as he heard her light footstep passing his door.

She went in, and found him leaning back in his chair, very exhausted.

"My child," he said, "I feel I shall not be with you much longer, and I have a last request to make; will you remember it?"

"I will try, Herr Räume."

"Listen, then. When I die, will you keep my violin for Conrad, when he comes home again? for I know he will return, though I shall not be here to welcome him; it is my last wish, little one."

"Dear Herr Räume, you are tired to-night, you will feel better to-morrow; but I promise you."

"You will promise never to let it go out of your possession on any account, or under any circumstances?"

"Never," said Esmé earnestly, adding gently, as she stroked the thin, white hand, that fingered so tenderly the old Cremona violin, which had been his daily companion for so many years, "I hope God will spare you to see Conrad once more; and, oh, I should miss you so dreadfully!"

A faint, sweet smile flitted over Herr Räume's face, and he smoothed Esmé's cheek softly. "You will miss the old violin, my child; it will be silent for a time, till Conrad comes; then he will make it speak again; the soul of the violin will awake once more, when the wanderer returns, though its old master will have passed away for ever. And now I must rest, so good-night, Esmé; to-morrow I will play again to you, if I can. Remember your promise."

"Good-night, Herr Räume; I will not forget," said Esmé, as she stole out of the room, taking one last look at the face she loved so well, ere she closed the door and left him alone.

Early the next morning, when Esmé went in with some fresh flowers for Herr Räume, she found him where she had left him the night before, in the same position, resting his head on his hand, as though asleep.

"Herr Räume, see these sweet flowers, all fresh from the garden; they are for you."

But he moved not, spoke not, and Esmé, in sudden terror, ran to his side. Only too soon did the truth flash on her. The broken heart was healed at last. The wonderful music that he had made last night, was now continued and perfected for him in heaven. For him, Esmé could not mourn; but for herself,—the dreary void in her life could not be filled.

The weeks following his death passed like a dream. The old violin, which was consigned to her, as arranged in his will, was treasured with the greatest care. Fastened to the neck of the violin, Esmé found a thin strip of parchment, with the words, "Für meinen lieben Conrad, wenn er nach Hause kommt," written on it in faint, feeble writing.

Great was the consternation in musical Leipzig, when the death of Herr Räume was announced. In the height of his fame. Now that perfect "Lebewohl" would never more be heard. Lost for ever! buried in the still, deep echoes of the past!

For several years after this, Esmé's life went on monotonously; now that there was no Herr Räume to play to her by the hour, her life felt very empty. Music had always had a different meaning to her than to any of her companions. She had heard, as it were, with Herr Räume's ears, and now that he was dead, the thoughts and feelings of her friend became even more than ever the mainspring of her life.

"Art," he had said one day to her, "is to purify and ennoble; it should ever elevate the thoughts and feelings; it is a gift from God to make others better, and to draw us nearer to Him."

All he did or said was the same, and Esmé had unconsciously been forming her life from his.

She practised assiduously; and, although no genius, yet her music awoke longings in the hearts of those who heard her; for Esmé's whole soul spoke in every note. She was often asked to play at concerts, and one New Year's Eve, which she remembered long afterwards, she was obliged to go alone to a grand choral concert, in which she was to take part; for her mother, who had become rather feeble, was not well enough to go that night with her.

As soon as the concert was over, Esmé hurried off home, feeling anxious to get back to her mother, who had seemed lonely and depressed.

As she walked quickly in the direction of Grieg Platz, where she lived, the streets seemed to become more and more crowded. She never remembered having such difficulty in forcing her way along.

At last, meeting another rush of people coming in a contrary direction, Esmé was carried along in the opposite way to where her home was, and feeling lonely, and rather frightened at finding herself so far away, she managed to slip into a doorway, where she thought she would wait till the crowd passed.

"Grieg Platz is quite destroyed; the whole circle of houses was in flames when the engines arrived," said a passer-by, carelessly, as he crossed Esmé's hiding-place.

A hand was flung on his arm, and a stifled, agonised voice cried,—

"Sir, sir, tell me; what did you say?"

"Pardon, Fräulein," said the speaker, as he turned. "Oh! Grieg Platz is burnt. Why, what is the matter; do you know any one there?"

"It is my home," gasped the girl, white as death, "and my mother!"

"All the inhabitants are safe," said the gentleman, kindly.

"Thank God! thank God!" murmured Esmé, convulsively.

The stranger hesitated a moment, then looking kindly at her, said,—

"I will take you back if you will trust me."

Esmé glanced at his frank, open face, and thankfully accepted the kind offer.

As they hurried on towards Grieg Platz, she found herself telling this new friend many little details of her home life, and of her great love for music.

He proved an attentive listener, and told her how great an interest he took in those who devoted their lives to the study of Art. It seemed a long time to the impatient Esmé, ere they entered the familiar street which led into the well-known Platz.

When they reached the scene of the fire, the smoking houses, falling bricks, and rushing people, bewildered her, and she clung to her kind protector for support.

"If I could only find out where my mother is—ah! there is Gretchen. Oh, Gretchen, Gretchen," she cried eagerly, as a stout, good-natured woman pressed close to her, pushing her way through the crowd, "where is my mother?"

"Miss Esmé, my dear, how lucky I am to find you! Your mother is half wild with anxiety; she was so afraid you would be lost. Quick, come with me."

"This kind gentleman has taken care of me," said Esmé, as she turned to thank him; but he had disappeared. In a few moments, Esmé was clasped in her mother's arms.

"My child, my child, oh! thank God you are safe!" cried the widow, as she pressed her child to her heart.

"Keep my violin for Conrad, . . . I know he will return."

Her mother was saved, that was all that Esmé thought of at first. She had been taken by Gretchen, on the first alarm of fire, to the house of the old washerwoman who had worked for them for years.

Some careless servant had spilt a lamp in an adjoining house; the inflammable oil caught the wood-work, and soon the wooden house was in flames. It burnt like tinder, and very soon the fire spread, and the whole of Grieg Platz was destroyed.

"Nothing could be saved, Esmé," said her mother, "not even the violin. A number of things were thrown out of the house; but even if the violin was amongst them, I doubt if we shall find it again."

Esmé was greatly grieved at this, and the next day she went to the scene of the fire, inquiring of every one if they had seen it; but "No" was the answer which greeted all her inquiries.

She found a table and two or three chairs belonging to them, but that was all. All their little treasures were gone, except just a few things which her mother had brought away with her.

She and her mother were in very poor circumstances after this, for they had lost all their worldly goods; therefore Esmé had to work hard, giving music lessons to try to help her mother.

CHAPTER II.

"Creep home and take your place, lad,
The maimed and halt among;
God grant you find one face there
You knew when you were young."
—KINGSLEY.

How often in the days that followed the fire did Esmé wonder what had become of the old violin.

How often did she grieve over the promise which she would never now be able to fulfil; though, as the years passed by, and no news of Conrad Räume came, the hope of seeing him once more grew fainter and fainter.

Times were hard now to Esmé, and she grew pale and thin with anxiety; her mother's health failed fast, and she could not procure the little delicacies with which she longed to be able to tempt the invalid.

However, one bright, sunny day in the Autumn, some months after the scene described in the last chapter, Esmé was walking quickly homewards with a happy smile on her face.

In her pocket, carefully hidden in the innermost recesses of the little well-worn purse, lay two golden sovereigns, part of her hardly-earned salary, and with it she meant to get a few luxuries for her mother.

As she turned down a narrow bye street, which would take her home a shorter way, her eye was attracted by a large placard in a dingy shop full of quaint old musical instruments, announcing a sale of all the present stock, amongst it a Cremona violin, slightly damaged, dirt cheap.

The violin was hanging in the window, and Esmé glanced carelessly at it. Something in it seemed familiar, and looking at it more carefully, with a start of joy, she recognised the lost violin of Herr Räume.

But how could she use her little bit of money, when her mother needed all that she could earn? How eagerly she had looked forward to getting her some little dainty that night.

It seemed almost impossible to decide. Her promise, and her love for her mother were both fighting for the victory.

While she still stood hesitating, a poorly-dressed, ragged-looking man passed into the shop, and in a minute the violin disappeared.

Esmé hesitated no longer; her mother would say it was right; but how hard it seemed, and there was little chance of its costing less than two pounds.

"At any cost I must purchase it, and fulfil my solemn promise," she said to herself.

She entered the dingy little shop, just as the dealer was saying: "Come, it's no use your standing haggling there; you shan't have it for fifteen shillings, or for fifty shillings; so be off."

The stranger now had lost his chance of the bargain, and, looking longingly at the violin, moved off with a sigh.

Esmé's heart sank; how could she hope to get it with only two pounds?

After nearly half an hour spent in explaining and bargaining, the dealer consented to let her have it for that amount; for, as he said, "she was a lady, and that other fellow was a regular bad lot;" besides, Esmé's story of the violin interested him.

Joyously did Esmé hasten home with her treasure; and her mother's words: "Quite right, my child; I would not have had you miss the opportunity of regaining possession of the violin on any account," rewarded her. "And see, dear, our good Gretchen has made some hot cakes for your tea, as she said you should have something nice to cheer you up before you go to the concert."

Esmé smiled; but the thought of the sacrifice she had had to make weighed heavily on

her mind, as she watched her mother, and noted how fragile she looked. Mrs. Frieden noticed the shadow which passed over her child's face, and, guessing its cause, tried to divert her thoughts, by asking her all particulars of how she had found the lost violin. She soon heard all about the poor man, who, Esmé said, looked so disappointed when he found that he could not buy it.

"I was so thankful, mother, though, that he did not. The dealer told me a poor girl had brought it to him some weeks ago, and I expect she did not get much for it; for the dear old thing has been so hurt by the knocking about, that it is very dilapidated now; but it is a real Cremona, mother, and worth hundreds of pounds; Herr Räume told me so. I suppose some one picked it up after the fire. I hope it will not be spoilt."

"I hope not indeed, dear," said her mother; "but now I think it is time for you to get ready for the concert."

Esmé did not take very long, for her dress had done duty on many occasions before. Her only ornament was a tiny diamond star, which had belonged to her great-grandmother. She looked very sweet as she stood waiting for Gretchen, who was going with her; so her mother thought, as she put a few finishing touches to the simple toilet. She was just saying "Good-bye," when a loud double knock, and a voice asking if "Miss Esmé Frieden lived there," interrupted her; and great was her surprise when Gretchen walked into the room with some beautiful hothouse flowers, and a little note.

"For Miss Esmé Frieden, from her conductor on the night of the fire, Graf Bernardt von Errichstein," read Esmé. So that was her kind protector, the man of whom all Leipzig had been talking; the man who encouraged Art in every form, and who was never so pleased as when rescuing unknown talent from the darkness of obscurity. Why, it was he who was that very night to introduce a stranger called "Der Wanderer," a violinist whom he had found in want and despair in a small, wretched lodging near the Grieg Platz, to musical Leipzig, at the concert in which Esmé was to take part. She had often talked about her kind friend, and wondered who it was.

The fact was, that Graf Bernardt had got separated from her in the crush just as she saw Gretchen, and before he was able to find out her name.

He only knew she was called Esmé. He had been away, too, in Berlin; and in all the rush and hurry of his busy life, for a time he forgot the girl he had so kindly assisted.

Seeing the name "Esmé Frieden" on the programme of the concert, at which he was to be present in an official capacity, the remembrance of the bright, girlish face came back to him, and finding it was the Esmé he knew, he had sent the few flowers from his beautiful hot-house to her, for the concert.

Esmé and her mother were delighted; and as Esmé, carrying the sweet scented bouquet, walked along towards the public Hall, she thought how good and kind her former protector must be.

The first performance in the second part was reserved for the strange violinist, and with a few kind words, Graf Bernardt led forth a very plainly, almost meanly clad man, and with a start Esmé recognised the poor man whom she had seen in the music shop that morning. He had once been handsome, though now his face was emaciated and colourless, and his hair was streaked with grey; in years he must have been quite young. Esmé watched him with a strange fascination.

He began to play, and then all in that immense Hall, in the intense interest with which they listened, forgot his attire, forgot everything; for it was the voice of genius speaking to them once more.

Wilder grew the music; it seemed to tell a story, such a story as few amongst that audience could have understood. To Esmé it sounded like a despairing cry, the refrain repeating again and again: "Ich bin allein nach Hause gekommen." Then the music changed, and in soft, dreamy sweetness it died away. Rest after suffering; peace after loss.

The applause was tremendous. From henceforth "Der Wanderer" would need no more help. He had spoken to every heart in that great Hall.

Graf Bernardt, delighted at his success, came forward to congratulate him, and reached him just in time to prevent him from falling.

"Food, food," murmured the fainting player, as he sank almost unconscious into the friendly arms stretched out to save him.

"Quick!" cried the count, "Herr Räume is starving."

"Herr Räume! Herr Räume!" shouted the enthusiastic Leipzigers, almost wild at the thought of the want which had brought the son of their old beloved master so low.

Strengthening food was soon procured, and Conrad, for it was he, revived a little. Esmé, quite upset by the sudden excitement, could hardly believe that the poor man who had looked so longingly at his own father's violin that very afternoon, was indeed "Der Wanderer."

She hurried home as soon as she had seen Graf Bernardt drive Conrad Räume off in his own carriage, and in a short time her mother knew all.

"Only fancy, mother," she exclaimed; "only fancy; it is just like a story!"

The next day, Esmé and her mother went

"'At any cost I must purchase it.' . . . The stranger now had lost his chance of the bargain."

to the wretched lodgings where Conrad was living, taking the violin with them.

"Herr Conrad, this is yours," said Esmé, when the first excitement of the meeting was over. "It was your father's;" and she handed him the dear old Cremona violin, and gave him the message, which she knew word for word, though the little strip of parchment had been lost.

A happy time followed for all our friends. Conrad told how bitterly disappointed he felt, when he offered all he possessed in the world to the dealer, in the hopes that he might sell him the violin.

"I knew it again instantly. My dear father! How I long to see him once more, if only for a moment, to tell him that now I have sown my wild oats, I have come home to be a better man. Never to see him again! It is a sad home-coming!"

"He knew you would come back," said Esmé, gently; "he made me promise never to part with his violin on any account. It was to be kept for you."

Graf Bernardt rejoiced over the happy re-union of the old friends.

Once more did the violin speak to Esmé, as of old; and Conrad, who had at last realised the importance of the talents committed to him, tried each day to copy the father who loved and mourned him so long.

"I often thought of him, and of you, too, Esmé," he said, one day, as he sat watching Esmé's clever fingers arranging the flowers he had just brought her, "when I was far away in foreign cities; I always knew that home was waiting for me, and now you can understand my feelings, when I find my home gone and my father dead."

The sunshine of prosperity shone on the little home now, for Count Bernardt helped Esmé in many ways, and Conrad had made her take back the two pounds she had given for the violin.

Now my story draws to a close. The old violin is found again; the wanderer has returned; but I can fancy my readers saying, "And is that all? Surely there is something more."

Well, just one more peep at them, then. Conrad finds Esmé's presence so necessary to him while he plays, and it seems so dull and lonely in his lodgings, that night after night he carries his violin over to the little room where he knows he will find a warm welcome; and one sunny evening in July, Esmé heard another story on the violin, and her answer to the question that Conrad asked her after, was so low, that it had to be repeated again. This, dear reader, is what she said,—

"Ewig dein, mein Conrad, ewig dein."

And as from henceforth, Conrad and Esmé and the old violin became life-long companions, so we will leave them with a loving "Lebewohl" in their happy home in the old city of Leipzig.

"ONE drachma for a good book, and a thousand talents for a true friend:—The silent volume listeneth well, and speaketh when thou listest."

A steam tandem tricycle has been devised, and was on exhibition at Atlantic City. The machine does not differ, in front view, from an ordinary open front tandem, and the whole has very little of the appearance of a steam vehicle. The engine, which is capable of developing two-horse power, is of very light weight.

HOUSEHOLD MANAGEMENT.

FOR MARRIED FOLK.

By Daniel McCoy,
Author of "Hints on Poultry Keeping,"
"Window Gardening," etc., etc.

III.—Furnishing.

IT is scarcely possible, in an Article such as this, to give an exact catalogue of drawing-room furniture.

But all sitting-rooms should be home-like, and as free from glare and glitter as possible. The days of white paint and gilding are happily passed; even the old familiar white marble mantel-piece has fallen into disfavour. The ideal drawing-room should look like the resting-place of the household.

Of course the floor will be stained, and some prefer to have only soft rugs and skins strewn about. But for real comfort and convenience, a large-sized square carpet in the centre is best; the rest of the floor can be dedicated to mats if you will. The wall paper should have no conspicuous pattern; a soft tone of green, grey, or terra-cotta will best set off pictures, if you have them. In any case, simplicity is better than flights of tropical birds, or distorted botanical phenomena. The paper, and colour of the ceiling should harmonize, or contrast effectively with the skirting-boards and mouldings. Consider the aspect of the room; if north, or east, a much lighter paper must be chosen, as the darker shades add to the gloom.

The choice of window curtains will be governed by the state of your purse. From satin or velvet down to cretonne or striped muslin, you have endless variety. Choose not only what looks pretty by day, and will not fade in the sunlight, but what will also look well at night.

Avoid large expanses of plate glass. They are cold-looking and inartistic. A long narrow strip, running from floor to ceiling, set in a plush frame, or draped gracefully at the sides, is sometimes effective at the end of a room, but it needs to be carefully arranged. A gilt-edged mirror over the fire-place is never bought now-a-days; a pretty over-mantel, with plush brackets for china or pottery, and a pair of dainty little wall cabinets, with bevelled glass panels, will be far more pleasing.

As to the larger articles of furniture: A piano of course you must have; but *wait* until you can buy a good one, which will last. A soft couch—two, if your room be large; chairs light and heavy, high and low; a moderate-sized table in an unfrequented part of the room, two smaller ones for work, books, or afternoon tea, and perhaps a nice cabinet for china, will be all you will actually require. If you can trust your eye as to fitness of form and colour, none of these articles need "match"—be careful that they harmonize.

Do not furnish your room in a hurry; add to it from time to time, as you meet what suits your taste. Be *natural* rather than fashionable in your choice; thus your room will look as if it belonged to you. It is needless to particularise smaller details of ornament, etc.; such things cannot be done by rule.

If there be a library in the house, it will need little beyond a warm, soft carpet and the books, with the means of keeping them, and reading them in comfort. This will include neat strong book-shelves, either of oak, mahogany, or stained deal, with borderings of stamped leather or cloth; one, two, or more strong, useful tables—not cumbered with knick-knacks—on which heavy books can be conveniently handled; deep-seated, leather-covered arm-chairs, in which a newspaper or magazine can be read, and several solid but comfortable chairs for use when studying at the tables. All requisites for writing should be at hand. A few good engravings will improve the walls, and a marble statuette or two, if you happen to have them, will be in keeping with the character of the room.

The schoolroom should be furnished with strict regard to comfort and durability. It is not fair to surround children with breakable things, neither is it wise to accustom them to live in the midst of shabbiness. The carpet should be strong, and easily movable; the tables should possess the same qualifications. Sometimes, especially in a day nursery, it is well to cover the floor with thick cork linoleum, which is more serviceable than carpet, and at the same time *warm*.

The chairs should be both comfortable and roomy, and it is well to have a *flat* couch, on which the tired children can rest. A press will be needed for books, etc., and, if the schoolroom be also a play-room for the elder children, a place where toys and such-like can be tidily stored. The schoolroom will not need curtains if the window fits well,—it will be more healthy without. The table covering may be of American cloth for school hours, and of some dark red material for the afternoon. If meals are taken in the room, no food should, on any terms whatsoever, be allowed to remain from meal to meal.

It ought not to be necessary to say a word about day or night nurseries,—a mother's heart would surely devise the best things possible for these. Still, it is well to emphasize the fact, that everything about a nursery should be bright and wholesome. No old dusty curtains or time-worn carpet; no cupboard redolent of cheese of by-gone years; no chairs with loosened stuffing oozing out, to tempt the baby fingers, and infect the baby breath. Give the children as little as you like, but let that little be spotless and pure. Have old things in your drawing-room, if needs be, but have new in the nursery. Let the little cribs be plain, but provided with the best bedding. A caution as to the regular use of a fire-guard may be needed,—such terrible accidents have been known to happen to helpless children from carelessness in this respect.

As to the bedrooms, their furniture may be either elaborate or simple, according to the purpose they are meant to serve. It is well to have all the carpets on one landing the same, so that those from the larger rooms can be cut down, when worn, to fit the smaller.

It is also desirable that all the windows at the same side of the house should have curtains and short blinds to match.

Various priced suites can be purchased readily, and to these may be added a writing-table, an easy chair, and a couch, if the room be large. The bedstead is sure to be of metal—probably brass; and some variety of wire mattress, with a curled hair mattress over it, will be found far better than any upholstered spring or feather bed. Throughout the house, even in the servants' rooms, these wire mattresses will be found the cheapest and healthiest. They are also light, and easy to move. In choosing suites of furniture, special inquiry should be made as to the age of the wood. It is a common thing for pretty suites to warp so much in a few months, as to make the use of drawers or shelves impossible.

THE MIS-USE OF BIRDS.

By C. F. GORDON-CUMMING,
Author of "Fire Fountains," "A Lady's Cruise in a French Man-of-War," etc., etc.

WE have recently spoken of the beautiful feather work of various Pacific islanders, notably those of Hawaii and of New Zealand, and of the law enacted by the great king Kamehameha I. for the protection of the Royal bird, which yields the tiny golden feathers—a law which, though it in no wise regarded the birds' right to their own dainty gems, at least did this good, it preserved their lives.

But what legislation can affect the wholesale destruction of every species of bird of beautiful plumage, which of recent years has resulted from the mania for turning all such to account for personal adornment? Vainly have divers Societies—the Selborne League, the Audubon Society, and the American Ornithologist's Union,—striven both in the Old and New World, to awaken womankind to a sense of the barbarity of causing the annual sacrifice of millions of the loveliest of *God's* creatures, in obedience to a cruel and objectionable fashion of their own creation—scarcely to be described as the gratification of personal vanity, inasmuch as a ribbon will set off a pretty woman's beauty to quite as great advantage, without involving any destruction of her lovely and helpless fellow-creatures.

Ladies who shudder with disgust at the account of wild Indians glorying in the number of foemen's scalps they can hang from their girdle—(the scalp being simply a lock of hair from the crown of the head with the skin attached to it, by no means necessitating a broken skull)—fail to perceive any cruelty in creating a demand for the graceful so-called "Osprey" feather, which now so commonly figures as one item in the trimming of a fashionable hat or bonnet. So airy and delicate a plume seems naturally destined to supply the finishing touch to a dainty lady's head-dress, and few indeed pause to consider at what price it has been purchased, or how the robber has secured it, at bitter cost to the family of its rightful owner. For these slender, fairy-like feathers are obtained from certain graceful, small herons, which wear them only during the time they are breeding.

Therefore, each feather represents a family of poor little helpless herons left to starve in their nest, craning their long necks to watch for the parents who can never return, and screaming pitifully with weaker and weaker cries, till at last merciful death comes to their release. The class of men employed by feather-dealers are not generally tender-hearted, so when they find a heron colony, they do their best to secure all the old birds, without one care for the tender nestlings, whose sufferings matter not one whit to them. Nor does even self-interest stay their hand; for who can tell whether the fickle fashion which this year demands egret's plumes, may not by next Spring have devised some new requirement, so that the poor heron's finest feathers may find no market?

And what is true of them, is more or less so of all other birds, many of which don their best plumage in Spring; and it is evident that the massacre of parent birds, vast as it is, does not represent a quarter of the actual loss of bird life, when the slow starvation of an incalculable number of young ones must be added thereto. The amount of suffering thus represented is something inconceivable. Long Island, near New York, alone furnishes above 3,000 skins of the sea-swallow in the early Spring, and it has been estimated that in the United States, fully 10,000,000 of birds are annually slain for the sake of their plumage. Of these, about half are required for home use, and the rest are exported to Europe, which also receives large supplies from South America, India, Australia, the Papuan Isles, and Africa. One Parisian house states, that in a single year it disposes of a hundred thousand West African birds; and Mr. Musgrave has told us that in *one London auction room* the number of prepared skins sold within four months included:—

404,464 birds from Brazil and the West Indies; 356,389 East Indian birds; 6,228 Birds of Paradise; 4,974 Impeyan pheasants, and 770 Argus pheasants; besides a large miscellaneous collection, including some of the rarer Birds of Paradise, Parrots, Bronze Doves, King-fishers, Golden Orioles, Black Partridges, etc.

This foreign supply secures no immunity for our own feathered tribes, more especially for the sea-birds, whose delicate grey and white plumage is in such demand, that their remotest haunts are invaded. Wherever they have found a resting-place, either on the mainland of Britain, or the adjacent isles, there the destroyer finds his way, and does his utmost to thin their ranks. The Shetland Isles, the Orkneys, the Hebrides, are all harried by professional bird-shooters, and the same may be said of all places where birds abound, where human beings can possess themselves of either guns or bird-lime. The village on Long Island supplied the New York market with 70,000 bird skins within four months, and a ruthless woman on the coast of Virginia contracted with a Paris Firm to deliver to them, during the past Summer, upwards of 40,000 pelts of sea-gulls and terns, at an average price of 1s. 8d. One professional murderer of these innocents states that, during a three months' trip in South Carolina, he prepared for the market upwards of 11,000 skins, and that, on an average, he sells 30,000 annually!

The ladies in America seem to out-Herod those of Great Britain, in their extravagant mis-use of plumage. One gentleman was so struck by this curious prevalence of bad taste, that he took careful notes of the head-dresses of his companions in a New York tramway car, and found that no less than eleven were so adorned,—their stolen plumes including "the heads and wings of three starlings; an entire bird of unknown species; seven warblers representing four species; a large tern; a small tern; the head and wings of three shore-larks; the wings of seven shore-larks and grass finches; one half of a gallinule; a turtle-dove; a virco; a yellow-breasted chat, and a number of ostrich feathers."

Orioles, tanagers, grosbeaks, cedar wax-wings, blue-birds, meadow-larks, and golden-winged woodpeckers are all in great demand.

Some of the details of thoughtless barbarism which have recently come to light, remind me of the story of a man who, whenever he heard of any peculiarly horrible crime, was wont to say: "Now I do like to hear that. It makes me feel as if, after all, I am really not such a bad chap; for I can say to myself: 'Well, I may be bad, but I'm not so bad as that!'" Now this is the sort of feeling with which I read of a lady in Nevada, overburdened with wealth and bad taste, who resolved to possess herself of such a feather coat as should be the envy of all other women, so she sent sharp-shooters to New Guinea for the express purpose of killing Birds of Paradise, in order to secure their gorgeous pelts for her own adornment.

We can all sympathize with our first parents when they made themselves "coats of skin" of the beasts offered in sacrifice; but I think that whoever has read Wallace's description of "Birds of the Sun," or "*God's* Birds," as the Portuguese and Malays respectively call them, must surely feel that the slaughter of such marvellously beautiful creatures comes little short of sacrilege. He tells us of the glorious tropical forests which are the home of 38 species of Birds of Paradise, each more lovely than the other. Of one species, he says that sometimes a flock of perhaps twenty birds in perfect plumage assemble on one tree; they "raise their wings, stretch out their necks, and elevate their exquisite plumes, keeping them in constant vibration. Between whiles, they fly across from branch to branch in great excitement, so that the whole tree is filled with waving plumes of every variety, attitude, and motion. The bird itself is nearly as large as a crow, and is of a rich, coffee-brown colour. The head and neck are of a pure straw colour above, and a rich metallic green underneath. The long, plumy tufts of gold and orange feathers spring from the sides underneath each wing, and when the bird is in repose, are partly concealed." When in excitement, however, the wings are raised vertically, and the long plumes expanded, till they form two magnificent golden fans, striped with deep red at the base, while the softly waving points fade off into pale brown. Such a scene must surely be a relic of that primeval world of which the Creator Himself declared that it was "very good."

But into this Paradise enters covetous man, regardless of all its poetic beauty. The native hunter builds for himself a leafy bower amongst the branches, and therein conceals himself, with his bow and arrow, and whenever a bird alights to seek a moment's rest, its doom is sealed.

When he has killed as many as possible, he descends, skins the poor little corpses, extracts the brain, removes the legs and wings, mounts each skin on a stick, wraps it up in leaves, and dries it in a smoky hut, whence it is despatched with many more to form part of "a consignment" for some trader. So remorseless is the pursuit of all such saleable beauties, that unless it can be checked, there is good reason to fear the extinction, not only of these Peris amongst birds, but of many other rare and beautiful species. Especially barbarous is the havoc perpetrated in the great family of humming-birds—"sun angels," as they are called in some parts of South America, where they live their joyous lives, glancing like glittering gems as they dart to and fro in the radiant sunlight, sipping the nectar from blossoms less brilliant than themselves. Is it not pitiful to know that hundreds of thousands of these dainty darlings are, year after year, sacrificed to adorn hats and bonnets, muffs and dresses, after a little while only to be thrown away as worthless rubbish? and is it not a contemptible fashion which can induce women in all parts of the world to keep up this demand?

Though the lady who provided herself with so costly an advertisement of her barbarity as the mantle of Birds of Paradise, is probably an exceptional case, there is little to choose between her bad taste and that of some of her sisters, both in England and

America, who have sought distinction by trimming a whole ball-dress with canaries or robins! Of one American belle, a Society Paper records that "her dress of unrelieved black was looped up with blackbirds, and a winged creature so dusky that it could only have been intended to represent a crow, reposed amongst the coils of her hair."

Surely this epidemic of bad taste has raged long enough, infecting all classes, from the palace to the scullery. So long as the leaders of fashion have chosen to make themselves walking bird-shows, so long have their humbler sisters followed their lead to the utmost of their power. At last, however, there seems some hope of a dawn of better days for the poor birds,—a Conference of ladies having recently been held in Bond Street, to discuss various points connected with dress.

At this they all happily agreed in a verdict that henceforth the plumage of small birds should be deemed old-fashioned, and unsuitable trimming for either dresses or head-dresses;—a decision at which we may well believe that all "birds with painted plumage" would warble in joyous chorus: "Jubilate! Jubilate!"

CLERK OR SENATOR.

MANY young men covet a comfortable clerkship in one of Her Majesty's various Departmental Offices. Visions of little to do, and a splendid salary for doing that little, have passed before their eyes. My young friend, have you never heard of a proverb intended to teach you that things may seem bright and genuine, and after all not be "A. 1"?

This is painfully true in regard to Government clerkships. I will tell you a story—and a true one—that will illustrate this. In the United States, young men are just as eager for a desk in a Government office as the young men in this country. Two young men, fresh from college, presented themselves for examination for a Government clerkship at Washington. They both passed a highly creditable examination, but the average of one was a trifle higher than the other; consequently, as there was only one vacancy to fill, the one with the highest average received the position. The young man who did *not* get the clerkship then began to study law, was successful, and in the course of a few years became a millionaire, then District Attorney and Governor of his State, and is now a Senator. One day, in his first term in the Senate, he had occasion to go to one of the Government Departments, and when his name was announced, with the title of Senator prefixed, all the clerks in the room looked up from their work, each one eager to serve him. One wizened, grey-haired old man, sitting at one of the desks, stepped up to the Senator, and seized his arm.

"Why, ——," eagerly exclaimed the old man, calling the Senator by his Christian name, "don't you know me? I am ——, who beat you thirty years ago in the examination for a clerkship. I well remember how disappointed you were, and how elated I was; but here I have been ever since, while you—look at the honour and success that has attended you!"

The clerk and the senator, there and then, renewed their long-interrupted friendship; but the Senator says that no young man shall be advised by him to seek a Government clerkship.

BRITISH INDUSTRIES.

THE MANUFACTURE OF FISHING TACKLE AT REDDITCH.

By HENRY H. BOURN,
Author of "Earth's Diamonds; or, Coal, its Formation and Value."

ALTHOUGH angling can boast of a remote antiquity, it is only within the last few years that fishing tackle has been produced in such artistic and finished style as to leave scarce anything to be desired.

Believing that many will be pleased to know how hooks, and flies, and floats, and rods are made, we will give a description of what we recently witnessed when paying a a visit to two of the leading manufactories at Redditch.

The making of fishing tackle is an industry with which the great majority of men and boys in this country may claim to be in some degree acquainted, seeing that at one time or another they have sallied forth with a willow or hazel rod, a yard or so of thread, a bent pin or two, and a number of grubs or worms, to wage war against minnows. But such appliances as these will not suffice for those who desire to become experts, and have the means for procuring the best which are in the market.

We can imagine that many men, and a much larger number of boys, would be delighted if they could see the variety of rods, baits, floats, hooks, and general fixings, ranging in price from a few pence to as many pounds, which we had brought under our notice.

Commencing with the fish-hook department—the wire having first been cut into lengths, the barb, or, as it is technically termed, the "beard" is then cut with a sort of knife or chisel under proper guards to prevent it going too deep. This "barding" is done by pressure, not by a blow, the workman holding several pieces of wire at a time, and with a movement of his thumb and fingers causing one after another to pass under the knife. During the day, a man will beard from 10,000 to 12,000. We saw also a machine which drew wire from the coil, bearded it, and then cut off the desired length, all at the same time. In some instances, and especially for the larger sized hooks, the end of the wire is passed under a stamp or hammer, and flattened, so that the line may be more securely fastened.

After "bearding," the pieces of wire pass into the hands of the filer.

The hook is next bent by the aid of a very simple implement, which is held in the left hand for the smaller sizes, and by a machine, fixed to the bench, for the larger sizes. A woman sitting at one of these machines, with her apron full of hooks, told us that she could bend, on an average, about 30,000 in a day.

The hook is now made, but before it will be fit for use, it has several processes to pass through, such as hardening, tempering, blueing or japanning, and scouring. The latter process is effected by the hooks being placed in hollow, wooden cylinders, with proper grit, soap, and other scouring materials, and then by the aid of machinery turned over and over; in fact, they are simply churned. Very small hooks, being unequal to this process, are shaken to and fro by two men, in canvas bags containing oil and emery. Washing in boiling suds is necessary for both small and large hooks, after which they are dried in sawdust, and then, as the case may be, left bright, or tinned, blued, or japanned.

In the hook warehouse, the amateur would be almost bewildered in the midst of such a variety of kinds and sizes. Some idea may be gathered of the complications of this branch of the business, when it is mentioned that there are about seventy different kinds of hooks, in from twenty to thirty different sizes.

One could scarcely help wondering where so many hooks would be required, until it was remembered that one boat often throws overboard as many as five hundred hooks at one time.

We next visited the shop where flies are made, and saw a considerable variety of patterns. There is one fly which is very popular among Americans, five hundred gross of which we saw in process of manufacture. It is extremely interesting to witness the dexterity with which some of the women pick up the feathers, gut, and silk, necessary for making the pattern required, and the rapidity with which the flies are completed.

The workshops where artificial baits are made, are not less interesting, neither are the store-rooms devoted to that branch of the business. We saw shadow-eels, phantoms, paragons, sylphs, cleopatras, acme, together with all their delusive kin. Then came artificial insects—blue-bottles, locusts, bumble-bees, caterpillars, grubs, may-flies, fern-flies, and artificial shrimps. During our visit, we saw some beautiful specimens, the heads, tails, and fins of which move by the slightest touch, or even the action of the water. A new one covered with luminous paint, which it is thought may allure many unsuspecting fish, was also brought under our notice.

In the float-making department, we found much to interest us. This was the first time that we had seen cork turned in a lathe. The floats, after being smoothed on a grindstone, and having the quills neatly fitted in, were passed on to the painting shop.

The machinery for making swivels is most ingenious. The swivels are cut in strips, cut off, fitted, and the ends rounded in a lathe, after which they are drilled and finished. So accurate is the working of these machines, that either a boy or a girl can superintend them.

After visiting the sheds where logs of wood are cut up into planks and strips, we found much to interest us in the rod department. The rods are rounded in a peculiar kind of lathe, the moveable rest both rounding and tapering them, as it is pushed along on the bed of the lathe. Passing on to other workshops, we observed that all the rods are "taken down" by hand, that is, after having left the turning lathe, the rod is planed by hand, a process which needs great skill and care, seeing that it has to be made perfectly round with a small common smoothing plane.

Most of the work in the ferrule maker's shop is done in the lathe. The ferrules for common rods are cut from brass tubing; those for better class goods are hammered out by hand, and then brazed. If the brass fittings are to be bronzed, they are fixed in a lathe and polished with emery-paper, and while the metal is still hot from friction, sulphuric acid is applied.

The making of reels and winches is the work of another department, and is mostly done by hand.

The rod warehouse contains an assortment of rods, weighing several tons, amongst which an enthusiast might spend hours. We were shown some specimens of rods made from bamboo cane. The cane for these rods

is cut into sections, and these, when glued together, form one solid mass; the sections having been so cut as to correspond from the half butt end to the fine tapering point of the fly rod. Some of these rods, with nickel-plated fittings, seem perfect. Solid built cane rods for pike, with three extra tips, and bound with silk for 1½ in., seemed equal to killing the biggest pike that ever swam. But the best rod was, doubtless, a fly rod 12 ft. long, yet only nine ounces in weight. The work in this rod was really artistic, different coloured woods being inlaid at the butt end.

The different qualities and sizes of gut are rufina, fina, regular, padron, Nos. 1 and 2 marina, and marina extra, which last is used for extra strong salmon lines. The scarcity of gut and the costliness of preparing it make lines expensive. A very small quantity would be worth two or three thousand pounds.

AN EASY PLACE.

A WELL-KNOWN preacher once received a letter from a young man, saying: "Get me an easy position, that honesty may be rewarded." The divine replied: "Oh, my young, honest friend, you are in a hard world! I know of but one really easy place in it; and that is the grave."

The cry of many a young man to-day is for an "easy place." The fact is, that we want more young men to-day with backbones of steel, and possessed of grit and gumption. We want more men like a certain young man in college, that I heard of a little time ago. He could not afford to complete his education as he wished, so left college, and engaged himself as a car cleaner on one of the large American railroads, in order to raise sufficient money to continue his studies. The foreman over the car-cleaners on this railroad stated, that at one time he could have supplied from amongst his men, a man for almost any profession. He had one graduate of a European University cleaning cars for a year; he is now an eminent lawyer. Another time he had three Ministers of the Gospel working for him, young men who had at that time no prospect of pulpits in which to follow their profession. They are now doing well in their respective circuits. They certainly deserve to prosper. These men never asked for an "easy place."

WITS AT WORK ROUND WINTER FIRES.

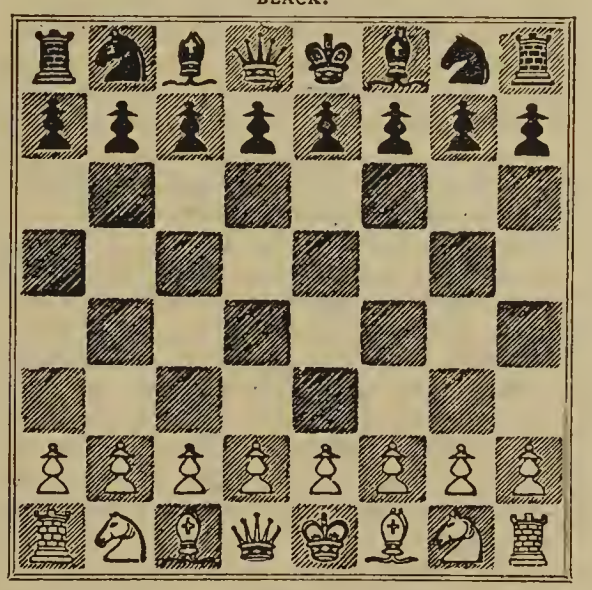
DURING the Christmas recess, when heads and hands are at leisure, and chilly Winter chains us at home, we propose to announce, week by week, a series of novel and entertaining Competitions, which are sure to arouse interest amongst our readers. We shall keep entirely off the beaten track, and though we shall not divulge all our secrets now, we may state that amongst several other amusing Competitions, a "Spelling Chase" will be a special and mirth-provoking feature.

Money Prizes will be offered each week, and our lists will be open to all. The first Competition, with rules, etc., will be announced in our Number for December 17. We make this preliminary announcement in order that anticipation may heighten the value of the good things in store.

CHESS.

By F. F. ROWLAND.

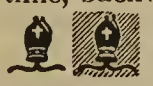
PART I.



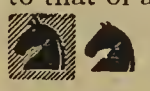
THE CHESSMEN ARRANGED FOR PLAY.

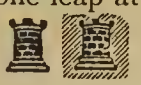
"HOW do you play chess?" is a question that has been frequently asked, and as frequently answered in so vague a way as to shroud the game in mystery, and make it appear all the more difficult to those who desire to learn. It may be, that some of those who answer in such a way, know nothing of it, and perhaps do not like to plead ignorance; or those who do know it, prefer, perhaps, to have all the enjoyment to themselves, and have not the inclination to devote time to teach it to other people.

The first step is to procure a chess board and set of men, then to arrange them as shown on the diagram.

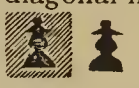


The King is the largest piece in the set, and is easily recognised by the crown which surmounts it. It stands on the fifth square of the first rank, and moves one square at a time in any direction, backwards or forwards, but must not move to a square immediately adjacent to the opposing King. As this piece cannot be taken, it never leaves the board during a game.





The Queen is the second largest sized piece, and, in the beginning of a game, stands on the fourth square of the first rank. The Queen is the most powerful piece on the board, and combines the moves of all the other men, excepting the Knight. She moves in any direction on the rank, file, and diagonal lines, one or more squares at a time, backwards or forwards.



The Bishops stand at each side of the King and Queen; their moves are confined to the diagonal lines only, one or more squares at a time, backwards or forwards in any direction. Being confined to the diagonal lines, they cannot move from the square of one colour to that of another.

The Knights, readily distinguished from the other men by their resemblance to a charger's head, stand next the Bishops, and have the power of leaping over a man, an advantage possessed by no other piece. The move is a leap from the square occupied to the second from it of an opposite colour. If it starts from a black square, it must rest on a white one, and *vice versâ*. This necessitates a sidelong, or oblique leap. It is allowed only one leap at a time.

The Rooks, or Castles, occupy the corner squares, and move in any direction in a straight line on the ranks and files, one or more squares at a time, backwards or forwards, but never on diagonal lines.

The Pawns, eight of which are on each side, move straight forward along the files, one square at a time, except on the first move, when they have the privilege of moving two squares. They capture diagonally, a feat to be hereafter explained. They are not allowed to retreat like the pieces, but on gaining the last square, they may be changed, or promoted to a Queen, Rook, Bishop, or Knight.

(*To be continued.*)

MEN THAT CAN'T.

THE MAN THAT CAN'T SEE IT.

By the REV. J. H. THORPE, M.A.

OF course we hasten to inform our readers that this inability on his part does not really arise from any visual defect. Not at all; he may be endowed by nature with two eyes of average, or even of unusual, power, and yet he will confess himself that he "can't see it," or his neighbours will testify to the same effect, and you will not understand any absurdity thereby.

You will no doubt see at once that the reference is to that keener sight which we may call mental vision; and the blindness which its absence means, though not so distressing, often handicaps people more in the race of life, than that kind of blindness which compels a man to employ a canine friend to be eyes for him, and to lead him along his way.

It is not needful to offer an elaborate proof of the existence of such a disease, defect, or whatever you wish to term it. We take it for granted, that our readers, if they have not read the book, have at least learned the quiet suggestion of the title, "Eyes and no Eyes, or the Art of Seeing." We are persuaded they have by this time appreciated the full import of the words of Solomon: "The eyes of a fool are in the ends of the earth," and deduced therefrom, as a matter of most simple inference, that he cannot therefore be expected to see that which is right under his very feet.

Mr. Spurgeon once advised his preachers to have a blind eye and a deaf ear for certain disagreeable things and sounds, and we are forced to believe that these are the unconscious possessions already of not a few who are not preachers. The individuals in whom this sort of blindness we hint at exists, are very diverse in characters, in convictions, and in mental peculiarities, but in this they are all brethren. There is one side of their minds not sensitive to certain things. There is some class of thoughts, distinctions, events, and, without striving after a more elaborate definition, we simply say, they will say it themselves,—they "can't see it."

Would you wish to inquire into this matter further? Your best course will be to notice the causes of this "Can't-see-it-ness."

Some men can't see it from a want of power, a radical organic defect. Some visitors

to a picture gallery paused in their round before a picture,—a study of sea and cloud,—which was marked as having gained a prize, unconscious that the thoughtful-looking man standing by was the artist himself. "I do not see anything in it," remarked one of the visitors to him." "Don't you wish you did?" was the artist's pithy rejoinder.

There are men you meet now and then whose minds seem incapable of perceiving certain beauties, or deformities, or differences, where others do. This want of power, like colour-blindness, is often natural. When it is, these men are to be felt for and judged very kindly indeed, instead of being voted stupid. If He who gave you your mental power of dissection and penetration, witheld the gift from your brother, is it not all the more reason that he should have your sympathy? But I want very earnestly to press on young men, for whom I chiefly write, the fact that it is not always, or even usually so. In many cases this incapacity (rather inability) arises from neglect or indolence, or what we may call mental slovenliness. When the Creator has laid it on a man as part of his burden, most probably He has compensated in some other way for it; but when it arises from any of the latter causes, it is a downright loss to a man.

We suppose many of our readers, like ourselves, have spent the greater part of their lives in cities, paying an occasional visit of longer or shorter duration to the country. On these visits, have you not been surprised at your want of power to see, say little birds? We have. "See that lovely goldfinch," and our bewildered eyes scanned every leaf, but could see nought like a bird! "What a lovely robin! See him just there on that bough to the right," but not a feather could we make out. Why? Because our eyes were unaccustomed to seeing such objects. They were well practised in observing hall-doors and house fronts; in reading sign-boards and samples of the bill-sticker's skill. They could perform feats of observation in a city crowd which would amaze a country cousin; but, strange though it be, we could not, positively *could* not, see a bird on a twig!

Now we make bold to say that many a young man has, from a like *mental* defect, which it was in his power to correct, made sad blunders and mistakes. For instance: Some we know seem not to be able to perceive, or are slow in perceiving opportunities. You meet from time to time men whose lives have not been prosperous; they allege to you in explanation, that they have "never received fair play; they have been passed over; they had not influential friends," and so forth. No doubt these things are causes in some cases, but in many you will find, if you analyse their career, the secret of it all was this—they could not see their opportunities, or they were late in seeing them. Be assured of this, every man has his opportunities, and some men have even learned the secret of making opportunities. Brother, there is a niche in the temple of life for you to fill; there will come a moment or moments when it will be possible for you to step into that place prepared for you, but if you are not ready, it will not be left empty, yet it will not be filled by you. The man who sees his opportunity, and the man who really profits by it is he who is ready; for opportunities will not wait till you are ready for them. Therefore we say, "Whatsoever thy hand findeth to do, do it with all thy might." Do not sit down in idle dream, waiting for promotion to knock at your door and call you forth to take it. We have no fear if you are worth anything, but that you will have your opportunities; we are the rather concerned that you may be ready for them. "There is a tide in the affairs of men"—you know the rest of it,—well, the man who is left behind, high and dry on the sands of failure, is the man "who can't see it" when it comes.

Turning to another cause, a man "can't see it," *because he is not looking that way.* If it were necessary to quote an authority in support of this obvious reason, could we find a better than Bishop Butler? And this is his remark: "Though a man hath the best eyes in the world, he cannot see except in the way they are turned," and so it is from a mental habit which looks at only one side of a subject at a time, that a man often does not see truth, because he is not looking in the direction where truth lies. The effects of this are to be seen in many ways. Some men seem unable to feel the force of arguments brought to show them their errors, which are yet plain and manifest to others. The art of seeing both sides is a splendid possession, and it is absolutely essential in the search for truth on any subject. If you read the lives of men who have quarried in the mine of truth, and brought forth new and unknown treasures for their fellows, you will see that they combined with perseverance and talent, the art (may I put it thus?) of walking round their subject, and viewing it in every aspect; while, on the contrary, men who have impeded the onward march of right and truth, men who have been so much dead weight on their day and generation, have been those unfortunate individuals who, with reference to the claims of all that is new and enlightened, "can't see it." May we mention two evils which have resulted from this? Bigotry and indifference. Men have burnt their brothers at the stake because they never really looked into the claims and reasons of their difference. Men to-day look on Christian enterprises, such as Temperance Reformation, Home or Foreign Missions, as needless, because they have never lived in places where they could see the full evils of Intemperance or the darkness of Heathenism. So, when you speak of the need of these, they reply in effect, if not in word, that they "can't see it."

May I here suggest some remedies? Become possessed of a horror of getting into a narrow groove. Read the newspapers on the other side, as well as your own pet print. Read good books. Converse with as many different sorts and conditions of men as you can. Go amongst the poor and find out how they live; these things I believe will open your eyes wonderfully.

Some men "*can't see it*," for a plainer reason than either of those we have mentioned, *they do not want to see it; they will not.* Lord Nelson was sailing into a certain harbour, when his admiral sent an urgent message, ordering him to retreat, on the ground that his flank was threatened by another French fleet. Nelson, putting the glass to his eye, took it down, closed it, and turning to the officer who brought the message, said he could not see the fleet the admiral referred to. Of course he could not; we all know Nelson had a blind eye, and it was to *this* he put the telescope. He did not want to see. Granted he did a foolish thing, and had he not won his battle, he would probably have heard more about it. But the story shows that the man who "can't see it" is the man who "*won't* see it." And these are some of the things he does not see for this reason.

Disagreeable things. We shall mention but the one class. Is it not a very disagreeable process to have your faults pointed out plainly and forcibly, to have them dragged out from their hiding-places and held up to your view; especially so when your friend has not a kind way of doing it? Some men are saved the pain by a simple process—they refuse to look! It is easy, but it is foolish. Beware of this tendency. "A wise man heareth instruction." Your faults are the weights which hinder your speed. Who will choose to handicap himself in the race of life, to save his pride a little sting from truth? Let it not be said of you, "There goes So-and-so; he might be top of the tree only for such a fault, and he might have got rid of that fault long ago, but he wouldn't see it." There is another thing we would mention. The most disagreeable thought to some men is *the thought of God.* You meet at times men who profess to be infidels; they laugh at Christianity as a fable, and God as a myth. Ply them with the arguments of Butler or Paley, or any of the noble army of the defenders of the Faith. No use. The most overwhelming argument is lost on them. "They can't see it." Why? Let a good old Bishop of the English Church reply: "Men deny the truth of Christianity, because they hate the practice of it." The seat of their infidelity is not the head; look for it lower down, you will find it in their heart. The strongest argument against Christianity, for a man's self, is a bad life. I leave it to you as a suggested question, whether Atheism does not oftener proceed from a defect in the will than a defect in the reason.

Hitherto, we have dealt with only one aspect; we must just touch another and have done. There are some men who "can't see it," and all honour to their brave hearts! These are the men whose eyes refuse to see the so-called insuperable difficulties in the path of noble purpose. These are the men who are deaf to the cries of the prophets of failure. They enter on holy enterprises against any odds, refuse to see that they are in the minority, and adopt as their motto, "Where God is, there is the majority."

Young man, if you are to do anything very much for God, you will need this sort of blindness. Blindness the world calls it, but we know a nobler and truer name—it is called "Faith." It has been a characteristic of all the men of the Bible who may be called its heroes. We suppose when Moses, having weighed the luxury, ease, and grandeur of the Court of Pharaoh, against the hardness of the lot of the people of God *and their future*, and having decided to suffer affliction with the latter, rather than enjoy the pleasures of sin for a season, there were friends of his in the Court of Pharaoh who "could not see it;" but he saw it, and we see it now. The decision is one we have each to make at some time, if we would be with him in the kingdom of God. Blessed and happy is he whose eyes are opened to see the exceeding riches of glory that are laid up for the people of Christ. Blessed is he whose eyes are holden with a holy blindness, which enables him to reply to all the seductive allurements of the world, and the prince of this world—

"I CAN'T SEE IT!"

The Cross of Christ is set up in the marketplace of the City of Destruction—not half-way between earth and heaven. Man has not to climb to a certain height to embrace it, but where he is, and in the very midst of an active life, he may find its power and efficacy.

PHOTOGRAPHY.

SIMPLIFIED LESSONS FOR AMATEURS.

By A. H. WALL.

PART II.

ABOUT THE APPARATUS.

AND first about the camera and lens, which form the photographic eye. It closely resembles in various ways the human eye, although in other ways—size being one—it is very different. I have no doubt that many of my readers will know all about this instrument; for now-a-days, happily, elementary science is taught in most schools; but I trust those who do, will be kindly patient with me while I endeavour briefly to simplify an account of it for those who do not. Bearing in mind what has already been said about the nature and properties of light, you must now consider it from the optical point of view.

Light conveys its images to the eye as sounds are conveyed to the ear, by vibration in the atmosphere. On every object you see myriad rays of light fall, to be reflected (thrown back) and scattered in every direction. When these are intercepted on any surface sufficiently opaque for their reception, images or pictures are formed, faithfully reproducing forms and colour, light and shade, etc.

A dark box with a very small hole in one side—a kind of trap to catch a sunbeam—will have, on the interior side opposite that hole, a picture of outside objects, perfectly recognisable, although blurred, indistinct, and upside-down, because the rays of light entering the box diverge and overlap. To bend them in a contrary direction, and so bring them more or less to points, we must put a lens in the hole. Then the picture will become clear and distinct. Thus altered, it at once becomes a photographic eye, or camera. In your eye the dark box, or chamber, is a round one about an inch in diameter, and the hole in it, which is capable of dilation and restriction, is called the pupil. Its lens is a liquid one. In the photographic box the lens is a glass one. In it, that side on which the picture falls, is called the focussing screen. It is made of ground glass. In the eye, where the light falls, it is called the *retina*, a name derived from the Latin *rete*, which means a net, because the retina is that network of nerves by which we perceive, as the photographer in the dark behind the focussing screen of his camera perceives, those pictures which the light conveys, and focussing makes clear and distinct.

Focussing, or bringing the rays of light to points, is done by the eye unconsciously, by the lens mechanically. If I am looking at a tree, I get a general impression of it as a whole. If I want to examine a bough, twig, or leaf, I immediately find myself doing so. But in proportion as the bough, twig, or leaf has suddenly become more perfectly visible, the tree itself is less perfectly visible. I have altered the focus without knowing it. The rays of light thrown off at various angles get confused in their scattered courses; the lens of the eye, or that of the camera, brings them, so far as vision is concerned, into orderly connection, concentrates or focusses them.

If you have purchased a camera, and it has what the cheaper ones have not, a moveable lens, you may concentrate or focus upon any particular part of the picture, on its ground glass, by turning it with the hand, and screw in or out, until that part is most distinct, or what is technically called, sharpest.

But as a rule, when artistic purposes are to be served rather than scientific, the focus should be nowhere perfect. Out-of-focus images are distorted images. You cannot detect their untruthfulness when the picture is slightly out of focus, as you do not recognise perfect truthfulness where the focus is most nearly perfect. The object of the artistic photographer is therefore to get as near absolute truthfulness as he can, to use his focus carefully, spreading it over as wide a field as possible without recognisable distortion, and thus sacrificing merely that extreme sharpness which could only be appreciated with a microscope, in fact, nothing. But here another point arises for consideration.

If you observe the picture given by a lens on the focussing screen, you will see that it is brightest in the centre, and diminishes in brilliancy as it diverges from it. You know already that the rapidity of the exposure depends upon the brilliancy of the image. Examine a collection of photographs, and you will probably find many of them are wanting in distinctness and brightness towards the edges, or more rarely in the centre. This is due to combined errors in focussing, exposing, and developing, by skilful management of which, such defective effects are avoidable, unless the lens is an imperfect one.

With Exposing and Developing we have yet to deal. Our present subject ought not to be hurriedly dismissed, and you will understand all these things more clearly if you give a little more attention to lenses.

A lens is dependent for its power upon its density and its shape. The lens of the eye has a curious power of altering both, and this power is, as I have said, exercised unconsciously. It is composed of two *humours* (more or less liquid), the one called the *aqueous*, or watery, and the other the *crystalline*, icy or glass-like (*vitreous*). In like way, the lens of the photographer is composed of two different densities of glass, called crown and flint. Their forms are various and differently named. The most common are the bi-convex, the concavo-convex or meniscus (crescent-shaped), the plano-convex, the concavo-plane, and the double-concave. Those which are thicker in the middle than they are at the edges, cause the rays of light passing through them to converge, and those that are thickest at the edges cause them to diverge. The achromatic-meniscus lens has a concave lens of flint-glass, and a convex lens of crown glass, cemented together.

Lenses vary in dimensions, and are used according to the size and kind of picture required. That lens which is suitable for landscape is less suitable for architecture or copying from flat surfaces, and portraiture also requires a special lens, one which of all others gives the brightest image and requires the shortest exposures.

For the beginner, and for small pictures, however, a good, cheap lens may serve all ordinary purposes, if carefully chosen from the stock of a respectable optician or photographic warehouse. This will be a landscape or view lens, a meniscus—sometimes mis-called a single lens. Its main defects are smallness of aperture, which lengthens exposure, and the small field it covers well, or over which the focus is distributed, which becomes very conspicuous when a street or building is taken; and lines outside the centre that should be straight are shown curved. For landscapes it is, however, an excellent lens, and its distorting power can be largely avoided by choosing subjects in which its chief defect is either unobserved or unimportant. Its chief advantage resides in what is called depth of focus, meaning the power of giving objects, removed from each other and the lens, proportionate degrees of focus, without such perceptible distortion as a portrait lens would give if used for the same purpose—or rather misused.

The camera, if a good one, will be perfectly impervious to light for the reason explained in my first Paper. If a cheap one, the focussing arrangement is from the back, and takes the simplest form of sliding in and out by hand. It may be purchased with its lens from a guinea upwards; that price including a three-legged stand or tripod, which should be strongly made and perfectly rigid, and one dark side to contain the chemically sensitized plate, which, when the focussing screen of ground glass is turned up or removed, takes its place by sliding into the groove it had occupied. As complete a set of apparatus, with a more rapidly working lens, may be bought for from three guineas upwards, and with this, a slide which holds two plates is usually provided, as well as chemicals, dishes for solutions, printing frame and paper, dark room lamp, and a packet of dry plates sensitive to light.

INSECTS AND PLANTS.

THE Animal and Vegetable Kingdoms are wonderfully connected and interlaced. There are no isolated facts in Nature, no sharp lines of demarcation, such as we so often "discover" or invent. Man, being finite, can only grasp the universe in sections; God, in His infinity, needs no divisions or arbitrary distinctions, and He has made none. One of the first great facts taught us by microscopical science is this—that the two great kingdoms which appear to be so distinct, in reality blend so imperceptibly, that it is impossible to say where one ends and the other begins. The vast family of Diatomaceæ, for instance, are classed by one scientist in the higher kingdom, while another unhesitatingly delegates them to the lower. When we see animals growing like blossoms on a stem (as the *Vorticellidæ*), or reproducing themselves by buds and offshoots (as in the Fresh-water Polype); when we see vegetable organisms rolling slowly through the water, propelled by whip-like appendages (as *Volvox globator*), or moving with a steady grace by some undiscovered agency (as many of the *Desmideaceæ*), we are fain to admit that the relationship between the kingdoms is closer than at first appears. We can almost appreciate the feeling which led some of the earlier students to maintain that there was no distinction at all, as they believed they had *seen* a plant, under the microscope, bring forth veritable animalcules!

When we ascend higher in the scale of existence, and plant and animal develop from the simple cell form, to varieties of complicated tissue, we find that though the resemblance is less marked, the connection is scarcely less interesting and continuous. The wayside plants furnish "board and lodging" to insects innumerable; the curled-up frond tells of precious eggs entrusted to its friendly shelter; the bared stalk, or punctured leaf, shows where sustenance has been given; while too often the fading, drooping plant betrays the presence of voracious grub, or active wire-worm, feeding and fattening on the hidden root.

We have all had wasps in our primest peaches, and slugs among the earliest gathering from our strawberry beds; we have had our fern fronds nipped by the wood-louse, and our rosebuds injured by the aphis; we have had (to be more prosaic) green caterpillars amongst our cabbage, and have read of the potato bug, the phylloxera, and the locust, until it must seem as if the insect portion of the community were having undue advantage in the struggle of life.

There is, however, another side to the question. An animalcule, so minute as to be invisible without the aid of the microscope, may frequently be seen with a perfect forest of infinitesimal fungi springing from his poor little body, waving gracefully to and fro as he slowly swims along. In New Zealand, a remarkable group of fungi spring from the head of a certain caterpillar, when he buries himself in moss before his metamorphosis. Expecting—if he has power to "expect"—to reappear in butterfly form in due time, he settles to his rest, knowing nought of the fatal fungus germs in his head. Soon a long slender stalk springs up, sucking the juices, and taking the very life of its victim. The life is not extinguished, it is transformed; what might have been a lovely winged butterfly, has turned to a nauseous fungus. Is there not, in passing, a lesson for us here? a word of warning about the danger of self-deception, and the need for the cleansing of our heart, in this present life, from sin-germs, if we would obtain the "better resurrection?"

In the West Indies, wasps are sometimes seen flying about with fungoid plants, nearly as long as their own bodies, attached to them. It is not uncommon to see a blue-bottle killed by the growth of a club-shaped fungus, half an inch in length, from his body. Our common house flies, too, suffer much in Autumn from a fungoid disease. Frequently, on our window panes, will be seen a fly, motionless, but apparently feeding, with

SUNDEW.

extended proboscis, on something on the glass. Touch him, and he will crumble to dust, for he is dead. A fine patch of whitish substance spread on the glass tells the tale. The whole body of the fly is lined with the white, felt-like fungus, which has left its victim with a perfect appearance of life, but no reality. A warning echoes for us: "Thou hast a name that thou livest, and art dead" (Rev. 3. 1). If sin dwell in our mortal bodies, our life cannot be real, well as it may look from outside. Let us see to it, that He who knows our secret sins has free access to cleanse and keep our hearts.

The *Botrytis bassiana* is a fungus affecting largely the health of the silkworms in Syria and China. It, too, grows in the internal tissues of its victim, and frequently causes the death of a whole stock of worms. Sometimes the caterpillar is only partially affected by the fungus; his vital organs are not destroyed; so he goes through his metamorphosis, and becomes a butterfly at length, but still with the fungus mass in his body. Is it not wonderful? In the waiting time nothing is altered: the fungus that went to rest with the caterpillar wakes with the butterfly; there is life, but such a poor, maimed, hampered life, compared with *what might have been*. We need to "cast away every weight;" for *as* we enter the waiting time, *so* we shall issue from it to the higher state.

Analogies and "lessons" must not tempt us to linger unduly, for there is much yet to be said Perhaps the most striking instances of the retaliation (so to speak) of plants upon insects is furnished by the family of insect-eating plants. It does not seem so very strange to us that plants should grow on insects, as they would in a garden bed; but to picture a plant setting to work not only to capture, but to enjoy, a good "meat dinner" is not so easy at first. Many tropical plants (such as Venus's Flytrap) are insect-eaters, but amongst our native plants there is only one which *unquestionably* has this strange power. The beautiful Bog Violet is generally credited with it; but though its oily leaves are frequently found curled round hapless flies, there is no actual proof that the glands on the surface are capable of absorbing the juices of insects. The Common Bladderwort entraps water creatures in its bladders, and a large species of it is said to have captured tiny fish; but here, again, satisfactory evidence of absorption power is lacking. The Sundew is the only native plant whose insect-eating powers are established beyond dispute. Not only has this strange little plant the power of catching insects,—it is absolutely dependent on them for support. Two vessels containing Sundew plants, which had been taken at the same time, from the same place, and in every way treated alike, were used for the experiment. The plants in one vessel were protected from the approach of insects by a fine wire shade; those in the other were left uncovered. The sheltered plants dwindled and died; those in the uncovered vessel caught flies and throve. This experiment was tried again and again, with the same result.

The leaves of the plant are spoon-shaped, but not larger than an *oval* threepenny piece, and are covered with reddish tentacles, longer at the sides and shorter at the centre. Each tentacle is tipped, when the plant is hungry, with a drop of sparkling sticky fluid. This attracts the insects, and one touch is fatal, for the tentacles have some marvellous power of inter-communication; and though only three or four of them may be in contact with the fly, all the others move slowly towards him, pouring out their secretion the while, until he is bathed in it, and embraced closely by the red arms. For many hours—sometimes for days—the prey is closely held; then the tentacles relax slowly, and the dry body of the fly is exposed to view. The tentacles show fresh dewdrops as soon as the plant needs another meal. It is the sparkling of the tiny drop of fluid on the top of each tentacle which attracts the flies; and though we do not seek to lure to destruction, we need all the attractive power we can to draw to us the flies that buzz on every side. A missed lesson is as bad as a dropped stitch in a long stocking,—pick this one up, and learn from the Sundew that simple, shining, sparkling, glistening in the sunlight, has a mighty attractive power.

CHAPTER V.

"MOTHER, I AM CAIN."

SPENCER RAE'S struggle with death was a long and bitter one; for weeks he hovered on the brink of the grave, but his fine constitution prevailed at last, so death, giving up a fruitless struggle, raised the siege.

His first sensible words were spoken to Maggie, who sat quietly by his bedside sewing, in case he should need her.

"Where am I? What has happened? Cousin Maggie, why are you there? Am I dreaming? Have I been ill?"

"You have been very ill, boy; but you are out of danger now, only you must be a good patient, and not talk."

He attempted to raise himself on his elbow.

The exertion was too much, and he fell back exhausted. She put a spoon to his lips, and though he swallowed the contents, his language became wandering and incoherent again.

"We have won the match to-day. Oh! that is fine! Oaksworth never could beat Allandene. I knew they couldn't. Well hit! Bravo! Godfrey, Godfrey, why that look? Why that fearful frown? Here, here, take back the foolish flower. Ah!"

The last exclamation was almost a shriek, and the unhappy patient relapsed into insensibility.

Maggie had trembled while she listened to his words, and now the silent tears were trickling over her face.

But there came a morning when her cousin awoke refreshed and to all appearance well, though weak and feeble as a child.

Maggie was there as before.

He put out a hand—how thin and white it was!—and took hers.

"Dear nursie," he said, "how kind you have been to me!"

"Have you known? Have you sometimes been sensible?"

"Sometimes," he answered, with a faint smile; "often enough to be aware of your sisterly care. I can never reward you. Has Godfrey been here?"

She was silent and very sad now.

With his dark, dilated eyes, he gazed on her face for some moments without speaking.

"Maggie," he said at length.

"Yes, Spencer."

"Tell me truly, have I been talking much during my illness?"

"Sometimes, Spencer."

"Have I talked about Godfrey?"

"You have."

"I've been raving. Remember that, Maggie; I've been raving."

"Yes."

"But I want to get well now. I want to see Godfrey, because I—I behaved badly to him. Poor Godfrey! Poor Godfrey!"

He said no more then, and Maggie was so glad that he fell asleep, for she wanted to get away somewhere to weep. Her heart was full to overflowing.

Once having turned the corner, as the doctor called it, Spencer's progress towards recovery was very rapid indeed, and in a week's time he was back again, and sitting on the sofa in his mother's room.

The story of Godfrey's strange flight could now no longer be kept from him; and miserable enough it made him too.

That same day came a brief letter to his mother from the fugitive himself.

"Burn it when you read it;"—this was part of the contents. "Do not keep in your possession that which my polluted hands have touched. I am going into exile for ever. I am Cain. I have slain my brother; and better it is that I should depart to a living death, than remain in England to bring you all to disgrace. My crime has been great and inexcusable, but believe me, the punishment I shall inflict on myself will be ten times greater than any the law could mete out to me. I write to tell you so, and not to beg your forgiveness—that I do not deserve—but to crave your prayers. Once again I will write—then consider me as dead. I dare not write to Rosa; I dare hardly breathe her name."

The letter ended abruptly, and somewhat incoherently. Mrs. Dennis herself brought it over to Rae's farm, and the invalid saw it.

"He thinks I am dead," he said, excitedly, "and the fault was mine, and mine alone. I will never forgive myself till I find and fetch him home. Oh! mother; oh! aunt. Henceforth I have but one aim and object in life—to find poor Godfrey. If I live, and live I will and must, I shall be successful, if he be in the wide, wide world."

CHAPTER VI.

"I REALLY WASN'T LISTENING, GENTLEMEN."

"I TELL you what it is, Jack," said Desmond O'Neil, "there is money in it."

Jack leant back in his easy chair. "Perhaps," he said, after a pause.

"There is no 'perhaps' about it, Jack; it is a sure and certain thing with ordinary luck."

"Ordinary luck, yes."

"And what is even better to us than money, there will be new and strange adventure. Why, I mean to write a book about it. We're both young, you know, and neither of us has over-much of the needful."

"True, true,—too true."

"Your father is an English baronet, but he won't supply you with unlimited funds. My father is an Irish landlord, and can't if he wanted to ever so much, poor soul. Besides, you know, Jack, I dearly love independence. As to going and settling down on our respective estates, or rather, dads' estates, I for one would rather not till I've seen life a bit."

"Nor I, Desmond."

"I'm too fond of life. And here we have a chance of seeing a bit. If we let this opportunity slide, we'll only repent it once, and that will be for ever. It will never come again. But we go out with this captain; we join in assisting to fit out the ship; we do most of the shooting and hunting, and we come home so rich that we can afford to have plenty of fun before we go home."

"You're sanguine; you're Irish."

"Yes, sanguine and Irish. But now the question is, will you go, or shall I go alone?"

"No, no, my friend; I'll be with you. We are too good friends to part so easily."

A deep sigh from the sofa. Poor Godfrey, *he* was thinking of *his* friend that he ne'er might see again.

"Ha!" said Desmond, as both glanced round, "I forgot we weren't alone."

Godfrey got up, stretched himself, and strode towards them.

"I really wasn't listening, gentlemen. That is, I've been half asleep, but I couldn't help hearing some of your remarks. You are going somewhere, to—to—to do something."

"Yes," and both friends smiled.

"Well, do you want an assistant?"

"What for?"

"Anything—clean your boots." Godfrey smiled as he spoke, but the smile was a sad one.

"But," he added, "I heard you talk of shooting. I may say, I can shoot."

"You are a gentleman's son! Quarrelled with your friends?"

"I've left them—left them all, and will never, never see them again; not even her."

"Sit down, my good fellow," said Desmond O'Neil, kindly. "Forgive me if I have touched a tender chord."

Like a great many Irishmen, O'Neil had a feeling heart of his own. He was, nevertheless, quick and impulsive; his soul had a turn of romance in it, but was all sunshine and shadow, as it were. Rather under the medium height, he was good-looking withal, with light blue eyes and fair hair. Keenness of expression was the most noticeable feature in this young man; at first acquaintance, one would have wondered how he could have been so extremely friendly—nay, but brotherly, I might almost say—with that companion of his, rough and right Jack Silk, with his over-plain features, his dark, jetty hair and swarthy complexion.

Jack Silk by name, but not Jack Silk by nature by any means. There was nothing soft nor simple about Jack. If he said anything, he meant it. If he made up his mind to do anything, he did it, and did it with a will. But he never did do anything till he *had* made up that somewhat phlegmatic mind of his.

I daresay Jack's forebears came over with the Conqueror; I really have little doubt about it. And had Jack been dressed in a coat of mail, with vizier and all complete, with an unwieldy lump of a battle-axe in his arms, he might have sat for one of his own ancestors, and the picture might have been placed side by side with those of the grim warriors that frowned from the walls of his father's picture-gallery.

To make a long story short, Jack and Desmond had served in the Royal Navy, and had been shipmates for three years on African shores. They had been in many a gale of wind together, in many a dangerous squall, and had fought side by side on the battle-deck of Arab dhows. On board their gunboat they were always together; and on shore, in the woods, they were seldom separate.

Jack had once saved Desmond's life; at least, so Desmond said, though Jack himself would not admit he had done anything particular.

But it was not this alone that made Desmond so fond of his friend. It can only be accounted for by saying that they suited each other, and that extremes meet.

Well, these were the two young men whom it was now Godfrey Dennis's lot to meet.

They had left the service on half-pay. It was at a time when the Royal Navy was being reduced, and any officer almost might take his retirement. There was no war, else Jack and Desmond would have remained. No war, no excitement, hardly anything to do on board from one day to another, except to eat, drink, and read. No wonder that two such spirited young men got sick and tired of it.

But what were they to do now? Their united funds did not aggregate much over a thousand pounds. Prize-money this was, which they had received for the capture of Arab slave-dhows on the coast.

They had been on a walking tour in Cornwall and Somerset, and to-night found themselves in the cosy parlour of a little roadside inn, not a long way from Bristol.

They had dined, and now over their coffee they had set themselves seriously to consider the answer to that momentous question: "What were they to do now?"

Partly in fun, partly in solid, sober earnest, the following were among some of the proposals made by Jack Silk, each of which was of course laughingly vetoed by Desmond.

"Sell tea?"

"Live on our money?"

"Take a farm?"

"Work a milk walk?"

"Marry an old maid and live happy ever afterwards?"

When Jack found that none of his proposals found favour in his friend's eyes, he said,—

"Well, old man, what would you do?"

Now, as he afterwards expressed it, Desmond had "his shot ready all the time, only

he wanted to let Jack Silk empty his locker first."

Then Desmond began. He had been to Bristol not long ago, and had there met his old friend Captain Jack Boyd, who owned the bold little steamer *Oonalaska*, a steamer that could go anywhere and do anything. Jack Boyd *had* been comparatively rich, but things had not gone quite so well with him of late. He had made a voyage or two to Spitzbergen, expecting to do wonders among the seals, but had to return almost empty. He would be glad, therefore, if Desmond and his friend would put a few hundred pounds of capital into the concern, so that a fresh start could be made, and he—Boyd—did not doubt but that they would be successful.

Then Desmond explained the whole programme to listening, thoughtful Jack. As he was proceeding, all unobserved by either, a listless, weary young man had entered, and laid himself down to rest on the sofa.

CHAPTER VII.

CAPTAIN JACK BOYD.

GODFREY'S adventures since last we saw him had been many and varied. He had sold his noble horse. He rode into the market with him at T——, intending to sell, but saying nothing of his intentions to any one. With a load of grief and wretchedness at his heart that might have sunk a ship, he yet managed to assume the careless, easy demeanour of the well-to-do gentleman farmer. He had been a week on the road, and was so weary of life that he cared not, except for the disgrace it would bring to his people, whether he were captured or not.

Here, at the great fair, was every class of horse, from the hack to the hunter, from cob to thoroughbred. It seemed evident to many gentlemen there that the young man came to buy, not to sell; but they could not help admiring his horse Nimrod, and towards evening several forced themselves on his acquaintance, and made inquiries about the steed.

"I'm going to get refreshments," said Godfrey, off-handedly. "If you like to come with me, I'll tell you all about him while I eat." He called for bread and cheese and a sheet of paper, on which he hurriedly sketched out Nimrod's pedigree.

The animal's sires were known to several of these men.

"I'll give a cool hundred for the nag," said one.

Godfrey looked at him, but said nothing.

"Harry," said some one, "do not insult the gentleman."

"Harry shouldn't have him now at any price," said Godfrey, quietly.

"I don't wish to part with Nimrod," he continued, and he spoke the truth, "nor do I intend to for a song; but in case any of you mean business, I will now be pleased to show you what he can do."

Godfrey was soon mounted. The country about was a stiff one, with here and there a hedge and ditch, and here and there a stone fence.

Horse and man seemed one and the same, and the daring way they took the fences and flew over them astonished all.

"Gentlemen," he said, when he returned, "it is getting late; I must be off. Good-night all."

"One minute, sir," said a quiet, farmer-looking individual, who really was a squire.

They went aside together under an elm-tree. In less than ten minutes Nimrod had changed masters, and Godfrey had the squire's cheque for two hundred guineas.

Crestfallen enough now, he patted his horse, and went wearily away on foot.

In a fortnight's time he was nearly at Bristol, and here, at this roadside inn, we find him to-night.

Godfrey took a seat at the table near Desmond and Jack, and for a few moments neither spoke.

"Ever been to sea?" asked Desmond at last.

"Only down the Mediterranean. But I'm not afraid of it."

"You don't look as though you were afraid of anything much. But you look ill."

"Grief and worry."

"Poor fellow! Well, what can you do?"

"On shore, anything. Shoot, as I have told you, ride to hounds, farm, garden, anything in a country way."

"I don't want to be inquisitive," said blunt Jack Silk, "but haven't you had a tiff with your intended, and run away, and want to get abroad for a bit?"

"You're not *very* far wrong," replied Godfrey, sadly.

"Well," said Desmond, "we have not settled to anything yet, have we, Jack?"

"Yes, we have; I'll go."

"Spoken like your honest self, Jack Silk. I always thought you weren't so soft as you looked."

"Well, my friend, you seem cut out for the kind of life we mean to lead for a time—and a wild enough one you'll find it; and if you will stop here over to-morrow, you will see another friend of mine—another Jack, and all can be arranged."

"You spoke of this Captain Jack," said Godfrey, "wanting funds. I have a hundred or so in ready cash; will you permit me to add that to your capital?"

"I'm sure Captain Boyd will be pleased. My friend Mr. Silk here, and myself, are to be first and second mates; you must be a cabin officer, and we'll have you rated gunner of the first class. Will that suit?"

"Anything will suit."

Next day, Captain Jack Boyd himself came bustling in.

Short, stoutish in build, with an exaggerated brick-dust colour of complexion, and hair and whiskers as white as Greenland snows, he entered smiling, and seemed to bring with him a veritable odour of the briny ocean.

"Hallo! my boys! and how are you? I'm positively glad to see you both together. Indeed, indeed I am."

Then there was a deal of pump-handle hand-shaking, and a good deal of laughing and joking.

After this had gone on for some little time, the captain turned abruptly towards Godfrey. "This gentleman is in your company, and yet you have never introduced him."

"Why, captain, you haven't given us time."

"A farmer's son, or I'm a Frenchman, sir."

"Yes, you're right, Captain Boyd; I'm a farmer's son," said Godfrey, with a faint smile.

"Well, now let me introduce him to you, captain,—Mr. Frank Godfrey, gunner-in-chief to the *Oonalaska*."

"Eh? What?"

"It is a fact what I tell you," said Desmond O'Neil. "He has thrown in his lot with us, and puts a bit in the funds as well."

"Well, well, well. Let me shake hands with you, sir. I hope our venture will be a happy and a paying one for all of us."

"I trust so, sir," said Godfrey; "but as I don't choose to sail altogether under false colours, let me just add that I have not given my complete name. Unhappily, I am under a cloud."

Desmond took Captain Boyd aside for a minute or two, and talked to him.

"Poor fellow! poor fellow!" he heard the captain say. Then the honest sailor, with his heart upon his sleeve, must needs come and shake hands with Godfrey once again.

"We'll do all we can to make you forget your fickle fortune," he said.

Now there was quite a deal to be done to, and done about the *Oonalaska* before she could be ready for sea. She was all but ready, but three weeks must elapse before she could actually sail.

Next day, Godfrey's new-found friends went off to Bristol to begin work in earnest, while Godfrey went away to live for a time as a recluse at the small, quiet Cornish village of Newlyn.

Captain Boyd was one of those active, energetic men, who fully appreciate the value of honest labour, and the advantage, morally and physically, of having work to do—duty to perform.

"Sixty-five, and began again," he would have told you in all candour, had you asked his age.

"In the evening of life," said a would-be sympathetic friend of his once, "do you find it a great difficulty to support the burden of existence?"

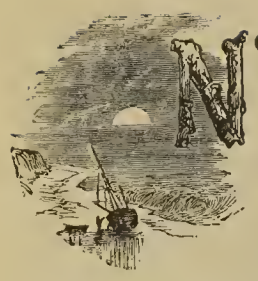
"Burden of fiddlesticks!" This had been Boyd's blunt answer. "I feel no burden about it. I'm as happy now, and just as active, as I was at forty. Life is precisely what you make it. If I were to sit down and twiddle my thumbs, why, my heart would shrivel, and my soul would shrink, and I'd be in the grave in a year."

There is no doubt about it "plain Jack Boyd," as his dearest friend called him, was a very busy man; and he now set about getting the *Oonalaska* ready for sea.

There was a good deal to be done, but he had able assistants in Desmond and Jack Silk. They were on board the craft, morning, noon, and night, and in their blue serge jackets and trousers of duck, you could hardly have told them from any of the workmen.

The ship received such a cleansing and disinfecting as she had never had before, for she was to carry a few passengers for San Francisco, and ere she reached the Arctic regions—her ultimate destination—she had twice to cross the line, twice to be roasted on the equator. So for three whole days it was scour and scrub, and wash, and swill, and pump. Such scouring, scrubbing, washing, swilling, and pumping had never before been seen by the good folks of Bristol. At last, however, the captain declared she was as sweet as hazel-nuts or new-mown hay.

Then the fitting of the saloon commenced, and repairs in general all over the ship; and the rapping and tapping, and sawing and planing, were almost deafening, while the decks below and above were littered and bedded with chips and shavings, boards and logs, and tools of every shape and form.



While carpenters were busy below, sailors proper were hard at work aloft, scraping masts, and bending new rigging and extra spars. Nor were the sail-makers idle, for the *Oonalaska* was to be an independent ship—that is, she would sail when the wind was favourable, and steam when it was not.

(*To be continued.*)

WORDSWORTH'S JOY IN NATURE.

By J. H. Rose, M.A.

I.

NOT a few persons who are fond of poetry and of beautiful scenery, yet have an impression that Wordsworth's poetry is dull and monotonous. To such I will try to show that they may from it enrich their lives with a new and lasting delight in Nature.

Wordsworth's life was one of thought rather than of action. He passed through Cambridge with little ambition or distinction; and the French Revolution of 1789–1793 was the only event which stirred his placid nature very profoundly; for he, Coleridge, and Southey shared extravagant hopes of its results.

> "Bliss was it in that dawn to be alive,
> But to be young was very heaven."

His faith in its principles outlived the Reign of Terror in 1793; but when the young Republic attacked free Switzerland in 1797, and entered on a career of foreign aggression, disappointment drove the poet in upon his own thoughts and his Cumberland dales. In the downfall of his political ideals, he took comfort from Nature as she reveals herself in mountain, wood, and stream, and in the simple lives of the tillers of the soil.

We, too, may draw fresh hope and strength for life's duties from Wordsworth's pages, even though our lives are spent in smoky cities; for the poet sings not only of the present power of natural beauties on the beholder, but also of the abiding joy which these can exert through the memory.

In fact, Wordsworth made the most (as every prudent person does) of his simple woodland pleasures, both (1) in anticipation; (2) in his present delight, as pictured by fancy or imagination; and (3) in the treasure-house of his memory. Wordsworth has left behind him in his poetry nearly all the thoughts and emotions of his long life; and the great bulk of his writings frightens away many students who know not where to search for his choicest poems. But under the above-named headings much of his noblest teaching about Nature may be conveniently grouped in these Papers.

1. The pleasure of anticipation is described in the "Poems of the Imagination," No. 6, called "Nutting." In the eagerness of boyish hope he set out for a grove where

> "The hazels rose
> Tall and erect, with tempting clusters hung,
> A virgin scene!—A little while I stood,
> Breathing with such suppression of the heart
> As joy delights in; and, with wise restraint,
> Voluptuous, fearless of a rival, eyed
> The banquet:—or beneath the trees I sate
> Among the flowers, and with the flowers I played;
> A temper known to those who, after long
> And weary expectation, have been blest
> With sudden happiness beyond all hope."

This "wise restraint" has been much admired; and it is like the canny north-countryman, that he should get all the delight possible out of his anticipation, before seizing on the long-coveted pleasure. Nay! the boy found the expectation better than the act of ravage; for when—

> "The shady nook
> Of hazels, and the green and mossy bower
> Deformed and sullied, patiently gave up
> Their quiet being,"

then he felt a sense of pain, and his final feeling is:—

> "With gentle hand
> Touch, for there is a spirit in the woods."

2. Present delight in Nature breathes in almost every one of Wordsworth's poems; and it is a thoroughly healthy feeling. I mean that he does not translate *his own* moods into Nature. Perhaps all of us have caught ourselves, at some time or other, indulging in that false sentimentality, that the sky is weeping tears of grief, because it sympathises with our woe. Whenever Wordsworth was tempted to that feeling, he shook it off as unhealthy; as in Stanza 3 of his "Ode on the Intimations of Immortality":—

> "No more shall grief of mine the season wrong."

All of us must feel that this is a more correct and healthy view of Nature than that of Tennyson's "In Memoriam," xi.—

> "Calm is the morn without a sound,
> Calm, as to suit a calmer grief."

But the Laureate's desire for a harmonious background ought to keep us from contrasting too sharply his lines with Wordsworth's.

Many great poets have finely treated the beauty and grandeur of natural scenes as an effective setting to their main theme of human incidents; but in Wordsworth's eyes, Nature and man were of equal importance; and his poetry is full of the influence which the one has on the other.

In the "Preface to the Excursion," he explains this in a philosophical way, viz., that the mind of man is exquisitely fitted to drink in the truths of the external world; and also that Nature has been made by God no less exquisitely adapted to the needs of man's mind. He also touches on the same truth in more popular language in the little poems, "Expostulation and Reply," and "The Tables Turned":—

> "One impulse from a vernal wood
> May teach you more of man,
> Of moral evil, and of good,
> Than all the sages can."

This belief of an "*impulse*" coming from Nature, and of her moral teaching, is a truth which Wordsworth was the first to explain poetically, and in the next Papers I shall hope to prove that amidst all his delight in natural scenes, his matured mind always found teachings grave or gay, according as they were the results of imagination or fancy.

I say that his *matured* mind saw these lessons, for in boyhood he simply enjoyed his Cumberland mountains and lakes just as every other healthy boy would. As a proof that in his youth his was no old head on young shoulders, read the healthful description of his skating on the lake (middle of "Book I. of the Prelude").

> "So through the darkness and the cold we flew,
> And not a voice was idle; with the din
> Smitten, the precipices rang aloud;
> The leafless trees and every icy crag
> Tinkled like iron; while far distant hills
> Into the tumult sent an alien sound
> Of melancholy not unnoticed, while the stars
> Eastward were sparkling clear, and in the west
> The orange sky of evening died away.
> Not seldom from the uproar I retired
> Into a silent bay, or sportively
> Glanced sideway, leaving the tumultuous throng,
> To cut across the reflex of a star
> That fled, and, flying still before me, gleamed
> Upon the glassy plain."

This is a piece of poetry as fine and spirited as the sport it describes; and we may be sure that the boy enjoyed the fun as rapturously as any of his comrades,—in fact, much more so, for he had a poet's ear and eye even then in his boyhood, else he would not have remembered in his later years that the near crags echoed back the sound of the skates, while the far distant hills slowly sent back the weird sounds of horn and halloo; although the boy enjoyed his hare and hounds, we yet see that the reflection of a star was able to entice him aside in frolicsome chase. He had more sources of pleasure than they.

Or take this passage of the calmer joy (Prelude, Book II.) of boating on a summer's eve,—

> "Oh, then, the calm
> And dead still water lay upon my mind
> Even with a weight of pleasure, and the sky,
> Never before so beautiful, sank down
> Into my heart, and held me like a dream."

Such were the influences which played about the young poet. A quiet cottage life, with "plain living and high thinking," in one of the fairest spots of English ground. Would that these healthy conditions of life were more common now-a-days! But as that is impossible, the next best thing is, that those who must grow up amidst the din and temptations of great towns, should drink in some of Wordsworth's healthful teaching.

To those who have an ear for the cadence of poetry, I would commend a close study of the two last extracts.

> "The sound should be an echo to the sense,"

says Pope. The vigorous movements in the first piece are shown by the hurrying metre or abrupt breaks in the lines; while, on the other hand, the quiet ecstacy of the summer eve is reflected in the smooth, slowly-moving lines of the latter.

Mr. Swinburne says: "Wordsworth's metre is sublime; his choice or chance of language has miraculous effects in it, when he feels his foot firm."

For those who care to pursue further the study of his metre, I would name "Poems of Imagination," Nos. 5 and 16; the first ("Yew Trees") because *Wordsworth* thought it the best specimen of his blank verse; and No. 16, because the short, hurrying lines express the various activities of Spring, while the *long* lines of the first verse show the stillness of the oxen and of the field.

Everywhere in Wordsworth, Nature is a Being endowed with active powers and influences; and why not?

Even the North American Indians have called one of their loveliest lakes, "The Smile of the Great Spirit;" and it is said that the reason why they are silent in the woods, is, because they think the leaves may *hear*, and *whisper* of their talk.

THROUGH THE MUD IN NEAT'S LANE.

By A. Stuart Fletcher.

NEAT'S LANE, on a dull winter night, is not the pleasantest place for a walk. For one thing, its only means of illumination is a dim oil lamp, which hangs outside a cottage at the further end ; this faintly lights up a patch of whitey-brown wall, belonging to some Cement Works, and a row of small cottages, with cabbage gardens in front. Between the wall and the gardens is a slough of black mud, traversed by a line of broken bricks and cinders, called, by courtesy, a path. Along this uneven causeway, picking her steps as well as she was able, came a girl, who paused at the gate of the cottage with the lamp, and, breathing a sigh of relief, entered the gârden. She was evidently not an inhabitant of Neat's Lane; the quiet dress, the neatly-gloved hands, the well-poised head, with its mass of smoothly-coiled hair, which the lamp revealed, proved that.

The stranger turned the handle of the door, and looked in. She saw a room furnished with a deal table, forms and bookcase. Round the table sat about a dozen lads, apparently aged from fifteen to twenty, and arrayed, for the most part, in gorgeously-striped woollen jerseys. All the heads were bent over books or slates, and a grey-haired gentleman was talking in a low tone to one of the lads.

The girl entered, and every head was raised. "It's Mr. Morrison's sister, come 'cause he's ill with the Brown Crisis," said one lad to another with a nudge. "There's Mr. Blake a-shaking hands, and asking her to look over the sums."

Ellen Morrison laid aside her hat, and passed quietly round the table. Most of the scholars were lads from the Cement Works, whose holiday attire of bright jersey had been donned for the occasion.

"I've got a tough job here, miss," said one brawny fellow in gorgeous stripes of red and blue, as she passed behind him.

Ellen looked down on the thick fingers grasping a stumpy bit of pencil, and the much-besmeared slate, with its three short columns of oddly made figures, and inquired what the difficulty was.

"You see, miss," said the troubled student, "I adds up the figgers, and they comes to twenty-one. Then I puts down two and carries one, and yet it don't come right."

With some difficulty Ellen made this dark point clear, and lifting her head, met the gaze of a pair of deep-set eyes, looking at her from under thick black brows.

"Do you want something?" Ellen asked the owner, who was conspicuous by the absence of a brightly-striped jersey. The youth nodded, and Ellen took his slate. Instead of the usual additions and subtractions, this contained a problem in Interest, and Ellen had just time to wish that the arithmetical part of her education had been a little wider, when Mr. Blake said suddenly: "Oh, Armstrong, I'll correct that," and muttering a "Thank-you," the lad took the slate again, and passed it to the master.

"Who is your advanced pupil?" asked Ellen, as, an hour later, she walked with Mr. Blake down Neat's Lane.

"Oh, Armstrong," replied Mr. Blake. "There's the right stuff in that fellow ; he'll get on ;—never loses a minute or an opportunity. He has had no advantages, could scarcely read or write when he came to the night-school, but there is no one who comes anywhere near him now."

Wednesday after Wednesday found Ellen at the cottage in Neat's Lane, for her brother's attack of bronchitis proved a severe one, and no other substitute could be obtained.

One evening she found the youth of the thick fingers, Bill Stevens by name, waiting at the end of the lane with a lantern.

"It's awful muddy down tne lane, miss," he said awkwardly ; "I thought I'd best bring a lantern, and light you along." And Ellen accepted the escort gratefully.

Bill Stevens did not make much progress ; his brain seemed of the same texture as his fingers ; but John Armstrong's advance was sure and steady. He read omnivorously, and Mr. Blake told Ellen one evening that Armstrong had read almost everything he could lend him.

"Perhaps my brother could lend you some books," said Ellen to the boy, after class was over that night.

An eager gleam shot from under Armstrong's black brows. "Could he lend me something about America?" he asked.

"I think he could," Ellen answered. "But why particularly about America?"

"Because I am going there as soon as I can save the money," said Armstrong; "they tell me there's plenty of room there for every one who will work. And there's land, and wood, and water, you can have for your own, and there's no need to push another man to the wall when you want to get on. I'm going. I've no one belonging to me, you know, and I shall have saved enough money by the Spring."

Fred Morrison lent the books, and, being now in a state of convalescence, when his enforced imprisonment within doors in the winter evenings became tedious, he willingly listened to Ellen's suggestion, that he should offer Armstrong help in other subjects beyond the night-school curriculum.

So night after night Armstrong sat by the Morrisons' dining-room fire, and worked under Fred's direction, while Ellen, work in hand, sat on the other side, and listened, or joined in the conversation.

Spring came at last, with the light evenings, and the night-school term was ended. On the last evening, Bill Stevens presented Ellen with a huge bunch of wall-flowers and daffodils, "off a barrer," and otherwise gave vent to his gratitude by a lusty "hooray," in which the others joined.

Armstrong lingered when the other lads were gone. With the warmer evenings Fred Morrison's lessons had become less frequent.

"I am going to America next week, Miss Ellen," he said ; "may I come to say 'Good-bye'?"

"Come," said Ellen ; and in a few days he came.

"Good-bye, Armstrong," said Fred ; "you'll be sure to get on! And," he added lightly, eyeing the upright figure in its homely suit, the resolute mouth, and the keen eyes under the deep brows, "you will come back a gentleman."

"I will be as much of a gentleman, sir, as the memory of a real lady can make me," said Armstrong seriously. Then, turning to Ellen, he continued in a lower voice: "You told one of the boys once, Miss Ellen, that he must be a man before he could be a gentleman. I'll be a man, God helping me, and will never do anything a man should be ashamed to do, nor a lady like yourself ashamed to see."

A year passed away, and nothing was heard of Armstrong, and in the months that followed, Ellen almost forgot his existence ; her brother had had a more serious attack of his old complaint, and this time did not rally. After his death, followed sorrow upon sorrow, until to Ellen, now orphaned and alone, the memory of the time when, as a light-hearted girl, she plodded through the mud in Neat's Lane, seemed like a dream. Poverty, too, had been added to bereavement, and Ellen now earned a scanty livelihood by giving music lessons.

One evening in Spring, returning weary from her teaching, the sight of a costermonger's barrow, filled with bunches of wall-flowers, caused her to stop, and spend one or two of her scanty pennies in the purchase of a bunch. A smile lit up Ellen's worn face, as the scent of the flowers brought back the remembrance of the faithful Bill Stevens, and his floral offering.

After reaching home, and placing the flowers in water, Ellen leaned back in her chair, and gave way to the memories that now came thronging into her mind: Bill Stevens and his gaudy jersey ; Armstrong with his intent gaze. Where was Armstrong now? Had he succeeded? Had he failed, or was he, too, dead?

The little maid bumping at the door with the tea-things put an end to Ellen's reverie.

"Please, ma'am," said the girl, as she set the table, "a gentleman came this afternoon when you was out, and he said he'd come again to-night. He didn't leave no name."

The prospect of a visitor was almost an excitement to Ellen, who lived now much alone. As she ate her tea, her mind was busy wondering who the mysterious gentleman who left no name could be, and she had just made up her mind that it must be an old friend of her father's, who sometimes came to see her, when the little maid's blundering knock was heard at the door, and a visitor entered.

Ellen rose from her seat, and gazed at the bearded stranger in amazement. No recollection of having seen him before crossed her mind, till a sudden glance from under a pair of black brows brought back, as in a flash, the memory of the night-school and John Armstrong. He saw the recognition in her face.

"I've come back at last, Miss Ellen," he said.

The rush of memories would not let Ellen speak. She pointed to a chair, and he sat down. Ellen looked at the vigorous form, the expression of power and will in the face, and, meeting the clear gaze of the eyes, felt that his old promise of manliness had been fulfilled.

They spoke of old friends, and of Armstrong's adventures ; then there was an instant's silence, till he said abruptly,—

"The thought of you has never been absent from me one day since I left you ; it has been company in my loneliness ; it has kept me up in the face of despair ; it has come between me and temptation ; it will never leave me till I die. I am a plain man, Ellen, no polished gentleman ; but I have been true, by God's grace, to the promise I made you ; and if you will give me the right now to take care of you till death parts us, there is no man on earth can offer you a truer love."

What could Ellen say?

"Give me time, John, to know you, and to know myself. You have thought of me all these years, you say ; but I had almost forgotten you. Give me time."

"I have waited seven years," said Arm-

strong, "but I could wait another seven if you would only call me 'John' again!"

But it was not seven years, nor even as many months, before John and Ellen stood side by side on the deck of an outward-bound steamer, and watched the English shores as they faded from sight.

"If there is one spot in England I should like to transplant to America," said John at last, as they turned away, "it's that muddy strip of earth called 'Neat's Lane.'"

MEN THAT CAN'T.

THE MAN THAT CAN'T HOLD HIS TONGUE.

By the Rev. J. H. THORPE, M.A.

AT the outset, we hasten to assure you that you are not about to be exposed to the chilling torrent of empty words, which he pours on all who come near him. No; you are only asked to stop a while, and hear *about* him. We do not expect to cure him of his desperate complaint by a public exposure; but by a closer consideration of him, you may be led to pity in some cases, to be patient in others, and perhaps to learn that there are times when "the man that can't hold his tongue" actually rises above being a social bore, and becomes nothing short of a moral nobleman.

Once upon a time, an ancient sage said to one whom he met, "Speak, that I may see thee." We believe this old gentleman was not a poet. Poets, you know, always speak of the eyes as "windows of the soul;" our friend, the sage, may have accepted this as true, but he seems to have regarded the mouth as the door of the soul. After all, people only look through their windows; but they walk through their doors, and let all the world have a full view of them.

Now we are about to investigate the causes of that strange phenomenon—"the man that can't hold his tongue." The simplest way to do so will be to hang our thoughts on this simple peg. "Why can't he?"

Our first answer will savour somewhat of nursery logic, "Because he can't!" Yes; we mean it. We go so far as to say, just here, with not a sound to disturb us, except the tick of the study clock, that some men can't hold their tongues, from a simple inability to keep silent. They must talk.

In ancient story, we read of a certain vanquished warrior, who was tied by the heel to his enemy's chariot, and dragged along in ignominy. Such a sight is a man, dragged by an ungovernable tongue at the end of his conversation, to his own sorrow, and betimes to the injury of his neighbours. He suffers from a fatal facility of speech. His tongue is so supple that, like a well-made and well-oiled machine, it runs along without requiring more than the least out-put of driving power; or sometimes like a railway train, with insufficient brake-power, running down an incline. His tongue makes words a great deal faster than his brain can supply thoughts to fill them.

Meet him in the drawing-room, and you constantly hear him saying "things one would rather have left unsaid," and then lamenting his blunders. Meet him in the "blues" after a party, because when his heart was merry, and the string of his tongue unloosed, he uttered words that were not lawful for him to utter—secrets that had been revealed to him under the sacred bonds of friendship; and now, alas! he cannot mend the mischief. Again, you go to some Public Meeting, and there he sits on the platform—you hope only as a sympathiser with the object in hand, but presently your hopes are shattered. You hear Mr. Blank called upon to move the first Resolution. Up he gets. Perhaps you hear something like a speech actually given in one of our colonies by a member of this family, when impassionately recounting an Indian raid on his native village: "And, gentlemen, when I returned to my home that I had left so peaceful and so secure, I found—I found—sir, I found my children fatherless, and my wife a widow!"

Sometimes "the man who can't hold his tongue" will be clothed in clerical garb. He mounts the pulpit and begins. At first you seem able to trace a good sequence of thought in his sermon, but presently it begins to get rather hazy, though never a word does he lack. On he goes, and by an irresistible association of ideas, you find yourself (mentally) humming the chorus: "Beautiful *words*, beautiful *words*." The usual twenty minutes have run; you expect him to stop. He is *trying* to stop, but he can't; somehow the last thread seems to elude his grasp. On he goes for ten minutes longer, like the child's windmill, which flies round but grinds nothing. At last you cannot say the sermon ends—it stops. Such men will begin with the largest congregation in the town, and scatter it in a few months with no more harmful weapons than *words*.

Is there a man here who suffers from this? Send him to the surgery at once, that we may inform him that the cause why the clapper of the ship's bell tolls the watches—namely, that *it wags in an empty vessel*—is also the reason of his complaint.

Now this poor fellow, who can't hold his tongue, would be completely cured by some mental tonic, which would restore his mind to its rightful place as master of his tongue. If such be not forthcoming, let him resolve from to-day, to exercise severest discipline over his tongue and conversation generally. Next, and most important, he must labour from day to day, to store his mind with knowledge of as wide a range as possible. As a man's mind becomes filled with thoughts, great, varied, and solid, his mouth becomes empty of words that are nothing but words—"*vox et præterea nihil*." The words he then uses, because of their solidity and truth, become the carriers of many treasures to his neighbours, causing them to own him a benefactor. Once again, we would ask him to remember that it is written, "Every idle word that men shall speak, they shall give account thereof in the day of judgment." With those words before him, no man can think it a matter of indifference whether his words be many and useless; or few, and to the edifying of his hearers.

We turn from this member of the "Can't" family to another, less amiable, and by far more harmful. There is another man who "can't hold his tongue," because he is possessed with an ardent desire to attract men's attention to himself. This man's tongue keeps up its ceaseless clatter, because it is the lineal descendant of the trumpet blown at street corners long ago by a Pharisee, "to be seen of men." We do not care to say much about him. Putting down buoys in a river to show dangerous places, is no doubt very useful work, but it is somewhat uncongenial to landlubbers. But it is needful, and it must be done, so here goes! This man talks long and loudly in mart and in meeting, in the parlour and the park, in all places, in a word, where he can get a hearer, because his heart is full of his own self-importance, and he wants to talk men into accepting his own exaggerated estimate of himself.

We have met this man more than once. We have ventured to tell of some remarkable achievement. We had barely concluded, when the pompous, self-conceited, inflated tones of this loquacious individual proceeded to unfold before the assembly a tale of his own prowess, which was as much superior to our little anecdote, as St. Paul's Cathedral is to a sentry-box.

We need not follow him further. We have written enough to enable our reader to see him plainly. We are unequal to the task of giving a full rehearsal of the most likely method for his cure. We almost wish the oculist could be called in, with skilful hand and keen tempered steel, to extract this great "I," as he does other "eyes" that have become of abnormal proportions; but we do not expect to live to see science so far advanced, so we are bound to adhere to the old ways still. We recommend him to renounce the selfish pleasure of talking about himself. Let him dwell on the sorrows of his neighbours, and store his memory with his own mercies. Above all, let him seek grace to be "clothed with humility," and, ceasing to *think* so much, he will soon cease to *talk* so much, about himself.

We have suggested the possibility of a member of this clan not being a social bore, but a moral nobleman.

What has been the history of men who have smitten mighty abuses on the head, and, smiting hard enough and long enough, have at last seen them laid low for ever? We believe it was this,—they were men whose hearts were so filled with holy indignation, that they could not keep silent. They spake with their tongues, because the fire had been kindled in their souls. The world said, "Keep quiet," but they felt that if they did, the very stones would cry out. And in the end, there came a day when they held their tongues, because their work was done. Was it not so in the days when Wilberforce and others laid low the giant of Slavery? Has it not been so in the history of the Temperance Reformation? At the outset, Temperance men were laughed at, and pitied, and abused, and persecuted; but they stuck to the talking, and in the Press, from the Pulpit, and on the Platform, they couldn't hold their tongues. As a consequence, while they have not attained the measure of success which we trust lies before them, they have, by God's blessing, accomplished little short of a Social Reformation.

Can you not see the same thing in the history of our holy religion? What, amongst other things, characterized the Apostles? They worked miracles, they journeyed, they laboured at handicrafts, they did many things; one thing they could not and would not do—they couldn't hold their tongues! It was to no purpose they were warned, threatened, beaten, cast into prison, that they should no more "speak in the name of Jesus." "They ceased not to teach and preach Jesus Christ." Amongst our readers, there are not a few labourers for truth and righteousness. To them we would say, "Keep not still silent." If your voice is to be heard above the din and clamour of life, so as to arrest men's attention, you must "cry aloud and spare not." The world will charge you to keep silent, for the world does not wish to be disturbed by such as you; for that very reason, the more it opposes, do you cry all the more, and "don't hold your tongue!"

LED BY A WAY THAT THEY KNEW NOT.

By F. C. K. Waller.

ATE one evening at supper, a father, hale and middle-aged, sat with his son of about five and twenty, and two daughters, one older, the other younger, than the brother. The room in which they were, and all the table appointments, bespoke comfort and even affluence, for their position in life. Mr. Harris, the father, was accountant for a large auctioneering firm; the son was a clerk in the same; the youngest daughter worked as a daily governess, while the elder found occupation enough in keeping the house going, with the aid of one active young servant. There was a little capital in the background; the united income of the household was quite sufficient for their needs, and the Harrises, as a family, were consequently counted amongst the well-to-do folk of their neighbourhood.

A few moments' observation of the party this evening, was enough to prove that *something* had greatly moved them. They all looked earnest and excited, and, moreover, in sympathy with each other.

"I don't think I ever heard such an interesting speaker on Missions," remarked Mr. Harris, pausing in his supper. "I never wished so much before that I were a rich man. I should like to help the work ten times more than I do."

"Just what I felt, father," answered Sarah, the eldest girl. "I think I understand now the meaning of the expression 'the heart burning within one.' I'm sure mine was burning to do more this evening. What a very interesting Mission it has been!"

"A Mission's mission," remarked Marion, the other girl, with a smile. "What an odd combination it sounds!"

"And the fact that there were no collections after the Meetings seemed to make one more anxious to give," said Alfred, the son. "Just like the contrariness of human nature! But these Meetings, on such warm evenings, are thirsty work, Sarah. Just pass over the claret, dear."

His sister took up the bottle. "You must ring, Alfred; this is empty," she remarked. "I'm afraid it's the last of the cheap wine. Jane," turning to the servant, "bring a bottle of the other claret." Then to her father she added, as the maid left the room, "Will you please order some more of the light wine to-morrow, father? this warm weather makes it go very fast," and she laughed as she looked at her brother.

He met her glance frankly with an answering smile. "It's capital wine," he observed. "I hope the next will be as good; and it's not dear either, is it?"

"Only fifteen shillings a dozen," said his father. "The best wine for the money I have ever had. I shall order two dozen to-morrow. That ought to carry us through the rest of this warm weather. It can't last long now."

"I don't know about that," remarked Sarah, meditatively. "We often open two bottles a day, and October is only just begun. Claret is certainly a delightfully refreshing drink in warm weather," and she reached out her tumbler for a fresh supply from the new bottle.

"It may suit you young folks," said Mr. Harris, laughing, "but there's not body enough in it for a man of my years! Give me out 'my own particular,' Marion, dear. There's nothing like a dash of good brandy in a glass of cold water when one is really thirsty."

"And that reminds me, father," put in Sarah, "you may as well order some pale brandy too. That is your last bottle."

"All right, dear," and he made a memorandum of both liquors in his pocket-book. "But now about this Mission work. Don't you think we can manage an extra subscription? I should like to be doing more if we can. You're accountant-general to the family, Sarah. What do you say?"

She looked thoughtful, and then shook her head. "I don't know what to say," she answered at last. "Expenses seem to increase somehow, though I don't know exactly where. The total for last quarter was higher than usual. In fact, each quarter's expenditure has exceeded that of the last all this year. I dare not promise any more subscriptions till I get our balance at the year's end. We may have to cut down instead of increase them.

"Couldn't we do without something—exercise some real self-denial?" persisted Mr. Harris. "Surely, if we are in earnest about it, we could make out amongst us an extra five pounds for this Missionary work! It seems to me we shall surely suffer spiritually if we don't try, after being so much moved about it, to do something definite to help it on. Come, Sarah, we leave all these matters to you. See if you can't manage it. We're all willing, aren't we, to forego some luxuries for the Lord's sake?" and he glanced appealingly at his younger children.

"Surely, surely, father," was their prompt reply. "If Sarah can arrange it, and tells us what to go without, we'll be quite content."

"Then I'll look over the accounts some day soon," she said brightly. "I should like to contrive it somehow. I think, with father, that we ought to put our feelings into deeds, if we're to profit by them."

The Harrises were not long left in suspense as to where their self-denial was to be made. They were sitting at breakfast one morning, shortly after this conversation had taken place, when Mr. Harris took up a heavy letter, from amongst the rest beside him, and opened it.

"Why, what have we here?" he exclaimed, holding up four tickets. Then reading: "'Public Hall, Ilminster. The well-known William Barnet will give an address. Reserved seat, three shillings.' Well, this is curious, girls! Who can have sent them? It's for to-night. Shall we go?"

"Well, it seems a pity not to go," said the practical Sarah, taking up a ticket to examine it. "The twelve shillings would otherwise be wasted. But I can't think who has sent them," and she took up the envelope and scrutinized the direction.

"A disguised hand evidently," remarked Mr. Harris; "but that does not matter. I suppose it will be worth going to. Do any of you know about William Barnet? What's he going to talk about?"

"Why he's a great Temperance orator, father," answered Marion. "I've often heard of him at the Smithsons'. I knew he was coming, but you know we have never thought Temperance concerned us, so I did not mention it. But I shall like to hear him now we have the tickets."

"Then arrange accordingly, Sarah," was the answer, and soon afterwards the party separated to pursue their daily businesses. They were not able to sit together at the Meeting. Sarah and her father were in one place; Marion with the Smithsons, her employers; and Alfred by himself. Leaflets of various kinds were scattered over the Hall seats, and while waiting for the Meeting to begin, the Harrises, like many other people, studied those they could get hold of. The whole subject was a new one to them, and they were startled and aroused by many of the facts they read, even before the great speaker commenced his Address. Then they were completely carried away by the flood of burning eloquence which poured from his lips. The fearful details of the havoc wrought by the drink traffic were a new and horrible revelation to these simple-minded Christians. The power of habit, and all the misery entailed by an hereditary taste for it, were startling facts; but when, in concluding, the speaker caught up a leaflet from the table, and thundered out all the degrading details of the National Drink Bill; when he drew a pitiable comparison between the amount spent on alcoholic liquors, and the miserable fraction of it which a Christian country was able to give to Missionary work; when he pointed out how much more money must be available for all God's work, if only people would deny themselves the habitual use of what was, at its best, an unnecessary luxury, and at its worst, the ruin and curse of thousands; then Sarah and her father turned and looked at each other with moistened eyes and beating hearts, for, lightning-like, it flashed into the thoughts of each,—this was the direction in which they must seek retrenchment for their additional Missionary subscriptions. How was it they had never thought of it before? Wine was certainly a luxury they could well go without. The extra five pounds would soon be saved out of the wine merchant's account. How glad and thankful they felt to have had the matter put so plainly before them, for surely scores of other people must be feeling as they did!

So when father and daughter left the Meeting, words were scarcely needed to make them at one as to their future course.

"We'll give it all up for the Lord's sake, my dear," said Mr. Harris, reverently, as he pressed the hand which rested on his arm. "It's a pure luxury to folk like us, who have plenty of good food and clothing. Have you any idea how much our quarterly wine bill is? Two or three pounds, I suppose—a grand sum to have available for Mission work! I'm sure Marion and Alf will be feeling with us. Curious, isn't it, dear, that these tickets should come for this Meeting, just to show us what we might do for God's work!"

But when the family party sat down together to their supper, the proposed alteration dawned upon the good man as a real sacrifice. A freshly-opened bottle of the light claret stood on the table, and filled the air with its aroma; and "his own particular" stood beside his glass, also adding its fiery breath to the atmosphere. There had been no opportunity, till then, of sounding Marion and Alfred on the subject; but Marion's action of withdrawing her glass as her brother proposed to fill it, broke the ice.

"We need hardly ask how you feel, my dear," remarked Mr. Harris, giving her a kindly glance. "You didn't fancy it, evidently, after all we have been hearing. Sarah and I have resolved to give up the habitual use of wine for the Lord's sake. The

lecturer's words about Missions seemed like a message straight from God for us. How much is it, Sarah, we shall thus save for Mission work?"

"It used to be only about three pounds a quarter, father," replied his daughter; "but the last year or two it has been increasing. I can't think why. When I came to look over the accounts, it was there the increase came. It was six pounds last quarter. I suppose the long, hot Summer made us extra thirsty."

"Well, we'll take it at its old valuation—three pounds a quarter," was the answer. "That is a nice sum for extra subscriptions. I suppose, Alfred, you'll agree to this household self-denial?" he asked, as he turned inquiringly to his son.

"Oh, yes, sir, certainly," said the young man lightly. "Of course I like my wine, but I daresay I can do without it at home. It was a family compact, and I won't be the one to break it. But as this bottle is opened, I may as well drink it to save it from spoiling. So, here goes for my last glass of claret," he continued, with a laugh, and filling himself a bumper. "It will be strange to drink only water after all these years. I don't think you fancy it much yourself, father."

Mr. Harris glanced rather ruefully at "his own particular." "Yes, it is a bit of a pinch, I own, my boy," he remarked, with a comical smile, as he corked up the bottle. "It is curious how strong these habits of ours are. I'd no idea that I counted on my glass so much, till now that I am to go without it. But there, children, we'll say no more about it! In a few days' time we shall get used to the change. You must give us coffee sometimes for supper, Sarah, as the weather gets colder; then we'll soon cease to miss our strong drink."

And so, quietly and without any special fuss, the Harrises, as a household, became total abstainers. It was also tacitly understood that three pounds a quarter, out of the amount laid aside for household expenses, was to be appropriated to Mission work, either at home or abroad. Sarah was to have charge of this special fund, and give from it according to the calls which might be made upon them.

But though so easily inaugurated, this great change was not destined to be thoroughly established on *principle* amongst the Harrises, without a trial such as they little expected, but from which they were to emerge more thankful and grateful than words can tell.

"'Why, what have we here?' he exclaimed."

One day, about ten days after the Temperance Meeting, Alfred Harris was sent by his employers to the counting-house of a wealthy wine merchant. After finishing their business, the old gentleman courteously offered the young clerk a glass of wine. It was the first time Alfred had been offered wine since the family had renounced the habitual use of it. For a moment, the young man was about to decline; but the wine merchant was already pouring it out, and its aroma filled the air. The young man caught a whiff of it, and suddenly became aware of a great longing to taste it. He had just time to reflect that he was bound by no pledge to abstain from wine-drinking at other people's expense, when the glass was handed to him. He seized it, and drank so eagerly, that the old wine merchant smiled, and hospitably offered him a second glass.

"Just half a one, thank you, sir," replied Alfred. "It is most excellent wine."

"Such as people don't often get," said the old man. "It won't do you any harm; it's a thoroughly sound, wholesome wine," and he poured him out another bumper.

Alfred drank it, thanked him, and took his leave. But before he had been many minutes in the street, he became conscious of a subtle change in himself, which he had never experienced before. He appeared to be possessed with an unaccountable longing for more drink, and something kept urging him to turn into the public-houses he passed, in order to gratify it. The smell of the liquor, as he caught it from time to time, exercised a powerful attraction over him. The longing grew and grew as he passed one and another, till he felt like one possessed. He had never been in the habit of frequenting public drinking-shops, so he could not understand what this sudden fascination meant. Why should he be wanting to go into them this morning? He had often laughed at his fellow-clerks for their frequent visits to these places, and had prided himself on his self-restraint; yet, now, every moment was making it more difficult to pass them by. A thirst for some kind of liquor consumed him. His whole being was calling out for it. So intense did the longing become at last, that as Alfred neared one corner, where he remembered there was a very attractive bar, much frequented by young men of his class, he suddenly turned down a side street to avoid it, and found his way back to his office by another route.

Once alone there, he sat down, and, burying his face in his hands, began to collect

"'Such as people don't often get.'"

his thoughts. What was this strange thing which had happened to him? Even now, alone in his little office, out of sight and smell of it all, he was still longing for more drink. He knew he had liked wine always, and latterly, that he had liked it more than before ; still, for ten days he had lived fairly comfortably without it. Why, then, this sudden passion for it after those friendly glasses given him at the wine merchant's?

Then there flashed into his mind words that he had both read and heard at the Temperance Meeting, and he began to understand it. This sudden and terrible longing must be the first symptoms of the drink crave, the first signs of the appetite for alcoholic liquor, which he had heard so powerfully described that evening !

God have mercy on him ; was it really so ? Great drops of perspiration beaded the young man's forehead as he sank on his knees quite overpowered by the dreadful thought. For he felt it was the truth. His memory rapidly supplied link after link of confirmatory facts. He had been growing fonder and fonder of drink for the last year, and he remembered with a flush of shame how gladly he had allowed himself to be treated of late by his friends, and how much more he had taken at home.

And this was the end of it ! The first taste of alcoholic liquor after his ten days' abstinence had unmasked the enemy ! Well, God be thanked, he knew his position now. He was young and strong of will. The liking could not have got a very strong hold of him, or his ten days' abstinence would not have been so easy. One thing was clear to him : it must be total abstinence again for him for many a long day. He would never willingly run the chance of arousing this enemy again. The struggle had just been real and hard enough to make him realise, that a little longer indulgence in his habitual drinking habits might have made it terribly more difficult to conquer. And Alfred bowed his head in silent prayer to God for strength to overcome this fatal liking, and then set himself resolutely to his work as the best way of forgetting, and living his temptation down.

But this was only the beginning of a long and hard struggle, such as Alfred would not have believed possible a month before ; for the enemy was not going to loosen his grasp on his desired prey without making him feel his power. The thirst, once aroused, was not to be so easily ignored. The young man took no one into his confidence, and, not being an avowed or pledged teetotaller, was continually tried by the invitations and teasings of his friends to share their libations as of old. How thankful he often felt, as he turned into his home from time to time, that there at least was a haven of rest, and freedom from temptation ! What should he have done if they, like his other friends, had assailed him with invitations to drink, and tantalised him with the sight and the smell of it. All unconsciously to themselves, his father and sisters were befriending and supporting him to their utmost by their abstinence. Sometimes in his gratitude, he was almost betrayed into telling his story. But he restrained himself. He wished to win the battle and master his foe, before he let them know of its existence, and told them of the help they had given him in his terrible struggle.

But unexpected circumstances brought all to light sooner than he intended. Alfred caught a violent cold, which developed into a serious illness, and they had to call in medical aid. When at last the young man began to improve, his doctor ordered him a couple of glasses of port wine daily, under the mistaken, old-fashioned, unscientific idea that it would help to "get up his strength."

It was to Sarah the doctor gave this part of his prescription. Not having adopted total abstinence practice from any particular principle, except that of personal self-denial for the sake of God's work, and wholly ignorant of the evil it might work, Sarah made no objection. She fetched up a bottle of the best port-wine from their little cellar, and, decanting it carefully, poured out a glass and took it up to her brother's room, with the beef-tea and dry toast prepared for his luncheon.

Alfred was sitting in an easy chair by the fireside. He was tired after dressing, and had dropped off into a doze. Sarah suddenly noticed, with concern, lines of care about his face not seen there before, and wondered if he had any secret trouble to make him look so much older than he used to do. She did not know of the solitary struggle with his lately-discovered liking for strong drink, which had tried him sorely. But her sisterly heart was greatly touched by the traces it had left behind on his countenance. She placed the tray on the table beside him, put the beef-tea to keep hot on the hob, and then sat down to wait for his waking, full of tender feeling, and trying to make out what could be the matter.

He woke at last with a start. His sister was out of the direct line of his vision, so he did not see her. But his eyes fell on the table with his luncheon tray. Sarah saw him flush up and sit upright, while an eager look came into his eyes. He glared down at the glass of deep red wine with such a longing look, as she never afterwards forgot, and half stretched out his hand to clutch it. Then he threw himself back in his chair with a cry for help.

"Not this, my God, not this !" he exclaimed, clasping his trembling hands together before his face. "Let me not be tempted in my own home. Have mercy upon me, have mercy, and help me to resist."

"'As you love me, take it away.'"

Sarah sprang to her feet in amazement, trembling with excitement. Alfred looked up to meet her questioning glance.

"As you love me take it away, Sarah," he cried, all his reserve broken down by his sense of danger and bodily weakness. "You little know what I've gone through these last two months. Don't you now be the one to put temptation in my way, dear. Home has been my one haven of refuge since I discovered my liking for strong drink. Don't let it cease to be such. Take it away, Sarah; take it away. It's 'the very devil in solution' to such as I. God only knows how soon I might have become a confirmed drunkard, if He had not in mercy opened my eyes."

Sarah was almost speechless with astonishment at this outburst. "Is it the wine, dear?" she asked at last.

"Yes, yes," he answered, irritably; "take it away, do, or I shall be drinking it in another minute, and then——"

"And why shouldn't you drink it, dear?" she asked, but lifting it well out of his sight and reach as she spoke, for his looks and words impressed her powerfully, though she failed as yet to understand him fully. "The doctor says you are to have two glasses a day to get up your strength."

"To get up my strength! to become a confirmed drunkard, I suppose," was the fierce reply. "He's a fool, and I won't take it. It is such men as he that have helped to make England the drunken nation she is. God help us! but it's hard enough to keep clear of this cursed drink all round us, without having it ordered as medicine. If I'd been weak enough to drink it, what might not have happened?"

"But wine is just meant for such as you, isn't it? It says, 'Give strong drink to him that is ready to perish.' You look so weak, dear, I'm sure you want something. I don't understand you, Alfred. What *do* you mean?"

He had sunk back in his chair now, and closed his eyes. This burst of excitement had tried him greatly. His sister was frightened to see how pale he looked, and her nursing instincts were roused.

"Here, take your luncheon, dear," she said, gently, and arranging it comfortably for him. "We'll talk it over when you are better. I don't know what Dr. Ellis will say about this wine business. He made a great point of it this morning."

"Just ask him if he wants me to become a drunkard," said Alfred, grimly. "I'll answer for it that he'll have nothing more to say after that."

"But I couldn't speak like that, dear," said Sarah, in great distress. "Whatever would he think of you?"

"The truth, anyway. There is no use mincing matters. I'll tell him myself, if you won't. But you don't seem to understand me, Sarah. Just look in the right hand top corner of that drawer there, and bring me the papers you will find."

Sarah brought them. He looked them through, and selecting one, handed it to her to read. She looked it through. "Did you notice the passages underlined?" he asked, when she glanced up at him inquiringly. "That is what I was fast becoming, Sarah. I never suspected for a moment that I was getting too fond of drink, till we all gave it up. Ten days afterwards I found it out, when I drank some wine at Mr. Oldham's office. It has just been one long fight ever since, though, thank God, it has not been so hard lately. With His help I shall live it down. But I feel I must never drink wine again. As you love me, Sarah, you must never tempt me again as you did this morning. Even the smell stirs the old longing, and to taste it might bring it all back."

While Alfred was speaking, Sarah continued to study both him and the leaflet. The latter she recognised now as one she had glanced over at the great Temperance Meeting. *Then* she had failed to understand it. It seemed utterly beside the question to such as they. *Now* every word was eloquent. The need for abstinence as a personal matter, was fully brought home to her by her brother's revelations, and a great wave of thankfulness to God, for His wonderful love and mercy to them as a family, began to rise within her.

"May I tell father, and show him this?" she asked at last, holding up the leaflet.

"Yes, do," he answered. "Tell him this evening. I meant you all to know some day. You'll all abstain now for my sake, won't you, as well as for the savings' sake?"

Sarah kissed him her answer. She was not one given to many words at any time, and now was too much moved to speak. She wanted to be alone to think it all over and thank God. So she made up his fire, left all comfortable around him, and then took her departure with the luncheon tray and the discarded glass of wine.

That evening, when her father and sister had finished their tea, she asked if she might read them something, and then went on as follows:

"Again I might dwell upon the prudential motive. I might ask you, without offence, to consult your individual safety. I might remind you of the fact, so mournfully attested, that the drink crave respects not age, nor rank, nor sex, nor profession. I might tell you that women of the utmost refinement are daily being unsexed by it, and men of the highest education enslaved by it. I might assure you that there is no drinking custom, from the coarsest carousal of the gin palace, up to the most delicately veiled indulgence of the best society, which does not furnish its quota of unhappy victims to the inebriates of England. And I might truthfully assure you, that if you were to examine into the histories of that great company of confirmed drunkards, who are at this moment the disgrace and despair of their friends, you would find hardly one who, at the beginning of his downward course, had the least suspicion of danger to himself. *By stages, of which he was unconscious, each became what he is. The liking, carelessly gratified*, grew into an appetite, and the appetite into a disease—a disease defying every remedy that human skill or love can devise. The dipsomaniac tells you *that before he knew his danger, he was a lost man.* And so, with the fullest and saddest justification from accumulating experience, I might appeal to the moderate to beware, and to complete the insurance of health and character by being more moderate still."

"Father," she continued, as she handed him the paper, "we have to thank God today for a great mercy. All in that paper is quite true. People can get too fond of drink without knowing it. Alfred was beginning. He found it out when we all gave it up for the sake of God's work. If we hadn't done so then, he might have gone on like other poor fellows, till he was past cure. You see, we none of us had the least idea of it. But of course that accounted for the increase in the wine bills I told you of. It is dreadful even to think of what might have happened if we hadn't been stopped. Perhaps we women might have become too fond of it! You see, it says there are drunken women!" and she shuddered in horror at the mere thought of it.

Mr. Harris sat silent for a few moments, looking alternately at the leaflet and his daughter. It took time for him to realise both the peril escaped and the mercy bestowed. Meanwhile, Sarah told all she knew. "Let us go up to him," he said at last.

The father and son clasped hands in silence. Alfred looked a little ashamed as he met his father's kindly glance of pity and regret.

"I have been to blame as well as you, my son," said Mr. Harris, noticing his expression. "I ought to have known that drunkards are not made in a day, and that an habitual use of these intoxicating liquors was very dangerous. Thank God for His great mercy in opening your eyes to your danger in time, and thank Him, too, that we have been helps and not hindrances to you since you knew it. We have truly been led by a way we knew not. You have borne the first brunt of the battle by yourself, Alfred; but we'll stand shoulder to shoulder in the future. God has taught us the fearful danger that lurks in habitual drinking habits. We adopted total abstinence practice for His sake. Now we must study its principles, not only for our own sake, in deepest thankfulness and gratitude for our opened eyes, but also for the sake of others, who may be in as great danger as we were—as you were, my son."

"Led by a way we knew not," murmured Sarah. "I haven't done wondering and thanking God yet. It's like a miracle to think that the danger of even our moderate drinking should have been brought home to us all like this. We must all go in for being regular temperance workers now, and try to save others from what might have been our fate, but for God's mercy."

And so it was. The Harrises, as a family, joined the active Temperance Society which had brought down William Barnet to Ilminster, and of which the Smithsons were energetic Members. But none but themselves ever knew why they all became such ardent, impassioned advocates of total abstinence. They often compared notes together, and used to hope, as one and another were induced to give up their habitual use of intoxicating liquors, that they, too, were being "led by a way they knew not," and would realise some day, the richness of blessing thus worked out for them, by the good hand of their God.

"OUT OF HIS MIND."

TWO young men were together in an office. One, looking over the other's shoulder, saw him write these words: "God so loved the world, that He gave His only begotten Son."

"Why," he exclaimed, "you must be out of your mind to be writing such things! and in office too."

"Yes," replied the other, "I have gone out of my mind. My mind is changed; I have not the same mind I had three weeks ago. I then had an evil mind; now I have the mind of Christ, and I never wish to get back to the old mind again, for it was not a sound one."

HOMELY HOBBIES.

By W. H. Harris, B.A., B.Sc.

Introductory.

AUTHORITIES on etymology tell us that the word "hobby" is derived from the old Norman French *hobin*, meaning "a strong, active nag." In later times, the term had a great fall in dignity, having been used chiefly for the wooden effigy of a horse, on which mummers made sport at Christmas revels, or on which children took their earliest rides in the nursery. With our English love of being in the saddle, it is not difficult to see how there was, by degrees, evolved from the two preceding significations, a third, which is now the common one, and may be defined as "any pursuit diligently followed for the purposes of recreation."

We have written the preceding paragraph because it is always worth while to have a clear idea of our subject, and because we know there are misconceptions in some people's minds on this particular topic. We may possibly make further reference to this point later on. It is, moreover, because we have a great belief in rational and interesting amusements, and because we know the value, both to young and old, of an occupation for leisure hours, that we intend to give suggestions and help to our readers in the matter of "Homely Hobbies." And when we speak of our readers, we refer to both sexes. Men, indeed, are, for the most part, at no loss for diversions; but we are often surprised at the amazing perseverance of women in their knitting and needlework, their crocheting and embroidery, as if nothing else were possible by way of occupation. It would be rude to say we pity them in the monotony of some of their usual employments; but we may, at all events, be right in directing their attention to certain forms of amusing and useful industry, as a relief from their common implements of handiwork, or ordinary household duties.

Even the busiest of brain-workers, who spend many hours daily in teaching or in acquiring knowledge, will be greatly the better for something to call into activity other functions of mind and body, than those which make their life-work. They will be rested and refreshed by having a hobby, and will, in addition, have the satisfaction of having something worth the doing, even in their recreation. Men of business, too, and youths in offices and shops, whose thoughts and activities are engrossed with trade from morning till late afternoon, and professional men, who have been engaged in various ways, heart and soul, in law or medicine or religion, will find wonderful relief from the high pressure of nineteenth-century life, in taking up an attractive diversion, and pursuing it with Anglo-Saxon steadfastness and skill.

Nor should it be forgotten that the interests of science, and the enlargement of our knowledge, have greatly profited through men who have indulged in the pursuit of some hobby.

A late well-known professor of geology was, in early life, a dispensing chemist. Geology was his amusement, but in his hands it received such admirable attention, that he soon became qualified to teach his favourite science in no ordinary manner. If we are not mistaken, one of the best known of living professors of this same science was a London wine-merchant, whose hours of freedom from business became absorbed in learning what was to be known of the crust of the earth, till he attained to world-wide eminence through this very hobby. We could refer to other men who have become distinguished contributors to other departments of natural history, simply by their devotion to what was originally taken up as an amusement.

Once more, home-life will often become the happier and the more refined, in two ways at least, when the different members of a family become interested in one or more recreative pursuits. To begin with, the *désagréments*—a much more comprehensive word than our *disagreements*—which so often arise from individuals having "nothing particular to do," will be diminished. The everlasting "weed," or pipe of the men, or (sad to say) of the boys, will be a less frequent nuisance. The passion for gadding about, for seeing shops and shopping, will subside to a rightful and thriftful point among the girls, to say nothing of a desirable exchange of aimlessness for definite purpose; of inane or mischievous occupation for well-directed zeal; of discontented, depressing, and, therefore, baleful frivolity or vice, for happy, exhilarating, and, therefore healthful effort. Then, again, a common interest of two or more inmates of a house in some special pursuit, will become a new tie to home and kindred, and a new incentive to strive for excellence.

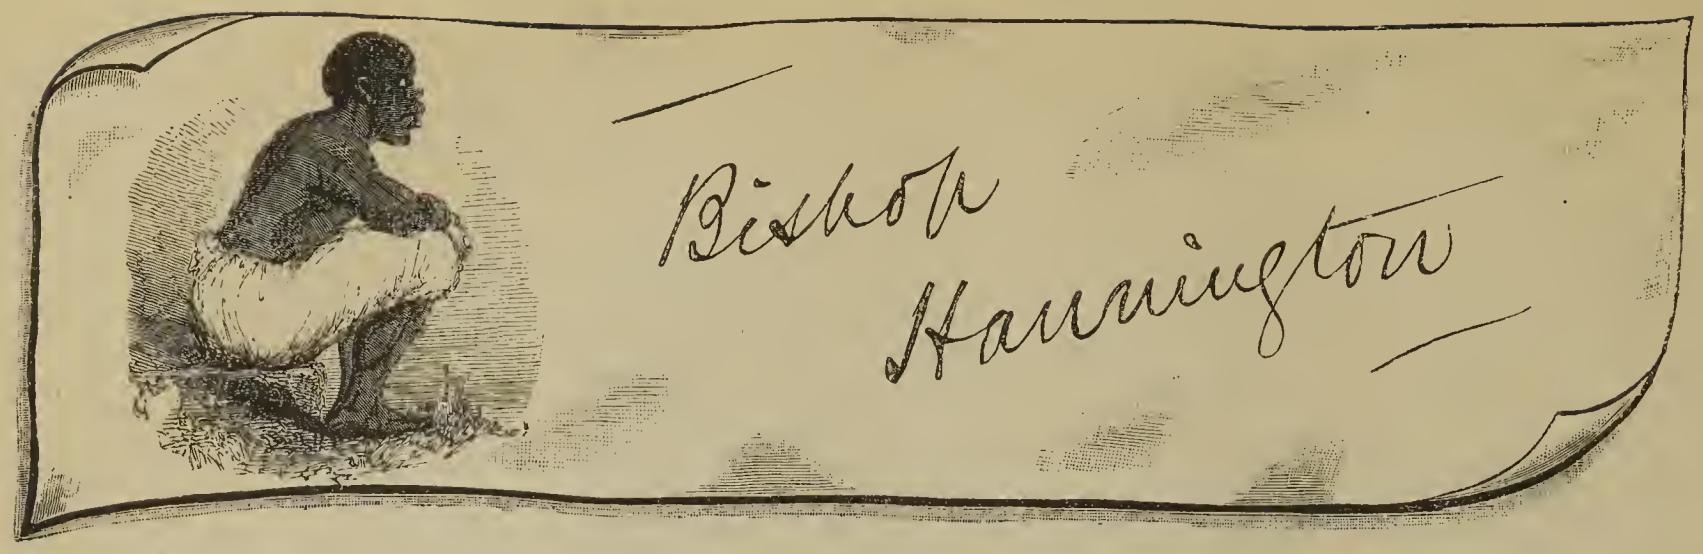
We think we have made out a tolerably good *primâ facie* case in favour of "Homely Hobbies." But we do not forget that certain objections are often urged against them. We will notice three of the most serious of these. It is said, firstly, that they take up a large amount of time, and, therefore, are not suited to people who have not much leisure, or who come home tired with their ordinary avocations. They may furnish the lazy, or the unoccupied, with something to do; but a man or a woman who has been doing something all day, cannot afford any further time for a special diversion. Well, there is something in the concession that hobbies are good to fill up the vacant hours of the indolent, or of those who have no set business in life, and there are really a great many people, to whom it is a distinct advantage to get an object thrust into their unused days. But it is hardly true that all hobbies take an immense amount of time. At all events, those of which we intend to treat shall not deserve this reproach. Of course they must require some time, or they would lose one of their very merits. Secondly, it is alleged that they "never pay." Now, before combating this objection, we must understand what is meant by "paying." If they provide healthful outlets for energy; if they afford pleasant change or relief from anxieties and responsibilities; if they bring enlargement of knowledge and increase of happiness, they will be yielding very valuable returns, whatever their cash results. But suppose we are to consider that by "paying" is signified yielding money-value for capital and labour employed, we are bold to affirm that there are hobbies, and of these we shall specially speak, which will show a very good percentage, if brain-power, skill, and care be bestowed on them. We can, in fact, point to several which are frequently pursued till they become actual means of livelihood, and which have developed new industries amongst us.

Thirdly, it is sometimes urged that people with hobbies are always bores. This is, at best, a half-truth. We may have to concede that there are individuals of one idea, of which alone they can talk, and in which they expect every one they meet to be interested. But these, according to our experience, are the exceptions and not the rule. On the contrary, the common sense required for the really successful prosecution of a hobby, is a preservative against a foolish intrusiveness of one topic. Moreover, it is equally certain that those who have acquired a practical and real knowledge of any particular subject, become some of the most interesting talkers, and often the most amusing companions, illustrating thoughts by the facts of their particular department of experience, and bringing to light new aspects of truth or speculation, of wit or fancy. In the belief that we have cleared the ground, so as to afford a fair field for our subject, we will now proceed to mention some of the directions our future Papers will take.

We shall begin with some talks about geological facts which lie all around us, full of wonders, had we but our eyes opened to behold them, and willingness to study them.

We shall give a series of Papers on poultry-keeping, and show how this may be made an interesting and a profitable pursuit, where circumstances admit of a fowl-run. Rabbit-keeping, and pigeon rearing and flying, will come into our list of topics, and will be proved to furnish useful adjuncts to household welfare.

We may probably, in due season, have something to say about collections of specimens, illustrative of points of interest in animal and vegetable life. Possibly photography and easy microscopy may find a place in our list.



We shall have a good deal to say about *apiculture*. Some of our more youthful and unscientific readers may have their expectations raised in a wrong direction, by the idea that this word has something to do with *monkeys*. Nothing of the sort! It is a good, respectable, highly classical term, fit to stand with "agriculture," "horticulture," and other very well-bred "cultures." In plain English, it simply means *bee-keeping*. And we must ask our friends not to spurn the subject at once, as being one in which they can never be persuaded to take an interest. In due course, we will anticipate and answer all the chief objections which are likely to occur against this pursuit; and we do not hesitate to say that we will present this science and art—for it is both—in such an attractive, and yet absolutely true a light, as shall lead large numbers of our readers to invest in "stocks" of these most wonderful workers amongst insects.

There is one point yet unmentioned, which we shall keep in mind. This is the endeavour to so treat our various subjects, as to lead to that reverential and God-discerning spirit, which suffuses all facts of so-called *nature* with a new joy; which sheds a fresh radiance about our pathway, or, as Shakespeare puts it:—

> "And this our life, exempt from public haunt,
> Finds tongues in trees, books in the running brooks,
> Sermons in stones, and good in everything."

Good-bye.—How few understand the full meaning and power of this expression, so continually on our lips. "Good-bye," that is—God be with you; I commend you to God. Do we indeed, when we say this, feel we are carefully committing the one we leave to the Almighty care? If, on parting, any one was to say, "The Lord be with you!" we should feel surprised, but it means the same thing; it is only the commonness of the expression that makes us indifferent to its meaning.

Discretion is most useful, seldom seen, and little valued; but it preserves the feet from many a pitfall, and keeps the life harmonious and consolidated.

A NOBLE LIFE LAID DOWN.

By F. Burton Irving.

Part I.—His Home Career.

At the end of February, 1886, when taking our last gaze on the beautiful Bay of the Tagus, from the deck of a homeward-bound vessel, we heard an old gentleman, who was returning from Lake Nyassa, exclaim in a horrified tone, as he looked up from a paper just opened, and only recently brought on board by the ship's agent: "Could not have thought it possible! Why, what a blow to the Mission, and Hannington so young too!"

Thus we, also returning from the land for which Hannington died, received our first intimation of the loss sustained to the Church militant, by the martyrdom of James, first Bishop of Eastern Equatorial Africa, the brave man who had journeyed through life—

"As one
That makes no pause, but presses on his road,
whate'er betide him,
If some urgent need impel."

Traits of childhood indicate future possibilities in the man; though whether the early promise shall ripen to fruition or not, is dependent upon many things, such as health, education, force of character, and tenacity of will.

James Hannington had circumstances in his favour; he was a lad of fearless, excitable nature, who spent the first thirteen years of his life at a worthy home, or in travelling and yachting with his parents, and the next two at a private school. Now any one who takes a bright young lad on such voyages, with equal conditions of comfort, implants in him a love of going abroad that, like thistle-down, may be passive for a time, but takes flight some day, sooner or later; for the travel passion, once roused, still cries: "Move, move, move," and will not be satisfied with a stay-at-home life, though sometimes compelled to endure it. Therefore it is not surprising that after six years of counting-house routine, James Hannington found himself wholly unsuited for the monotony of commercial pursuits.

"Forward and frolic glee were there,
The will to do, the soul to dare;
The sparkling glance soon blown to fire
Of hasty love, or headlong ire."

Hence we can understand how pent-up energies found a safety-valve during the clerkship era by amateur soldiery. His capacity for being a leader of men is indicated by the fact that he was made Captain of the Volunteers in his eighteenth year, and his fitness for authority is shown by much painstaking effort for the welfare of his corps. He procured suitable recreation rooms for the men, organised concerts, readings, and games for them, carrying out all his schemes with a hearty cheerfulness that ensured success, and from boyhood until his death he could always be "entirely relied upon to carry out anything he had once undertaken, and that not only in the letter, but in the spirit."

Fortunately for the Church and world so sorely needing such gifts as his, they were not suppressed by an unsuitable calling; but he was allowed to choose his path. His bent manifested itself by yearnings for ordination. Far be it from us to even seem to cast a slur on mercantile life; for there are records of men, living and dead, and there will be thousands more of those who find in it their successful niche, and whose uprightness in their vocation is a matter to thank God for, as well as a bulwark of natural strength at home and abroad. We must only remember that there are diversities of gifts, and happy is that young man who can glorify his own order, and stand to the end of the days in a lot to which he is called by character and Providence.

In James Hannington's diary for February, 1867, we find the following entry: "I lost my ring out shooting, with scarcely a hope of ever seeing it again. I offered to give the keeper ten shillings if he found it, and was led to ask God that the ring might be found, and be to me a sure sign of salvation. From that moment the ring seemed on my finger. I was not surprised to receive it from Sayers on Monday evening. He had picked it up in the long grass in cover, a most unlikely place ever to find it. A miracle! Jesus! by Thee alone we can obtain remission of our sins."

With his Biographer we would ask: "Is there no evidence in this of the assured, reasonable, though child-like trust in God, which so distinguished him in later life, and marked him pre-eminently above his fellows as a man of faith?"

The year 1868 was most eventful. On April 23rd, he wrote to his mother that he had decided in favour of the Church, and believed God was with him in the matter. In the October of that year, he bade farewell to business, and entered his name as a commoner in the books of St. Mary's Hall, Oxford.

In his twenty-sixth year, he became Curate of Martinhoe, where we find him serving the poor, and ministering to the needy, preaching strong sermons, too, against immorality and drunkenness, but weighted with the burden that he was a blind leader, pointing to a rest he had not found. He began to be troubled; words of spiritual advice in a friend's letter—unanswered for thirteen long months, though frequently re-perused—led him at last to apply to the writer for help and guidance. Thus, "after many days," that true friend received the reward of his faithful counsels, and was honoured to be the instrument of leading Hannington into the Light. From then until the end of his earthly career, James Hannington lived under the shadow of God's wings, and in the assurance of faith; —now, therefore, having peace with God through Christ, he was able to testify *that he knew*, and found no lack of willing hearers, rejoicing in a Pastor earnest in Missionary effort, zealous for their soul's welfare, and who also gave good heed and help to all, promoting their physical well-being and temporal prosperity.

Removing to Hurstpierpoint in 1875, he immediately took a public stand on the side of Abstinence, by accepting the Secretaryship of its Temperance Association. The coldness and indifference of people upon this subject distressed him greatly, his own zeal being such that he never went from home without a pledge-book. Once when advocating Temperance interests from the pulpit, he had an extraordinary gathering of different Denominations to hear him. He said: "Wherever I looked, I saw somebody I knew. I preached from 1 Timothy 5. 23, and as I gave out the text, "Take a little wine," I thought I saw some of them look terrified, but I went on to show that my brother had a stronger claim upon me than my stomach!"

Under date of September, 1876, we find he had transformed his coach-house into a Mission-room; on October 4th he started a Mothers' Meeting; two days later he commenced a Women's Bible Class; and on the 11th we read of him at his Male Bible Class, having an attendance of sixty. While in his twenty-ninth year, he qualified for yet wider usefulness by a highly suitable marriage, and was united to a lady who entered heart and soul into his work.

In the thirtieth year of his age, when taking part in the Birmingham Mission, the following entry appears in his diary: "February 14th. I pray and keep praying for the Holy Spirit." Here was the secret of power, and we do not wonder that he was in after request for similar services. In 1881, another reference is made to this special mode of evangelisation: "Arrived at Holy Trinity Vicarage, Blackheath. I am advertised to take twenty-seven services in eight or nine days, and they are pleading for more."

By his father's will, James Hannington

found himself, in the June of 1881, the owner of St. George's Chapel, but also in the awkward position of the possessor of a church without a stipend, or the means of providing one. He was still willing, as hitherto, to give his ministrations without recompense; but he felt that in case he were led to undertake any other work, it would be extremely difficult for him to provide a proper stipend for a successor, out of his own strictly limited private income. He felt that his father had made a mistake in omitting to make a suitable provision for the chapel. However, he cheerfully writes as follows concerning this grave difficulty: "The Lord will provide, and I will honour my father to the utmost of my power." With regard to this chapel, we may say here, that before his last journey to Africa, his eldest brother heartily undertook all responsibilities.

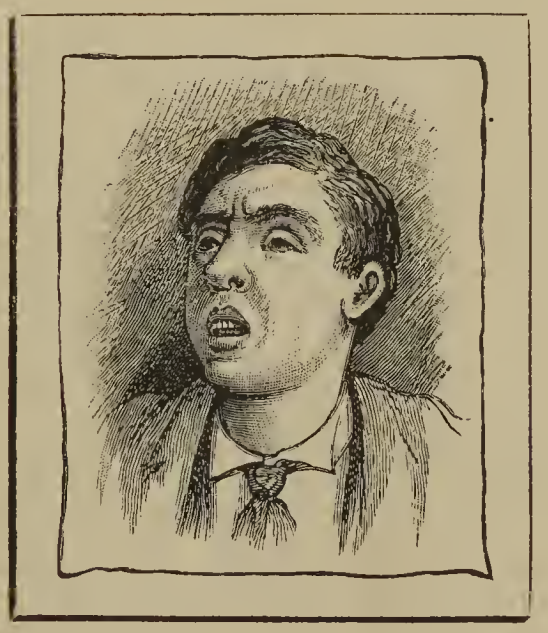
James Hannington's first longing after Foreign Mission service was created by hearing of the heroic labours, and violent death, of Lieutenant S. Smith and Mr. O'Neill, on the shore of the Victoria Nyanza. It culminated in the offer of himself for a period of five years, for the Nyanza work, on condition that the Church Missionary Society would supply his place at St. George's Chapel. He also offered to the Treasurer of the Society £100 per annum, to help to defray the expense of his maintenance abroad, as well as £50 towards his outfit; and had he not been bound to consider the needs of those who were dependent upon him as well as himself, he would have gladly poured all he had into the treasury, and have gone forth as a simple evangelist, to the nations which lie in the darkness and in the shadow of death.

After his acceptance for African work, he preached a farewell sermon to his people at Hurstpierpoint, from 1 Samuel 30. 24: "As his share is that goeth down to the battle, so shall his share be that tarrieth by the stuff; they shall share and share alike." He said that "if he lost his life in Africa, no man was to think it had been wasted. As for the lives which had been already given to the cause, they were not lost, but were filling up the trench, so that others might the more easily pass over to take the fort in the name of the Lord."

When it was finally settled that he was to go to Uganda, he wrote a letter to the *Times*, to ask subscriptions to enable him to carry a new boat, in which to navigate the Victoria Nyanza. The appeal was liberally responded to, and he took one out in sections.

On the 16th of May, 1882, there was a Valedictory Dismissal at St. James' Hall, Paddington, when "eleven missionaries were committed to the care of the Lord of the whole earth, and sent forth into the regions beyond."

Of James Hannington's farewells to his personal friends, his wife and his little children, he said: "The pound of flesh, blood and all, must be cut away;" and after these were over he felt as "one paralysed;" but the sustaining grace which nerved him to the great sacrifice, enabled him to add to his diary on the same night the words: "My God, how tender Thou art!"



SNEEZING.

THE VIRTUE OF A NECESSITY.

By Tracey Lavard Robinson.

DO we not often offer the salutation, "God bless you!" to one sneezing? and that, too, with only a very remote idea of why we say it. There is probably more superstition connected with sternutation than with any other human effort. Moreover, the superstitions are universal and of very ancient origin.

Famianus Strada, the Italian historian, author of "The Wars in the Netherlands," once wrote a treatise expressly devoted to sneezing. He declared that the custom of saluting those who sneeze is a relic of paganism, though it was in use both amongst the Jews and the Romans. In his "Account of Monomotapa," he says: "Whenever the prince sneezes, all his subjects in the capital are advertised of it, in order that they may offer up prayers for his safety." The author of "The Conquest of Peru" tells us that the cacique of Gachoia having sneezed in the presence of the Spaniards, the Indians of his train fell prostrate before him, stretched forth their hands, and displayed to him the accustomed marks of respect, while they invoked the sun to enlighten him, to defend him, and to be his constant guard. The ancient Romans saluted each other on what may be called sternutatory occasions; and it is related by Pliny, that Tiberius exacted every sign of homage from those around him if he happened to sneeze while riding in his chariot. In these more enlightened days, when snuff and tobacco smoke, not to mention fogs, dust, and chimney smoke, cause continued titillation to the mucous membranes of the nasal organ, it would hardly be expected of a large body of intelligent sight-seers to fall upon their knees, calling for a blessing upon the head of some great personage who had happened to sternutate while proceeding in state through their midst. Still we preserve the custom to a certain degree. Among the ancients, however, the person sneezing made a short prayer to the gods, Ζεῦ, σώ ζε, "Jupiter, save me!" It is related of Timotheus that he was one of the very first to ridicule the

superstitious practices about sneezing. Having sailed out of the harbour of Athens with his fleet, his fauces was tickled by some dust, or was irritated by the briny atmosphere, and he forthwith gave vent to a loud "Attishoo!" His officers, fearful of this natural effect being an omen of evil, begged him to return into the harbour. But Timotheus refused, saying reprovingly: "You are struck with astonishment, because amongst ten thousand there is one man whose brain is moist." His ultimate successes must have somewhat shaken the credulity of his Athenian friends, though doubtless, when he eventually died an exile in Eubœa, there were some wiseacres who put it all down to "that sneeze."

Superstition, whose influence debases everything, degraded even the honourable customs in regard to sneezing. All sorts of favourable and unfavourable omens were attached to the act, according to the hour of the day or night when it occurred, according to the existing signs of the Zodiac, according as a work was more or less advanced, or according as a person sneezed to the right or to the left. If, for instance, a man sneezed on rising from table, or from his bed, it was necessary for him to lie down again. To such degraded form of the superstition is due the old rhyme with which many must be familiar, but which is worth repeating, as it is only rarely met with at the present day. It runs thus:—

"Sneeze on a Monday, sneeze for danger;
Sneeze on a Tuesday, kiss a stranger;
Sneeze on a Wednesday, sneeze for news;
Sneeze on a Thursday, a new pair of shoes;
Sneeze on a Friday, sneeze for sorrow;
Sneeze on a Saturday, see your sweetheart tomorrow.
But if you should sneeze on the Sabbath morn,
You had better wish you had never been born."

This rhyme has many variations, but we believe this to be the correct one *par excellence*. It is a matter of wonder that so many ridiculous, contradictory, and superstitious opinions, have not abolished the customary civilities which are still preserved to a great degree by all classes. Probably, however, the cause is not far to seek; they are preserved just because they are mere civilities, and cost nothing.

Amongst the Greeks, sneezing was almost always a good omen; it excited marks of tenderness, of respect, of attachment. The

young Parthenis, hurried on by her passion, resolved to write to Sarpedon an avowal of her love. She sneezes in the most impassioned part of her letter. That is sufficient for her; this incident supplied the place of an answer, and persuades her that Sarpedon loves her. Penelope, harassed by the vexatious courtship of her suitors, begins to curse them all, and to pour forth vows for the return of Ulysses. Her son Telemachus interrupts her with a loud sneeze. She instantly exults with joy, and regards this sign as an assurance of the approaching return of her husband.

"She spoke. Telemachus then sneezed aloud;
Constrained, his nostril echoed through the crowd.
The smiling queen the happy omen blest."
(*Hom. Odyss. lib. XVII.* Pope's translation.)

Xenophon also has a sternutatory experience. He was haranguing his troops; a soldier sneezed at the exact moment when he was exhorting them to embrace a dangerous but necessary resolution; the whole army, nerved by this presage, determined to pursue the project of their General, and Xenophon himself orders sacrifices to Jupiter, the preserver."

Of course it is only natural that a superstitious reverence of such a universal habit, and so ancient, should attract the attention and curiosity of the old philosophers. Aristotle refers to the sources of natural religion, because the brain is the origin of the nerves, the organic seat of the sentiments and sensations. The Jewish rabbins have a tradition about the custom, and Polydore Vergil, who seems to have touched a little upon a vast variety of subjects, says it took its rise about the period of the plague, which began in Europe in 558 A.D., and extended over a great part of Asia and Africa before its force abated. At this time, many of the people fell dead in the streets, though to all outward appearance they were in good health; the first and only warning they or their friends had of their approaching end, being a severe fit of sneezing. Hence the custom grew, of praying the Almighty to avert the terribly dreaded doom of the plague-stricken, whenever any person sneezed. Strange to say, we can find no mention of sneezing in the works of Shakespeare, though he says, "at Naples, that they speak i' the nose," and makes many references to various noses; neither does he neglect several allusions to snoring, and "to hear by the nose, it is dulcet."

BEGIN AT ONCE.

REMEMBER in all things, that if you do not begin, you will never make an end. The first weed pulled up in the garden, the first seed cast into the ground, the first shilling deposited in the Savings Bank, and the first mile travelled on a journey, are all important things; they make a beginning, and thereby give a promise, a pledge, an assurance that you are in earnest in what you are undertaking. How many a poor, idle, hesitating man, now creeping and crawling on his way through the world, might have held up his head and prospered, if, instead of putting off his promised industry and amendment, he had only made a beginning! Therefore we say to you, with all earnestness: Begin the new course you speak of at once. Don't waste your good emotions and intentions in wishes and words, but act at once, and let your decision be for life, and let it be formed in the strength of God.

THE YOUNG MAN AND HIS FRIENDS.

By M. Butler Gerds.

SHOW me a man's friends—the factors of his immediate environment—and I will tell you the character of the man before you introduce me to him.

Standing in a city counting-house one day, watching the various applicants for a vacant clerkship, and listening to their stories, I was struck with the reception accorded to one young man.

"I see So-and-so's name mentioned here—he is a friend of yours?" said the principal, perusing a brief letter which had been put into his hands.

"Yes, a great friend of mine, sir," volubly replied the would-be clerk, as if the fact were an undeniable letter of credit.

"Then *you* may go! No friend of his shall enter my employ, for I know him to be an unmitigated rascal, loafer, and gambler."

"Birds of a feather flock together." Here is a young man walking down one of the streets leading out of the Haymarket; he gives a knowing nod to every "horsey" man he meets; he is close-shaven, lean, and with his hands in his pockets, and his eyes upon every horse in the road, he savours so unmistakably of the stable, that you would never think he is the lace-buyer in an Emporium of fashion not a quarter of a mile off. His *alter ego* is coming up the street. I know they will meet, turn, and together enter a gambling club, and I am not surprised when, a few months later, I see the name of this man in the police news, and learn that he has been robbing his employer to a large extent. He has "backed" any number of real and imaginary "favourites," and his betting book shows the amount of his defalcations and losses. He has been ruined by his *friends* (?).

Another man will persistently choose the companionship of those whose idea of enjoyment is to be found in a full glass and the free use of profane and foolish expletives, and whose Utopia is the bar-parlour. You know the *end* of such a man? I saw him yesterday, dishevelled, prematurely old, bleareyed, with but one set—his outer—of tattered garments; his blotched face, swollen nose, and trembling hands tell their own tale. He cannot get, even if he were capable of understanding it, a smile from his once-effusive friend, the barman of his pet tavern, for he has no money to pay for drinks now. Poor, easily led creature! A pauper's grave, and a drunkard's doom are before him; and though I know he deliberately chose them by making friends of the tavern-seekers, yet I turn with pity to the poor stumbling wretch, and pilot him across the road.

I am looking at the portrait of a young fellow, who once used to write to me as a Timothy would have written to a Paul. He was a Member of a large Y.M.C.A.; his name was on many of the lists of workers; he used to take Classes, and visit thieves' kitchens, preaching the truth, and giving evidence that it was the most precious thing he possessed. Dear fellow! as I scan his features—the weak mouth, and the large, capable, though unformed brow, tell me that this one will need careful hedging about, or he may be tossed to and fro "by every wind of doctrine." I hear from some of his associates that he is forming new and more intellectual (so *he* says!) friendships. Presently I hear that he is withdrawing his name, as he has done his presence, from Classes and Meetings, and the old channels of good. My letters remain unanswered, and I find, ultimately, that he is the leader of a red-hot Socialist club, a speaker at an embryo (atheist) hall of science, and writer for a libellous Sunday Paper!

I get down-hearted as I think about him; for I know the young fellow has been led into all this through bad friends.

I am thinking, too, of poor B——. What a bright prospect was his! His father gave him his choice—a profession, or a business, and he chose the former. Yes, he would be a lawyer. Some of you fellows who have gone through it all know just what this means: the hard reading, the examination, successful or otherwise; more reading, more cram, more exams., until you are able to put up that slip of brass—the last of a long line of slips, some with their well-known legends nearly erased, through the housekeeper's desire that the owner shall leave an untarnished name behind him—on the door-post of some dingy pile of chambers, Lincoln's Inn way, and you know how you have had to pull *against* the stream (only dead dogs and dry leaves go *with* it) to keep all straight. Well, poor B—— had none of that sort of pluck in him; as long as he was at home, with his mother to speak to and to comfort him, and his father to plan and propose, he was all right. But, once out of this element, with plenty of cash in his pockets,—the worst thing he could have under the circumstances!—any amount of animal spirits and "go" in him, and no definite principle to guide him, he was *lost*. Yes, he made friends with a wild, racketty crew of young clerks,—one, especially, led him into vile and secret sin,—his study was neglected, his promises broken; he missed in his exam., and went from bad to worse, until he had to flee the country—a disgrace to his name; a blot on humanity; a worthless, useless wreck. And the verdict was—"Poor fellow! he was led away by bad companions!" Do you think I am painting *pictures* merely, or drawing on my imagination? Would to God it were so, for some reasons! No; I am writing sober truth.

"But there are friends very different from those you have described," say you; and you are right. I know two friends of this type. One, a jolly, clever, open-hearted fellow, as 'cute a man of business as you could well meet; thoroughly up in all that is going on around him; sincere, staunch, liberal,—yet not yielding one jot or tittle of his principles before anything that he does not feel to be the truth. His friend, his dear companion, is younger than he by some years; calm, upright, generous; as tender as a woman, yet every inch of his six feet a *man*. These fellows have been friends in travel for years—friends at home, friends in everything, for they are friends in *soul*. They work together in the name of Christ, both being engaged in that branch of philanthropy which snatches friendless young fellows from evil associates and themselves, and gives them reading, pleasure-giving occupation,—a mental, moral, and spiritual lifting out of all that defiles into whatever will purify. The elder married during this friendship; but, unlike the married woman, who often drops the friends of her youth, these men are as necessary to each other as ever. Thank God for such blessed friendships! They cannot be without their hallowing influence on all who come within the range of their genial warmth.

A great writer has defined friendship as "A strong and habitual inclination in two

persons, to promote the good and happiness of each other," and I doubt if we can find a better definition than this. One of the old sages advised: "Always treat your friend as if he were one day to be your enemy." It looks what it is—a cold, calculating, faithless creed, that could lay down such a canon; yet there is an element of sound truth in it. How? Where? you ask. I take it to mean this: Never say, do, suggest, or support any word or thing in the course of your friendship, that the eye of God may not behold with pleasure, and that *you* would or could regret or dread did your friend become your enemy. Let thoughts, actions, words, the thousand little nameless expressions that belong to the intimacies of the soul, be so pure and blameless, that when you see your friend lying dead before you, you will not have to say, as one recently said under such circumstances: "Oh, God forgive me! would that he had never known me!" How different the verdict upon that romantic and beautiful friendship of Jonathan and David! —"My brother Jonathan, very pleasant hast thou been unto me: thy love to me was wonderful, passing the love of women."

We read that Jonathan loved David "as he loved his own soul;" and without indulging in sentiment or speculation, we see the source of that love in the words that follow, from the lips of the princely and self-forgetting Jonathan: "The Lord be between thee and me for ever." No compact between the flesh, of place, power, possession or pride; no covenant made in their own strength, with a glass or two of wine, and a cigar to seal it; no agreement entered into with hands clasped over the card-table, and brains excited with losses or gains thereat; no unholy affinity discovered in the haunts of sin, the sharing of vicious pleasures, the proved power to extricate one another from the outside consequences of folly and wickedness. No; but the *Lord* between them, to shield, to guard, to *keep* them in all their tempted ways, so that it was easy for Jonathan to meet David in the thick of his troubles, and to "strengthen his hand in God."

That is the kind of friend we need—one to *strengthen* us; for though we boast of our firmness and our power, we are weak at our best. Outside we can, and do very often, put on a bold front; but *in*side—ah, there are clamouring voices, importunate demands; eager, growing, insatiable cravings that seem as if they will *not* be denied—monsters within us, who frighten us with their din and strife; and unless we have on the soldier's unrusted armour, alas! we often yield. *You* know it; *I* know it; and at such times our inmost soul cries out: "Save me from *myself!*" Oh, have not you passed through this trial, my dear fellow? You have; and how have you come through it? with not even the smell of the fire you have passed through upon you? or, God pity you! scathed and marred, and writhing and blackened? You want a friend, then, more than ever you wanted one—a friend to *strengthen* you, to lift you out of yourself. You know what I am going to say; you know perfectly well that there can be no compromise, no half-way measures. You must turn *from* yourself to God, and His power in you will give you the victory you covet and long for, yet have not strength nor will to compass for yourself. Make *Him* your Friend, first and last, and then you will find it easier than you think to *be* a friend to others, and to find friends in those who are of the brotherhood of God.

Let friendship walk *slowly* to perfection; and in choosing your friends, think of those who will "wear." The man who is all rush and gush, who links himself to you the moment he catches sight of you, and swears he never met a fellow to suit him as you do; who drains his pockets for you in the first week of acquaintance; who places himself and his banker (if he have one) at your disposal; who will do anything and everything for you; who is always dropping in upon you, even in your busiest or most private moments; who offers to introduce you to everybody as "That very particular friend of mine, don't you know? of whom I have told you so much," and who uses your possessions and your name in the most persistent and public manner, after an unwarrantably short acquaintance, is a friend of whom I counsel you to beware!

To the youth just going out into city life I would say: Never forfeit your self-respect, nor place yourself in the power of another by permitting him to use his purse in your behalf. Be independent, and very firm in this. The man who will seek to buy your friendship with his gifts is not worthy the name of friend; he is forcing himself upon you, putting you under humiliating obligations to him, and purchasing your society at the ultimate cost of your self-esteem.

One day you will bitterly regret having leaned upon him, or in any sense having put yourself into his power.

But when you *have* found the man after your own heart, do not lightly part with him. Remember then that talking to your friend (I am quoting the author before named) is but thinking aloud. The restraints, the polish, the ease, the truth, the depth, the trust, the unselfishness, and the *purity*, of friendship, will elevate every one of your thoughts and passions, and make you fitter for that holiest and most enduring of all earthly friendships —the lifelong companionship and love of her who is to crown your life as sister, lover, wife, and *friend*.

"HE AND SHE."

I.

TWO little vessels, side by side,
Over the rippling waters ride,
Sailing onward so bright and gay,
Over the waters far away.
Guided each by a youthful hand,
Leaving behind them childhood's strand,
He, so stalwart, so staunch, and true;
She, so fair with her eyes of blue.
Dreaming not of stormy weather,
Happily they sail together.

II.

Days pass quickly; the years soon fly;
Storm-clouds gather across the sky;
But though the winds and raging gales
Have soiled and riven their snowy sails,
Still they are floating side by side,
Floating adown Life's rapid tide.
Happy still, no care for weather,
"He and She," for they sail together.

III.

Time rolls onward, and one sad day
One little vessel sailed away,
Sailed away to the better land,
Moored at last on the golden strand.
Desolate, left behind is he,
Roving across Life's wintry sea.
One little wand'rer o'er the foam,
Soon will he, too, be safe at home,
Safe on the waves of the Crystal Sea,
Happy for ever, "He and She."

(*Continued from page* 80.)

WE have most of us seen in hothouses, and perhaps in our country rambles, plants of the Orchid tribe, whose blossoms have a curious resemblance to bees and other insects. The reverse of this—insects with a strange resemblance to plants—also frequently occurs. Not long since, when clearing some dried twigs from a rose tree, we essayed to break off a rugged, mottled brown caterpillar, who had projected himself from the end of a branch, a little thicker than his own body, and had posed himself to look so exactly like a bit of withered stick, that the most enterprising bird would never have tried to eat him.

This "protective resemblance" is found in a very marked degree among some tropical species; the "leaf" and "stick" insects are familiar examples in our museums. Thus unconscious mimicry saves the creatures, to a great extent, from watchful foes. Well may the Psalmist say, "His tender mercies are over all His works."

The relations between insects and flowers are of extreme interest. Most people are sufficient botanists to know the parts of a flower. They can show you the *pistil* in the centre, with the *stigma* at its top, supported by the *style*, while the *ovary* lies at the base. They can also point out the *stamens* surrounding the pistil, bearing on the top of their little pillars—called *filaments*—the *anthers* in which the pollen is found. For the production of seed, it is needful that some grains of pollen should get on the stigma, and through the style to the ovary, to fertilise the ovule, and thus produce seed. When the stamens are longer than the pistil, this process is easy, as the pollen grains, when ripe, naturally fall, and some of them alight on the stigma. In very many flowers, however, the pistil is longer than the stamens, or there are structural difficulties which prevent the pollen from reaching its destination, without external aid. Here the insect agency comes in. The bright colours of the corolla, which charm our eyes, also attract the insects, and it will be noticed that most flowers have either lines or hollows in the petals, leading direct to the centre, where the parts to be fertilised are. The perfume of flowers also attracts insects, as does the drop of honey so often concealed near the ovary. Even a casual glance at the leg of such an insect as the bee, will show how admirably it is suited to brush the light pollen off the anthers, or gather it up from near them, and deposit it unknowingly upon the stigma of some other flower of the same class. It is a noteworthy fact that bees generally devote a whole day to one class of flowers, thus avoiding the mixture of pollen, which would nullify their work. Flowers which are open by day are fertilised by day insects; others, which open only at night, by moths. Certain flowers of peculiar structure can be fertilised only by one kind of insect; for instance, the pollen of the Common Red Clover can only be reached by the weighty bumble bee. By a curious chain of connection, it happens that the more cats there are in a neighbourhood, the more wild clover there will be! The cats eat the field mice, the great enemies of the bees; the mice being kept under, the bees work in peace, and so the clover multiplies.

The "Cuckoo-pint," or "Lords and Ladies" as it is sometimes called, is dependent in a very curious way on insect aid. The greenish spike in the centre of the flower contains both stamens and pistils,—the stamens at the bottom, the pistils at the top. To add to this initial difficulty in the way of fertilisation, the pollen is ripe long before the pistils are ready for its reception. But down at the bottom of the spike there is a drop of honey, which attracts insects, and a curious *chevaux de frise* prevents any insect who reaches that honey from escaping. Insects in this temporary prison get quite covered with the ripe pollen, and as soon as the stigmas at the top of the spike are ripe, the *chevaux de frise* withers away. The pollen-covered captives crawl up the spike, effectually fertilising the pistils, and enabling the plant to produce its lovely scarlet berries.

WANTED—A CAB.

By Anna Shipton.

I WAS once much troubled in the north of London with the incivility of the cab-drivers and the discomfort of their cabs. It was not until I was fairly worn out with the annoyance, that I thought of my Heavenly Friend, to Whom I could make known all my grievances. I asked Him to lead me to a cab in the neighbourhood, driven by a respectable man, who would be near enough to my lodgings to enable me to engage him without any difficulty.

Only a few days later, I had to walk towards the City, and, forgetting my former request, I prayed to be directed into the route for a cab. I saw none, and being unable to proceed, a good-natured lad offered to send me the first he met if I would wait. I did wait. The Lord had remembered my petition. In five minutes, there arrived a comfortable brougham, driven by the proprietor. He drove me to my lodgings, and finding that I remained there, he asked me if I would like to employ him, as he lived in the mews close by. I did so, and praised the Lord many a day for the convenience and comfort gained by this granted prayer.

Fifteen months afterwards, I was at the West End. I had walked the length of Bruton Street in much distress, not wishing to hire one of the jaded horses that at the close of a hot summer's day passed by.

I paused, hesitating what to do, and said in my heart: "Oh, that the Lord would send me a good cab and horse, as He did at Islington." My heart melted within me at the remembrance of the Lord's loving-kindness, followed by my regret that I had withheld from *Him* the request of my lips so long. As I crossed the street, a coachman with a fresh, strong horse touched his hat to me, and I recognised him as the same man that had driven me for five weeks at Islington. He told me that he had followed me the length of the street, hoping that I should need his brougham, and had striven in vain to gain my attention. He rejoiced my heart by telling me that the books and tracts and papers that he had collected, while I employed, him had been in great request through that Winter, and not a stableman in the yard but came from time to time for the loan of some of them.

At once I gave him all I had with me, which he gratefully accepted; and this blessed seal on "Whatsoever," strengthened my faith in an unfailing God.

HOW QUARRELS ARISE.

TO avoid all quarrels and differences, we should ever bear in mind the characteristic tendencies of those who oppose us; for the peculiar tempers, constitutions, habits, and previous life have much to do with the impressions produced in our minds by facts or statements that we hear and see.

Have you ever noticed how widely different are two reports of what has been said, or two descriptions of what has transpired? Two different minds have each received different impressions, which, when compared together, seem neither to harmonise nor agree in most essential points; very often it ends in charges of untruthfulness, wilful perversion of facts; and so strife begins.

Is it not best, in all our differences, to let charity and consideration guide us? Look at things with the eyes of others, and place ourselves on their standpoint before we condemn. Bear and forbear. Forgive and be forgiven.

It is the glory of kings to pass over a transgression; be therefore like a king, so that you may the more readily join in the prayer—"Forgive us our debts, AS WE forgive our debtors."

Our Life.—Every day is a short life; our whole life is but a succession of days. He, therefore, who loses a day, loses a part of his life that never can be recalled or re-employed.

WEEKLY — Edited by MRS. STEPHEN MENZIES.

"OONALASKA:" A TALE OF A FAR NORTH LAND.

By GORDON STABLES, C.M., M.D., R.N.,
Author of "The Cruise of the 'Snowbird,'" "Thirteen Hundred Miles in My Caravan," "From Pole to Pole," etc., etc.

"He told her all his funniest stories."

CHAPTER VIII.

ON THE WINGS OF THE TRADES.

AFTER the painting and varnishing had been finished, there was a general "clear up" of litter; but still the saloon and half-deck smelt of turpentine. Boyd was equal to the occasion. For two nights he had buckets placed all round the decks, filled with some mysterious mixture that he alone knew the receipt for; and lo! at the end of that time, all odour of varnish had fled.

Meanwhile, stores were being got on board, and the donkey engine kept puffing and blowing, and rattling and clanking, all day long, and far on into the "stilly night."

Then blue-jacketed stewards took possession of the pantries, and kept moving in and

out of cabins, and curtains were hung, and beds made, and table-linen looked over, folded, and put away. Lamps were hung in the saloon, to say nothing of vases filled with flowers; at night all the place was lit up, and as Jack Silk walked through with the captain, he declared that the saloon looked like a fairy-land afloat. And Jack Silk really was not far wrong either. A good deal of perception had Jack.

At last all was ready, and away went the *Oonalaska* on a trial trip. She came in again next day, and you could have told by the smiles on Captain Jack Boyd's rosy face, that everything had gone as merrily as marriage bells.

On the same evening, "a few friends"—this is how the Captain phrased it—came on board to dine, and wish good luck to the brave ship and her bold crew.

On the very next morning, the passengers came on board, and expressed themselves delighted with all around, and the care manifested for their comfort.

The last to join was Godfrey.

About one o'clock the *Oonalaska* slipped her moorings, and soon after began to steam slowly away.

Captain Boyd turned his eyes away from the shore at last; there was moisture in them. He was leaving home.

By sunset the ship had made good offing, and as the wind was fair, fires were banked, and all possible sail shaken out.

It fell dark soon after nine; the stars were out, the good ship was bowing and bobbing to the seas, while the water went swishing round her bows, and rushing and bubbling aft on each side. There was singing forward, and laughing and talking downstairs in the saloon.

The captain walked rapidly up and down the quarter-deck with Desmond O'Neil, whose watch it was.

"Well," he said, "we have sailed propitiously—sailed without a hitch. So may our voyage end!"

"Amen!" said Desmond.

During the night the wind increased to half a gale, but as it continued fair, no one grumbled. Great waves, however, chased the ship, and threatened to poop her, and rake the decks from aft to fore.

The sea was a sight in the morning. None of the passengers, however, came up to admire and wonder at it.

"Toes up, every one on 'em, sir." That was the report of the head steward, when the captain asked why his good people did not come to breakfast, as sensible people invariably should.

"They didn't look much like invalids when they came on board, sir; but la! sir, you should see 'em now."

The truth is, that, with two exceptions, every one of Captain Boyd's passengers was supposed to be an invalid. At least, being bound for San Francisco, they had been recommended by their several doctors to sail with Boyd on this long voyage round the Horn, instead of taking the ten-day trip to New York, and going thence by sail to 'Frisco.

So they did not care how long the voyage lasted.

The gale continued—increased, in fact. With the exception of some cloth on the fore-yards, and a close-reefed main top-sail, there was little else carried. And much to the joy of Boyd, even with this scanty canvas, the *Oonalaska* went tearing through the broken water and wind-tormented waves, at a good twelve knots an hour.

The wind increased; but still she scudded on. The captain knew his vessel well, else the danger of being pooped would have seemed imminent. Those rushing, chasing seas would have struck terror into the heart of a landsman. At one moment the *Oonalaska* would be so down by the stern, that she appeared to be inviting the wave on board; but just as it came surging and curling up, preparing, as it were, for a spring, "No, you don't," the *Oonalaska* seemed to say, and down by the head she went, till the spray surged over the bows and forecastle.

Some of the bravest of the passengers appeared at the dinner-table about the third day, while the wind was still doing its best to make it uncomfortable for all hands.

"It is only a puff," the captain told them, consolingly.

"If it be only a puff," thought the passengers, "what can a gale of wind be like?" And they tried to grin and bear the thoughts of it. They smiled grim and ghastly smiles when the ship kicked at a sea, and their soup was spilled about their legs. They pretended to think it was no end of a good joke when a green wave darkened the skylights, and the potatoes hopped up and went chasing each other over the decks. But for all that, they were very glad when dinner was over, and they found their way back to their wave-darkened cabins.

In less than ten days, the *Oonalaska* had made the port of the wondrously beautiful isle of Madeira. And by this time, all the passengers were sea-fast, and as gay as ever gay could be—the gentlemen wearing light suits, and the ladies looking well in dresses of white. The most noticeable and attractive of the latter, and the only two with which our tale has much to do, were Miss Graves and her cousin Kate. Now Miss Graves was an old maid. She was, nevertheless, about as unlike your ideal old maid as any one could wish. She was not tall, lean, and scraggy; she did not give herself the airs and graces of sweet seventeen; she never said she could have married well, had she cared to; she did not own a cat, and never made allusions to a lover who had been drowned. She was fair, fat, and, maybe, forty.

She took the bottom of the table (the captain being at the head), in the most natural way possible, from the very first day she recovered from her *mal de mer*.

"I'm going to sit here," she said, "opposite you, Captain Boyd. You and I are old people—at least, we're getting on. So I'll be ship's mother, and you'll be ship's father."

"Capital!" said plain Jack Boyd—"capital!"

"And at table, ladies and gentlemen, all remember I am to have my proper title. I am to be addressed as 'Mother.'"

"Agreed," said everybody.

Kate Graves was only a baby—to all appearance, I mean. She was seventeen, or perhaps a little over, very small and slight, though round-faced withal, and if I add exceedingly pretty, I shall only be throwing in my verdict with that of all hands. But it was a baby beauty for all that.

Nat Graves was Katie's brother—a stalwart, broad-shouldered, handsome young American. He and Kate were the only two of the passengers who were not so-called invalids.

What ailed *Miss* Graves then? Nothing much. If you had asked her, she would have said: "Nerves, or something."

For the matter of that, there was not a sickly looking person sat down to dinner. Once past Madeira, and on the wings of the trades, the way those invalid passengers caused the viands to disappear, was a source of astonishment to the head steward.

"If they go on as they're doing now," he told the captain one day, "we'll hardly have fresh prog to take us to Rio."

'Let them—bless them—let them eat." That was the captain's reply.

The captain made very much of Kate, who, by the bye, soon became Katie. She sat at his right hand at dinner, and he told her all his funniest stories, to which she was never tired of listening.

Black Jack Silk pulled his friend right aft one morning, and told him to lean over the bulwarks, and look at the sea with him, till he made a confession.

No one could hear it thus, except Desmond.

"Desmond, my lad," said Jack; "you've known old Silk for some years now?"

"Yes."

"Well, you never knew me fall in love anywhere or with anybody, did you?"

"Not exactly."

"Dess, I'm in sober earnest."

"Really! well, heave round."

"I'm going to heave round. You're not smitten with the charms of Katie, are you?"

"Not the least wee bit, Jack. But you don't really mean that you——"

"But I do mean it. And as the coast is clear so far as you're concerned, I mean to go ahead. I mean, that though I may never tell Katie I love her, I won't prevent myself from loving away at her on the quiet. But had you been going to be my rival, I'd have brought myself up with a round turn."

"All right, Jack; I'll keep your secret."

One evening Captain Boyd, Katie, and Miss Graves were seated abaft the mizen, and after a pause in the confab,—

"Do you know, Captain Boyd," said Miss Graves, "whom I consider the most interesting individual in the ship?"

"Couldn't guess."

"Your mysterious passenger, Mr. Godfrey."

"Ah! poor fellow! Yes."

"Then there *is* a mystery?"

"N—no; that is, ye—yes, somewhat."

"Oh! I'm so glad; a mystery is quite refreshing. But he is so handsome, yet so gloomy and sad at times, and his smile is never a very merry one. There is no infection about it. It doesn't make others smile. Do you know the name I give him in my own mind?"

"No, Miss Graves; I'm bad at riddles."

"Eugene Aram."

"'Eugene Aram'?"

"Yes, but hark! there goes the second dinner-bell."

CHAPTER IX.

"WE HAVE FOUND STOWAWAYS ON BOARD."

BOTH morally and physically considered, "life is full of contrasts" (the latter part of that sentence is so ancient and trite, that the printer has been requested to put it within inverted commas); but so far as travelling is concerned, those contrasts form the chief charm. Yet people who make their round-the-world-in-sixty-days' tours see far too few of them. Independent of the fact that the rate of travel in these cases is far too fast, the tours themselves are too much within the same parallels of latitude to afford scope for a deal of change.

The voyage of the good ship *Oonalaska* was of a widely different character.

Leaving England and the boisterous Bay

of Biscay, at the very time that Autumn—often in this country a season of clouds and gloom—was drawing nigh, hardly had they been afloat a week, ere they were in the regions of what might be called perpetual Summer; and the atmospherical effects, the balmy wind, the life-giving sunshine, the ozonic breath of the blue sea, the clear sky and fleecy clouds, appeared to gladden the hearts of all. Even the worst of Captain Boyd's invalids were fain to confess that there was but little ailed them, after all.

Under a press of canvas, that looked almost snow-white in the sunshine, the *Oonalaska* went stretching away over the ocean southwards, with a point or two of west in it. Although the ship made quite as much motion as ships of her class are wont to do under sail, before she had been three weeks out, every passenger on board, including Katie Graves, had acquired that amount of agility on deck, which enabled him or her to boast of the possession of sea-legs.

On a long voyage like this, there is always some sort of fun and jocularity occurring on board. On the very morning, then, after they had left Madeira, and just as breakfast was finished, a very pretty surprise fell to the lot of Captain Boyd and his passengers.

Prayers were read every morning; and to-day, during this matutinal service, it was noticed by Miss Katie Graves, who probably ought to have been looking somewhere else, that Dr. Duncan McPhee, the surgeon, several times forgot himself so far as to smile. The honest Scot evidently had something on his mind. So thought Katie, and when the surgeon, immediately after prayers, drew Captain Boyd aside, and confided something to his ear that made that gentleman stare and start back, Katie was sure of it, and made her cousin remain on deck.

"Call all hands," cried the captain.

"Ladies," he continued, approaching Miss Graves, "we're going to have a sort of drum-head court-martial, without the drum. We have found stowaways on board."

"How romantic!" said Miss Graves.

"How delightful!" said Katie.

The captain looked from Kate to her cousin, and from her cousin to Kate. He was very nearly saying, "Bother the romance!" but his gallantry forbade him. He only wheeled away rather crossly, and said something in a low tone to Desmond O'Neil.

"Ay, ay, sir," said that young gentleman. Then he shouted in a loud voice: "Rig the plank!"

As such an order had never before been heard on a civilized ship, the men did not know how to obey it. But "Chips," the carpenter, and "Pipes," the boatswain's mate, were summoned forward, and, under the supervision of Desmond, the thing was soon done. The plank was a broad piece of timber, one end of which was lashed to the bridge, which crossed from bulwark to bulwark abaft the mizen; the other end overhung the sea.

"Bring up the stowaways, and let them lay aft."

The order was obeyed, and a stranger or more badly matched trio, when they did appear, was probably never seen on the deck of a ship before.

The crew were drawn up in two lines in the ship's waist, and between these the culprits had to march on their way to the quarter-deck.

First came a little dumpy old woman with a funny red face, black beads of eyes, and hair as white as lime.

Behind her a regular bean-pole of a fellow in knee-breeches, a long ragged ulster and brimless hat, with a clay pipe stuck through it—Irish without a doubt. He marched with head erect and a jaunty air; the expression on his face was comical enough in all conscience.

Bringing up the rear was an old-fashioned, cheeky-looking, pale-faced boy. Any one would have put him down as a Londoner at first glance, and a Londoner he was.

Sally, for that was the name she gave herself, walked very slowly, with a pretence of being infirm, though her face belied her footsteps.

She groaned aloud. "My poor back," she said. The men began to titter.

Sally stopped short, glancing at them left and right. "You'd laugh at poor me, would you? Old enough to be yer grandmother, ye graceless boys. Heigho! my poor back!"

"Trip along wid ye, mother," said Paddy from behind; "shure, can't ye see his honour the captain's awaitin' to grant us an audience?"

"What's your name, my good woman?" asked Captain Boyd.

Sally's answer was given with many enforced sighs and groans, as if she were too feeble to talk.

"My name, sir? Heigho! my poor back! Which it is Sarah Bennet, sir. But the boys of my village calls me Sally Bunny, sir. Heigho! And those boys do be so plaguey, sir, and keeps a-callin' of me names that—Heigho! my poor back!"

"And what possessed you to stow away in our coal-bunkers?"

"Heigho! which I'm a decent married woman, sir, and I have a darter in Ameriky. But my man is a bad un, sir, and the third day of our wedded life, sir, as ever was, he threw a boiled sheep's head at me—which I'd boiled it with the hair on, sir,—and I never see'd him from that day to this."

"I don't wonder," said the captain, laughing. "So you're going to Ameriky to look for him?"

"No, sir; my darter, sir. If *you* please, sir."

And Sally curtseyed and smiled, and a titter rippled round amongst those on the quarter-deck, which infected the men, and ended in a general explosion of laughter.

"Go away forward," said the captain; "somebody will look after you."

And away went Sally; the boatswain's mate politely giving her his arm, much to the amusement of all hands.

"Lay aft here, you two fellows. Stand in a line. Now, your names?"

"Turlough O'Brady."

"Samivel Bates."

"Give account of yourselves."

"Oh, indade, your honour. The story uv me loife w'dn't be worth listening to at all. It's a jarvey I've been; you know the song, sir,—

> "'Ach! she dearly loved the jolting of an Irish jaunting car.'

"Well, sorr, I'm likewise an amatair fotograffer, and sure I thought I'd try me luck on t'other side o' the water; and the boy here came wid me for luck."

"Did you entice the boy, then?"

"Sorra a much entoicing he naded, sorr, for the matter uv that."

"Did you come of your own free will, boy?"

"In course I did, sir. Why, d'ye think a scarecrow like that 'ere 'ud hinfluence the likes o' I? Ye doesn't know Samivel Bates yet, sir; that ye doesn't."

"I don't want to know much of you. But what made you come on board?"

"The School Board, sir," replied Samivel, drawing himself up to his full height of four feet five; "the tyranny of the School Board, sir. Wot with the teacher a-caning of me all day, and my mother a-jawing at me in the evening, my fine constitution, sir, was beginning to give way. 'Samivel, my boy,' says I to myself, 'you were designed for a 'igher career. Go to sea, Samivel; go to sea.' So I wented, and 'ere I be, sir, beggin' yer parding, and 'oping no offence."

"You see that plank there, both of you?" said Captain Boyd, assuming a seriousness he was far from feeling; "in a few days you've got to walk that plank on at one end, and off at the other."

"Ah! shure yer honour," cried Turlough; "ye niver mane it. Ye won't drown a poor bhoy! Ah! sorr, say you are joking, and sure it's Turlough will work for ye till his bones stick out——"

What more Turlough would have said, or where the bones were to stick out, may never be known, for at that moment the boy Bates touched his forelock to the captain.

"Got too much jaw, that 'ere chap," he said. "Samivel Bates don't mind bein' scran for the sharks. Sharks is better nor School Boards, sir. By-bye, ladies. Give us a bit o' baccy, matie."

The latter was addressed to a sailor.

"I've found," said kind-hearted Miss Graves next morning, "that Sally is not half a bad creature; and with your permission, Captain Boyd, I shall have her for my maid."

"Oh, do what you like with Sally," said the captain, laughing.

Now Captain Boyd was a man of the older school, and had a very great reverence indeed for ancient customs. Knowing this, no one in the saloon was surprised, when one bright moonlight night, while the *Oonalaska* was steaming quietly through a calm sea, with apparently showers of diamonds sparkling in her wake, a voice from the sea hailed in stentorian tones,—

"*Oonalaska*, ahoy!"

"Ay, ay," roared the captain through his trumpet.

"Any babies of mine on board?"

"Who are you at all?"

"Neptune, god of the waves and king of the ocean."

"All right, Nep, old man," cried the captain; "there's something for you to do in the morning. Come on board, and bring the missus with you."

Next afternoon, the ship was right on the Line, if ever ship was there before.

Old Sally Bunny said she'd often heard speak of the Line, and would like to see it.

Desmond O'Neil tied a black thread across the large glass of a telescope, and bade her look through. Sally looked, and then turned up her face and hands.

"And is that the 'quator?" she exclaimed. "What would my darter in Ameriky say to that? Why, you could dry clothes on it."

Plain Jack Boyd was as good-hearted a sailor as ever handled a wheel or adjusted a compass; but he looked upon the stowaway as one of the meanest kind of walking frauds, and determined to punish O'Brady and Bates in his own peculiar fashion. They had been strict prisoners since their trial, and had been fed on biscuit and water.

When Neptune came on board, they were the first to be brought up—blind-folded, and with their hands tied behind their backs.

A plank really was rigged from the bridge, but it hung over an immense tub or tank of water on deck, instead of over the sea.

They were led up the steps and along the bridge, by the boatswain's mate, and on to the plank—Paddy praying to the captain to "spare a poor Irish bhoy's life, for the sake uv the mother that bore him," Boy Bates bringing up the rear, and saying but little.

"Tell 'em at 'ome, old un," he cried to the captain, "that Samivel died game, and that sharks is nothing to the tyranny of a School Board."

How long Turlough O'Brady might have stood on that plank bemoaning his fate, and beseeching for mercy, there is no telling, for Boy Bates gave him a sudden push, and next moment Paddy was struggling in the tub. The boatswain tilted the plank, and down went Boy Bates on top of him.

Both stowaways had received a lesson they were not likely to forget; the bandages were taken from their eyes, and the play was over, so far as they were concerned.

The fun now grew fast and furious, for there were many young fellows on board who had never crossed the line before, and who were now duly ducked and shaved.

There was a late dinner that night in the saloon, and a deal of talking and laughing about the events of the day. But by ten of the clock (four bells by ship's time) all was hushed and serene both fore and aft, and the moon shone calmly, brightly down from a sky of palest blue, in which the stars were but dimly visible.

South and south went the good ship *Oonalaska*, steaming when the wind was light, sailing whenever possible, and before a great many days were over, they had reached the wildly romantic and beautiful harbour of Rio de Janeiro.

Provisions and coals had to be taken on board here, for it would be quite a long time ere the vessel again touched at any civilized place. Four days were spent at Rio, though Captain Boyd could have got off to sea again in half the time; but he was good-natured, and Miss Graves and Katie spent most of their time on shore. They took Godfrey with them as a protector, and Sally as a companion. Sally looked quite gay in the light-coloured cotton dresses and broad sun hat her new mistress had given her. She gazed and wondered at everything she saw, both in the town, with its strange market, and in the forest they visited.

A hundred times a day at least, Sally felt constrained to turn up her hands and eyes, and relieve her feelings and her "poor back," by exclaiming in rapture,—

"What *would* my darter in Ameriky say to that?"

Well but, joking apart, there is a deal of the wondrous and beautiful to be seen here; and really, nobody should die, until they have paid a visit to Rio.

This pen of mine would be worn to a stump, long before I could describe half the quaintness and romance of the place,—the loveliness of its flowers; the look and the odour of its luscious fruits; the gloom and glory of its silent forests; its humming birds; its splendid butterflies, almost as large as ladies' fans; its curious and gaudily dressed people, including its slaves; the villages and huts; the mountains; the water; and the brightness of its cerulean sky.

The whole forms a picture, or rather a series of ever-changing pictures, that deeply impresses itself on the memory of those who behold, and to which, amid the wild and lonesome scenery soon to be described, one looks back, again and again, as to a half-forgotten, but happy dream.

(*To be continued.*)

BE GENTLEMEN.

By the Rev. THAIN DAVIDSON, D.D.

GEORGE MACDONALD gives sound advice to those who have the upbringing of children, when he counsels them to treat them "as souls having bodies, rather than as bodies having souls." But the mistake he guards against, is one that all religious teachers are apt to fall into; and that not only in dealing with the very young. Nothing is more common than to remind you, individually, that you have a soul, that God has given you a spiritual nature which must not be neglected, and which demands your constant and assiduous care; I am finding no fault with this mode of teaching, *only*, there is another side of the truth that is just as important in its way.

But, come along, I am not going to mince matters; there are one or two characters that want to be very plainly spoken to.

First of all, I shall name the SLOVEN. We have all seen him at times, and a very objectionable fellow he is,—clothes, gait, hair, hands, everything about him denoting a lazy, indolent nature, that is utterly without self-respect. For anything like gracefulness and decency he has only contempt; his neglected person, untidy attire, and loutish appearance proclaim the absence of even a trace of natural refinement. If this were necessarily linked with poverty, I would be the last to say an upbraiding word; but the character I point to may be found at every step of the social ladder. The faultless elegance of one's outward get-up cannot alone decide the question; else the barber, the clothier, and the shoemaker might turn any one into a gentleman. At the same time, character is often betrayed by externals, and you can generally tell the sloven at a glance. If you keep in mind this little text: "A body hast thou prepared me," you will feel it a sacred duty to keep your physical frame in proper condition, and by every attention to personal cleanliness, tidiness, and order, to show that you have a high sense of true self-respect. Even the use of a clothes-brush may be significant, and an honest patch is better than a half-concealed rent.

Secondly, I name the BOOR. He is not unknown, even in respectable company, and he merits a good castigation. He shall get it, too, if I have a chance! Here he comes, slouching along, arms and legs working, apparently, on "universal joints," and not a bit of rigidity in his frame. (Wouldn't six months' drill do him a world of good?) Lifts his hat in the presence of a lady, or when he meets you on the street? No; would never think of such a thing. Did you ever see such a Goth?

"Be courteous," is a Scriptural admonition we should all endeavour to obey. The word occurs but once in Sacred Writ, but perhaps is the more observable on that account. It means deferential, having a due regard to the feelings of others; and this is always characteristic of the true gentleman. It is not a question of birth, or money, or gold rings, or tailoring, or anything of that sort; genuine refinement is an essential element of character.

It is only a fool who imagines that it is the hairdresser, outfitter, and jeweller, who from the raw material can turn out the genuine article. I have seen the highest refinement where outward accessories there were none. A young man of true Christian instinct, though brought up amidst the humblest surroundings, will soon acquire the culture and urbanities of good society.

Take a word of advice, my lad, and get rid of any uncouthness of gait or manners. Whatever you are, don't be a boor!

Thirdly, as little would I like to see you a FOP. Dandyism is one of the most contemptible developments of humanity, and always betokens extreme littleness of mind. It is hard to tell which is the worse of the two—the sloven or the fop. In the one case, sensible men avoid you; in the other, they laugh at you.

How ridiculous does Samuel Pepys make himself in his entertaining "Diary" (which, I presume, most of you have read), by his repeated reference to his dress! If we are to believe contemporary testimony, he was a shrewd and accomplished man, a conscientious and valuable servant of the State; but how *small* does he seem when we read such entries as these:—

"22nd January, 1659. This day began to put buckles to my shoes." "July 1st, 1660. This morning came home my fine camlett cloak with gold buttons, and a silk suit, which cost me much money, *and I pray to God to make me able to pay for it.*"

You cannot but feel, when you see a man who, as Carlyle says, "rather lives to dress than dresses to live," that he must be a weak and effeminate creature. When the exterior is the object of such pains and attention, you suspect there is not very much beneath it. The youth who wastes his precious minutes before the mirror, and whose supreme ambition is to be up to the latest rule of fashion, is not likely to make a man of business, or to be good for much in any trade or profession; he is so occupied with the husk, that he gives little thought to the kernel.

Such gentry have commonly a horror of hard work. They have a particular aversion to be seen carrying a parcel, and would rather die than stain their kid gloves by any form of manual labour. The body God has prepared them is to be pampered, dressed, and perfumed,—so they think, but was never made to sweat with honest toil. There is hardly a town or village which has not some instances of this glaring insanity; in London their name is legion. To them the real enjoyment of life is unknown. The poor, but industrious man, is always happier than the rich and idle; and honest work, hard but not excessive, is the best promoter of health, both of body and mind.

In David's beautiful description of morning, in Psalm 104. 23, he says, "Man goeth forth unto his work and to his labour until the evening." The sun ariseth, the wild beasts betake them to their dens; but man goeth forth to work!

A man may work as hard with the pen as with the pickaxe. The toil of nerve and brain is more exhausting than that of muscle. Now the fop is essentially an idler, and

> "An idler is a watch that wants both hands,
> As useless when it goes as when it stands."

Avoid such a fellow if he comes in your way; he will do you no good. His mind is much more upon play than upon work. He is a great authority, possibly, upon sports and *prima donnas*. He can tell you all about the latest race, or the forthcoming regatta; but question him about his business, and he is silent. He dearly loves to talk of his club and of the opera, and is full of stale jokes and town gossip; but as to all serious and important questions, his mind is a vacuity Well, bow him politely out of your company; life is too short to waste it on a silly coxcomb. Try to be "examples of believers," "the sons of God *without rebuke*."

GIRLS I HAVE MET.

By Mrs. SKINNER.

IV. THE GIRL FROM THE COUNTRY.

HER cousins and I met her at the railway station. As she alighted, and I noticed her thoughtful, ruddy face, the rough red hands, the ill-fitting clothes, and heard her broad dialect, my heart went out in sympathy towards her. Quiet snubbing, hints rather harsh, admonitory advice, home-sickness,—all, I was sure, were in store for her.

How indignant the cousins would have been, had they known what I was imputing to them! Of course they would not wilfully be unkind; but then, so many of us are blind to our faults, and indulge in such painful behaviour without realising its nature.

Oh, the number of packages she had! an edition of "Mrs. Brown's luggage!"

"Mother thought you'd like some fresh fruit, and these posies all came out of our own garden. Oh, what a noise there is! It's worse than it is at Watcombe Fair." She had hardly finished speaking, when her plums fell, most of them rolling on to the rails.

Country Lizzie.

There was a cry, a rush to recover them; but Milly, the eldest cousin, forcibly detained her. "You might get killed. You must let them go. Don't pick any up. See how people are staring at us."

"I am so sorry; they came off our best tree—the one that grows near the gate."

"Never mind; plums are cheap enough."

"But——" and then she stopped, a pained look coming into her face, and she bit her lips to keep the tears back.

Florry, the youngest cousin, had meanwhile got a cab, and we were all stowed inside, packages and all. Half a dozen ragged urchins feasted upon those precious plums as we drove off.

None of us could help smiling just a little at her quaint remarks, as we went along. The sights, all so stale to us, were so fresh and wonderful to her, evidently having a keen eye, quick intuitions, and an open way of expressing herself.

"You make me think," said Milly, "of the old man from the country who stood by the Bank, waiting for the crowd to go by."

"And what harm was there in that?" she innocently asked. "Did he stand long?"

Milly laughed. "Wait till you see the crowd there; then you will understand."

"I understand already," she said, after a pause; "the crowd is there all day. Poor old man! I can sympathise with him, because I am from the country as well."

"And it is the best part of the world, too," I put in, fearing an unkind pause. "'God made the country.'"

"'And man made the town,'" she added. "You can see that there," pointing to the end of a narrow, squalid street we passed. "God made wide commons and great hills,—nothing like that."

"Hear, hear," cried the girls; "our cousin is an orator. Who would have thought it!"

"Let us have the finish of that quotation from Cowper," I said. "Please give it us, Milly,"—just to see whether she knew more or less than this girl from the country.

"What quotation?"

"'God made the country, and man made the town.'"

"Oh, I don't know it. Isn't it from Tennyson?"

"No," said Lizzie, "it is from Cowper's 'Task.' It goes on:—

'No wonder, then, that health and virtues, gifts
That can alone make sweet the bitter draught
That life holds out to all, should most abound
And least be threatened in the fields and groves.'"

"Well done, Lizzie! You read to some purpose," said I.

"Oh, yes," she answered, with a smile, the first since the catastrophe of the plums; "we read a great deal in the long winter evenings."

"Precious dry stuff, if that's a sample," remarked Florry.

"You must be quite a blue stocking," said Milly.

"Oh dear no; I never go in for that at all; I've something else to occupy me."

At the door of her aunt's house we parted, but I met her again the following week. It was at a girls' working party. She had on some of Milly's ornaments, her hair was turned up in the latest fashion, and Florry quietly informed me that they had been two days altering her dress. But they had not been able to soften her accent, or whiten her hands; and the silver bracelets made them look even a deeper red than before.

She seemed very constrained and awkward, quite different to the outspoken girl I had met before; the result, no doubt, of private lessons given by the cousins. At tea, I noticed Florry and Milly take their places one at each side of her, and more than one of Lizzie's sentences came to an abrupt ending because of an admonitory pull.

During the evening, a solo or recitation was asked for, and as usual there were many obstacles, difficulties, and apologies in the way, that formed quite an entertainment in themselves. But "the girl from the country" quietly stood up, and at once gave a selection from "The Lady of the Lake."

"How ever could you do it?" whispered Milly at the close.

"Because I knew it, was asked to give it, and hate making a fuss," was the brave reply.

Calling at the aunt's house next day, I happened to mention the needs of a certain small orphanage. Two other ladies were in the room, who *looked* unutterably sympathetic, and spoke in very smooth tones; but Lizzie from the country was the only practical helper.

"I'll give you a sovereign," she said.

"My dear, you cannot afford it," said her aunt.

"Oh, yes, I can; I can do without that travelling trunk you wanted me to buy, aunt; and it is my own money, not father's, so he would not mind."

"I suppose it was your father's first?"

"Indeed, no, it was not."

"Have you got a private fortune, my dear?" asked Milly, rather sarcastically.

"No, I have not; but I earn money."

"By churning, no doubt," said Florry.

"No; I'm a market gardener."

"Oh, my dear, how shockingly you talk. Pray, friends, don't listen," said the aunt.

Town Lizzie.

But the sympathetic-looking ladies and myself wanted very much to know all about it.

"I rent two fields from father. Mother gave me twenty pounds when I was twenty-one, so I stocked them, and I send all my produce by train to Milford, our nearest town. I have had some forcing houses put up this year, so shall get early things into the market soon."

"Well done! you are a sensible girl," remarked the ladies.

The aunt and cousins were listening in speechless amazement. What would come next? If only those two ladies had *not* been there, it would not have mattered at all; but they were the richest and grandest acquaintances they had. What would they think?

"And do you make much?"

"Oh, yes."

"You must be quite rich," said Florry, with something like a sigh.

"Oh, no," rather bashfully.

"What do you do with it, then?"

No answer.

"I suppose you give it nearly all away?" said her aunt, with some curiosity. It was

spoken in jest; but many a truth is thus unconsciously clothed.

"It is the only way I have of doing good," she replied, as the red in her cheeks spread over her face; "I'm not clever, like some girls are."

There are days in our lives, whose memories are burnt in upon us; days that haunt us; days that will never die. The day I met Lizzie again was one of these. Will it ever leave me? Nay, I do not wish it to leave me; the very pain it brought gave joy.

I called to ask her to accompany me to one of the hospitals. She was all alone, the aunt and cousins having gone to a garden party.

"I did so want to go with them; but aunt said it would be too tiring for me. It seems strange, because, in a usual way, I am very much stronger than either Milly or Florry."

"Those sort of parties are fatiguing, certainly."

"Are they? Then it was kind to leave me here; but I felt so lonely at first, I really cried. You don't think, then, it was because they are ashamed of me?"

"What a question! I don't think they need be, dear."

"Ah, I see you don't like to say. How glad I shall be to get home. I am going to-morrow. Do you know what I shall sing then? Listen;" and then she broke out in a sweet, low voice:—

"'Stay at home, my heart, and rest,
Home-keeping hearts are happiest;
For those who wander they know not where,
Are full of trouble and full of care;
To stay at home is best.'

"And so it is, too."

"You sing very nicely. I did not know you were a singer as well as a gardener."

"Why, Milly says she would not like anyone to hear me, as they would know directly I had not been taught; but I thought you would not mind."

Instead of going to the hospital, I went with her to some celebrated nursery gardens, out in the country, where she did some business. Unconsciously, we had gone in the same direction as the aunt and cousins had previously taken, and as, in the quiet of the evening, we were walking back towards the station, we heard a loud noise behind us, and, turning round, saw dashing down the hill a pony carriage, the pony mad with fright, the reins dragging on the ground. In an instant we each saw that the three occupants of the carriage were the aunt and cousins—knew them by their feathers. At the bottom of the hill was a sharp bend; should the pony take a straight course, it would hurl the carriage down a steep bank into a wide canal. From where we stood, we could see the red gleam of the setting sun on the waters, like an awful danger signal.

"I maun save them," she almost shrieked, in her broadest tone.

"Girl, it would be madness to attempt it," I exclaimed, gripping her arm. But she had gone; my touch was like a child's, compared to the energy awakened in her.

Shall I ever forget that little figure, standing so erect and motionless in the middle of the white, dusty road—the wild, dashing beast so close upon her?

With one strained effort, she clutched hold of the bridle, with the agony of death in the grim grasp. For an instant she was lifted off her feet, and then I heard the word, as from some far-off land: "Steady!" The voice had a magic ring in it. The animal stood still, trembling in every limb, and in almost a moment's time, it was surrounded by strong men.

Lizzie, the girl from the country, had saved those three lives. The folks were full of her praises; but she lay motionless by the side of the road. She had broken her arm through falling on the shaft of the carriage, and had fainted.

After we had got her home, and the doctor had set the arm, we began to praise her for her heroic deed.

"Oh, don't!" she implored, "it was nothing. I once broke a pony in; I know well how to quiet them."

But the aunt and cousins could not keep from praising her. How could they? She had saved their lives.

"How can we ever repay you?" said Milly.

"There is only one thing," she replied faintly.

"What is it? Oh, do tell me," and she bent down in her eagerness to listen.

"Don't ever be ashamed of me again."

"Never, *never*;" and Milly threw her arms round her cousin's neck, and the two girls wept together.

"Ashamed again of Lizzie!" said Florry to me in private afterwards; "I should rather think of being ashamed of the Queen. Why, she's a gem, a brick,—I don't know what she is not. God keep me from ever being ashamed of any girl again, simply because she is not stylish. It was nothing but abominable pride that caused it. How I hate myself for it."

The cousins did all in their power to atone for the past, petting and feasting and fêteing Lizzie all day long. Through the accident, the visit was considerably prolonged. There was no going home the next day, or next week; and yet I am sure, in spite of the changed feelings manifested towards her at the close of her visit, this brave Lizzie, the girl I met from the country, still sang to herself, as once more she stood in her peaceful humble home,—

"Stay, stay at home, my heart, and rest,
To stay at home is best."

ON SITTING STILL.

(RUTH 3. 18.)

By the Rev. J. B. FIGGIS, M.A.

THIS is a restless age. It sometimes seems as if upon us, especially, had fallen the imprecation of the psalmist: "O my God, make them like unto a wheel!" That is just what people *are* like. The whirl and the buzz are incessant, and the mischief and the misery thus occasioned, are enough to make angels weep; but especially the angels of young people, the angels of the lad or maiden just starting in life.

"Starting in life!" what an expressive phrase that is, with a touch, too, of the same disquiet in it. It makes us fancy ourselves at the railway station. Trains rushing in; trains rolling out: all commotion and excitement; your own head full of both, for you are going for a long journey. Well, and so it is with those "starting in life;" you, too, are going for a long journey. Are you sure that you are in the right train? You want to go to heaven; but what if the train you are entering should be for quite another place? You want to be happy; what if it should travel through, and to, a land of misery, where happiness would be unknown?

So, anxious for you, my reader, to be in the right train, what can I do better than what Naomi did, say to each one of you, "Sit still, and think; sit still and look; sit still and listen; sit still and learn; sit still and love"?

Many a fine property is ruined; many a fair name stained; many a precious soul lost, for want of thought. It is so about money; five minutes' reflection would have prevented that man taking the desperate step, which plunged him in ruin. He was hurried into it because he would not *sit still and think*.

It is so about marriage. Anne Boleyn might have saved her life, Mary Stuart her crown, and many of lesser name their character, if only they had pondered the consequences of a step the most momentous of their lives. There is much need in this matter that every Ruth should take the counsel of Naomi, and "sit still."

It would be easy to multiply instances; what we want is to apply them; not to talk about thinking, but to think.

Suppose one were to come to you and say: "You have in your possession a fair and costly jewel, nay, that which can create jewels, and transmute the pebbles under your feet into pearls," would not your heart leap, leap with delight, only tinctured with incredulity? Yet, why be incredulous? Every soul has that within itself which is capable of being made happy, and of making others happy, yea, of making God happy; may it not be fairly called a jewel? There are others no greater than you, no richer, no cleverer, who, just laying their ability, or want of ability, at the Master's feet, have received from Him power to be an immense blessing to others.

I would give anything if I could stir in some of your hearts the holy ambition of being of some use in the world. At present the comb stands almost empty. Take care that it be filled by-and-bye, and with pure, sweet honey.

Especially think of duty. You say: "I do not like the word, and I do not like the thing. I love my friends, and I want my friends to love me. But cannot one have

pleasure, without always thinking about this dismal, dreary duty?"

But is it possible to have real pleasure without duty? It seems to me that it is like a fairy ring, or some other enchanted circle, inside which all is happy; outside all is sad. The same games played within the ring are delightful, while without, they are miserable, and make people so. Now duty is that sprite or fay, and every one that lives inside lives merrily; every one that lives outside, lives miserably. On which side of the ring are you?

Yet, after all, duty will not save. In the court of conscience, none of us shall find salvation. Duty will not save, but Jesus will, Jesus and His work. I heard them compared to a lightning rod, which attracts all the danger current to itself, and keeps the house it touches free. Do you live in this house? Have you this danger rod, drawing the doom, justly due for your sins, away from you, so that you stand safe, free, forgiven?

Not merely about the main issues of life, but about all the side issues, be sure to ask yourself both, "Is it right?" and "Is it safe?" Beginning such a habit, beginning such a book, beginning such a friendship, sit still and think. Think of life with all its possibilities, what you might be, what you might do; think of death with all its possibilities, what it may bring, how near it may be. Thoughtlessness is your great danger, the rock on which, if your bark is shipwrecked, ten to one but it will split. Oh! do not be thoughtless; sit still and think.

Sit still and look. For indeed there is much to look at—a wonderful sight, a wonderful Face. What face? you say. Whose face? Nay, look at it a little first, that even the look may attract you, as looks do and may. We read of one, that Jesus "looking on him loved him." I want you to look at this Face, that you may love it. It is a Face all fair, so fair that you never saw a lovelier. And it is pure as it is fair, utterly pure and noble and good to the fullest—the very Face to be worthy meditation. It is gentle and generous; millions of men forgiven by it have only made it more forgiving. True, also, there is a firmness about those lips that make you sure of everything they say, sure of the lightest word, or least. Oh! a holy Face, yet a happy Face too. It beams, as the little child said of Mr. Pennefather, beams upon you with a heavenly smile, a smile new made in heaven itself. Oh! such a sight, such a Face. "Sit still" and look; you might look at it for hours and not be tired, nor feel it waste of time. But whose face is it? Nay, do you not know? Whose face could it be? There is no such face but one, none good but one, none pure but one, none all holy, all loving but one. It is the face of Jesus, and Jesus is just the Face of God, the frontal visible, through which and through whom the invisible God is seen. Look at Jesus, I say. Have you ever done so? ever spent five minutes in thinking—just *Jesus*, five minutes in considering and contemplating Jesus, five minutes in meditating and gazing on Jesus? Never? Why, then, you are like a person walking about with blind eyes. But stay. There were blind people in Christ's day, and though they could not see Jesus, Jesus could see them, and He let them come to Him, as He sees you now, and will let you to-day, if you will.

"Sit still and listen," was what I meant to say next, but I think "*Sit still and love*" must come in here. For seeing is believing, and looking is loving in some cases, and I am sure it is so in the case of Jesus. Who can look at such an one as Jesus, know what He has been, think of what He has done, and not love Him? Only adamant hearts can look thus. Other hearts must be bursting, be burning, they cannot choose but love. What! I,—so loved, so lovingly dealt with, so lovingly sought and smiled on,—and yet not love, not love Jesus?

And this love of Jesus must—

"All vain love expel."

Let me say to you, very solemnly, that the sort of character to make others happy must be cast in the mould of Christ. I know there are thousands who are attractive, and yet not Christian. But attraction is one thing, affection is another; and I do believe that to win that highest prize, and wear it long, piety must be the basis of the character. You were made for heart union, I know, but miserable is either the man or woman who bases it on anything else than Christian, Christ-like character. He hath built his house upon the sand; the floods of life's sorrow will find out his mistake. So be Christian, be Christ-like; and what I bid you to be in yourselves, I bid you to seek in others.

When your friendship is sought, above all, in that deeper friendship which claims a dearer name, "Sit still;" sit still, I pray you, and consider what it must be to base your hopes of happiness elsewhere. You cannot expect agreement, assured happiness, where you have not two ideas in common; and those who are one in and one out of Christ, really have *no* ideas in common; a whole world keeps them apart. You may think nothing of this now. It may be quite possible to get through the present, to get through the preliminaries with seeming satisfaction, because, for the time being, your minds have enough to think of in one another; but wait awhile, and divergence, on so cardinal a point especially, is sure to tire, sure to grieve, sure to divide. Suffer the word of exhortation. But if it be never needed on this point, it may be on another, and that is, to let the love of Jesus not only rule out all love contrary to His, but exalt and ennoble all according thereto. Keep Him first. Count not friendship nor love, paradise; but only the fullest of all friendships, only Divine Love.

Sit still and learn, shall be my next word. There is so much to learn, to learn of God, and "who teacheth like Him?" It is so sweet to be taught by one we love; blessed learning, indeed, that is. So sweet to have Jesus say, therefore: "Learn of Me;" and, as I say, there is so much to learn. I am so glad there is, do you know? It would be such a dull time if we knew all at once; but as we only pick up knowledge, like the birds their food, a grain at a time, it gives zest and interest all the way. Intermeddle with all knowledge, secular as well as sacred, art, science, as well as Scripture; for, for the sake of others and yourselves, I urge you to the blessing of a well-stored mind. But have a care that one door, which stands open night and day,—open to the poor, to the busy, to the servant as well as to her busy master, God's precious Book, teeming with science, bright with poetry, rich in the wisdom of "the only wise God,"—be your constant companion, your guide, and your counsellor. And now for my last word.

Sit still and listen. They say that the Red Indian, when upon the war track, by putting his ear to the ground, can detect the presence of the enemy a long way off. And if we have the open ear and use it, we may know the approach of danger and of temptation, and avoid them thus. But there are other voices to hear also. "Hark! 'tis angels singing," rejoicing now over a soul new-born on earth, now over a saint new-born into heaven. And do you not hear very different voices sometimes? Do you not hear the voices of bitter wailing? Methinks I do, and amidst the surges of sorrow, I can detect articulate words, such words as these: "If I had only sat still and pondered, I should never have come to this pass, I should never have come to this place!"

So for the great crisis of being, and for every lesser crisis, "sit still." If a great sorrow come into your life, or a great joy, "sit still." To do so, will turn sorrow into joy; not to do so, will almost turn joy into sorrow. As Mary the Virgin, sit still and listen; as Mary of Bethlehem, sit still and learn; as Mary of Magdala, sit still and watch; and you shall not watch in vain.

HOW SAM'S INFIDELITY FAILED.

By ANNIE FRANCES PERRAM, Author of "Go Work," "The Opposite House," etc.

"'*Come with us, will you?*'"

CHAPTER I.

PROGRESS HALL.

"I SAY, Sam; do you know that the infidel folks have rented the Hall down —— Street, and have dubbed it Progress Hall?"

"You don't mean that? I wonder what they'll have to say for themselves, and how many converts—*perverts*, I suppose, would be more correct to say—they'll make."

"That's more than I can say; but there's going to be speechifying to-night, and I, for one, shall be there. Come with us, will you?"

"I don't mind if I do," answered the man who had been addressed as Sam.

He had been surrounded from infancy with religious influences. Like Samuel of old, whose name had been given him, he had been dedicated to God and His Church by a godly father and mother, who, in their village home, were still praying for the boy who had left their roof in his early youth, all unprepared to battle with the temptations and snares which awaited him, in the circle of godless men amongst whom his lot was cast. But as yet their prayers were unanswered, save that the remembrance of them had hitherto availed to prevent Sam from joining in the more open sin of his lawless companions. Yet there was every prospect that close association with those who feared not God, nor regarded man, would shortly bear its inevitable results; for, one by one, familiar landmarks were being left behind, and he was already carelessly drifting towards those fatal rocks of scepticism, on which many a goodly bark has been broken. He was in this state of mind when a fellow-workman gave him the above invitation to an infidel lecture.

For the first time in his life, Sam listened that evening to a definite statement of infidel tenets, and, prepared though he had been, by years spent in the company of those who cavilled and sneered at revealed truth, he was staggered by the new and startling speculations that were advanced. With a great revulsion of feeling, he left the place, and as he found his way to his solitary lodging, the simple faith of his parents and the purity of their lives, rose in strong contrast to the complicated theories propounded by the lecturer of that evening, and the life of open sin, in which he well knew many such theorists to be indulging.

"Can my father and mother be deceived? Is the Bible all false? Is there no God?" So he questioned, and questioned in vain. The next morning he met his fellow-workmen, and, while listening to the sophistry of their arguments, began to think that after all they might have arrived at a more reasonable conception of truth, than those whom he had left in the secluded village home.

He visited the Progress Hall again and again, until the questions that were raised in his mind on the first evening he spent there were silenced, and his conscience lulled to rest; he presently embraced, and afterwards publicly advocated, infidel principles.

* * * *

"A letter from our boy, father," said Mrs. Richards, Sam's mother, a few months after he had openly professed his change of sentiments; "God grant that it may be good news. Why, the dear fellow's got married at last. Eh, dear! I hope he's made a wise choice," said the old dame, as she read down the first few lines of the letter.

"Tell us who it is, quick, mother," answered her husband.

"Why, it's the sister of one of his mates —a dear girl, he says—and she sends her love to father and mother, and says she'll try to make a good wife for their boy. Well, I'm sure I hope she will—bless her. Not a word about anything else, father. We must just hope and pray on for him and his dear wife now, and the answer's sure to come."

Yet how it tarried, as month after month passed, and Sam grew more bitter in his hostility to any form of religious truth, and openly reviled its adherents.

So matters went on, until after the birth of his first child. Watching with pride its cradle slumbers, during one of the earliest weeks of infancy, he suddenly looked up and said to his wife,—

"I shan't wish to interfere much with your management of baby, Millie dear, especially as it's a girl; but there's one thing I must insist on. You must never teach her any religious humbug, hymns or prayers, or anything of that sort; and you must keep her away from people who would be likely to say anything that would make her think about stuff she could never understand, any more than her father. When she's old enough, I'll give her plenty of ideas worth having, especially if she turns out a sensible child, as she's likely to do, with such a mother. You understand, don't you, dear?"

"Yes, Sam, and I will attend to your wishes; but it will seem strange for the little thing never to hear about what the poorest child knows now-a-days," replied his wife.

"Better without such knowledge, as I'll prove my little girl shall be. Well, good-bye, wifie. I'm off to the meeting. Wish you were coming with me, as you used to do." And kissing his wife, Sam left the house.

A sigh, for which Millie could not have reasonably accounted, escaped her, and she lay back in her comfortable arm-chair, and indulged in a prolonged reverie. The time had been, when, in early womanhood, she had pictured, as every woman does, a happy home of her own, with little children around her, whose hands she would fold in prayer, and whose lips she would teach to frame the name of God, in accents of reverence and love. And now the happy home was hers, and she had carelessly consented that her first-born should be kept in total ignorance of Him, whom till a year or two previous, she had believed in as the Saviour of helpless infancy and childhood. She thought of the doubts insinuated into her mind during the first days of her intimacy with Sam; and how, in her strong love for him, she had heedlessly allowed him to undermine the foundations of her early faith, until, in profession, at least, she stood side by side with him as an avowed unbeliever.

But she was a true woman, with a woman's deep craving for rest and satisfaction, that was not to be found in human love. So, while for a time he was content with his new theories, she was not; and when, in the hour of a mother's pangs, there had been a sudden fear of a fatal termination read in the anxious faces around her bed, her mind had vainly searched for an assurance and ground of safety, which infidelity utterly failed to yield. When she had struggled back to life again, no words passed her lips concerning the darkness which had appalled her as she faced an unknown future. She resolutely turned her thoughts away from that vivid experience of insecurity, and rested in the devoted love of her husband, and the joy of her new possession. But now, with Sam's

edict fresh in her mind, she could not help the wish rising, that her child might have been permitted to learn the sweet stories of the Bible, and the childish hymns which even then rang in her own ears, and which, strange to say, she had caught herself humming as lullabies to her baby. But she had given her promise, and of course her word must be kept to Sam, who so completely trusted her.

As she rose to prepare supper, words from the long-neglected Book came to her mind: "Without God, and without hope in the world." Wearied at length with the incessant mental repetition of the passage, she presently exclaimed,—

"If there is no God, as Sam says, isn't it better to put all thought of an imaginary Being out of our lives, and to face the truth that we stand alone to do the best we can for ourselves? And as for being without hope, people who do their duty, like we do, never need to be hopeless. We've always something to fix our minds on, something to look forward to."

She stopped suddenly, as the thought of her own hopelessness, while standing on the brink of the cold grave a short month before, recurred to her.

"Oh!" she said, with her hands on her breast, "death *is* an awful, hopeless mystery. Who can fathom its unknown secrets? But what am I talking about? All these things, Sam says, are not to be thought of. We must live to enjoy ourselves while we can; and surely I ought to be very happy with so much more than many to make me so." In this way Millie sought to banish her unwelcome thoughts, and to forget the God whom she once professed to love.

"'*You must never teach her any religious humbug.*'"

CHAPTER II.

JULIA'S GRANDMOTHER.

FOUR years went by, and a long-talked-of visit from Sam's mother was arranged. The evening she was expected, Sam said to his wife, "Millie, I don't want to grieve my old mother, so don't say anything about the Progress Hall, and my doings there; just keep little Julia with you as much as possible. She's not too young to pick up rubbish that my mother may try to teach her."

"Very well, Sam," replied his wife, and Sam left the house to meet his mother.

It was a great pleasure to Millie to welcome the mother of her beloved husband, and she left nothing undone which might add to her comfort and enjoyment during the visit. But it seemed as if the chief pleasure in her son's home centred in the little grandchild. They soon became inseparable, and scarcely a day had passed before the child's silvery voice was everywhere heard repeating, "Grannie, Grannie."

On the third evening of his mother's stay, Sam was absent from the home, and Mrs. Richards was sitting before the fire, gently swaying the little one backwards and forwards. Presently Millie rose, saying, "It's time for Julia to go to bed, mother." The child turned to her grandmother, crying, "Grannie, take me," and, well pleased with the request, Mrs. Richards rose; but Millie interfered, saying,—

"Julia shall come to say good-night to Grannie when mother has undressed her." But Julia cried and sobbed so bitterly with disappointment that Millie grew alarmed, for any excitement had been strictly prohibited for the sensitive child, who, from her infancy, had been liable to sudden attacks of faintness, if unduly agitated. At last she was hushed by Mrs. Richards' promise to accompany her, and the trio adjourned to the bedroom, where Julia patiently waited until arrayed in her white night-dress. Then, making a spring across the room, she climbed to her grandmother's knee, and said, "Dood night, dear Grannie; please put me in my little bed."

"Bless you, my lamb, yes; but you must say your prayers first," and Grannie tried to fold the little hands, as she had folded those of Julia's father years before. But Julia did not comprehend the movement, and smiled at the novel proceeding.

Mrs. Richards looked up in bewilderment at her daughter-in-law, and said,—

"Why, Millie, any one would think the child had never said a prayer in her life."

Seeing no other way out of her difficulty, in desperation Millie answered,—

"They'd think right, then, mother, for she has never been taught."

"Oh, Millie! how could you let her first years go by, without telling her what her heavenly Father expects of His little one?" exclaimed the grandmother.

"Well, mother, you may as well know first as last. When she was a wee thing, Sam made me promise that I'd never teach her anything of that sort; and he wouldn't like to know that anything had been said before her, because she's so sharp—she picks everything up," answered Millie, hanging her head, partly from shame, and partly from a regret that she should have been compelled to reveal the truth to one who would mourn on account of it.

"I can't understand it, Millie; I can't, indeed. My boy, who was so early taught to read his Bible and pray, not liking his little child to hear about the Saviour who loves her, and who called the little children to His side and blessed them, when He was upon earth. I know he is careless of these things himself; but surely he can't think it right to keep Julia in ignorance of the God who made her," replied the poor old lady, looking helplessly for further explanation from Millie.

"Oh, mother, I can't say anymore to you. Sam must tell you all his reasons himself, for he will explain so much better than I can," cried Millie, sadly perplexed; and continuing: "but I must not let you talk any more before Julia. She'll be asking questions for days to come, about what you've been saying, as it is, and if her father gets to know, he'll be really angry. Kiss grandmother, my pet," and in another minute Julia's golden head was nestling on her pillow, while for a second Mrs. Richards stood looking down upon her with tenderness, and a voiceless prayer for the child who had been launched upon the troublesome waves of life, without a chart by which to avoid hidden rocks, or fatal sands. Silent and thoughtful, with her head resting on her withered hands, Mrs. Richards sat until Sam returned, and took his place in the chimney seat opposite. Then she said: "Sam, I've been shocked to hear what Millie's told me. Why, she says it's your wish that the child shall never say a word of prayer, or hear about good things. What can you be thinking about, my boy?"

His mother's troubled eyes were scanning his face, and Sam looked away from them into the glowing coals. After a moment's hesitation, he said,—

"I'm very sorry to say anything that will trouble you, mother, the first time you've come to see us; but I'd better speak the plain truth, and say that of late years I've thought differently of these things, and I've

come to the conclusion that I can't believe in what you and father stick to. Of course it stands to reason that I can't have my child taught what I think is false."

Her son's confession was a terrible blow to her hopes concerning him.

"Sam," she presently said, "I can't reason and argue with you; but I'll never believe but what at some time or other you'll come to see what an awful mistake you're making. My heart will be sadder than ever before—and that's saying a good deal, my boy—until I hear that you're back in the old path."

"I'm happy enough, mother. I've got a dear little wife and a bonnie child, and health and strength to work for them; and I'm sure you might go home well contented with what you've seen of us, instead of worrying," replied Sam, in a half-annoyed tone.

"I can't help troubling, Sam, when I think of you, and know that a time's sure to come when the things you've set your heart on will slip between your fingers, and you'll want something that your new-fangled ideas can't give you," answered the mother.

"Well, we shan't agree upon the matter, and we'd better let it drop, mother;" and Sam rose and took down his pipe from the mantel-shelf, and settled himself back in his chair for a prolonged smoke.

(*To be continued.*)

GRANDFATHER.

GRANDFATHER sits in his old arm-chair,
And dreams of a bygone day;
Sweet visions of children with golden hair
Before him in fancy stray.
He feels soft kisses upon his brow;
Bright faces around him throng,
And he dreamily watches, and wonders how
They have left him alone so long.
The fire-light flickers, the light grows dim,
While the hush of the twilight falls over him.

Grandfather listens, and seems to hear
Sweet voices he loved before,
He fancies they're calling "Father, dear,"
As they did in the days of yore;
And he smiles as he sees his darlings there,
And calls them in wistful tone,
Outstretching his hands to the empty air,
While he sits by the fire alone.
The fire-light flickers, the night grows chill,
Yet the angel faces are with him still.

Grandfather sighs, and with tear-dimmed eyes
He watches the flickering flame,
While as it quivers, then softly dies,
He whispers each well-loved name;
He sees them beckon, he hears them call,
Ere they fade away in the light,
And deeper the evening shadows fall,
As they pass from his dimming sight.
And the darkness gathers, the night winds moan,—
Still grandfather sits by the fire alone.

The night has fled, and now, loud and clear,
The clock strikes the hour of four;
But it falls unheeded upon his ear,—
He will list to its voice no more;
For although he still sits in his old arm-chair,
And the morning dawns rosy red,
And sunbeams, flickering in radiance fair,
Fall softly upon his head,
'Tis the light of God's glory rests on his brow;
He is with his darlings in heaven now!

WASTED HALF-HOURS.

THE daughter of a well-known artist, bred in comfort and luxury, who had trained herself as a first-rate musician, had a sort of religion which "did not satisfy her." It was a strange thing to see her at the penitent-form. She seemed, however, to get saved that Sunday night, but the next Friday she was again in trouble. What was the matter?

The evangelist put his hand on the girl's shoulder, and said, "Weren't you here last Sunday night?"

"Yes," she answered.

"Didn't you get what you wanted?"

"Yes; God saved me, I haven't a doubt."

"Well, what do you want now?"

"Why, if what you've been saying to-night is true, I want something more. I need to be saved from wasting half-hours. I want power to put aside a book which does me no good, and won't make me fitter to do good to others."

"Wasn't that a good way to put it?" asked the evangelist, when he told us the story. "It set me thinking, was I saved from wasting half-hours?"

And it set me thinking, too. Saved from wasting half-hours! Are you? Am I?

Are you saved from wasting half-hours over books which do you no good, over papers which do you positive harm? Or are you one of the people who always seem to know what Parliament is doing, and are up in the details of the latest murder, and yet "haven't any time for Bible study"?

Are you saved from wasting half-hours in useless talk? When you come to the meeting unusually early, do you gossip—mild, amiable gossip, about meetings and so forth, with somebody who needs, perhaps, to be praying every minute for power to do his duty in that very meeting? Or do you keep a sharp look out for any sinner who may drop in early, too, and pray straight through it all? Lord, keep those half-hours before meetings in Thine own hand!

Are you saved from wasting morning half-hours? Those half-hours when one lies partly awake, and realizes sleepily that there will be time to eat breakfast and get to work in time, if we stay in bed just half an hour longer! But will that half-hour dozed away leave you time to feed your soul; time to pray with your lads before they go off to school—with your wife before she faces the trials of her busy day? We have proved in our own experience that the busiest day is less tiring, if that first half-hour is flung into the Godward side of the scale!"

"Isn't you going to give me my little bit of Bible?" asked our astonished four-years-old child the last time we overslept, and had to hurry off without explaining to her the one verse of Scripture we teach her every day. We don't mean to over-sleep again!

"The King's business requires haste," and we can save many a half-hour for it if we train ourselves to quick motions, rapid thought, habits of putting our clothes, and our tools, and our song-book, and everything just where we can lay hands on them.

How many half-hours of thought do we waste, or worse? "Bringing into captivity every thought to the obedience of Christ" means a great deal. It does not allow us to spend time in thinking what we *would* do to the man who had cheated us, if we were not saved. It compels us to bring all our spare thinking to bear on the problem of how to get him saved from cheating.

If you once get saved from wasting half-hours, you will be surprised to find how many of them you can accumulate to give away to the people who need them. The last six weeks have been almost the busiest I have ever lived and worked through. Yet I have managed to crowd into them more odds and ends of help and work for other souls than usual, simply because I knew I was so busy that I dare not waste one moment or one thought. It is down-right sin to be so busy that people feel afraid to tax us with their worries. The work cannot be of God's shaping, if it crowds us so for time that nobody would even think of dropping into our office, or our workshop, or our kitchen, or running round to our house after hours, to get a bit of advice, or ask us to pray with them.

He was a very busy man to whom I once took a budget of difficulties and perplexities, very much as a child takes a hurt finger to its mother, when it knows she can't cure it; but I found the busy man "ready to help."

"Good-bye," I said, as I rose to go. Then, glancing at the pile of letters on his table, I added: "It is good of you to have wasted your time over this."

"That is not what I call wasting time," was his grave answer. It gave me a fresh view of our mission, and made me freshly eager to be saved from wasting half-hours.

£5 5s. IN PRIZES.

WE now announce the first of our series of Competitions. We trust the mental exercise will pleasantly occupy leisure hours. We are aware that we have set our competitors a task which will be no slight test of their ability and ingenuity, but they will feel all the better pleased when they see their names in our list of successful competitors.

A PRIZE OF £1 1s.

is offered for the best Double Acrostics on the names of men well known in—

1. Church and State.
2. Army and Navy.
3. Art and Science.
4. Commerce and Agriculture.

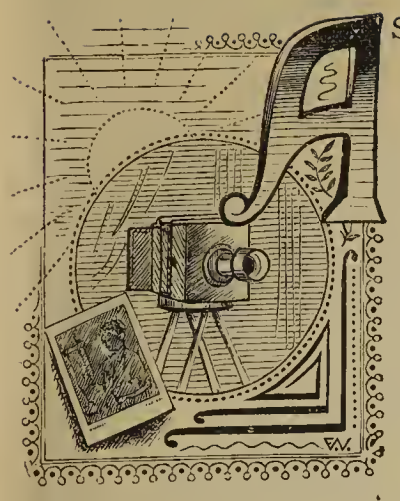
The Primals must spell the name (either surname only, or surname and first name) of some celebrated man in a Christian Church, the Finals the name of some celebrated statesman, and so on. The names must be kept in pairs, as arranged above.

Further: for each pair of names a secondary Acrostic must be constructed, whose Primals and Finals spell some characteristic of the first and second names of the pair respectively. These characteristics may be either substantives or adjectives.

RULES.

1. The Acrostics must be strictly original.
2. Each Competitor must do the Four Acrostics, and the secondary ones to match, but the choice of names is left entirely free.
3. Questions may be asked (stamped addressed envelope for reply); but when sending in their Papers, competitors are required to state how many questions they have asked. Each question will *slightly reduce* the marks awarded.
4. The Competition is open to *all*.
5. As no Acrostics can be returned, copies should be kept.

The Competition closes on January 31, 1888, on or before which date, all Papers must reach the Office of—"A. 1,"—62, Ludgate Hill, London, E.C.



£4 4s. WILL BE OFFERED
in the following consecutive Numbers.

PHOTOGRAPHY:

SIMPLIFIED LESSONS FOR AMATEURS.

By A. H. WALL.

PART III.—FOCUSSING.

S you have now a knowledge of the simple optical and chemical principles which govern photographic operations, you may turn attention to their practical applications, with comparatively greater chance of being successful. Half the failures, at least, in what is now a very simple and easily-attained art, are due to ignorance of How and Why, rather than any want of manipulatory or mechanical skill, or deficiency of intelligence in the operator. The process has been so simplified by the introduction of dry plates, that every one may succeed in taking a photograph of one kind or another; but he or she who understands the principles upon which success depends, ought certainly to surpass in the perfection and beauty of the pictures, the mere happy-go-lucky mechanical operator.

Focussing is done with your head and the camera under a dark cloth, and, as I have already said, either from the back of the camera, with a rack or screw arrangement attached to the lens, or by one part of the box sliding in and out of the other, or by an expanding and contracting arrangement of folds, such as an accordion or a pair of bellows has. Whatever the arrangement, the purpose is the same—that of securing, *in the first place*, distinctness, or sharpness. It is done with your head under a black cloth to secure sufficient darkness, and the view, as you already know, is reversed.

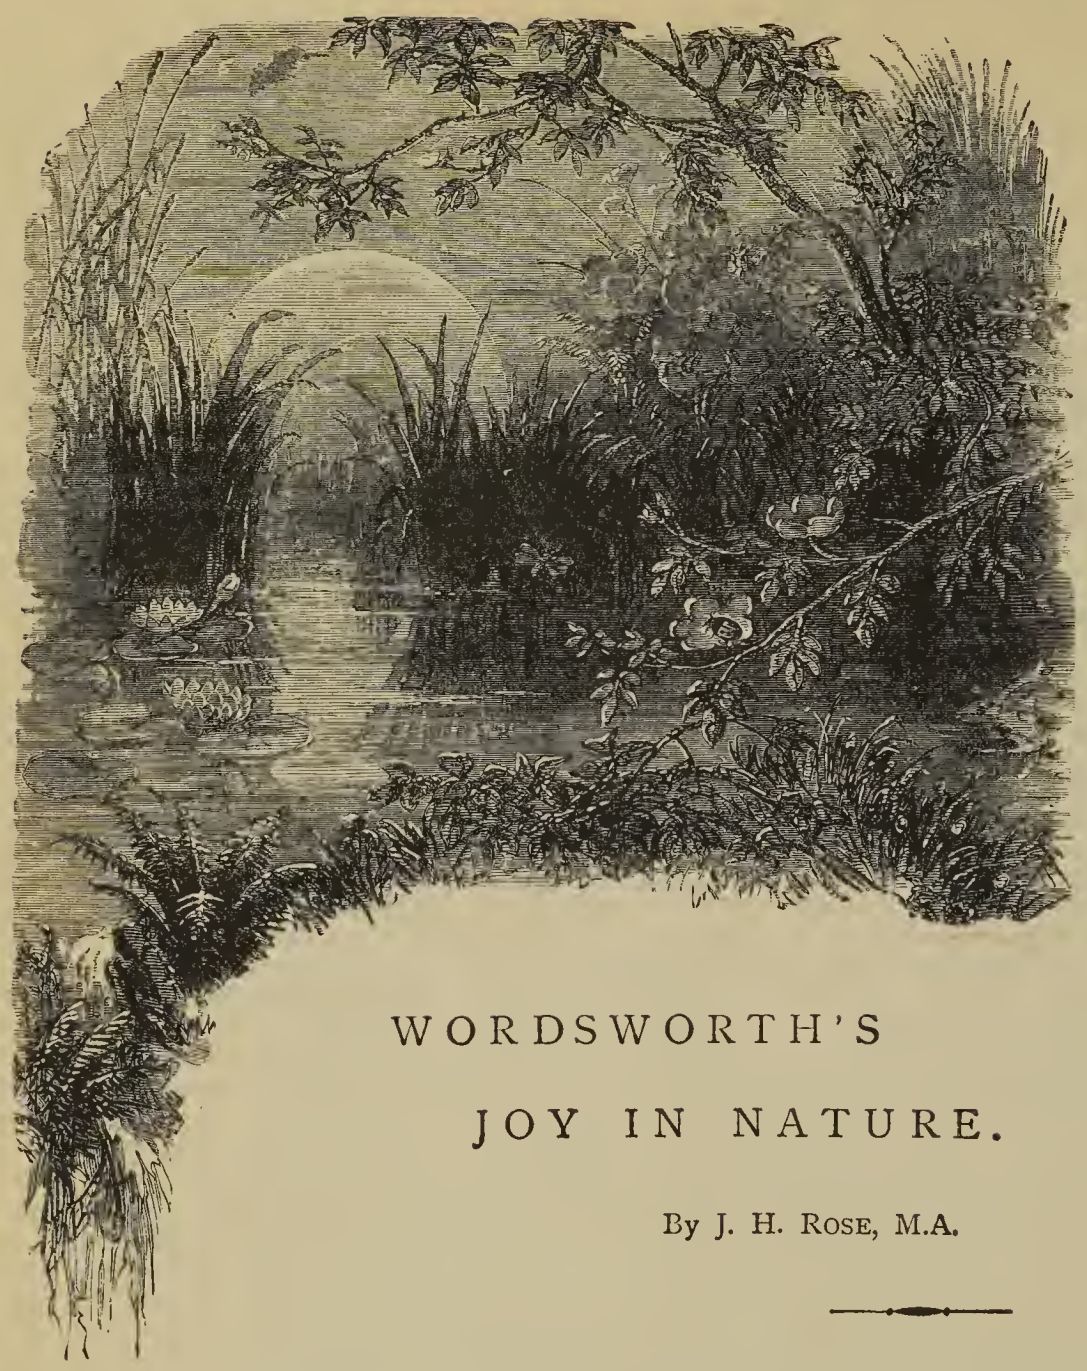
With the better kind of lenses, operators have what are termed *diaphragms*, from the Greek, meaning a partition or "stops;" the purpose of which is to enable you to increase the sharpness of the image, by using only the central, that is to say, the best portion of your lens, and thus stopping out marginal rays of light which are less perfectly focussed. These diaphragms are thin metal plates, made to slide down between the parts of your lens, through a slit at the top, provided for that purpose, and they are perforated with circular apertures of different dimensions, usually from one-eighth of an inch upwards, the smallest giving the greatest degree of sharpness, and of course the least light. As the rapidity of the chemical or photographic action on the exposed plate is proportioned to the amount of light admitted through the lens, the smaller the aperture of the stop, the longer must be the time given for the plate's exposure in the dark chamber, before the opened lens. This exposure varies with the subject and the light's character, and lengthens *pro rata* as the size of the aperture diminishes. As the dry plates are so rapidly acted upon,—some professedly more so than others,—you will find that this increased exposure is not very often a matter of any particular consequence, while the gain in truthfulness of representation is certainly considerable.

Carefully observe the changes in the image on the ground glass, produced by the use of different "stops," and you will glean a very useful preliminary lesson. Presently you may, with even greater benefit, notice with like carefulness differences between photographs of some one subject taken with the different diaphragms.

In some of the cheaper lenses, the stop is a fixture, and instead of being between, is in the front of the lens. For all purposes, except copying from the flat surfaces, such as prints and paintings, this is a disadvantage. It causes not only a loss of light, which means of course chemical power, but optically also it is defective; the pictures it gives are not so well defined or focussed. The disadvantages of the "stop" being fixed, are, that you have but one, that the image is less brilliant, and that you cannot first examine the effect of the image with the whole aperture of the lens open.

"By the skilful adaptation of his diaphragm," says an eminent artist photographer, Mr. Lake Price, "one operator shall, with an inferior lens, make a fair picture; while another, inexperienced in its use, will utterly fail with the most perfect instrument that the optician can furnish. . . . *Time of exposure* and *quality of definition* are entirely dependent upon the proper use of the diaphragm, so the necessity of carefully studying its varying action will be apparent, and also that of so altering the size of the aperture, as may be most appropriate to the circumstances of *light*, size of *reflecting area* of subject, and the *distance* of the lens from it, that not one pencil of light shall be suppressed which could contribute to forming the image correctly, nor any allowed to remain, which, by their obliquity, would distort or confuse the picture." But apart from the lens, there are other focussing conditions which will make or mar your photographs.

Parts of the picture which on the ground glass, when you were examining and focussing it, appeared clear and distinct, will not be so in the photograph; because the colour of one and that of another, having different chemical powers, act so as to alter their relative tones in the chemically produced picture, and make them more alike or less alike than they were in nature. Some large, brilliantly lighted object in the distance, for instance, although on the ground glass it kept its place, by losing atmospheric effect in the exposure, will, in your resulting photograph, come so forward, that even immediate foreground objects appear much further from you than it does, and a more subdued and smaller object in the foreground is made to retire beyond it. This will be especially striking if you chance to have focussed upon the bright and prominent distant object, as most beginners would be tempted to. The colours and luminous variations of objects are indeed the photographer's chief focussing difficulty, and the proper time to think what their chemical, pictorial, and optical effects will be on the plate, is while your head is under the dark cloth. Everything depends now-a-days upon the focussing. You should always devote quite a long time to preliminary drill in focussing, until you could tell why one scene which looked particularly pretty on the ground glass—I am of course not speaking of portraiture—would be a very poor thing as a photograph, and why another, much quieter and less strikingly attractive in the camera, would produce a far more effective and pleasing result. Objects which, in nature, and in the picture given by the lens, stand out round, bold, and distinct, in consequence of their position, lighting, and colours, will often in the photograph be neither one nor the other, because of the optical and actinic (chemical) conditions involved in connection with exposure.



For photographic art is not a mechanical one easily excelled in, but one which requires training and study.

Much will depend upon how the scene is lighted. In the shadowless aspect of a noonday view, the effect may seem very beautiful in nature, but it is apt to be spotty and inartistic in the photograph. When the atmosphere is purplish, and shadows lengthen, and the light grows golden as day declines, the contrasts are less brilliant, and the exposures are longer, because there is less chemical power in the light. But admirable pictures are often then obtained by the skilful and experienced. Good effects are secured most frequently, with the light falling at an angle of about 45 degrees.

The sky being blue, and clouds pearly and white, or softly grey, these are impressed upon the plate so rapidly, that the instantaneous exposure required for them is not sufficient to ensure objects beneath them being properly impressed on the plate. To take sky and landscape together, is therefore regarded as a photographic triumph.

Lakes and rivers reflecting sky and cloud, and being also very strongly luminous, present like difficulties, when in association with objects far less luminous, and of colours having much slower chemical action—such, for instance, as foliage, etc.; but when the colours on the banks are reflected in the water, or the colour of its bed affects it, the conditions are altered for the better, and the task of properly photographing water becomes easier. Motion in leaves, waves, and grasses, cattle and figures, is often an element of difficulty; substituting, for the clear, variously characteristic outlines of trees, the sharp, clear-cut ripples and wave-curves of streams or lakes, and forms of men and animals, blurrings and patches, and eccentric shaped spots of light and dark, which represent nothing but optical defects and chemical shortcomings. And all these things have to be seen and partially mastered on the focussing screen, as preliminary to more complete mastery in the exposing and developing.

The easiest subjects, and those which the beginner should select for his early efforts, will be rocks, ruins, wind and water-mills, cottages, barns, and farmhouses; groups of foreground plants; a motionless figure; ruined buildings; boats ashore, amidst their fishing and sailing gear, with a boatman or two, if you can induce them to be quite still, and not look at you or the camera. The first thing you photograph might well be a plaster bust or statue, as these are easiest, presenting no difficulties of colour, no polish of surface, or possibility of movement. Put the cast in a quiet, soft, uniform light, with fairly well-defined cast shadows. By cast shadows are meant shadows thrown by projecting surfaces. Other shadows are those which are caused by their retiring from the light.

WORDSWORTH'S JOY IN NATURE.

By J. H. Rose, M.A.

Part II.

In the first Paper we noticed some passages which described Wordsworth's youthful rapture amongst the scenery of the Lakes. We must now turn our attention to poems where his Fancy and Imagination come into play. He encountered no small amount of ridicule and opposition in his day, because he named many of his poems, not according to their outward form, but according to variations in his treatment,—thus, "Poems of the Fancy," and "Poems of the Imagination;" and he was the first great poet after Pope, who maintained that the outward form of poetry was far less important than the feeling which it enshrined.

Wordsworth had many talks with his friend Coleridge about the difference between Fancy and Imagination. They concluded that Fancy is a lighter and sportive kind of Imagination. Fancy playfully seizes on outside resemblances which the *mind* can feel or prove. The "Midsummer Night's Dream" is in the realm of Fancy; "Hamlet" is in that of the Imagination. But if you wish to see examples of this contrast, read over some of Wordsworth's "Poems of the Fancy," and then those of the "Imagination." Notice that he has a poem to a Skylark in each class; that the treatment of the one is bright and joyous, whereas the other closes with a comparison which our brain has to think about, before we see its full beauty :—

"Type of the wise who soar, but never roam,—
True to the kindred points of heaven and home."

Now, there is no external resemblance between the skylark and the wise; but the poet's flash of thought shows us a hidden resemblance, viz., that the wise in all their soarings of thought and learning, though they have their aspirations after heavenly bliss, are kept from aimless wanderings by the home ties of love and duty. It is one of the highest aims of poetry to set forth in a beautiful way, great and inspiring thoughts like this.

Of Wordsworth's "Poems of the Fancy," I would also recommend the study of the two on the Daisy, the two on the Celandine, the Redbreast, the Wren's Nest, and the Kitten and Falling Leaves. Every one of these shows what Wordsworth has well called—

"The harvest of a quiet eye."

For what are the subjects? Most ordinary and common-place, some may say, with a half sneer! Quite so; but that is the charm of these idylls or little pictures. Their subjects are so very ordinary, that we have lost sight of their beauty; but when a poet describes them in smoothly tripping verses, and shows us what we *may* all see if we open our eyes, surely he gives to us all a new source of health and contentment. Our poet does not merely photograph the scene; but, as an artist, he makes it *live* in our thoughts by adding some touch of human truth.

Thus, in the first poem to the Daisy :—

"In youth, from rock to rock I went,
From hill to hill, in discontent
Of pleasures high and turbulent,
Most pleased when most uneasy;
But now my own delights I make,
My thirst at every rill can slake,
And gladly Nature's love partake,
Of thee, sweet Daisy!"

This little flower, then, taught him to rise above the "glad animal pleasures" of his boyish days, and to reach a more regular and restful joy in natural scenes; and if, in his mature years, "stately passions" and ambitions burned in him, he felt a rebuke whenever his eye chanced to turn on the modest flower, so beloved by all poets down from Chaucer's time.

You will notice that Wordsworth cares little for garden and hot-house flowers. He scarcely notices them in his poetry; but he often sang the praises of the foxglove, primrose, daffodil, daisy, and, above all, of the little celandine. Why? Because they come fresh from Mother Earth without man's interference. The poet himself confesses, that for thirty years or more he had seen the celandine, before he really found out its beauties; for,—

"While the pătient primrose sits
Like a beggar in the cold,
Thou, a flower of wiser wits,
Slipp'st into thy sheltering hold;"

and its glossy face, scattered broadcast in the earliest Spring, is Nature's sermon to us, to turn gloom into cheeriness,—

"Telling tales about the sun,
When we've little warmth, or none."

In fact, Wordsworth's eye was always for the happy and inspiring side of Nature; he does not treat of her tempests and earthquakes; but he fixes his eye rather on her kindly influences in our English climate—for truly we are more favoured in climate than our love of grumbling will admit. Thus, in the "Wren's Nest," he gives us a pretty picture of the primrose leaves growing up to hide the tiny nest from intruders; and though falling leaves often bring to us sad thoughts, yet the sport of the kitten leads him up to the cheery wish :

"Spite of care, and spite of grief,
To gambol with Life's falling leaf."

These are a few of the easy and sportive lessons which Wordsworth's fancy threw off as he wandered about his dales; but more serious and profound thoughts came besides, and in the next Paper we must notice some of the lessons which Imagination saw—

"By observation of affinities
In objects where no brotherhood exists
To passive minds."

It is just this which marks the difference between poetical and prosaic minds: the latter are passive in this matter; they see no resemblance between Nature and human life; in fact, they see resemblances only between things which are as much alike as two peas.

Those, however, who wish to enjoy good poetry (as distinguished from mere verse-making) must try to get rid of this rigidly accurate, yard-measuring spirit, and look beneath the outward show of things.

Let us close this Paper by noticing a few poems, which are not grouped under "Poems of the Fancy," but under "Poems referring to Childhood," and "Poems founded on the Affections." (What a pity that Wordsworth gave such long, cumbrous titles to his poems!) In fact, a notice of our poet's easier teachings would not be complete without a reference to some of these poems; but, because they refer to the period of childhood, you must not suppose that they are childish poems, for they were composed during the best period of his life, between the ages of twenty-eight and forty. For though these poems contain the "Idiot Boy," which Byron so laughed at, saying,—

"That all who view the 'idiot in his glory,
Conceive the bard the hero of the story;"

yet this group also contains "We are Seven," and "The Pet Lamb," which every one knows, or ought to know. These two little

poems beautifully set forth teachings of "natural piety" and kindliness; and in the grander poem, "Michael," is a touching account of one of the "Annals of the Poor."

Mr. Matthew Arnold has pointed out the wonderful pathos, both in the thought and rhythm, of the lines near its close:

> "That many and many a day he thither went,
> And never lifted up a single stone."

If you read the poem, you will understand the pathos of these lines.

For a short study of Wordsworth's best poetry, I would suggest the following plan:—Begin with the poems last named in this Paper, referring to Childhood and to the Affections; then pass on to a study of the poems which I select from the Poems of the Fancy, and of the Imagination, and these will lead you up to the "Ode to Duty," and the "Ode on the Intimations of Immortality."

BISHOP HANNINGTON:

A NOBLE LIFE LAID DOWN.

By F. Burton Irving.

Part II.

WORK AND DEATH IN AFRICA.

"Speed Thy servants, Saviour, speed them,
Thou art Lord of winds and waves;
They were bound, but Thou hast freed them,—
Now they go to free the slaves.
Be Thou with them:
'Tis Thine arm alone that saves."

JAMES HANNINGTON'S voyage from England to Aden was made in the *Quetta*. As usual, there was a mixed company on board—worldly men, profane and irreligious men, as well as Christians of differing creeds. We find mention made of Congregationalists, Baptists, Churchmen, and Wesleyans. Here Hannington's catholicity came to the light, and he evidenced, by his courtesy and charity, that when a man is in close fellowship with the Master, he is sure to live in peace with all the Master's servants. Hence he met with co-operation—not opposition—when he made it his first business on board to go to the captain and petition for public prayers, which request was granted.

A good deal of his time on the outward voyage was passed in studying Swahili, as a qualification for usefulness in the interior; for Hannington knew what was essential and valuable, and he was not the man to have to seek his straw when he wanted to make his bricks.

David of old spent many years, before the erection of the Temple, in gathering materials, and it would be well for young men the world over, if they would copy this example, spend less time in dreaming of duty, and more time in preparation for it. Grinding at rudiments of grammar, and studying ways and means, with an eye to the executive, is not heroic business, but it is a sure foundation. No man is likely to do acceptable mission work, at home or abroad, who neglects this primary delving at the commonplace and needful.

Even doctors of divinity, medicine, and science, have had to commence their career by a study of the alphabet; and the dullard who despises arithmetic at school, is not likely to become Prime Minister afterwards. The royal road to every position of power and usefulness is the road of hard work, and the first Bishop of Eastern Africa began his by studying the intricacies of Swahili.

From Aden to Zanzibar, Hannington voyaged in a dirty vessel called the *Mecca*, which, in addition to being dreadfully overcrowded, swarmed with cockroaches, black ants, and bugs; but the discomfort did not end here, for stormy weather, bad food, bad management, and sea-sickness were added, and the good missionary wore clothes for three days without an opportunity of changing. Thus, before he set foot in Africa, the discipline of suffering began, which was to continue with little intermission, save the brief European visit necessitated by broken health, until the end. Now and henceforth he was in his measure like the great apostle of the Gentiles, "in perils of waters, in perils of robbers, in perils by the heathen, in perils in city, in wilderness, and in sea."

On landing, he had to make acquaintance with the fact, that travel into the African interior must be accomplished in a very laborious fashion. No train, no tram, no steamboat—not even the old lumbering stage-coach to help his progress; neither good roads nor yet good halting-places; and, without any means of transport but native porterage (generally clumsy and frequently untrustworthy), he must convey on every journey, almost all the stores a vessel would need when arranging for a voyage; viz., clothes, tinned stores, medicines, tools, tents, guns, ammunition, with various other et-ceteras, and, as in this special case, a boat in sections. He was often oppressed by the lethargy of his African helpers, and found it notoriously difficult to set anybody or anything in motion; to English notions, alas! it was even then "motion without progress."

But we need not linger on this usual trouble of procuring porters, or of weighing loads, except to say that the maximum burden for each being seventy pounds, much calculation was necessary in the adjustment of the several packages. Therefore clever generalship, and a knowledge of needs on the route, were as essential to the missionary's success, as Bible lore, and an insight into tribal vocabularies.

So much for the harassments of the start; now for a brief description, from diary and letters, of some of the less understood hardships by the way. At Ndumi the drinking water was so full of filth, it could have been "cut with a knife;" and Hannington writes further, "an English cow or Irish sow would have turned from it." This explains why, on similar occasions, he went "three or even four days at a stretch without drinking anything."

Next we find him battling against a forest fire, dashing through burning grass as high as his head, and then, "scorched and dripping with perspiration," urging on other workers, with all possible lung power, to beat back the foe with green boughs. "Suffering severely from black ants; nearly driven mad with pain by contact with the short red hairs of a malignant bean; volumes of dust, swamping beds, blankets, boxes, buckets, everything—that night we slept in a dust-heap; this is the kind of thing all the way to Ugogo. It is bad enough in a hot climate to have dust in your hair and down your neck, but when every mouthful of food grates your teeth, I leave you to imagine the amenities of tent life."

Again: "Tangles overhead, rough, stony ground below, for three miserable hours we stumbled on, not without many cuts and bruises. . . . Fever, violent sickness, intense pain in every limb, burning thirst, nothing to drink, tongue so hard and dry that when I touched it with my finger, it made a noise like the grating of a file . . . too feeble to stand, carried in a hammock by two men."

In the dry season "leafless boughs form no protection against the burning rays of the sun. . . . We came upon skulls, broken boxes, and other signs of a fight with robbers."

At Wanyamwezi there was a native dance in honour of Hannington as "great master." He writes: "We grew pale with the ceaseless thudding of the drums." At length, when the dance was over, he showed the women a doll he had with him, and undressed it, to illustrate the way in which the white sisters clothe themselves.

In September, 1882, he had an attack of acute rheumatism, which, added to previous fever and dysentry, brought him to the gates of the grave; but, in the weakness of this serious illness, he would sit up in bed to write a book that should be helpful to the Missionary Committee in London, and also to men who, like himself, embarked in the enterprise of preaching the gospel to the heathen in Central Africa.

On Christmas Day, 1882, though still very ill, he celebrated Holy Communion at eight o'clock in the morning. For dinner he killed a kid, while Mr. Ashe made a pudding from flour, not only musty, but full of beetles and fermented raisins. This pudding, such as it was, stuck to the bottom of the sauce-pan, and was turned up under-boiled. Much is suggested of previous privation on the score of diet, when he can style this wretched mess "a real treat," and add: "I cannot remember ever to have enjoyed a Christmas pudding half so much."

With indomitable courage he was still pursuing his journey, though, after leaving Kagie, he had to write in his journal: "Very ill with dysentry and violent internal pain; my liver, too, is in such a state that I have to walk with my hands tied to my neck, to prevent my arms moving, as their least motion gives me intense pain." Such experiences went on from bad to worse, until he

reached Msalala, when, fainting from suffering, he had to confess that he was "done," and reluctantly consent to return invalided to England, where, on the tenth of June, 1883, he was received with joy and thanksgiving, as one "alive from the dead."

As soon as he recovered health, he spent himself, without stint, in advocating the claims of the Church Missionary Society on home platforms; and six months later, the fifth of December, he penned a jubilant letter, containing six "hallelujahs," because the doctor said he might resume work abroad. Afterwards, when offered the bishopric, "he took it as a sign from God that he had work to do for Christ in Africa, and could no more say 'NO' than did Gordon when he went to Khartoum."

HOMELY HOBBIES.

RECREATIONS IN GEOLOGY.

By W. H. HARRIS, B.A., B.Sc.

NO. I.—INTRODUCTORY PAPER.

ONE of the writer's friends—a man who has worked hard for more than thirty years at one of our most trying professions—resolves, at considerable intervals of time, to give himself the mental diversion of reading some popular novel. With this intent, he goes to a large library to select his book. Over and over again he has been known to come away, after a lengthened scrutiny of the catalogue, not with any work of fiction after all, but with a volume on some branch of science. If jested with on the breakdown of his resolution, he is apt, in a half-apologetic tone, to plead that it was so difficult to pick out any romance worth anything; but, if twitted with the dryness of his story-book, he is apt to fire up, and say that no efforts of human imagination can vie in interest with the marvels of Nature. Moreover, he boasts that he has this further advantage over the novel-reader, that whereas, when the latter reaches the end of his sensational plot, he has to acknowledge to himself the unreality of all the characters and the conversations, the student of science can rejoice that all the wondrous incidents, the changes, the chances, the "situations" he meets with, are *realities* capable of verification, which repeat themselves in miniature all around him. He is right, too; and we have no hesitation in recommending our readers, if in need of mental recreation, to take up, with more or less thoroughness, according to their opportunities, some natural history pursuit.

By way of putting them on one such track, we intend to furnish a short series of Papers on the oldest, the most comprehensive, and by no means the least interesting, of nature-volumes. We refer, of course, to the history of our earth's "crust," or "rind." As a science, it is called geology. Though its pages are the most ancient, though they have been everywhere under the foot of man since his first appearance on the globe, and though, for hundreds of years, he has been dipping, for various purposes, into many leaves of this great book, the history itself is one of the latest written by pen and ink. It is true that various attempts at a connected narrative have been made, but these proved abortive until the present century from several causes. It is not necessary now to enter into a discussion of these reasons; but there is one which must be mentioned, because its removal not only marked a new era in the science, but because it affords the possibility to any one to become now a searcher and a finder in this field of truth. The circumstance to which we allude, is the doing away with a fundamental error of the early workers in geology. To them it soon became evident that past changes of the original position had taken place, in many *strata* or beds of rock; that whole species, genera, and even types of plants and animals had passed away for ever from the earth, to be succeeded by altogether new ones, which in their turn had yielded to others of dissimilar nature. To account for such revolutions in the earth's history, it was thought necessary to call in the supposed occurrence of tremendously destructive agencies—earthquakes, volcanic eruptions, floods and catastrophes vastly exceeding anything within the experience of man. The Noachian deluge was credited with a force inconceivable in violence and extent, and all sorts of impossible powers were attributed to the land and water of the globe. It is one of the scientific glories of our nation, that these delusions and mistakes were corrected by an Englishman. To the late Sir Charles Lyell, students of geology are supremely indebted for showing how all the marvels to which we have referred can be accounted for by agencies at work all over the globe at the present day, and without any enormous exaggeration of their actual potency.

Now, it is this circumstance which makes geology fit to be taken up as a "homely hobby." Hundreds of interesting facts connected with this science lie round about us. In our daily walks and journeys, in our holiday rambles in our own country and abroad—nay, in our houses and our *homes*—there are plenty of subjects for investigation.

Further, just as we may enter on historical studies piecemeal, taking an incident here and there—a biography from one and another period; the establishment of this principle and that in one century and another; and by this means may lay a good foundation for a comprehensive understanding of the growth of our nation, and the development of our political institutions; so, in geology, we may direct our attention at first to points more or less distinct, and gather from them facts and principles which, later on, will enable us to grasp the whole subject more widely and connectedly.

To illustrate our meaning, we may, for instance, find out what we can of the history of the soil of our gardens and fields; of the gravel of our paths; the bricks of our houses; the slates of our roofs; the mortar of our walls; the materials of our mantelpieces and fire-place jambs; the coal of our grates; the stones of our pavements; the iron of our locks and keys; the water of our wells and cisterns; the gold and silver of our coins; the precious stones of our jewellery—all "homely" enough subjects; and when we have obtained reliable outlines of knowledge on these matters, we shall have laid a basis on which we may easily erect a structure of scientific value.

There is another point of immense importance, to which immediate and definite allusion must be made. In order that all geological phenomena hitherto ascertained by men should be explicable on principles, and by forces, still manifestly at work, it became necessary to extend enormously our ideas as to the period during which this world has existed. In fact, just as the development of the science of astronomy led to an indefinitely great enlargement of the one of our elementary conceptions—that of space—so the progress of geology has induced a similar enlargement of our ideas of the other—that of time. Moreover, just as the facts insisted upon by discoverers and reasoners in the celestial sphere brought down on them charges of heresy, and even of atheism, so, also, equally grave objections were taken to the conclusions of workers at terrestrial phenomena and questions. It lies outside the scope of our purpose to reconcile the various cosmogonies or theories of creation with that given in the sacred Scriptures; but we may make one or two remarks on this matter for the removal of difficulties which might otherwise be felt.

We say, first of all, that most undoubtedly the 4,000 years of the formerly received chronology, as the extent of the earth's age, must not only be given up as utterly inadequate for the explanation of scientific certainties; but such a period can be considered as, proportionally, little more than the space traversed by the minute-hand of the geologic clock, going uninterruptedly for a thousand years. If we are asked how, on any thinkable theory, we reconcile such a statement with the Biblical account in Genesis I., we answer that the words: "In the beginning God created the heaven and the earth," supply a period long enough to include any number of ages of ages. If asked, further, how far science and Scripture are at variance with respect to subsequent operations of Divine energy, we reply, first, that the seeming discrepancies have greatly diminished with a better understanding of the Word of God; and, secondly, that the correspondences between the two, thus far made out, are so remarkable, that it appears to us perfectly incomprehensible, from what we know of ancient science, that the unaided intellect of man could, in the time of Moses, have reached conclusions so much in accord with the discoveries of modern investigators—the heirs of the knowledge of all the centuries subsequent to the days of the inspired Hebrew writer.

Let none of our readers, then, be staggered by any so-called contradictions between what man has found out and God has revealed. The divinely written books of Nature and Revelation cannot be radically opposed in their teachings. We may err in our interpretations of the one or the other, or even of both; but the truly scientific method is to collect and collate all ascertainable facts, and to wait in patience and assurance for the theory which shall embrace and explain most or all of the phenomena. This is the mental attitude in which we shall conduct our story of some of earth's wonders, and it is that which we recommend with unfaltering faith to our readers.

CHESS.

By F. F. ROWLAND.

PART II.

ABBREVIATIONS, NOTATION, AND THE TECHNICAL TERMS EXPLAINED.

NFERRING that our students have become thoroughly acquainted with all the moves, as given in our last, we will at once enter on the notation, so that what we will have to say hereafter may be more readily understood. Our chief aim is to impart a thorough knowledge of the preliminary steps, and if anything should arise which may not be quite clear, we should be pleased to answer any inquiries sent to us.

The lines running across the board are termed *ranks;* those running up and down *files;* and those in a slanting direction, *diagonals.*

The abbreviations are as follows :

K for King.	sq. for square.
Q „ Queen.	ch. „ check.
R „ Rook.	dis. ch. „ discovered check.
B „ Bishop.	dbl. ch. „ double check.
Kt „ Knight.	en pas. „ *en passant.*
P „ Pawn.	x. „ takes.

The squares of the board are numbered from 1 to 8 along the files, and are called after the pieces which occupy the first rank at the beginning of a game. For instance, K stands on Ksq., Q on Qsq., KB on KBsq., etc. The square in front of the K is K2, the one beyond it is K3, etc.

The diagram we give, shows the squares numbered from White's side only; but it must be borne in mind that they count from Black's side likewise. The black K's square is the white K's 8th, his 2nd is the white K's 7th, etc.

The object of the game is to try to *checkmate* the opposing King, that is, to hem him in so that he is unable to move, or escape by the interposition of a man or capture of the attacking foe. Any squares the men may be able to move to, are *covered* or *attacked* by them; and if the hostile king should be on any such square, he is in *check.* To give check, the player moves a man to a square, from which it attacks the one occupied by the adverse K. In doing so, he must give his opponent warning of the attack by saying "check;" then his opponent must either move his K out of check, interpose a man, or capture the checking one. If he is unable to do any of these things, he is checkmated, and his game is lost.

The King is the essential and vital piece, and, therefore, the chief object of attack and defence. To be more explicit, we will say that each player's object is to compass the capture of his adversary's King. True it is that, as a conventional mark of respect shown to his majesty, the King is not removed from the board, as are the other men when captured. With the King it is sufficient, according to the laws of chess, to aim such a blow at him as he cannot parry, repel, nor avoid. Every beginner should play as though the King were to be captured.

While duly looking to the safety of his own pieces, he should never rest content with standing merely on the defensive, but should make a spirited attack on his opponent.

WHITE.

CRISP CORRESPONDENCE

AND

ODDS AND ENDS.

E. M.—Will any reader inform E. M. how stammering may be remedied?

Willie.—A quiet walk with a Christian friend on Sunday afternoon may not be otherwise than helpful in itself. But, since Sunday afternoon is made by thousands an occasion of pleasure-seeking, should not Christians avoid what must certainly give encouragement to this? Further,—are not the hours of Sunday afternoon too valuable to spend thus? Can you not teach a Sunday School Class,—or yourself join a Young Men's Bible Class,—and thus lead other young men to join? Or, why not go out tract distributing? The question is not so much one of right and wrong,—but of using to the best advantage for God, hours entrusted for His glory. We quite agree with you as to the wearing of flowers on the Lord's Day.

Sanitas.—The ventilator in the chimney is a very inexpensive contrivance,—a perforated piece of iron let into the wall above the fire-place, and about six inches from the ceiling. It relieves the room of much warm and impure air, which, as we know, is pressed upwards by the cold air entering by the door and windows. The Table of Expenditure in our first Number was not intended to be exhaustive, but rather suggestive, as would be seen by the omission of many items of such ordinary and necessary use as tea, coffee, soap, etc. It must also be borne in mind, that the price of almost every article varies widely, according to locality, and also according to the experience and skill of the housewife in purchasing.

Eine Unzufriedene.—Your letter has interested us intensely; we understand your yearning to dig more deeply into God's Word. Breathe that longing into your Father's ear. Surely He will delight to satisfy your soul. Plead for the Holy Spirit's teaching; do not give up the consecutive reading of your Bible—straight through from cover to cover; then you will never be perplexed what to read next. Finally, always have a definite subject on hand to be studied with a Concordance, or some Scripture character, about whom should be gathered together every reference or allusion. This will unfold continually to view the hidden treasures of God's Word; and, as you feed thereon, you will grow thereby. Especially make the daily portion the subject of your communion with God; when He speaks to you, respond, pray over it, speak of it with God.

YOUNG MEN'S DEFENCES.

THE famous Brooklyn Tabernacle was recently crowded early one Sunday to hear Dr. Talmage's sermon on "Young Men's Defences." The popular American preacher read for his text the words: "And the Lord opened the eyes of the young man." (2 Kings 6. 17). Dr. Talmage used the text as a basis on which to build a sermon to young men, his object being to show how young men might be defended from the snares of the world, and their lives made successful. The first, and, as he said, most solid defence was a good home. The home of piety and prayer, the home of sad, it might be, but still sacred memories. Such a home, well remembered and fondly cherished, was, and could not but be, a powerful defence to the young man.

A second defence was industry, or industrious habits. There was the young man who, not finding success coming fast enough, puts his hands in his master's till. There was the young man who, by way of exercising his pen, learned to copy his master's signature, and did it once too often. All these were in error, as they generally found to their cost. What was wanted was industry.

A third defence to the young man was a sacred regard for the Sabbath day.

A fourth defence was a high ideal of life. It was all-important for a young man that he should have a purpose—a preconceived plan. The young man was about to build. It was for him to say whether the finished structure was to be a Tartar's tent, or a St. Mark of Venice. There were those who, like the foolish mariner, went to sea without a chart, sailed without a guiding star, and who sought no harbour. Such could come to no good.

The first of a series of twenty-three Sunday night Evangelical Meetings for college students only, was held recently at Dockstader's theatre, New York. These Meetings are the result of a mission of Professor H. Drummond, of Edinburgh, to the Institutions of learning in the United States, advocating a Union Association of American colleges. Mr. Chauncey M. Depew, who addressed this Meeting, said that one of the intents of the Association was the correcting of false notions of manliness, now prevalent in colleges, and to convince students that true manliness does not lie in drinking, gambling, and sensuality. He said he never yet knew of a young man who kept his mother's Bible about him who went to the bad.

An immediate result of the Meeting was the organisation of the Christian Association of Columbia College.

There are 234,000 young men in London between the ages of 15 and 23.

In Mexico, it is the custom to address people of both sexes by their given names.

The Young Men's League of the Emmanuel Baptist Church, Brooklyn, has established a free reading room in one of the main streets of "the city of churches," where many advantages will be offered to young men.

ST. PATRICK, THE APOSTLE OF IRELAND.

WHO was St. Patrick? Comparatively few persons are able to answer this question, except in a very superficial manner.

A doggerel well known in Ireland, says:—

"St. Patrick was a gentleman,
And came of decent people."

That fact has still some charm, even in our republican times. For, notwithstanding the denunciation fulminated by noisy demagogues, the appellation of "gentleman" is still held in honour amongst our working classes.

In his *Confession*, or *Autobiography*, St. Patrick states that he was of "noble faith," that his father was a "deacon," and also a "decurio," or local Town Councillor, in his own locality. His name was Colpornicus. The grandfather of St. Patrick was also a clergyman, a "presbyter," named Politus. In all ages, the ministers of religion have been looked up to as the leaders of men, and St. Patrick's forefathers belonged to that noblest of all professions.

It is generally thought that St. Patrick began his work in Ireland in A.D. 432. The place of his birth has long been a subject of controversy. Scotland, France, and Ireland have all claimed the honour of being his native country. It is now generally believed that his birth-place was Dumbarton, on the Clyde. He was taken captive at the early age of sixteen, with a thousand others, and brought over to Ireland. Irish pirates at that time often made descents on the Scottish coasts.

St. Patrick speaks of his captivity, as having been a punishment for ungodliness and indifference to the teaching he had received in his youth, and for his inattention to the offers of salvation made frequently to him by his parents in his own home.

The captives taken in this raid, were dispersed amongst all the nations of Ireland. St. Patrick, having been sold as a slave, occupied a miserable position in the midst of a strange people. Of him it might almost be said literally, that "he was sent into the fields to feed swine." But in this low state, the Lord revealed Himself to His poor, sinful servant, and had pity on him, and comforted him "even as a father does his son."

It was because the Lord had this mercy on him, that Patrick felt unable to keep silence, but was forced to declare the great mercies of the Lord in the bond of his captivity. He felt that after the chastening he had received, he was bound to exalt God's wonderful works before every nation under the whole heaven.

In his *Confession*, which is the name given to the writing which is virtually his Autobiography, he expounds briefly the Gospel, which he had learnt, one might almost say, not from men, but through the study of the Word, by the teaching of the Holy Spirit. The instruction which he had received in his youth, came home to his soul with great power. He says, "He has poured upon us the abundance of His Holy Spirit, the gift and pledge of immortality, made us sons of God, and joint heirs with Christ, whom we alone adore, one God, in the Trinity of His sacred name."

Patrick confesses that he was deeply ignorant. He speaks of himself as a sinner, the rudest and most contemptible. The thought of his unworthiness often oppressed him. But he wished his brethren to understand the longing of his soul, and his desire to testify to the goodness of the Lord, and to bear witness to the power of Divine grace, like David, Paul, and the Apostles of the Lord. He wrote his *Confession* in order to declare what the Lord had done for him.

He seems to have been long uncertain whether he should commit his thoughts to writing, because he feared the scorn of men. He was fully conscious that he possessed little learning in both secular and sacred things. He was obliged in Ireland to speak in a language which was not his mother tongue, while his knowledge of Latin grew less by constantly hearing and speaking Irish.

He evidently wrote his *Confession* in his old age. He lamented that he had neglected the opportunities of learning languages in his youth, but he pleads as his excuse, that he was only a boy when he was taken captive.

"I blush to-day to expose my unskilfulness." He often felt that he could not express himself with clearness, even when stirred up by the Spirit. Though he well understood what he wished to say, he had not the words "with which to express his thoughts as well as he desired." But he comforted himself with the reflection that it was written: "A stammering tongue shall speak plain," and he felt strongly, with St. Paul, that all Christians should be the epistles of Christ.

In his weakness he had been made strong, by the power of Divine grace. God had used him to do a mighty work, although he had been a rustic; a fugitive; unlearned; and, until humbled, like a stone lying in the mud. He therefore boldly exclaims to those who cavilled at him: "Be ye therefore astonished, both great and small, lords and learned men, that He has aroused me, a fool, to perform the work of Christ in Ireland." He goes on to say that Christ had inspired him to preach the everlasting Gospel with humility, as long as life was granted to him.

THE SHIELD;—PROTECTION, DEFENCE, VICTORY.

By Mrs. Halliday Douglas, Author of "Under the Old Oaks; or, Won by Love," etc., etc.

IN olden times we know that no warriors went to battle without the shield. They were of different forms at different periods, and were used for defence, chiefly in warding off the missiles of the enemy. At one time, the shield worn by the Greeks and Romans was circular in shape, the body generally made of wood, covered with leather, or with plates of brass (1 Kings 14. 26, 27), or sometimes of gold (1 Kings 10. 17); then, about the third century, the shield took the triangular shape, so well known to us in pictures.

The word "shield" is used in three ways in Scripture. First, as a protection. When God wishes to strengthen the faith, or allay the fears of His people, He reminds them that even as a shield protects the body, so does He cover His loved ones, shielding them from the danger to which they are exposed. Thus, He reminded Abram, in a vision, saying: "Fear not: I am *thy shield*" (Gen. 15. 1). It is in this sense that the Psalmist so often uses the word, saying (Psa. 3. 3), "Thou, O Lord, art a shield for me;" and again (Psa. 5. 12), "For Thou, Lord, wilt bless the righteous; with favour wilt Thou compass him as with a shield." Blessed protection! If we are shielded and protected by our God, what evil do we need to fear? What darts of the enemy can reach us?

The word is also used specially as a *defence*—not merely as a protection, but as a weapon to be used in fighting with our enemies. In this way Bunyan uses it, when he tells how Christian, when sorely beset in the "Valley of Humiliation" by the arch-fiend Apollyon, caught the flaming dart which his enemy threw at him, on the shield which he had in his hand. We, too, need so to use our shield, which is given to us to quench all the fiery darts of the evil one (Eph. 6. 16); and, knowing that Jesus, the "Anointed of God," is our shield (Psa. 84. 9), we can just put Him between ourselves and our great foe, and then we know that Satan's missile cannot pierce us.

"What do you do when Satan tempts you?" asked the beloved Scotch evangelist, Mr. Hay Grant, of Arndilly, of a little boy who had lately given his heart to Christ; "do you fight him?" "Weel, no, sir," was the reply; "I used to try that, but noo I jist rin ahint the Saviour, and let Him fecht for me." That boy had learned how to use Jesus as a shield; and, in like manner, King David, when pursued by his enemies, besought God to be his shield, praying, "Plead my cause, O Lord, with them that strive with me. Take hold of shield and buckler, and stand up for mine help" (Psa. 35. 1–2).

We read in the Word of God of shields, when battles were over, and victory obtained, being hung up in the temple, and dedicated to God, (1 Chron. 18. 7; 2 Chron. 23. 9; Song of Sol. 4. 4). So shall the redeemed of the Lord, when they stand before the throne, declare that in the battles in which they overcame, the glory was due, not to themselves, but to their great "Shield," who fought for them, and through whose blood they were "more than conquerors."

Ere we end our short talk to-day, let us read together the eleventh verse of Psalm 84: "The Lord God is a sun and shield; the Lord will give grace and glory: no good thing will He withhold from them that walk uprightly."

The words of the verse we have just read were used some years ago, to lead two young girls to the cross of Jesus. They had gone to visit a friend for some days, and there the Lord met them, and revealed Himself to them. They took up the cross, and followed Jesus. They needed the shield, and also the sun, and they got both; and more still, the promised grace was given to them, through years of their earthly pilgrimage, and now both are drinking of the river of life, before the throne of God and of the Lamb, and walking in the full blaze of the glory there.

DEC. 24, 1887. ONE PENNY.

"A.1."

WEEKLY — Edited by MRS STEPHEN MENZIES.

"OONALASKA:" A TALE OF A FAR NORTH LAND.

By GORDON STABLES, C.M., M.D., R.N.,
Author of "The Cruise of the 'Snowbird,'" "Thirteen Hundred Miles in My Caravan," "From Pole to Pole," etc., etc.

"'*Godfrey lives,*' *he said;* '*that is enough for me.*'"

CHAPTER X.

ON SHORE AND AFLOAT.

FOR many and many a long year, it had been the custom with the good folks of Allandene to go to their clergyman for advice in all cases of difficulty, concerning either their temporal troubles, or their deeper spiritual anxieties.

He was an old man, a very old man; he was pastor, and one might say father, of the village. No one ever left his small, old-fashioned study, without some hope and comfort in his heart. He had had to listen to many a strange confession

in his time, and to ease many a conscience.

Old Mr. Lea—for that was this clergyman's name—was bending over his manuscript one Autumn evening, when a lady was announced.

He put a paper weight quietly on his half-finished sermon, and welcomed Mrs. Dennis.

Only a few months had passed since fate had bereft her of her only son, and yet in that brief space she had grown old. She held in her hand a letter.

Mr. Lea beckoned her to the easy-chair, and took a seat right opposite and close to her, so that the light of the French window streaming in, fell right upon his clear-cut, semi-stern, but earnest face, and lit up his long white hair.

There were no tears in Mrs. Dennis's eyes. Perhaps she had been crying, though.

"It is his—my Godfrey's—last letter. He will never, never write again."

Mr. Lea was quick with comfort.

"But he *lives*, Mrs. Dennis. While there is life, there is hope. That thought alone should serve to keep your spirits up."

"He has gone, sir, to a land—or is it but a sea of ice?—where no one can ever follow him, and from which he can never return."

Mr. Lea was silent. He took the letter from the mother's hand almost mechanically, and read it through and through. There was grief and anguish and repentance in every line; the outpourings of a breaking heart, a heart that had lost everything that binds one to this world below. It ended by bidding his mother, his father, and his sister a long and last farewell, and asking for their forgiveness and prayers. The letter was for their eyes alone; with the exception of Mr. Lea, no one else was to see it, or even to know that he had written it. This last injunction, Godfrey hoped, would be looked upon, and kept as inviolate as the mandate of one dying.

Mr. Lea read the letter twice ere ever he spoke, while the mother sat as rigid as stone, her eyes on the face of her pastor.

"Mrs. Dennis," he said at last, "this letter concerns us all; it ought to be read, thought over, and considered by us all."

"Mr. Lea, does he not say it is for our eyes alone?"

"Mrs. Dennis, circumstances alter cases. Poor Godfrey, whom I loved, as you know, like a son, has gone away with the notion that he has slain his friend. Miss Neil, his all but affianced bride, has heard the sad story from Spencer's lips; Mrs. Rae and Mr. Rae are mourning for Godfrey as for one who is dead. There is a gleam of hope in this letter. Mrs. Dennis, you have asked me for advice, and I unhesitatingly tell you that this gleam of hope belongs to us all."

Godfrey's mother sat thinking for a moment, then she slowly rose and walked towards the room door. She turned when half-way, and extended her poor thin hand to her pastor. "Mr. Lea," she said, "I leave it all to you."

Then she went her weary way homewards. The parson sat down again as if to write; but he soon pushed the papers away.

"I have a duty to perform first," he thought; "then my mind will be clear."

A minute afterwards, he was riding on his old white pony, as fast as that somewhat self-willed steed would canter, towards Rae's farm. Spencer was galloping over a field of stubble. When he saw Mr. Lea, he swerved round and came rapidly towards him, though he had a hedge to leap and a five-barred gate. Perhaps his hand was a trifle nerveless, for he did not succeed in raising his horse clear over the latter, and the top bar came rattling down.

"This is your day in your study, Mr. Lea," were Spencer's first words. "You do not break through old customs for nothing."

"I do not."

"You are a good man, and bring good tidings."

"My tidings are there."

Here Mr. Lea handed Spencer the letter.

Joy and sorrow, hope and disappointment, flitted over Spencer's face as he read, like cloud-shadows and sunshine over a Spring landscape.

Which would be victorious—the sunshine or the shadows? The sunshine won. Spencer smiled—a happy and hopeful smile.

"Godfrey lives," he said; "that is enough for me."

He was about to hand the letter back.

"No," said the parson; "restore it to me when you have read it to your father and mother, and to the Neils."

Spencer hardly stopped long enough to say "Good-bye," but went galloping along the road to the village of Allandene.

He found the old man and Mrs. Neil in the parlour, Maggie by the window curtain, Rosa at the piano, singing—yes, singing; but it might truly have been said of Rosa, as of the Irish heroine,—

"She sings the wild song of her dear native land,
Each note that *he* loved awaking;
Ah! little they think who delight in her strains,
That the heart of the minstrel is breaking."

Changed was Rosa? But little. A little paler, perhaps, a little sadder-like than usual; but her paleness and sorrow only added to her extreme beauty. Maggie and she were all in all to each other now.

They both rose to welcome Spencer. He plunged at once *in mediis rebus*.

"I do not yet know," he said, as he refolded the letter, and put it carefully away, "how it is to be done; but I, who am the cause of this great grief to you all, am going to seek for my cousin. I am going to bring him back to you, Maggie; to his mother; to you, Miss Neil, whom I have so bitterly wronged, and to us all."

Old Mr. Neil got up from his chair, and shook Spencer's hand.

Maggie only sat gazing out of the window at the setting sun and the falling leaves.

Rosa was quietly weeping.

Perhaps there was moisture in Mrs. Neil's eyes, for she wiped her glasses before she spoke.

"I am this old," she said, in her queer Scotch phraseology—"I am this old, and I never yet knew of an answer in peace being refused to an earnest, heartfelt prayer. If you go, Spencer Rae, you'll have an old woman's blessing and prayers."

* * * *

The *Oonalaska* was beating round the Horn, about the very time this conversation was taking place in Mr. Neil's parlour at Allandene; but it was morning instead of evening. The ship had got well to south of the Diego Ramirez group of islands. No business there? Certainly she had no right to be out of her course; but she had encountered a gale of wind of hurricane force, and here she was.

It was a morning to make any one shiver; yet the quarter-deck was crowded, and the passengers, clad in their warmest, with cloaks of fur or sealskin, paced rapidly up and down the planks to keep themselves warm.

"The glass is settling down for a blow, I think, Captain Boyd," remarked Desmond, as the gentleman addressed passed him, with Katie Graves as usual by his side.

"Well, my boy, we'll have to take our chance; we have already weathered the biggest gale we're likely to encounter on this side the Arctic Circle—and weathered it well."

Katie looked anxiously into the captain's kindly, trustworthy face.

"You don't think there is danger, do you?"

"No, my child, no," he said, laughing in a way that quite reassured her.

But all that day the wind went on increasing, and the waves waxed bigger and angrier. The ship herself seemed to be getting out of temper with them, judging from the irritable, quick way she plumped her bows into the trough of the seas. Now and then she shipped a sea, that came tumbling, foaming and fretting aft, carrying with it whatsoever lay loose on the decks, and the passengers had to jump on the seats or sky-light, to escape wet feet and ankles.

There were times, also, when the screw missed catch of the sea, and went rattling round in the empty air.

The sun went down with an ugly, yellow-red glare; then the sky looked all solid and black-blue, while the horizon appeared to creep nearer and nearer as night fell.

There would be little comfort at dinner on this particular evening. A glance down into the saloon showed the fiddles already stretched across the table, and the stewards staggering about, apparently very much out of the perpendicular indeed.

Presently Jack Silk was observed coming towards the quarter-deck. His face was longer and darker than usual. The captain went to meet him alone.

"The engineer has discovered a flaw in the shaft, and wants to stop the engines, sir."

But even as he spoke, high above the hissing of the waves and the roar of the rising wind, was heard the sound of a concussion, that seemed to shake the ship from stem to stern. In a moment more, the engines stopped, and the chief came up to make his report.

"All hands make sail."

Yes; there was danger. Every one on board knew that now—even Boy Bates. Yet the ladies were very brave. There was an item of comfort, at all events, in hearing the men rushing about at their labours, in the creak of hoisted yard-arms, the flapping of canvas, the tightening of tacks and sheets, the repeated words of command, the boatswain's shrill pipe, and the song of the busy crew, as they bent every nerve and sinew to the work.

It was fully an hour ere Captain Boyd got down below. His oilskins were shining with wet. But of these, with the aid of a steward, he quickly divested himself, and came forward smiling.

"Sorry to keep dinner waiting," he said; "but we'll be easier now."

"And quieter as well," said Katie.

"Too quiet, I'm afraid."

"But the danger is over, is it not? The vessel is much more steady."

"I haven't admitted that there was any danger yet, but we are laying-to. Henceforward, and until we reach 'Frisco, we will be a sailing ship."

"I'm so glad." The captain looked at Katie half inquiringly.

"Oh," she added, by way of explanation, "it will make the voyage ever so much longer, and there will be less noise—not the constant rattle of engines and screw, and the shouting of the men taking up ashes. Why, Captain Boyd, it was precisely like living in a mill before."

"Well," said Boyd, "'it's an ill wind that blows nobody good.'"

So used, however, had the passengers been to the noise of the mill, as Katie called it, that hardly any one slept a wink through all that wild and stormy night. If there was no rattle of engines, there was the roar of the wind through rigging and cordage, the dash of the waves, and the dull thuds ever and anon, as some huge sea struck the good ship, often followed by a strange stillness, as the green water filled her decks, that caused Katie in her cabin to tremble and assure her cousin that the ship was foundering—"going down to the bottom of the merciless ocean."

It was a long night and a dreary one; but morning broke mistily over the sea at last, and when Katie went on deck, she found that the ship was once more holding her course on the wings of a beam wind.

It was Jack Silk's watch. The waves were still houses high, and the ship anything but steady. So Jack gave Katie his arm; and a happy man was Jack. He did not say very much—it was not his way—but when the steward's bell rang for breakfast, and Desmond came aft to relieve him, he wondered how the time had slipped away.

Desmond went aft to have a peep at the binnacle; he gave Jack one sly look as he passed, singing,—

"There's nothing half so sweet in life
As love's young dream."

CHAPTER XI.

SPENCER MEANS BUSINESS.

THE voyage to San Francisco was a very long and a very pleasant one. They encountered more than one gale of wind, but they did not mind them; they were becalmed for weeks at a time, but they did not care. They had quite settled down to sea life. Even old Sally complained less of her poor back, though she never could resist talking about her "darter in Ameriky." Boy Bates became a smart hand—almost too smart; he was by far and away the cheekiest boy in the ship. Turlough O'Brady had dragged his photographic apparatus out of the coal-bunkers, and proved himself such an excellent artist, that Captain Boyd vowed he would be an acquisition to the expedition, and determined, on his arrival at San Francisco, to furnish him with the best lenses and chemicals procurable, and take him in the ship to Arctic regions.

Captain Boyd was good-natured; and whenever Miss Graves or Katie asked him prettily for a boat, when in the neighbourhood of any of the islands that dot the blue Pacific, he would have the fore or mainyard hauled aback, and let them go.

If Miss Graves laid any claims to being an invalid, and if she had—some folks delight in it—any pride in being called or thought so, it was a pity she did not look more delicate, or even do things that delicate people do. But she looked "bonnie," as Boyd told her almost every day at the breakfast table.

"You're looking bonnie this morning, mother," he would say; "but I really would like to see you on deck before breakfast. Invalids should take exercise of a morning, you know, and in your delicate state of health, with your finely-strung nerves, you——"

"Captain Boyd," Miss Graves would reply, "that cold tongue is delicious," or she would say something else, equally *in-a-propos;* so plain Jack Boyd would have to cease his banter, and turn to, himself, at cold tongue.

One morning, Miss Graves sailed up as usual after prayers, and looked languidly around her. It was certainly a delightful day from a landsman's point of view. There was not a cloud in the sky as big as a blanket; the ocean all around was unruffled and glassy, of a light blue in the distance, greener and more transparent alongside, where you could see the sharks swimming, and lovely medusæ, as big as parasols, floating lazily in the sunny water.

Miss Graves sailed past Godfrey, who was seated in a chair with a book. She did not stop, but only smiled him a kindly "Good-morning," and went right away to Jack, who was aft.

"Jack Silk."

"Yes, mother."

"It is a lovely morning."

He knew she did not come on purpose to tell him that, so he offered the lady his arm, with all the politeness and *finesse* he could muster. Poor black, and somewhat grim Jack! he could not muster much.

Miss Graves looked at him, smiled, and took his arm. Jack always felt not-at-home when he had a lady "in tow," as he called it.

"It's the getting about that's the bother," he told Desmond. By "getting about," he meant turning round. "It's the getting about, Dess; walking along the quarter-deck is plain sailing, but when you come to tack and turn, and they don't round in the slack of their dresses, why, ten to one it gets round my counter, and Jack Silk finds himself on his beam ends, unless he can catch a hold of the binnacle or something, and bring to like that."

"Jack Silk, I like you very much."

"Thank ye, mother."

"You've a good heart, Jack."

"Thank ye, mother."

"And so has a walnut."

"In a rough shell, mother?"

The ship's mother nodded.

"Now mind, I'm your friend."

"What's in the wind?" thought Jack.

Then he started, as if a centipede had crawled up his sleeve. She had discovered his secret about Katie.

A poor diplomatist Jack would have made, for he merely looked at Miss Graves, and said,—

"How ever did you know?"

She was about to reply, when Captain Boyd stepped in front and stopped them.

"Yes, Miss Graves, you can have a boat, and yonder is your island," he said.

"Oh, how delightful! A pic-nic!" This from Katie Graves.

"Honolulu!" cried Jack Silk,—this was Jack's mode of expressing himself when excited. "Honolulu! Look at that shark!"

He rushed off to get his rifle, and Boyd called away the second whaler.

* * * *

The game of draughts is not one that requires a very powerful amount of either knowledge or forethought, unless, indeed, you happen to be playing with such a mathematical and psychological wonder as the Scotch Herd Laddie. But for the simple reason that the game is easy, and the two friends are well matched, the brothers-in-law, Farmers Dennis and Rae, whiled away many a long evening with it.

Even Yorkshire farmers cannot always talk about cattle, grain, and root-crops; and there are times when even game and shooting get dull, as subjects for conversation.

So, of an evening, Dennis would come to Rae's hall door, or Rae would come to Dennis's, as the case might be, and simply open the door and walk in. They knew each other's footsteps; and while the visit*or* would be rubbing his feet on the mat, or hanging up his coat, the visit*ed* would pitch aside his book or newspaper—the latter generally a week old—and reach down the board.

"Come away, Dennis," said Rae, one evening, precisely at the time Captain Boyd called away the second whaler; "come along and have your revenge."

Rae rattled the pieces defiantly as he spoke, and Dennis smiled and sat down.

It was soon evident that revenge, even if meditated, was out of the question. After making one or two ridiculous blunders, Dennis placed his hand on the board, and mixed all the pieces up into chaos.

"There! Bother!" he said. "I can't play to-night, and I wonder that you can. Hasn't Spencer told you?"

"No, nothing; it is just his way. He always goes straight to you first; for he knows that you will give him a patient hearing. Then, when he has got you on his side, both you and he tackle me, and then, where am I?"

"Nowhere, brother; but listen. We've both of us, Spencer and I, been going to work in a quiet, business kind of a way. We've been studying shipping lists, and making all kinds of calculations, and we've found a cue at last."

"Tell me."

"Well, a week ago, instead of going to the Show at York, as you thought we did—oh! we know that you'll forgive us—from information received, we bent our steps to Bristol, and then we found out that my boy—bless him——!"

There were tears on Farmer Dennis's eyelashes. Rae bent over the table and grasped his hand.

"Brother," he said, "call him *our* boy."

"Our boy, then, brother, sailed for San Francisco, *viâ* the Horn, *en route* for an unknown land, on the shores of the Bering Sea."

"Yes, well? This is not all you have to tell me?"

"No; I almost fear to add the rest. But Spencer is a wise lad; he will do nothing rash."

"I see it all, Dennis; Spencer means business."

"Yes; he will tell you himself. He will start for San Francisco by New York, and, brother, you and I will supply the needful."

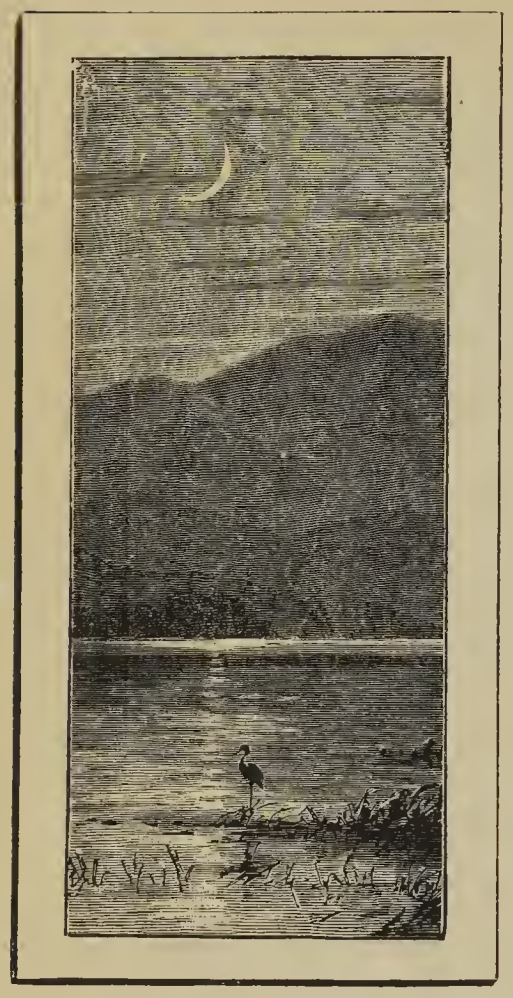
Rae sat for a moment in deep thought. Then he got up, and folded and put back the draught board; but in so mechanical a way, that, had he been asked the next moment where it was, he could not have told without looking.

Dennis only waited and watched him.

"Yes, brother Dennis," he said at last; "you are right, and Spencer is right. Spencer will do nothing rash; he is a wise lad, and from my heart of hearts I thank Heaven at this moment, who hath made him so. Money? Yes; what is money to you and me, brother Dennis, but to give happiness to those we love? Spencer must go, even if——"

"Don't breathe it, Rae. Don't think it. It has pleased Providence to cloud our lives with sorrow. Let us trust Him, Rae. It is for good, and He will clear the cloud away."

* * * *



"The second whaler is all ready, sir," said a sailor.

"Thank you," said Captain Boyd. "Tell the ladies."

(*To be continued.*)

WORDSWORTH'S JOY IN NATURE.

By J. H. Rose, M.A.

Part III.

OUR poet showed, as early as his sixteenth year, and just before leaving school, that he possessed much more than the mere rhyming power, which misleads so many young people into the belief that they are poets. In the little piece placed first in order of his published poems, he expresses the wish (happily fulfilled) that his old age may greet the scenes of his youth, just as the sun does at sunset,—

"A lingering light he fondly throws
On the dear little hills where first he rose."

This is a beautifully imaginative comparison which raises that little poem into the region of true poetry; but it must be confessed that there are many pages of Wordsworth's poems which are unimaginative and uninspired. A search after his loveliest thoughts sometimes seems like a search after precious ores, in a vast mine or quarry. The precious metal is there, but often overlaid with much rubble; and one of the aims of these Papers is to guide students easily to some of the poet's best work. Now the most precious vein of truth which runs through Wordsworth's works is perhaps this:—That this is no dead, mechanical universe which we see around us; but that God's Spirit is ever moving in the world which He has created; that this Spirit causes the miracle of life, and will always breathe healthful influence through Nature, on those whose minds are open to receive it.

Of his youth he says, near the end of Book. II. of the "Prelude":—

"I was only then
Contented, when with bliss ineffable
I felt the sentiment of Being spread
O'er all that moves, and all that seemeth still."

And at the end of the well-known poem, "Hart Leap Well," after relating the pitiful end of the Hart, he adds:—

"This beast not unobserved by Nature fell:
His death was mourned by sympathy Divine.
The Being, that is in the clouds and air,
That is in the green leaves among the groves,
Maintains a deep and reverential care
For the unoffending creatures whom He loves."

In fact, Wordsworth firmly believed that God had created all natural objects as counterparts and companions to His human family. The researches and discoveries of scientific men have since done much (far more than Wordsworth could ever have hoped), to show the beautiful fitness of this world of ours to the varied needs of its inhabitants; but the poet has shown how it was fitted to man's *mind*, and in the "Prelude" and "Excursion" he has traced the influence which Nature had on his own growth, and on the lives of the peasantry; but I would warn my readers away from these longer poems, until they have well studied the shorter poems noticed in these Papers.

Perhaps the easiest and most beautiful sketch of Nature's education, is in No. x. of those first "Poems of the Imagination," which contain so many of Wordsworth's best short pieces. It begins:—

"Three years she grew in sun and shower,
Then Nature said, 'A loveliер flower
On earth was never sown;
This child I to myself will take,
She shall be mine, and I will make
A lady of my own.'"

This child lived in a humble cottage near the source of the river Dove; and Wordsworth has described his admiring love for her, in Nos. vii., viii., and ix., of his "Poems founded on the Affections;" but in this poem we can see the source of her fascination over the poet. In his eyes she was as superior to a fashionably dressed young lady, as a celandine was to a hot-house flower. Read over and over again this poem, whose beauties perhaps culminate in the lines—

"And beauty born of murmuring sound
Shall pass into her face."

In his poem, "To a Highland Girl" (No. vi. in "Memorials of a Scotch Tour"), he feels the same delight in gazing on another of Nature's nurslings:—

"For I, methinks, till I grow old,
As fair before me shall behold
As I do now, the cabin small,
The lake, the bay, the waterfall,
And thee, the Spirit of them all."

Wordsworth, however, held that only the pure in heart could see God *in Nature*, so he was led to utter a passionate protest against the worldliness which clouded men's eyes, and clogged their minds, in *his* days (what would he have said now?) in the famous Sonnet No. xxxiii. (Part I. of the Sonnets):—

"The world is too much with us: late and soon,
Getting and spending, we lay waste our powers."

What powers? Why, those powers of seeing a vision of God in Nature, which, if we do not use them aright, may, alas!—

"Fade into the light of common day,"

as the poet tells us in his famous Ode. Learn by heart and treasure up this Sonnet xxxiii., which is more than ever needed now, as a protest against our feverish and sensational age. Its closing lines have been wrongly taken by some, to mean that the poet's hold on Christianity was weak. Not at all so! The contrast is between the nature-worship of the Greeks, and the mammon-worship of moderns, who only look on sea and landscape with an eye to their own profit; and our poet means that the former, though it is a "creed outworn," is at any rate better than to be out of tune with Nature's harmonies. The worship of sea-gods was at any rate better (cries our poet) than looking on the sea as a mass of salt water, or as a fish-pond for the epicure. Wordsworth had a poet's love for the Greek mythology. See his second poem on "Love lies bleeding." ("Poems of the Fancy," No. xxix.).

Almost equally rapturous is the comparison in Sonnet xxx., of the calm of an evening sunset, with a "nun breathless with adoration." (Literal-minded persons may perhaps, at first, see no possible resemblance between the sunset and a nun! But, if they will put their yard-measures away, I think they will see it). All the time, too, the Sea (the "mighty Being") booms a deep pedal-note of harmony, and the living forces of Nature are all actively breathing their blessings on the poet, and on the child by his side. She knows it not in her happy glee; but, all the same, she is—

"In Abraham's bosom all the year."

As a last example of imaginative comparisons, turn to "The Solitary Reaper" ("Memorials of a Tour in Scotland, 1803," No. ix.). He heard a Highland lass singing to herself, quite alone in the vale:—

"O listen! for the Vale profound
Is overflowing with the sound;
No nightingale did ever chaunt
More welcome notes to weary bands
Of travellers in some shady haunt
Among Arabian sands;
A voice so thrilling ne'er was heard
In Spring-time from the cuckoo-bird,
Breaking the silence of the seas
Among the farthest Hebrides."

The last four lines have been singled out by Mr. Matthew Arnold for special praise; and truly it is the most vivid of the three pictures given in this poem,—the first one of the actual scene witnessed by the poet, and the other two painted by his imagination. We seem to see the cold, leaden, calm sea, with its gray islets filled by that "wandering voice," as the poet elsewhere calls the cuckoo; and if we think about it, we shall see that the two similies fitly illustrate the Highland Reaper's song. The rocky solitudes filled with the overflowing voice, are present in all three cases; but a prosaic mind would never, on hearing the song of the Highland lassie, flash across to the oases of the Arabian desert, and then back again to the farthest isles of Scotland, for poetic illustrations.

Even the best and noblest narrative may be relieved and adorned by this by-play of imagination. A mind thus trained, will quickly note points of interest in events and scenes, which call forth no response from a sluggish and untrained mind. The nimble brain will see new light and teaching in art, poetry, history, and politics; and you will thus have taken the first step towards fostering the imagination, without which much of Wordsworth's beautiful poetry must remain for ever a sealed book.

AN ANTIDOTE TO ENVY.

By EDWARD BUTLER.

"YOU need not be so proud of your long legs," said a short man to a six-footer; "you legs only reach to the ground, and so do mine." With foot on earth, and face skyward—our basis of present operations, and our future destiny the same (subject, of course, to the solemn decision of our free-will)—there is every reason for exertion and activity, abundant stimulant to enthusiastic hope, and to great joy in living; but little indeed to nourish envy, jealousy, bitter competition, and rivalry.

The sour spirit which I have pillorised in the last four words, is the product of natures that are "cribbed, cabined, and confined" in wretched, narrow bunks of ignorance, without sufficient light, air, and space. The blue mould of envy will gather on any soul that does not disport itself in the full sunshine, and expand in the broad spaces of the thoughts of God.

We want largeness. "O Corinthians," cried Paul, "our heart is enlarged. Now, for a recompense in like kind, be ye also enlarged." Great peace enfolds the spirit, panting from some arena of competition, when it perceives that all earth's competitive glory is vain-glory, and that the true glory of the spirit of man is its station in God, its motion in God, its progress towards the central light and love which are its home.

Worldly distinctions have their value, of course. They have a bread-and-butter value, which is not to be scoffed at. They also have a value in the confidence they impart to the wearer—in some cases, but not in all—of his possession of power and faculty. But if they proceed to the further effect of making a man measure his merit against his fellows, and fall to drawing comparisons and contrasts, and revelling in sense of superiority, then the mischief inherent in these distinctions is closing round him, shutting him into a narrow cell of self-adoration, wherein the blessed light of day, which is the heritage of all his race, is exchanged for the wax-tapers he burns before his own shrine. But if even in this sanctum of self-conceit, with his own precious image reflected from innumerable mirrors, and his high qualities testified by the decorations of his shrine—by his certificates, degrees, testimonials, and mystic arrangements of the letters of alphabet, following after his name, like little pages holding up his resplendent train—he still prays to God, he shall not be left in his cell. Whether the door be quietly opened, and he be gently "led forth into the large place" of man's common heritage and common glory, or whether a wind from the Lord tumble his pretty little palace about his ears, he shall not be left to be suffocated in the choke-damp of his pride; he shall come forth in God's mercy, to stand in rank with the simple, the poor, the lowly, to rejoice that all are heirs with him of the sole genuine dignity of his race,—the capacity of receiving the Spirit of God.

I would therefore say to young men, and most emphatically to the most generous-hearted amongst them: make not the cardinal mistake of aiming at self-elevation. In these days of whirring wheels, of pushings up and beatings down, of scrambling, jostling, elbowing, and hustling, of fevered competitions, of endless prize-givings, of honours for the jubilant few, and failure for the dejected many, there is danger of being swept away in the nineteenth century hurricane. The Lord is not in the whirlwind. Your title to ecclesiastical peerage, amongst "thrones, principalities, and powers," depends on no rough-and-humble play on the surface of this planet. Councils, and Examining Boards, and Educational Departments, can neither give it nor withhold it. God offers it. You can either accept or reject it. That is all.

Believe this: you can give scope for the action, room for the indwelling of Deity. Be your equipment of abilities and opportunities, to your thinking, great or small, God has made you, God can use you. Probably you have but a very poor notion of what He can do by you and in you to His glory. He must first have unlimited submission. He who fed five thousand with five small loaves and two fishes, will be at no loss to work by your slender means; but the tiny store must be offered to Him.

"Bring them hither unto Me;" where the King dwells, the royal standard waves, and the cottage is a palace. In calmness of mind, and peace of heart, lay yourself and your abilities before the Lord, a living sacrifice that shall not be rejected; and dwell for ever in the quiet upper air, looking down, as on things far beneath, upon the angry thunder clouds of men's vainglorious strife and rivalries.

£5.5. MONEY PRIZES.

Offered in our Special Christmas Competitions.

THIS week we announce the Rules for our Spelling Chase. Next week we shall publish an incorrectly spelled paragraph, which our Competitors are to write out correctly.

We give the Rules a week beforehand, because, from the nature of the Competition, we can only allow it to remain open for *one week*, and without such due notice, many might not observe it until the time had almost expired. After the Competition is over, we shall publish an illustrated page of results, showing, in a novel manner, the names of successful Competitors, and the words which were most frequently mis-spelled.

A FIRST PRIZE OF £1 1s.

and Four Second Prizes of 5s. each will be awarded.

RULES.

I.—The Competition is open to all.

II.—No dictionary may be used, nor is any help to be in any way obtained as to the spelling of any word.

III.—Two consecutive hours is the time allowed for writing out the paragraph. It must not be written from dictation, nor be re-copied after it has once been written out.

IV.—A certificate, signed by some responsible person, must be appended to the paragraph, as a guarantee that the Rules have been kept.

For Paragraph and final regulations, see our next.

PROSPECTS.

WE desire to call special attention to the arrangements for our January Numbers. The thrilling serial, *Oonalaska*, will be continued; and we shall also have a vigorous and pungent story by the Rev. P. B. Power, called "Luck and Pluck." The Rev. J. G. Wood, F.L.S., and W. H. Harris, B.A., B.Sc., will contribute Science Papers. Thain Davidson, D.D., and Major Seton Churchill, will be represented by Papers on moral and spiritual subjects. "Volcanic Mythology," by Miss Gordon-Cumming, will find a place in an early Number; and also a striking Paper by Emily Sarah Holt. We shall continue our series on "Chess," leading our readers to the deeper science of the game; and two sets of Papers of great interest will be begun—one on "Love, Courtship, and Marriage," by Phyllis Browne; the other on "Anatomy Spiritualised," by the Rev. J. Hiles Hitchens, D.D. Some fresh and weighty Papers on "Marine Zoology," by Professor A. C. Haddon, are in process of arrangement; and the Rev. F. B. Meyer has undertaken for us a Series of spiritual Papers, similar to those previously so widely appreciated from his pen. Arrangements are pending for Serial Stories by well-known writers. A column of Skeleton Notes on the International Sunday School Lesson for the week, will be given in each Number. It is expected that these will prove specially helpful to teachers lacking leisure for independent research. As varied questions reach us, Crisp Correspondence will gain fresh vigour, and will be increasingly helpful. From time to time, Competitions similar in nature to those arranged for our special Christmas series, with Money Prizes and Certificates, will be announced.

"STOP! DON'T WRITE THERE!"

"STOP! Don't write there!" said a father to his son, as he was tracing letters on a window-pane with a diamond.

"Why not?" said the boy.

"Because you cannot rub it out," was the reply.

Stop! Don't write there, young man; you can't rub it out. Those deeds are being indelibly impressed for all eternity.

Stop! young woman. Don't write there; you cannot rub it out. The step you are about to take is an *irretraceable* one; once done, there is no reversal, nor can the writing be effaced.

HOMELY HOBBIES.

RECREATIONS IN GEOLOGY.

By W. H. Harris, B.A., B.Sc.

No. 2.—The Soil of our Gardens and Fields.

E are going to give a series of simple Papers as the first of our "Homely Hobbies." It will be needful for readers at the outset, to make their minds perfectly familiar with two or three preliminary facts. To one of these we made very distinct allusion in our Introductory Paper last week,—we referred there to the enormous periods of time in the history of the earth's crust. Another is the amazing results produced by the long-continued action of simple agents. A third, is the instability of the land and water surfaces of the globe. Of these points, the last will probably be the most difficult to realise; yet it is as certainly true as either of the others. Instead of the present continents and oceans having existed from the creation, all the known lands of the world have many times been covered by the sea; and we have every reason to conclude that vast tracts of the now marine parts of our globe have, at other periods, been dry land, and have been so for ages on ages.

All three of these elementary truths must be remembered in trying to solve the question: How has the soil of our gardens and fields been made? To begin with, there is no doubt that our own country has been for millenniums on millenniums above the sea; long enough, for instance, for the waves to widely separate England from the Continent, and Ireland from England. Those pieces of water-work were not done in a few thousand years; and, during all that period, and the ages which may since have elapsed, the quiet, but telling energies of various natural agents, have been in operation on the earth's surface. Yet, though the present general outlines of our country may have been the same for an indefinitely long time, there have probably been slight oscillations of height above the sea-level, which have considerably affected the work done, for example, by rain and rivers, in making the top soil and the subsoil.

There are several ways in which we may learn something of the constituents of the black mould of our flower-beds and fields. With a good magnifying-glass, it is easy to see that there are gritty particles of different sizes, glassy looking and very hard. Then, amongst these, and distributed throughout the dark and finer parts, we may discern vegetable fibres, rootlets, and decayed pieces of leaf, or of minute branches. Besides these, there are shapeless small pieces of mineral matter which are either finer sand or clay.

Again, if we put some soil in an iron or earthenware vessel, and heat it to redness for a time, we shall see, when it cools, that it has lost bulk considerably, and that what remains has changed colour to some extent. Now, a chemist would tell us that it is the organic matter, or what has existed in animal or vegetable structures, that has disappeared, and that mineral matter alone has resisted the fire's consuming power, though it may have had its tints altered.

Once more, if we take a small portion of mould, and shake it up in a good quanity of water, it will, at first, render the liquid perfectly turbid. If allowed to stand, even for a minute or two, the upper layer of the water will be seen to become clearer than what lies below; and if the bottle be left at rest for twenty-four hours, there will be a considerable portion of the fluid quite transparent. Then, if the sediment be examined, it will be seen that the bottom part contains the little pebbles and coarser grit, that on these are finer sandy particles, and above these again there is a very smooth, almost impalpable, mud. Floating on the surface of the water, or lying on the mud, will be observed little root-like or stick-like particles; so that by all three methods of investigation, we arrive at similar conclusions, viz., that the ground of our gardens and fields consists of organic and inorganic material, and that the latter contains particles of two or three kinds, and of very various degrees in size. This variation in size is especially true, of course, of our field-soils, for we take care to have our gardens raked tolerably clear of all large stones, such as frequently abound on our farm-lands.

Now, let us inquire into the origin of these two classes of constituents. We will begin with the inorganic. We have said that one part of these will almost certainly be made up of pebbles or grit. But whence have these come? The answer to that will depend chiefly on the replies to two other questions: Firstly, what is the nature of the subsoil? and secondly, what kinds of rock prevail in the neighbouring higher grounds? If at a little depth below the surface, we find abundance of flints, or gravel, or sand, we shall conclude that the hard, glassy particles of the soil have had a common origin with what lies under it. But that material itself may have had a wonderful history. It may have been formed at the bottom of the sea, or may have travelled for miles in the heart, or under the foot of a glacier; it may have floated scores or hundreds of miles on or beneath an ice-floe, or on the back or underside of an iceberg, before it found its present resting-place; or it may be the remains of thick strata, all of whose finer and more friable portions have been, in the course of ages, carried away by rain and streams, to be deposited elsewhere. Or, once again, these pebbles and gritty matters may themselves have gradually been brought down from the neighbouring heights, by storms and miniature deluges, after having, perhaps, been split and comminuted by frost.

How powerful these agents are in destructive and transporting energy,—we can see for ourselves, in our own hilly districts; but, for a full appreciation of what they have done and are still doing, we must go to mountainous regions. Tourists to Norway or to Switzerland, will find abundant evidence and most instructive examples, of changes being still wrought by snow and ice in various forms, by rain-storms and their consequent floods. In the beds of mountain torrents may be picked up boulders and stones of all sizes, down to the finest sands, which have evidently travelled down, in many instances, thousands of feet below their former height. At the ends of glaciers are to be seen mounds of rock rubbish of varied dimensions, which accumulations have been slowly carried from lofty peaks, and crags, and mountain sides, to the valleys. These heaps are gradually broken up and hurried down still further by the streams issuing from the glaciers, till they find their way into a lake or arm of the sea, leaving, it may be, in flood-times, some of their finer portions spread on the lands along the river-courses. If we want to know how much carrying work is being done by ice-floes and by ice-bergs, we have only to read the accounts of arctic explorers, or to remember that the great Bank of Newfoundland has been built up, and is still increasing, from the material deposited by the vast ice masses stranded upon it, or melting as they reach it, from Greenland and other lands of the extreme north.

That our own country has been subject, in bygone periods, to immense ice-action, there cannot be the slightest doubt. Hundreds, nay, thousands of feet have, in all probability, been swept away gradually from our mountains and hills, and whole strata have been ground down and transported to lower levels by ice or water. Everywhere our valleys show evidence, also, of having had, in past times, rivers running through them vastly larger than their present streams. In many instances, for miles on either side of their water-courses, the soil has evidently owed its origin chiefly to material deposited by floods or rivers, flowing with gradually diminishing speed, and, as they slackened in current, allowing the settlement, in more or less regular order, of gravel, sand, and mud. What is being done on a similar grand scale at the present time, may be seen in the annual floods of the Nile in Egypt, and along the basins or at the mouths of such mighty rivers as the Ganges, the Mississippi, the Amazon, and the Yank-tse-kiang.

Again, we must not forget what has been said about slight oscillations of level in our land surfaces. Now, a rise of a very few feet at the mouth of a river, would lead to the flooding of a wide extent of land up the stream, and to the deposit of much earthy material. If, subsequently, the river cut its bed deeper, or a sinking of the land at the lower levels took place, we should have large districts with soil made as we have described. Then, also, the blocking of estuaries by drifted ice has often taken place, when the climate of our latitudes was much colder than now. The effect of this would be to dam back the waters of the rivers just when they were bringing down most earthy matter, and immense districts in the valleys would then be be flooded, and covered with a thick deposit of mud.

Ice acts also in other ways in the formation of soil, especially by splitting porous stone, and separating particle from particle, as well as breaking up larger pieces. Every wet season, followed by sharp and continued frosts, illustrates the disrupting power of water, as it passes into a solid condition. The flakes of stone copings, and indeed from stone-buildings, the destruction of the mortar-joints between courses of bricks, so that one may often see lines of fallen material at

the foot of walls, will serve as illustrations, on a small scale, of what is going on in every foot of frozen soil. When such a disintegrating process has continued for a vast number of years, we can understand that its total effects will be very great.

Again, we must not ignore the silting up of river-mouths, so that places in our own country, once at the very borders of the sea, are now at a considerable distance from it. As examples, we may note Rye and Winchelsea, whose former commercial importance has suffered greatly from the effects of deposits, brought down by the streams running by them.

A similar process of the laying down of material by streams in the lakes into which they flow has, in many cases, resulted in partially or wholly filling up lake-basins, converting them into land fit for man's purposes, and adding considerably to the extent of surface on which vegetation can thrive. It seems likely that the great district of the "fen-country," in the East of England, was once a series of lakes, now reduced to small water dimensions, partly by mud and silt carried down by streams, partly by the growth of vegetation, which would serve to delay, and help in the settlement of earthy matter, besides making contributions of decaying organic materials, and partly, too, by the extensive human engineering works which have reduced swamps to *terra firma*.

As to the part played by vegetation in the formation of soils, we can form an idea for ourselves : first, from the deep beds of peat found in many parts of England, and notably in Ireland ; secondly, from turning up the ground under the trees of any old forest ; thirdly, from noting what has been the result of the growth simply of grass on chalk downs, or other districts never at all wooded. Again, when we remember that most of our country was once covered with forests, and think how much plant-matter perishes every Autumn and Winter in the leaves of trees, the stems and branches of herbs and shrubs, and the decay of roots, it is not surprising that we find in our fields and gardens a more or less thick layer of dark-coloured mould. Our coal-beds furnish us with the most surprising evidence of the extent to which vegetation has contributed, in various geologic periods, to surface-soil.

Of the part played by the decay of animal remains, we may be inclined to think less ; and yet the larger proportion of animals, as they perish, add "earth to earth." The scientific world, moreover, was surprised a few years ago by learning, through a most eminent student of Nature, that such apparently insignificant creatures as earth-worms had played, and still take, a remarkably important part in the formation of soils. They do so especially in two ways : firstly, by passing through their bodies, again and again, very large portions of the plant-made soil ; secondly, by bringing up from considerable depths, materials in which they find nutriment, and then ejecting at the surface, the indigestible portions of their earth-meals. Doubtless, too, by the decay of their own bodies, these diligent toilers and feeders contribute to the increase of the ingredients of our soils.

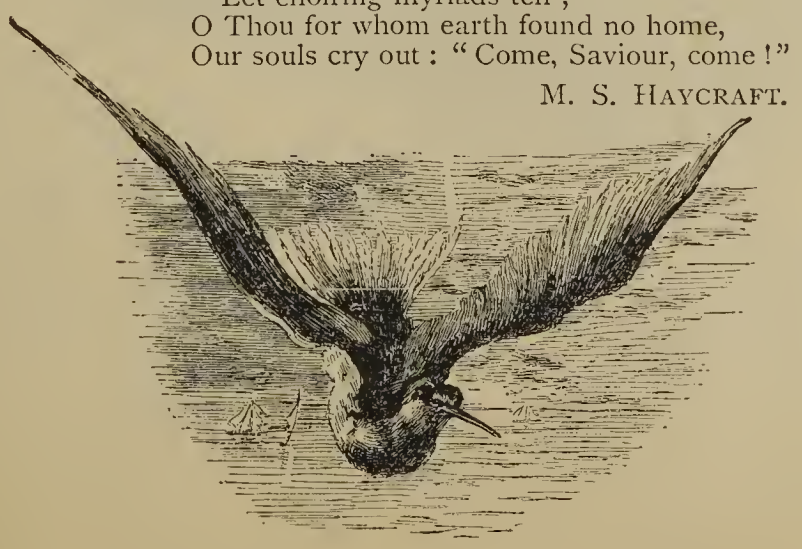
We have now said enough, we hope, not only to furnish an outline of the subject of our Paper, but, what is still more important, we trust the eyes of many of our readers will be opened to see how much opportunity for interesting inquiry and investigation lies at our very doors. We have only touched the fringe of the questions we have been discussing. Those who wish for further information, may find it in such books as "Lyell's Principles of Geology," "De la Beche's Geological Observer," Charles Kingsley's "Scientific Lectures and Essays," or in most modern handbooks of Physical Geography, which are full of interest and easily procured.

A CHRISTMAS STRAIN.

ALL hail, Thou Lord of love !
  The sweet bells chime Thy birth ;
The echoes float above,
  And, pealing through the earth,
The psalm of praise is ringing wide,
O Lord of holy Christmastide !

Let young and old rejoice !
  The blessed Yule is here.
Let every happy voice
  Be turned to carols clear ;
Let ageing lips Thy love proclaim,
And little children lisp Thy name.

Around the Christmas glow
  We bless Thee for this time—
The meetings that we know
  Amid the clanging chime.
Heart throbs to heart, hand touches hand,
Joy quivers out o'er sea and land.



The poor, the sad, the lone,
  Shall gaze in pity's face ;
Shall hear a tender tone,
  For sake of Christ's sweet grace.
"Come in, for we have room for ye ;
In Jesu's name our brethren be."

O Lord of Christmas peace !
  Great Giver of all good !
Now may these hours increase
  The bands of brotherhood.
Light Thou the lamps of love and aid,
And guide them to the paths of shade.

We thank Thee, Love unknown,
  Because Thou changeless art ;
We thank Thee Thou hast shown
  For aye the Father's heart.
To bring us to the sinless fold,
Thou didst come down, at cost untold.

Ye tongues of silver, ring !
  And let the anthems swell ;
The mercies of our King
  Let choiring myriads tell ;
O Thou for whom earth found no home,
Our souls cry out : "Come, Saviour, come !"

M. S. HAYCRAFT.

HOW SAM'S INFIDELITY FAILED.

By Annie Frances Perram, Author of "Go Work," "The Opposite House," etc.

"Her father marked for awhile her thoughtful face."

CHAPTER III.

FATHER AND DAUGHTER.

MRS. RICHARDS' visit came to a close, but not before she had begged that Millie would break her word, and tell her little child of the One who was watching her from His home in heaven. Although Millie would make no promise, she was much moved by the earnest words of her mother-in-law, and pledged herself to think seriously of the matter. But before she could arrive at any definite conclusion of what she should do, her child settled her uneasy questioning.

Millie wondered that Julia had made no reference to the few words which her grandmother had uttered in her presence, and had been considerably relieved, as the days passed without any troublesome childish interrogations.

But the little one had not only heard, but during many an hour of silent play had wondered over the strange conversation, and finding herself alone with her mother, shortly after her grandmother had returned to her home, she suddenly looked up and said, "What does 'saying my prayers' mean, mamma?"

Startled by the abrupt query, Millie answered sharply, "What do you mean, child?"

"What Grannie said, I mean. She put my hands like this, and said, 'Say your prayers before you go to bed;' and then you said I hadn't been teached, and Grannie was so sorry, and said daddy ought to have teached me 'bout the Saviour who loved me. So please, dear mamma, teach me now."

In dismay, Millie sank into a chair, wondering what the child's father would say; but Julia continued to plead, and at last Millie took her up and said: "Father doesn't think it right to teach his little girl how to say her prayers, and he would be angry if mother did."

But the child persisted, saying: "Grannie thinks I ought to know 'bout it, and don't you think so too, mamma?"

Millie's slumbering conscience vibrated to the innocent question, and she answered truthfully: "Yes, my pet, I think you ought to know."

"Then tell me now, mammie, and I'll be such a good girl and listen," said Julia, lying back and folding her hands.

Falteringly at first, but more steadily as she proceeded, Millie told the child the marvellous story, "never old, ever new," of the human life and cruel death of the Son of God. And as in simple words the truth fell from her lips upon her child's wondering ear, her own heart accepted it, and she said to herself, "Oh, it must be all true! I dare not think it only a story fit for childish hearts, for it reaches this unsatisfied craving in the depths of my own spirit, as nothing ever has before, as nothing else ever will."

"Isn't it bootiful, mammie?" asked Julia, as her mother paused. "Now, how shall I pray to the dear Jesus, who loves me, up in heaven?"

"Like this, my child." And Millie rose and knelt with her little girl. Holding the reverently clasped hands in her own, she uttered the first prayer that had left her lips since the days of girlhood.

"O God, whom we cannot see and cannot touch, and yet who art in every place, knowing all we do, or say, or think, we come to ask that Thou wilt mercifully forgive our many sins, and wash our hearts in the blood of Thy dear Son. Forgive me for my backsliding, and teach me the truth about Thyself, and help me to train my little one for Thee; and, oh, have mercy upon my dear husband, and bring us all to heaven at last, for Jesus' sake. Amen."

Long after her voice ceased uttering the language of petition, Millie remained on her knees, absorbed in sorrowful meditation, not observing that little Julia also was still kneeling, with folded hands, until the murmur of her childish voice caused the mother to turn and listen.

With serious, upturned face, and closed eyes, she was speaking to the Being of whose existence she had not known until that hour.

"Dear Jesus," she was saying, "make Julie a good girl, and don't let her ever forget to say her prayers, and make daddie and mammie always say their prayers, too, for Jesus' sake. Amen."

"Bless you, my darling! Keep on praying, and you'll be answered," cried her mother, seizing the little one, and covering her with tears and kisses. Through that day, Millie went about her duties with a sense of freedom and safety unknown before. But with this new experience, there was a longing that her husband, the father of her child, might share in her rest of soul. She thought that in her guileless chatter, Julia would quickly divulge what, perhaps, she herself would not have courage to reveal. But although the little one had been talking all day long about the fresh theme of interest, she met her father with no mention of that which filled her mind. She sat somewhat more soberly than usual upon his knee, and in answer to his questioning, "What has my little daughter been doing to-day?" she only answered, with some gravity, "Talking to mammie."

But when Millie, as she was preparing her for bed in another room, asked the child why she had not told her father that she had been hearing about Jesus, Julia replied,—

"'Cos you said that daddie would be very angry with you if you told me 'bout Him, and I don't like my daddie to be angry with you."

"Dear little soul! If you want to tell your daddie, never mind about his being angry with me; perhaps it would do father good to know," replied her mother.

"I'll tell him some day then, mammie."

And with this resolve Millie rested content, determining to wait until Julia should break the silence, and make confession for both. So the days passed; and all that Millie could tell her child of the familiar stories from the Book of Life, and of its hidden teachings, was not sufficient to satisfy

the little one's constant craving. Her mother marvelled at her rapid growth in spiritual things, but the Good Shepherd was Himself unfolding to the childish heart the deep things of God.

"I can't think what's come to Julia lately, Millie; she's just as sweet and playful as ever, but she watches me with her earnest eyes wherever I go, almost as if she'd something on her mind," said Sam one evening, after Julia had gone to bed.

"She's a sweet lamb, and never gives me cause to say half a word of reproof to her; it's quite enough to tell her I don't wish anything done," replied his wife.

"Take good care of her, Millie, and let her play about all her time," said Sam, with a touch of disquietude in his tone; for Julia was the very darling of his heart, and lately there had been that in her wistful regard of him, which, although he could not well define it, had yet caused him, whenever the remembrance of it occurred to him, a vague sensation of uneasiness. It was as if the child in her first years, and in his very presence, were growing apart from him, and held in her little soul, thoughts and feelings in which she felt that he could not participate.

One evening in the Spring-time, he took her into the fields some two or three miles away, to pick buttercups and daisies. After she had gathered a lapful, she sat down to arrange them in a bunch for her mother. When her task was complete, she still remained sitting, and with wondering eyes gazed at the lovely sight of the sun sinking behind the trees to his rest. Presently she gave a little sigh, and, quickly looking round, the father marked for a while her thoughtful face, and then said,—

"What is Julia thinking about that great red ball, up there?"

"Julia isn't thinking 'bout that at all, daddie," answered the child.

"What then?" asked the father, curiously.

"'Bout who made it and the pretty flowers;" and the same wistful, appealing look which had troubled him before, was in Julia's eyes, as she turned them upwards to her father's face.

"What do you think you know about Him?" he asked quite sharply.

"I know He loves Julie, and Julie loves Him," she replied, with a quiver in her voice; and before the pure, unquestioning faith of his little one, Sam was struck speechless. He could not at that moment even ask where and how she had learned the forbidden creed of his own childhood.

"'Oh, Sam, she's died for you; she's died for you.'"

CHAPTER IV.

JULIA'S MISSION.

"DADDIE," said Julia again, in a minute, "I'd like to go home to mammie; I'm so tired. Please take your little girlie home."

Glancing at her as they rose, he saw that the colour had left her face; and, as they walked towards home, he felt her hand tremble in his.

"Why, Julia, what's the matter?"

"I think I'm sick, and if you don't carry me a little way, perhaps I'll fall," she answered in a faint tone.

Sam instantly picked her up, and looked anxiously at her, as her head sank upon his shoulder.

"We shall soon be home, my darling. Be father's brave little girl," he said encouragingly; but Julia did not answer, and, until he reached home, she lay exhausted in his arms.

"Millie," he said, entering with his burden, "I'm afraid Julia's very unwell. I've had to carry her all the way back. Be quick and give her something reviving."

A cordial was placed to the child's white lips, but she only took one sip, and then, shuddering, fell back upon her father's breast.

"Oh, Sam, what is it?" asked Millie, gazing in terror at the pallid face.

"I don't know," he answered. "She came over faint before we started to come home."

"You must go for the doctor, Sam, at once."

Millie took the child, and Sam rapidly strode away. The little one looked up into the anxious face that bent over her, and, finding herself alone with her mother, whispered: "I've done it, mammie."

"Done what, my treasure?" asked Millie, stooping low to catch the feeble tones.

"Told daddie that Jesus loved me, and I loved Him. It made me shake so much, 'cos I thought he might be cross; and I couldn't tell him any more, 'cos I was nearly sick; but you'll tell him all about it, won't you, mammie? Julie did her little best."

The child tried to say more, but her voice failed, and she lay back, panting for breath. Millie's hot tears fell fast upon the little one, as she began to understand the meaning of her sudden illness, and for a moment there rose a strong feeling of indignation in her mind against the father, who had been the cause of Julia's suffering.

But it soon passed, as the child continually murmured words of love for her "dear daddie," who shortly took his stand beside her.

"Your little girl has been over excited, Mr. Richards. The action of the heart is almost imperceptible, and she must be kept in absolute quiet, for any further excitement would be fatal to her just now," was the doctor's verdict.

The husband and wife looked at each other in silent terror; but even in that moment of agony, Millie remembered her place of refuge, and grew calm to meet the emergency. Hour after hour Julia slept, or appeared to do so, on her mother's knee, while Sam sat opposite, ready to mark the least movement. It came at last, and Julia opened her eyes and gazed around, until she saw her father.

"Dear daddie," she whispered, "won't you love Julie's Jesus too?"

Sam hastily rose and left the room. Julia turned her grieved face round to her mother, seeking sympathy and comfort.

"Julie's so sorry — so sorry, poor daddy's angry with his little girl," she murmured slowly.

"No, my darling; father's only sorry to see his little girl so ill, and Julia mustn't talk till she's feeling much better."

But the warning came too late. Again the fatal symptoms showed themselves; and, in obedience to his wife's low call, Sam re-entered the room, to find the child struggling and gasping for air. When the spasm had passed, she fixed her blue eyes with steadfast gaze upward, while over her face there spread a glow of heavenly radiance. Was there at that moment revealed to her childish soul the vision of a waiting, welcoming Saviour? It may have been so; for, stretching out her hands, as if in eager response to some unseen Friend, she exclaimed: "Julie's coming, Jesus," and then the wide-open eyes slowly closed, the hands dropped lifelessly down, and the riven hearts that watched, saw the grey shadows of dissolution creep over the little face, and knew that for ever on earth the sweet voice of their darling was hushed. One short week, and then all that remained of the angel child, who had so early fulfilled her mission, was borne from the desolate home.

"Oh, Sam, she's died for you; she's died for you," cried Millie through her tears that evening to her husband, who had thrown

himself at her feet, and lay there with his face hidden. The strange exclamation made him start appalled; for they were the first words that had left the lips of his faithful wife, concerning the cause of their child's sudden death.

"What are you saying?" he hoarsely asked.

"Sam, dear, it's quite true that our darling died for you. Do listen, and don't be angry while I tell you about it. She'd been so anxious about you ever since grannie was up, and since she'd known about good things. Forgive me, Sam, for breaking my promise, and telling her that the Saviour above loved her and died for her. I'm so glad now to think that ever I did. Many a time she wanted to tell you, and to ask you to love her Jesus, but she was afraid you'd be angry with me; and when you were fetching the doctor, she told me that she had spoken to you at last, and that it made her feel sick and bad, so that she couldn't say any more to you; and it was that last effort she made, after the doctor came in the night, and the fear when you left the room that she had vexed you again, that took her off; for you know the doctor said any excitement would be fatal to her just then."

"Wretch, that I am! I have killed my only child!" exclaimed Sam. "Why don't you turn against me?" he continued fiercely, starting to his feet, and glaring at his wife.

"I don't feel like it, Sam. When I think that our darling Julia loved you so much and died for you, and when I remember"—and Millie's voice trembled as she spoke—"that Julia's Saviour loved you and died for you, I, too, can only love you, and beseech you to turn to Him who has saved your wife and your child;" and Millie put her arms round her husband's neck and clung to him.

"Oh, Millie; you're an angel, and I'm a brute! Teach me as you taught your child, for I'm as dark as sin and the fear of death can make me. Tell me how I can find my mother's God, for my child has gone to Him, and I must follow her, or she has died in vain for me," wept the man, to whom the overshadowings of sudden bereavement had revealed the dreary hollowness of the scepticism which had been all-sufficient in the days of unclouded sunshine. Millie put away her own grief, while she led her husband, step by step, into the light and truth of that Gospel which he had sought, but happily without avail, to hide from his child.

"Millie," he said, when at length she paused, "go down on your knees and pray for me just now, for I can't bear my misery much longer. I know it's all true what you've been saying. I feel it, only I don't know how to believe that such a sinner as I have been, can find mercy."

Millie knelt and poured out her soul in fervent prayer; and that hour there was vouchsafed to Sam's broken heart the healing balm of forgiving love and Divine peace. "Oh, that my little one could know what a change has come to her wicked father!" he said.

"She does know it, assuredly, dear husband, and is rejoicing because of it," replied Millie, striving in vain to check her grief.

"My poor Millie. It is I who have caused you this suffering. Would to God I could live the past over again! But I promise you, by the grace of Him whom I have openly blasphemed, to live differently, and to stand up for my child's Saviour; and if you ever see me hiding my colours, just remind me—though I'll be a monster if ever I forget,—that my precious child died for me, and that she waits and watches for me in her beautiful home above."

Sam's Infidelity failed; his faith did not.

THE CHRISTMAS CAROL OF THE PAST.

By WILLIAM J. LACEY.

IGHT we say that the Christmas carol, of all our Yule-tide fashions, old and new, — save only that of generous charity to the sick and the needy,—is the one most nearly allied to the events of which all our modern Christmas keeping is the professed celebration? The song of the angels, "Glory to God in the highest, and on earth peace, goodwill to men," has been taken up by erring, trembling human lips, and the melody of the Christmas carol is an echo of the happy message. As its sweet strains are most effectual in winning the heart to responsive gratitude, and an access of holy joy, so in its origin, is it more truly sacred than almost any other adjunct of the chief yearly Festival.

But in affirming this, the reference must be restricted to the truest and most ancient type of the Christmas carol. There are carols *and* carols. A broad line of distinction exists, as a glance at the history of these compositions will reveal.

As regards the derivation of the name "carol," there is some divergence of opinion. By some writers, it is traced back to two Latin words: *cantare*, to sing, and *rola!* an exclamation of gladness. Others identify it with the French *carole*, round dance, and the Welsh *caroli*, to reel, and believe that the word carillon (a peal, or "round dance" of bells) is closely allied thereto. The name is at all events parallel with the French *noël*, Christmas, which has become a useful generic designation for the Christmas carol, wherever found. The word *noël* is derived from *natalis*, and expressed originally, a cry of joy at the birthday of the Redeemer, so that the fitness of the term is beyond question.

It has been already stated that the first Christmas carol was sung by an angel band, over the quiet Judean fields. Jeremy Taylor quaintly writes: "As soon as these blessed choristers had sung their Christmas carol, and taught the Church a hymn to put into her offices for ever, on the anniversary of this festivity, the angels returned into heaven." But when this glorious example was first followed by those who owned Christ as their Lord and Master on earth, it is impossible to say with definite assurance. Much has been made in certain quarters of an alleged representation of carol singing, discovered on a Christian sarcophagus of the second century A.D.; and it is, of course, possible that such an interpretation of the postures, and apparent engagements of the sculptured figures, may be correct. Yet it is conjecture merely. A claim for the continuity of the observance will scarcely be acknowledged by the sceptical mind, on evidence so meagre.

The twelfth century is reached before the annalist of the Christmas carol can feel that he stands on firm ground. The dates of many early examples still extant, or named in mediæval manuscripts, may be either mythic or correct. But with reference to the famous "*Prose de l'âne*," a singular composition, in use in several old continental cities for the Feast of the Circumcision, there is little doubt. It was in existence at least as early as the period mentioned above. The chanting of this carol formed part of a ceremony, very similar in spirit and execution to the miracle play. A representation of the flight into Egypt was given, and, as mother and Child on their lowly steed were conducted through city streets, to cathedral or church, the accompanying crowd gave vent to their enthusiasm in the words of this apposite song.

Several very beautiful German carols are commonly believed to have been composed in the century immediately following. To the period 1200–1300 belongs also the earliest specimen preserved in the British Museum. It is written in the then prevailing Norman-French. Another early example extant in the same storehouse, bears the Latin title: "*Xristo paremus canticus—in excelsis gloria.*" It belongs to the fifteenth century. Somewhat modernized as to spelling, etc., the first verse runs:—

> "When Christ was born of Mary free
> In Bedlem—in that fair city,
> Angellis songen with mirth and glee
> *In excelsis gloria.*"

The pioneer English collection seems to have been formed in the reign of Henry the Eighth. The specimens afford curious, and even pathetic proof, of the intellectual darkness and prevailing superstition of the time. The people were credulous; and absurd monkish legends were forthcoming in abundance.

Carol singing, however introduced into England, had plainly become popular, and established itself as an integral part of the Christmas ceremonial. Gradually a new departure came about. The carol was diverted from its original purpose: that of praising God for the gift of the Babe of Bethlehem, and made to receive the impress of the old pagan and bacchanalian spirit, which still deformed so very much of the pageantry and feasting of Yule-tide. From this stage, classification is a necessity.

Before considering, however, what may be termed the company of carols of good cheer,

—of the dining-hall and the roaring Yule-log—it will be well to note the oddities of the local mediæval carol, and glance briefly at foreign work in the same field.

The metrical compositions that came to prevail in the several English shires, and respectively to distance all competitors in the winning of rural suffrages, were often little better than doggerel rhymes, set to sweet and simple airs. The burden of the words was a mixture of fact and fable; the latter frequently predominating. Perhaps it shows the innate conservatism of the English character that, once choice was made in any locality of a particular carol, variation was rare. Villages and towns, but a very few miles apart, would thus possess their rival favourites, and be jealously loyal to them. Even if in some districts no special form of words had received the sanction of tradition, and of continuous usage, it was highly probable that an old-fashioned tune had become the recognised orthodox setting to the changing ditty. In this department, as in others, improved methods of intercommunication have worked a revolution.

At Paris, in 1601, was published the famous "*Mélanges de la Musique*," of *François Eustâche du Caurroy, Maître de chapelle* to three of the French kings. It was a posthumous work; for its compiler died the year before its issue. Eminent authorities hold that in it was offered to the musical world of the Middle Ages, carols for the first time successfully treated in polyphonic style.

This claim to precedence is, however, contested as against France by champions of Italy. Giovanni Maria Nanini, who died at Rome in 1607, composed the magnificent Noël,—"*Hodie Christus natus est*," a labour doubtless of love, which for beauty and effect has not easily been surpassed. Who shall decide when doctors disagree?

One thing is evident on comparison. The Italian specimens surpass their French rivals in sustained excellence. But then, again, the French issued collection after collection, and their poets and musicians were continually striving after improvements and greater originality, while the Southern composers rested on their laurels.

The introduction into these sacred carols of the word *noël* as a refrain—it is employed under the form of "*noe*," in the Italian example just instanced—was frequent in the Continental and the Anglo-Norman examples. Some have conjectured that, used as a sudden, sharp cry of ecstasy, it is a transformed survival, an altered form of the old heathen *Io!* or *Ioul!* often heard in the wild revels of the Saturnalia. It is more agreeable to believe that the resemblance is only a surface one.

No glance at these Christmas hymns of gratitude and praise would be satisfactory, without the quotation from perhaps the most truly representative—so far as England is concerned. This is the first stanza:

"God rest you, merry gentlemen;
Let nothing you dismay,
For Jesus Christ our Saviour
Was born upon this day,
To save us all from Satan's power
When we were gone astray.
Oh, tidings of comfort and joy!
For Jesus Christ our Saviour
Was born on Christmas Day."

Under the later Norman monarchs, the gradual degeneration of the carol into a convivial song was taking place; and it was not long before this good old custom had lost its exclusively religious character, and become, to a greater or lesser degree, confused in the popular mind with other observances of Pagan origin, or of dubious advantage. It is generally understood that the ancient rites attached to the home-bringing of the Yule-log—and indeed that part of the paraphernalia of Christmas itself—dated from Scandinavian times. But now, when the huge tree was drawn in triumph from the woodland to the castle, the beginning of the custom was forgotten or ignored. The carol was brought into requisition, and lays of the new and purer faith were chanted around the symbol of the old superstition.

Not only so, but the eating and drinking, associated from the earliest times with the keeping of Christmas in England, was specially celebrated in the Christmas carol. To this order of production belongs the Boar's Head song, originally printed in blackletter in a volume of "Christmasse Carolles," issued in 1521, by Wynkyn de Worde. It runs as follows:—

"A carol bringing in the Boar's Head.
Caput apri defero,
Reddens 'laudes' domino.
The boar's head in hande bring I,
With garlandes gay and rosemary,
I pray you all singe merely.
Qui estis in convivio.

The boar's head, I understande,
Is the cheefe service in this lande,
Loke wherever it be fande,
Servite cum cantico.

Be gladde, lords, both more and lesse,
For this hath ordeyned our Stewarde,
To chere you all this Christmasse,
The boar's head with mustarde."

Robert Herrick, too, in whose "Noble Numbers" is found a beautiful "carol, sung to King Charles at Whitehall," of the older and exalted type, has the following verse:—

"Drink now the strong beer,
Cut the white loaf here,
The while the meat is a-shredding;
For the rare mince pie,
And the plums stand by,
To fill the paste that's a-kneading."

But a day was coming when the carol should be rescued, at least for a season, from the hands of the spoiler. The reign of the Puritans began; and with the grim earnestness that made them formidable, whether as soldiers or reformers, these worthies vetoed the semi-Pagan (as they considered it) riot and revelry of Christmastide. Holly and mistletoe were made unlawful badges. The business of the mummers; the dignity of the King of Misrule; the pomp of the feast table, decorated with boar's head and peacock,—were all menaced with suppression, and psalms were appointed instead of the corrupt carols.

The effort to abolish Christmas and Christmas doings by Act of Parliament failed, and in process of time, the second group of carols became even more distinctly bacchanalian in character than before. Nevertheless, the struggle may have had its use. The older, and purer, and loftier songs have since found their claim to supremacy better honoured, and to-day are almost alone recognised in the popular imagination, as Christmas carols.

BISHOP HANNINGTON:

A NOBLE LIFE LAID DOWN. By F. Burton Irving.

"'I had to stop a tremendous fight with my umbrella.'"

Part III.

A BETTER ROAD.

On the fifth of November, 1884, James Hannington left England again, to fill, in a tropical climate, a position that demanded not only earnest Christianity, but also courage, endurance, tact, and continual self-abnegation. The honour of being a bishop under such conditions needed, as he said, "condolence, not congratulation," and reminds us of the lines :

> "The clouds are not a nest,
> Spite of rose tints and of gold tints,
> There no weary wing may rest."

On landing at Frere Town, the headquarters of Church Missionary work on the East Coast of Africa, his earliest duty was to remove the reproach that the missionaries there dwelt in houses of cedar, and the ark in curtains. Hence, he at once arranged for the building of a new sanctuary, that should neither be "a tin ark nor a cocoa-nut barn, but a proper stone church—a church to the glory of God." Then, by stirring Addresses, he pressed upon the workers a high standard of Christian life, and aroused the desire to win souls. From Frere Town, too, he indited a number of valuable letters, which throw light on divers knotty questions, and will prove of permanent good. Amongst other things, he wrote that it was little short of homicide, to permit young married women to go beyond the neighbourhood of the coast, in connection with mission agencies, and added : "Nothing shall induce me to give my consent, that ladies attempt to cross the Wanyamwezi Deserts in the present state of the country. As a hardy, even somewhat reckless traveller, I shudder at the idea of attempting these, by-and-bye, myself."

During his journey to Taita, we find the old and common trouble of camping without a water supply. "How little," he says, "we appreciate our comforts at home. The blessing of a wash, for instance. No water means no wash. Being an old traveller, I meet the difficulty by filling my sponge before starting, and tying it tightly in its bag. If we have two days without water, the first day I have what a school-boy would call 'a lick and a promise;' then the second day I wring out the water, and get quite a brave wash, the water afterwards coming in for the dog and the donkey."

Difficulties abounded. He goes on to say : "After six hard days' travelling, Sunday came round again, and most gladly would we have accepted the divinely given day of rest ; but it could not be, for food was running short, and to lose a day would be to starve the men. The effect of their provisions being scant began to show itself in their growing rather quarrelsome, for soon after starting I had to rush in, and, like Mrs. Brown, stop a tremendous fight with my umbrella. Words had not only waxed high, but guns were about to be used. Your uncle seized one of their guns, but it was some time before I could drag it out of the man's hands ; nor did I feel safe in the skirmish, for a full-cocked loaded gun with weak and worn-out locks, is not the safest thing to be wrestling over, but such is life out here—one cannot stop to think what is safe, or what is unsafe."

Next, he is *en route* for Chagga. On reaching it, he writes : "May God give Chagga to His Son. It is a lovely spot. I often exclaim, 'Here is England, England!'" He never forgot the "object of his journey," which was the establishment of a chain of mission stations westward to the Lake.

Again, to cull from diary and letters :— "Marched with weary, stiff frames along a heavy wet road to Taveta, after two nights' exposure, amid torrents of rain. . . . April 7th, 1885. Fever threatening, but I won't give way. April 8th. Scotch mist and very cold, then terrible rain. The hammock men went ahead, leaving me to walk through the rivers. . . . Puts me in great danger of fever. Wring my socks, and get on as best I can. More rain, tremendously long grass. Arrive in camp 6 p.m., tired almost beyond endurance." Then comes an entry about exhausted stores, and a day or two on famine allowance. "Barely eating enough to support life, and it was difficult to eat that ; for the poor starving Wa-Taita came round and watched every mouthful we took, like hungry dogs. I think I should go mad if this went on much longer." After his work at that place was accomplished, he returned to Frere Town and wrote : "I have to praise God for one of the most successful journeys, as a journey, that I ever took. For myself, too, I have enjoyed most excellent health almost the whole way, during a tramp of four hundred miles. May the result be the planting of the Cross of Christ on Kilimanjaro!"

The results of this journey by the new westward route, as compared with his experiences in marching the previous year from Zanzibar to the Lake, filled him with a kind of triumph, and he began to think how grand it would be "to push straight through, as Thomson had done, to the north end of the Nyanza." The way was both healthier and shorter, and there was no reason to suppose that the Baganda would offer any opposition to an approach from the north-east. He apprehended no difficulty except from the lawless Masai, and was unfortunately ignorant of the suspicion with which "all visitors from the north-east are regarded by the people of Uganda." If Thomson's route could be opened, he judged that the work of the mission would be centralised, and that caravans might ply between Frere Town and Rabia, affording suitable employment to reliable Christian men. How could he know that an alarm existed "in the minds of the natives of Central Africa, with regard to a European Mission," and that the young king, Mwanga, was being trained to repel the entrance of white men by the "back door" of Kavirondo ; while the report of German annexations had excited the people to the verge of panic?

Thus the real danger was an unsuspected one, and, alas! the only one unprovided for.

We read again of unsparing exertions, a twenty-four mile walk to Fulladoyo ; then, on the second of May, of a tramp of thirty miles with the addendum, "Not even tired at the end of it. Since March I have walked about six hundred miles. To Him be the glory! Amen!"

Following this, there is an account of his joy in being permitted to ordain the first native Ministers of the infant East African Church ; the holding of his first African Confirmation Service at half-past six in the morning, with thirty-three candidates, and celebration of Holy Communion. Then at noon, "the Bishop and his party were dismissed with prayer, for their second journey into the vast interior," going by what Hannington considered the better route. Again we call attention to a feat of pedestrianism, one hundred and twenty miles in exactly three days and half an hour, with blistered feet, cloudless hot weather, and dew at night which wetted him through. At this period, he records the memorable sentence : "I am taught never to be disappointed, but to praise."

Another extract points to his trust in God amidst danger. "Much comforted and helped by the 9th verse of the 146th Psalm : 'The Lord preserveth the stranger.' Another man could add nothing to my safety—in Jesus' keeping I am safe."

All his leisure, whether in tent, by camp fire, or on board the steamer, was filled up by official correspondence, yet out of his toilsome days he reserved a little space for letters to his children in England, enlivened with pen and ink sketches, of which we give two, to make them attractive to juvenile eyes ; and we do not think he would have been so loveable, but for these evidences of home-loving nature and a father's heart.

Some of these references are exceedingly humorous, as the following extract will show :—

"The curiosity of the natives in these parts was unbounded. They swarmed round our tents from morning till night, asking to see everything we possessed, and, as they are noted thieves, we had to keep an uncommonly sharp look-out. In some of the places I passed through, they had never seen a white man before. They would gather round me in dozens, and gaze upon me with the utmost astonishment. One would suggest that I was not beautiful—in plainer language, that I was amazingly ugly. Fancy a set of hideous savages regarding a white man—regarding your uncle—as a strange, outlandish creature, frightful to behold. You little boys that run after a black man in the park and laugh at him, think what you may come to when you grow old. The tables may be turned on you if you take to travelling, just as they were with me. As with other travellers, my boots hardly ever failed to attract attention. 'Are those your feet, Whiteman ?' 'No, gentlemen, they are not. They are my sandals.' 'But do they grow to your feet ?' 'No, gentlemen, they do not. I will show you.' So forthwith I would proceed to unlace a boot. A roar of astonishment followed when they beheld my blue sock, as they generally surmised that my feet were blue and toeless. Greater astonishment still followed the withdrawal of the sock, and the revelation of a white five-toed foot."

On the twenty-third of July, 1885, Hannington led the way out of Rabia at the head of a caravan, two hundred strong. The difficulties of keeping such a mixed, undisciplined company well in hand, must be undertaken to be understood. The Rev. E. C. Dawson says : "A caravan leader needs the arms of a Briareus, and the sleepless vigilance of an Argus, to keep his men well together during the early stages of a journey to the interior." The men, to the dismay of the good Bishop, used water meant for two days in two hours, and then, half dead with thirst, they had to be urged on to the next well. In crossing the burning Desert of Taro, Hannington wrote : "Starvation, desertion, treachery, and a few other nightmares and furies hover over our heads in ghostly form." Yet we find him singing hymns in this cruel wilderness ; his especial favourite being :—

> "Peace, perfect peace, the future all unknown,
> Jesus we know, and He is on the Throne."

Merciful indeed was the goodness that veiled from his eyes the coming end.

Writing to his wife from Maungu, saying that he had just done forty-five miles, lit his own fire, eaten very little for eighteen hours, and had no rest for two days, he adds : "I am afraid, however, that our hardships have not even commenced . . . How gracious God has been in giving me so good a wife, and such dear children and relatives. . . . Do not expect another letter for a month or two, but just leave me in His hand."

Soon after, however, there came an unexpected chance to send a letter to the coast, of which he gladly availed himself, and on the eleventh of August, penned the following to the same dear partner : "The burden of my song must be 'Praise,' and the teaching of every lesson has been 'Trust ;' so comfort your heart during my absence." Then, in respect to his journey : "If this is God's time for opening up the road, we shall open it up. Let our watchword be, 'We will trust, and not be afraid.'"

His friends heard no more, until the telegram which reached Zanzibar on the first of January, 1886, telling of Bishop Hannington's seizure by the king, within two days' march of Uganda, and the report that there were secret orders to have him executed. His pocket diary, and the journal of the Rev. W. Jones, furnish the last links in his life chain.

On the twenty-fifth of August, they were reduced to the verge of starvation, the camp being full of weeping men asking Hannington "if they had been brought out to die ?" so much difficulty was there in getting the natives to sell them food. On the second of September, the Bishop went out with seventy men to buy everything himself, having to deal with natives notoriously treacherous and cruel. He writes : "The Masai people are as dangerous and troublesome as half-tamed leopards ; the traveller has to be for ever on the alert, or he will be pinned by the throat." On the twelfth of October, Hannington decided to proceed alone with fifty men, leaving Mr. Jones behind in charge of the caravan at Kwa Sundu, and, despite an inflamed leg, he walked eighteen miles that day. Twenty-eight days passed without tidings, and then the report came that the Bishop and his party had been killed.

Upon reaching Uganda, Hannington was stopped by the people, who said they wanted to send a message to their chief before he could advance. Soon after, he was seized, stripped of his valuables, hurried along, pushed against trees, or dragged on the ground at the rate of five miles an hour, until he was forced as a prisoner into a hut. He had purposed to find a better road ; he did not fail of his purpose. The feeble always fail—he was a man that would channel his own course, like the waterfall in the proverb. Alas, too, like the waterfall he was to be broken to pieces at the end. The horrors in the interior of the hut into which he was hustled, almost baffle description ; but it was through this "Inferno" that he must pass to finish his course and reach God's Paradise. We read that the floor of the Bishop's prison was covered with rotting banana peel, leaves, and lice ; a literal burrow for rats and vermin. There was a fire too, but no chimney or other ventilation to carry off smoke, and by this fire his guards were cooking food and drinking pombe.

Yet, bruised and suffering, racked by fever and bodily outrage, apart from his comrades of the mission, deprived of all the decencies of life, and without any of the alleviations of civilization, he wrote in his little note-book on the twenty-ninth of October, that he was greatly comforted by Psalm 30., which came to him with much power. There were eight days of imprisonment, in which he had no tidings touching his future, and until the last moment he did not know that he was irrevocably doomed to death, nor that Lubwa was acting the cruel and unmanly part of cat's paw to Mwanga.

He was summoned from his tent. Was there in his brave heart the hope of release, we wonder? Perhaps ; but God, not man, was about to set him at liberty. He heard a wild shout, when the warriors fell upon his helpless caravan men, and by their spears covered the ground with dead bodies. Then the Bishop faced his destiny like a Christian and a man, bidding them say to their king that he was about to die for the Baganda, and that he had purchased the road to Baganda with his life. The soldiers who were told off to murder him, hesitated ; he, calm even in the last crisis, pointed to his gun, which one of them discharged. Then he was free ; free from pain, free from anxiety about the morrow, free to leave Africa without reproach, free after thirty-eight brief earthly years, to enter upon glory, honour, immortality, and eternal life.

Only four men out of the fifty who accompanied Bishop Hannington, escaped the massacre, and these carried the tidings to Kwa Sundu and to Mr. Jones. Such is our brief outline of a noble life laid down.

OUR COMPETITIONS.

£5 5s. IN PRIZES.

THE preliminary announcement of our Spelling Chase will be found on page 117. We would remind our readers of the Prizes offered for Double Acrostics, in our last week's Number. This Competition does not close until Jan. 31, so there is still time to enter. Full particulars on page 106. The results will be announced as soon as possible.

CRISP CORRESPONDENCE.

An Invalid would like to know how to make skeleton leaves.

A Perplexed One. — Bagatelle played quietly at home is probably the best substitute for a billiard-table. Billiards at home might easily engender the taste for the billiard-room at a Club,—and hence it is safer to refrain from billiards altogether.

Amateur Fretworker.—Wood for Fretwork can be bought reasonably, either at any large Tool shop or Cabinet Maker's. Fretwork is much used in Pianoforte shops, or Depôts for Fancy Articles. Thanks for your hearty words about our Paper.

George H. R.—A wide distinction should be made between an affirmation and a blasphemous oath. What is technically understood by the "oath of allegiance," is only an affirmation of loyalty to the Sovereign. This is very different from profane swearing, deprecated by our Lord.

K. Killock.—Christians must not selfishly think only of their own spiritual advantage. Certainly give up one Bible Class a week, if by that means you can go out and search for or win souls for Christ. "It is more blessed to *give* than to receive."

Household Management.—"I have been a clergyman's wife for over ten years, and for our two selves and two servants I have found, after many times going through the items, that 1s. a day per head, is a good average calculation for food only. The items might be stated as follows :—

Per week.	£	s.	d.
Meat	0	11	0
Bread and flour	0	2	6
Milk, 1s. 6d.; Eggs, 1s. . .	0	2	6
Vegetables	0	2	0
Groceries (butter, tea, sugar, etc.) .	0	8	0
Fish	0	2	0
	£1	8	0

Fish may appear to be entered at a rather low figure ; but then the meat is put down higher than it would be if much fish were used. A great help to economy, is to draw out the amount that ought to be spent on each head per week, and then aim at keeping the books down to that amount. By this means, it is easy to balance one week with another, and so keep the expenditure within fixed limits."

"Petrel." — St. Paul did not think he might be a "castaway" from *Christ*—God forbid !—but from the *prize* which he was contending for, as the reward of his apostolic ministry. This he might lose without thereby forfeiting his salvation, as he expressly teaches in 1 Cor. 3. 14, 15.

M. E. C.—Anonymous reparation is *not* confession of sins ; and unless we are willing to confess, and repair *openly*, we give no proof of our sincerity. How can you expect full forgiveness for that past sin, until you obey the Holy Spirit, who is most clearly urging you to confession? God's peace lies on the other side of your humiliation.

MEN THAT CAN'T.

THE MAN THAT CAN'T FORGET HIMSELF.

By the REV. J. H. THORPE, M.A.

AT first, perhaps, our readers will be disposed to pass on, feeling that "the man that can't forget himself" is an individual who deserves to be forgotten. But we crave a moment's attention. Beyond all doubt, "the man that can't forget himself" is one who, very often, is a slave to that giant tyrant, Self. And so he has very little sympathy with outsiders, occupied as he is in his master's service. But he ought not to be condemned outright, without a patient hearing. "The man that can't forget himself" is not always brought to that pitiable condition by selfishness. On the contrary, he is very often a man quite innocent of such a charge. He is oppressed with an ever-present consciousness of his own personality, arising entirely from his nervous temperament.

In proof of this, see the experience of public speakers. Many, at the beginning of their career, have had a sore battle with self. Excellent and well-prepared discourses have been spoiled in the delivery, by the fact that the speaker was oppressed by the feeling of his own existence there and then. His advancement in his power of public speaking, has been almost in proportion as he became able to forget himself in his theme. But having set forth this exception, we are quite prepared to join in the ordinary verdict on "the man that can't forget himself." For this man, the whole universe is divided into two parts. We were going to write the word "bisected," but this would not do, because it means "divided into two *equal* parts." Our friend's division is not of such a nature. It is—(1) Himself ; (2) The whole remainder. Put these two in the scales, and the end of the beam over the scale containing number two, will be pointing to the sky.

In different men, this sort of ever-abiding memory assumes different forms, and produces correspondingly varied effects. In one man, for example, the exciting cause will be the fact that he has come of a good family. He seems never able to forget that his father did something more than was his duty, or that his grandfather was Sir Somebody in particular, or that some other relative farther removed did, or was, or said, something just a little off the beaten track. We do not for a moment lightly esteem noble or respectable ancestry. We believe the remembrance that he has come of a noble line has helped many a man, where a higher motive was wanting, to walk in an upright way. When a man, in God's providence, has been born of a family which has given to the world men of renown in the service of God, or the State, it is no small honour ; and inasmuch as it may be a stimulus to him for good, it carries with it a responsibility all its own. We have no sympathy with the cry which demagogues have raised in every age against a nobility ; for we feel that in every state, rightly constituted, there must be, and there will be, a nobility of some sort. Our shaft is aimed in quite another direction. We mean game of a different feather. We point at the man who is always boasting of his ancestors, and who has little, perhaps nothing, else to boast of. He thinks that because he is of good birth, he is to be recognised as lord over his fellows. He may not be able to make a sensible remark on any subject requiring thought and an expanded mind. He may have failed to hold a place in the honourable contest of a School or University. He may not have two ideas in his head. Yet he expects that because he is the Honourable Mr. So-and-So, or the grandson of the great Alderman Thomas Noddy, he is to assert himself on all occasions, and be the top of every social circle he moves in.

We do not suppose any of our readers will find the foregoing a mirror in which they can see their own image. But in case they should meet such a character, we would suggest a thought or two worth mentioning to him. In the first place, the man who, in virtue of his birth, is called to fill a prominent position in society, will, for that very reason, require all the more to be a man highly qualified, mentally and morally. To think that because he is "a swell" he may be an idler, is a profound blunder. A tree on the hill top is more exposed to the storms than one down in the valley. The higher up the mountain you go, the more you will feel the keen blast. So the higher a man's position, the more he is exposed to the critical observation of his fellows. The greater the airs a man gives himself, the more closely will men examine him, and search in him for solid foundations, whereon he might base his claims ; and if these be found wanting, the more withering will be their contempt. Besides, as a matter of mere worldly wisdom, such a man should be reminded that he is constantly meeting men who have no pretensions to noble birth, but who are highly gifted by nature ; though, alas ! many of them wanting in Christian principle. Let him know that every time he asserts himself, and affects a superiority over them *which is unsupported by personal worth*, he stirs up their animosity, and, if this be continued, they will probably develop into full-blown enemies of his. Therefore, tell him to speak but little about himself ; tell him to come down to the level of his fellows ; tell him to measure himself with them as a man ; tell him to show them that he is at least as good as, if not better than they, and then he may be sure his noble birth will receive their willing respect.

We might go on for many pages, pointing out the different ways in which the spirit we write of shows itself. In some it arises from a fancied or real mental superiority, which leads "the man that can't forget himself" to imagine that he has a monopoly of truth. His opinion is the only one which could by any possibility be the right one. And so, if you venture to express a view not exactly in harmony with his, you are at once exposed to the full play of all his argumentative artillery, and finally retire with a very vivid apprehension of your friend's personality.

At other times, you will see this in a man who has attained a position of some consequence. An unvarying haughtiness of manner, an "unbendability," a reluctance ever to enter into familiar conversation with old friends, lest he should unwittingly compromise his dignity. But we now turn to what we believe to be the pleasanter and more profitable side of our subject. Those readers who would avoid the character of "the man that can't forget himself," should addict themselves to *the pursuit of truth.* It may seem a startling statement ; but self is often a hindrance to this. This is chiefly the case, when the truth presented for our acceptance is opposed to our views or convictions. Self-love sometimes influences judgment. It is not always easy for a man to own as truth that which shows that he has been in the wrong hitherto. Therefore, let every man, in forming his opinions and judgments, take

cognisance of this. This very thing was one of the reasons why the Pharisees and Scribes long ago rejected the Saviour's teaching. They occupied the proud position of leaders of the people. They were the learned classes. They were the men whose opinion would be accepted on any question of religion.

Christ came "out of Galilee;" He taught entirely out of the ordinary groove; He set forth truth in an unconventional way; He did not dress it in the regulation forms; He "spake with authority," and He taught such truth that, if they acknowledged it, they would thereby own themselves till then in error. This they were not prepared to do, and so they conspired "how they might put Him to death." May not this have been the case also with the learned of Greece and Rome? Is it not possible that some to-day reject the Gospel for very much the same reason? It comes to them in a simple form, which does not harmonize with their elaborate systems, trimmed and adorned and fashioned with great show of intellectual ability.

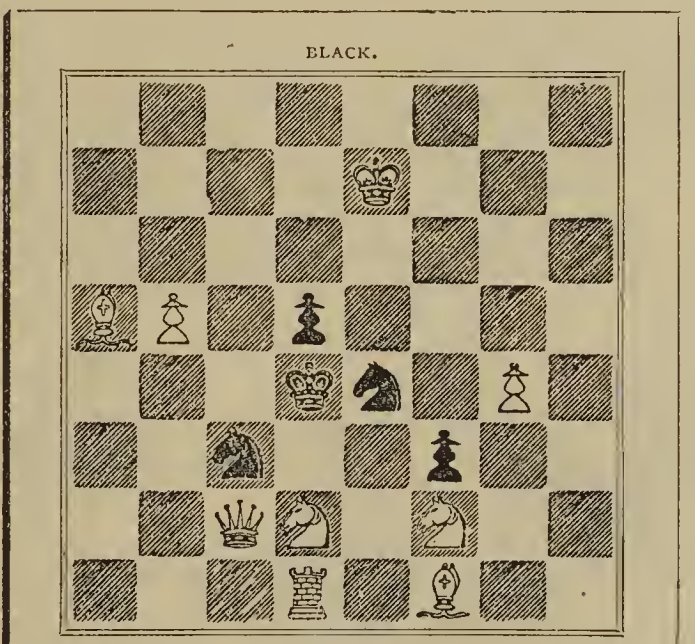
Again, we would remark that this character should be guarded against, by any one who would make his passage through life happy and smooth. "The man that can't forget himself" is always very sensitive. A small thing will often grievously wound his feelings. He is so conscious of himself, that his tendency is to misconstrue words and deeds, imagining insults and disrespect to be intended, when they are not. Does he not thereby give himself many a needless and bitter moment? Does not this tell on his manner, making him sometimes retaliate, thus provoking real insult, and causing irritation and pain?

So we say: Avoid being a "man that can't forget himself!" Young men! Take the advice given to the writer when he left home: "Keep a hole in your pocket for insults." Or better still, think of the Lord of life, "who, when He was reviled, reviled not again; when He suffered, He threatened not." Take a hint from one who has mixed a little in the world; the majority of insults which men think they receive, are unintentional. Few men deliberately insult their fellows. Don't *make* insults.

A word as to the bearing of our subject on direct work for God. We believe that "the man that can't forget himself" will never do much to spread God's most holy truth. The man who wants to be used of God in blessing to the souls of his fellows, must begin by laying aside every thought of self. One thing we learned long ago from the popular sport of fishing: a good fisherman never lets his own shadow fall on the water. He who would "catch men" for Christ must be careful to hide self; for nothing so mars a man's usefulness as his desiring to share in that which is only God's—the glory of good. Are you a Minister of the Church of Christ? Are you a Sunday School Teacher, or a District Visitor? Pray for grace thus to forget yourself; to be

> "Only an instrument ready
> His praises to sound at His will."

With respect to the difficulties of your work, you must be "a man that can forget himself." Moses was a man that could not forget himself, when God spake to him out of the burning bush, and commissioned him to deliver Israel. See how often his difficulty arises from himself. Note that his difficulties were overcome, but another was sent to share with him the honour which, we believe, would have been all his own had he gone forth to obey, like Abraham, and left the difficulties to God. Oh how much God's work suffers from this! How many are to-day neglecting their life's work, because they are dwelling on their infirmities and lack of gifts. They call this humility; we call it distrust. Do you not think that if God appoints you a work for Him, He will take care that your ability will be sufficient for it? Is the path of duty plain before you to-day? Friend, step out! let us hear no more whining and whimpering about your unfitness. If you are lazy, be honest and say so; if you are unfaithful, do not dare to charge God with the same; if you are REALLY fearful of your inability, take your wants and defects to Him in prayer, and be assured that if you follow where He leads, He will cause you to go from strength to strength, and make His grace sufficient for you!



CHESS.

By F. F. ROWLAND.

PART III.

ILLUSTRATIVE POSITION, NO. 3.

White to play and mate in two moves, or White to play and draw by perpetual check.

THE chess-board should be so placed that each player has a white square in his right-hand corner. The Ks, Qs, Rs, Bs, and Kts are termed *pieces*, and the small men *pawns*, and when arranging them for play, care should be taken to place the Queen on a square of her own colour,—as shown in the diagram first given.

According to the notation given in our last, the position of the men on the above diagram would read as follows:—

White—K at K7, Q at QB2, R at Qsq, Bs at QR5 and KBsq, Kts at Q2 and KB2, Ps at QKt5 and KKt4. Total, 9.

Black—K at Q5, Kts at K5 and QB6, Ps at Q4 and KB6. Total, 5.

To make a capture, remove from the board the man to be taken, and place your own man on the square it occupied. All the pieces can capture on the squares they can move to, but not so with the pawns; they move straight on, as already stated, and capture diagonally. In the problem we give, each of Black's Kts are in danger of being captured by the Q; a piece or pawn thus threatened is *en prise*. The Kt at K5 is also *en prise* to the Kt at KB2, which, as well as the Kt at Q2, is in turn *en prise* to it, also the black P at KB6 is *en prise*.

Check can be given six ways in the above problem; viz., Q to R4, or Q3, or Q takes either Kt, or QB to Kt6, or takes Kt; but, in the present case, such checks will not aid in checkmating, on account of Black's defences.

Discovered check is given by removing one man from before another, which opens an attack on the adverse King. For instance, play Kt at Q2 to QKtsq., or QB4, takes Kt, and *discovered check* from the R is given.

Double check occurs where the man, whose removal opens discovered check, gives check itself; as, for example, Kt at Q2 to Kt3, or takes P.

Perpetual check occurs when a player has two or more squares on which he can give check, and his opponent can only parry one check by affording an opportunity for another. If the first player then persists in the repetition of these checks, the game must be abandoned as drawn. In our position, White can draw by perpetual check by 1Q×Kt at B6ch, Kt×Q, 2B to Kt6ch, K to K4, 3B to B7ch, K to Q5, B checks again at Kt6, and White repeats the moves.

Checkmate has been already explained, so we will not enter further into the subject than to give illustrations of how it is accomplished. The problem we give is difficult of solution, and may not, perhaps, be the best illustration for beginners; however, having it before us, we will proceed to solve it, and so make our students' path much more easy for what is to follow. As already noted, White cannot effect checkmate on his second move by commencing with a check; the first move is Q to Bsq., then checkmate, and in some cases double check and mate, can be given after each move of Black, as follows:—

BLACK.	WHITE.
1. K to K4.	2. Kt×P checkmate.
1. K to B4.	2. Kt to Kt3 checkmate.
1. K to K6.	2. Kt×Kt discovered mate.
1. Kt at K5 moves.	2. Q×Kt at B6 checkmate.
1. Kt at B6×P.	2. Kt×P double check and mate.

Checkmate is also known amongst players by the term *mate*.

As we find that our readers appreciate this systematic instruction, we shall continue the series for some weeks longer. Beginners should not be disappointed by the seeming difficulty of the moves; they will readily be learned by practice on the board, though they may seem puzzling on paper.

SCRIPTURAL CHARADE.

A VERY ancient city for my first,
That with idolatry became accursed,
Yet the same streets the pious Jews oft trod,
And raised an edifice to Israel's God.

To find my second please a letter see,
A personal pronoun 'twill be found to be.

My third is (strange to say) my first again,
And we from Scripture have the statement plain,
That one who was beloved both far and wide
Did from this city claim his chosen bride,
Blest while he lived, yet blessing those around—
In him the tried a benefactor found.

My total is a root we oft have seen,
The plant appears in nature's garb of green;
It grew, we're told, in ancient Egypt's land,
When Israel's children were a toiling band;
Yet ere the pen is laid from willing fingers,
Our busy thought upon this word still lingers,
Which when 'tis backwards spelt reveals to you
Another city twice, and pronoun too.

For key to above, see our Number for January 21st.

THE ORIGIN OF OUR CHRISTMAS DECORATIONS.

By J. M. Laing.

THE time-honoured custom of decorating our houses with evergreens and mistletoe at Christmas, is of more remote origin than many who indulge in it are aware of.

In the mythology of ancient Greece and Rome we find that it was customary to deck not only private houses, but also the temples of Saturn, with laurel and evergreens, at the Saturnalia, or feast of Saturn, which was held in December. The festivities of the Saturnalia were afterwards intermingled with the rites and ceremonies of the Druids, as observed by them at their festival of the winter solstice, and later on, to these were added the grim mythologies of the ancient Saxons.

On the introduction of the pure and gentle doctrines of the Cross, its ministers found it almost impossible to win their converts from indulging in their old amusements and superstitions. They accordingly ingrafted the rites of the Christian religion on the old heathen festivals, in the hope that thereby the cause of Christ would be promoted. For instance, they put branches of evergreen in their places of worship, and, amongst themselves, regarded them as emblematical of Christ, "the righteous Branch." The result of this amalgamation has been "the strange medley of Christian and Pagan rites, which contribute to make up the festivities of our modern Christmas."

In some parts of Germany, the holly is termed the "Christdorn" (Christ-thorn), and the Danish and Swedish name for it has the same meaning. It seems particularly associated with Christmas.

A fanciful legend gives a romantic origin to our Christmas decorations. "The houses," it says, "were decked with evergreens in December, that the Sylvan spirits might repair to them, and remain unnipped by frost and cold winds, until a milder season had renewed the foliage of their abodes." Not our motive for decorations now!

The wax-like berries of the mistletoe form a prominent feature of Christmas decorations. In the Scandinavian mythology, the following legend thus explains some of our associations with the mistletoe:—

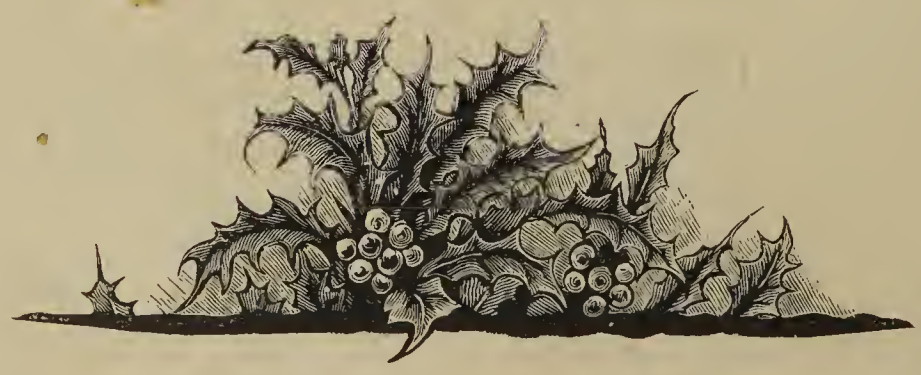
Balder, the Apollo of Northern mythology, was hated by Loki, the god of mischief, and of our earth. Loki wished to injure Balder, but as all that springs from fire, earth, air, and water had been sworn not to hurt Balder, there was little left with which to do mischief. However, the wicked Loki bethought him of the mistletoe, and he gave to the blind deity, Hoder, a twig of mistletoe, which he had fashioned into an arrow, instructing him to throw it at Balder, at a feast that was being held in his honour, when all were to throw missiles at the beautiful Balder, to show how impossible it was to injure him. But Hoder's piece of mistletoe (not having been sworn), directed by Loki, killed Balder, who was only restored to life at the earnest request of the gods. The goddess Friga, or Freya, as she is sometimes called, henceforth took charge of the mistletoe, which could not again do harm until it touched earth, the dominion of Loki. "Friga, the Scandinavian Juno, presided over marriages, hence it is that the mistletoe is suspended, and persons passing under it give each the kiss of peace and love."

The mistletoe is a parasite, and is believed to be propagated, in its natural state, by the missel thrush, who feeds upon its berries. It may be propagated artificially by squeezing the berries, which are viscid, on the bark of fruit trees, where they take root, and germinate rapidly. It grows abundantly in the orchards of the west Midland counties of England. Large quantities are cut, and sent to London and other places, for Christmas decorations both in home and church.

Amongst the Druids, the cutting of the mistletoe, at the time of the winter solstice, was one of the greatest events of their year.

"With much pomp and jubilation, the priests went into the forest, followed by the people; and the white-robed chief priest, ascending into the oak, cut off the berried tuft with a golden sickle, and dropped it into a white cloak, held up to receive it by two other white-robed priests. Two white heifers were sacrificed at the foot of the tree, and, sooth to say, often a fair youth or maiden." The mistletoe thus gathered, was divided and distributed amongst the people, who hung up the sprays at the entrance to their dwellings, to propitiate the woodland sprites.

In London, four centuries ago, the mistletoe and ivy were excluded from the list of Christmas decorations, on account of their association with Bacchus and Druidical superstitions.



In olden times, mistletoe was believed to be a panacea against every disease, and a remedy for poisons.

The church decorations must be cleared away before Candlemas Day. The same holds good, as a custom, with regard to private dwellings, superstition in both cases rendering it a fatal presage, if any of these sylvan ornaments are retained beyond the period indicated.

"If the Christmas decorations are not carefully cleared out of the church before Candlemas, there will be a death that year in the family occupying the pew where a leaf or berry is left," runs a popular superstition; and so persuaded are credulous old ladies of its truth, that they have been known to send their servants on Candlemas Eve, to make sure that those employed to clean the church had left no fragments behind!

"Down with the rosemary, and so,
Down with the baies and mistletoe;
Down with the holly, ivie, all,
Wherewith ye dressed the Christmas hall;
That so the superstitious find
Not one least branch there left behind;
For look, how many leaves there be
Neglected there, maids, trust to me,
So many goblins you shall see."

—*Herrick.*

With best wishes for a bright and joyous Christmas.

CHAPTER XII.

PARTLY A RAVEN AND PARTLY A GOOSE.

JACK steered the boat; and really Jack never looked more at home than when steering a boat. Perched on the gunwale, with his feet on the seat, and as far aft as he

"An 'ignorance' he called it. . . . Lives on wegetables. Well, that's consoling."

could get, holding the tiller carelessly in one hand,—that was Jack's free and easy style of steering. Only a sailor could have balanced himself so.

The sharks came lazily after the boat; there might have been three or more,—you could not have told,—but there they were in the wake of the whaler, a fin showing every now and again. Miss Graves glanced somewhat uneasily at this terrible following, and thence at Jack.

"You're quite safe up there, I suppose, Jack Silk?" she said.

Jack laughed and began to whistle. Just like Jack. But Miss Graves' little old maid, Sally herself, must needs put in her little old oar. She lifted hands and eyes skywards first, and screwing her little old mouth, muttered an "Oh!" which was partly a groan and partly an ejaculation.

"Oh, dear sir!" she exclaimed; "do have a care o' your purty self. Supposin' you were a-goin' to tumble in, sir, and them awful sharks to devour you! Oh, it takes my poor old breath away to think on it."

I daresay it never occurred to any one to call Jack Silk "purty" before. He took off his cap and bowed to Sally, and every one was glad of the chance to laugh without seeming rude.

The island they were bound for, was further away than it looked from the quarter-deck of the *Oonalaska*, whence it appeared like a ribbon of green, just where the blue of the sea and the blue of the sky were softened into one. But the men laid well to their oars, and the boat went dancing over the water. Sometimes she seemed to distance even the sharks themselves; but if these ugly gentry disappeared for a minute in one place, they speedily showed at another.

The shore soon hove in view,—a long line of silver sand, with palm-trees nodding over it.

And now the water grew greener; the great medusæ were more numerous, but the sharks kept aloof, for they love the depths of ocean, and dread coming in-shore, unless impelled by hunger.

"Up with her, men! Pull with a will!" cried Jack, and in a minute more she was rasping on the beach. Then two bare-footed sailors jumped merrily overboard, and hauled her high and dry. Jack jumped next, Desmond followed, and both were ready with a shoulder to assist the ladies to alight. Big, brawny Godfrey lifted Sally right out of the boat, and dumped her down on the sand; and Sally blessed "his handsome face" by way of thanks.

Now on board ship the sailor folks, as Miss Graves called them, could do as they pleased; but on shore, on an island, she herself took command.

"Shall we commence exploring, cousin?" said Katie's brother.

"No, indeed," replied Miss Graves, "we'll dine first. I don't believe in explorations conducted fasting."

The party spread themselves along the beach to pick up curios, and marvel at the strange and wonderful shells that lay all about; and, somehow or other, Jack Silk found himself alone with Miss Graves.

"What a booby you are!"

"Thank you, mother; but the booby is a very sensible bird."

"Perhaps; but it doesn't look so, Jack Silk. It looks partly a raven and partly a goose. I know why you have come after me. You want to know how I found out that you love Katie."

"That's it. Because I feel sure enough that Dess would never tell tales out of school."

"No; Jack Desmond is a gentleman, and so are you, only very shy and stupid."

Perhaps at that moment Jack Silk looked more like a booby than ever.

"Well," he said, after a pause, "nobody told you, because I never told anybody, so you must have guessed it. You're very clever, mother."

"No, Jack Silk, I'm only a woman of the world."

"Well," said Jack, "I confess I do care for—but when I come to think of it, I must be a booby—partly a raven and partly a goose."

"Poor boy!" said Miss Graves; "now go and see after the dinner."

"Mother, you have the funniest way of changing a subject ever I heard! Instead of easing off a bit with 'Wo-ho!' and a 'Gently does it,' you let go all standing, and down comes Jack Silk by the run 'kerslap!' from the realms of bliss. Dinner? All right; I'm off."

And off he went. And something else was off too; namely, and to wit, a load off Jack's mind. He had found a friend, he felt sure of that, so he was happier by far than he had been in the morning. There was hope in his heart—hope that brightened his very face, and sparkled clear out through his hazel eyes, as he bustled away to see about the dinner.

"Now, my lads," he cried, cheerily, "bear a hand with the prog. Steward, follow me up here; we'll lay the cloth under the trees. The bank is green and soft, the shade is delightful, and—— Honolulu! the ladies mustn't see that fellow, steward; Miss Kate would be frightened to death."

The "fellow" referred to was certainly one of the most repulsive-looking reptiles imaginable. A monster lizard, at the foot of a tree, fully six feet in length; he was covered with scales from crown to toes, with a back like a saw, a huge pouch beneath his chin, and eyes in his horrid head that looked very cunning and very dreadful.

"That's an iguana, sir," said the steward; "shall I get the gun and shoot him? He's no end o' good eating—tender as a chicken, sir, and with the flavour of a pheasant."

"No," said Jack Silk; "we won't shoot him to-day. I daresay he enjoys life, and this island is big enough for all of us. Here, Boy Bates!"

"Aye, aye, sir; here I is, sir, as large as life, and twice—— O! la! sir, look at this wonderful crockydile. Scuse me, sir, but I want to run away. I feel all over as cold and shivery as two penn'orth o' cow's-heel. Hush! I 'opes he won't come this way."

"Here, now, don't be silly, boy. That's an iguana, and he lives on vegetables. You've got to take a bough and switch him off,—I never saw one so tame before,—and keep him off till we finish dinner."

The steward clapped a branch into one of Boy Bates' hands, and a hunk of pie into the other, started the lizard, and told the lad that he was on sentry till dinner was done.

Boy Bates went slowly away after the ugly reptile, talking to himself.

"Which I begins to wish now I'd never stowed away. There ain't any o' them chaps on Hounslow Heath to frighten a poor chap to death. An 'ignorance' he called it; well, I can't say he's a beauty. He's turning round to look at me. Hush! Lives on wegetables; well, that's consoling. Hush—sh!"

As the iguana went up a tree out of the way, Boy Bates sat down and began to eat.

Godfrey had gone away alone, and returned in time for dinner, laden with rich fruit, and loud in the praises of the romantic beauty of the interior.

It was certainly a pleasant spot for a picnic, and a lovely, though somewhat drowsy day. Jack Silk was brimful of merriment and fun, but he never mentioned the iguana. Desmond and Katie's brother talked enough for four at least. Katie herself was all smiles; her cousin looked happy, apparently because everybody else was happy; and even Sally, who had been honoured with a seat close beside her mistress, with a huge pie in her lap, was the picture of content. The best of it all was that every one was hungry. The sailors were not forgotten, and squatted on the sward, near enough to hear all the talk, and enjoy all the fun.

The steward, at Jack Silk's request, took a huge branch of ripe bananas away to the sentry, and the sentry immediately registered a vow that he would eat them all before he stirred.

"There's only 'arf a dozen more," he said to himself, after eating eighteen, more or less. "Only 'arf a dozen; I could do that little lot standing on me 'ead. But, oh my! wot a lot o' money they'd cost to buy 'em in Whitechapel! I dessay now——"

Boy Bates never finished the sentence; the heat of the day and those eighteen bananas were too much for him; his eyes closed, and he began to snore.

Then something very wonderful happened. First a kind of whistle was heard amongst some branches overhead, and immediately after, down dropped a huge iguana, then another, and then a third, and the three of them made straight for Boy Bates's bananas; and it is only a wonder that the noise they made, as they snapped their shelly jaws together, did not wake that intelligent youth. The whistle must have been a signal of some kind, for the reptiles came rustling through the withered leaves and tall grass in dozens, passed over the sleeping sentry, as unconcernedly as if he had been an old tree stump, and made directly for the picnic party, intent on fruit.

Jack Silk had just volunteered a song—he only knew one—when the head of the horrible regiment hove in sight.

Old Sally shrieked; the men sprang to their feet; the ladies ran screaming towards the beach; birds and monkeys joined the chorus; such a commotion was surely never before witnessed on an unknown island, since the days of Robinson Crusoe. Meanwhile, frightened, perhaps, by the excitement they had caused, the innocent iguanas disappeared as swiftly and silently as if the earth had opened and swallowed them up.

But it took Jack Silk and the steward fully half an hour to calm the ladies' minds, and restore the *status quo ante*.

There really is a deal of sense in that proverb about the "ill wind." If any one had told Jack Silk, when he turned out of his hammock that morning, that to so hideous a reptile as an iguana he would be beholden for one of the happiest days in his life, Jack would have laughed the speaker to scorn.

But so it was; for when Miss Graves proposed an expedition to explore the interior, Katie Graves refused to leave the beach. It might be the *status quo ante* with the rest—and they might go—it wasn't the *status quo ante* with her, and she wouldn't budge.

"Well," cried Jack, "I'll stop with you, Miss Katie, if you'll let me."

Katie turned her bonnie face, all smiles, towards Jack.

"I'd rather you than any one," she said, "because you're so brave."

Jack Silk told Dess afterwards, that at this moment he was so taken aback, that you could have knocked him down with a sledge-hammer. When everybody was gone, Jack cleared his throat to speak.

"Miss Katie, ahem! Miss Katie, I——"

"Yes, Mr. Silk."

"I—I—I was going to say—to say something, but you've driven it all out of my head."

"I, Mr. Silk? I am truly sorry."

"You! No, no; not you. Of course, not you,—I mean—I mean the iguanas."

Katie looked fearfully round, and crept so close to Jack, that his big lump of a heart began to flutter.

"What should or *could* we do, if they all came back, Mr. Silk?"

"Get into the boat, I suppose."

"Can't we—can't we go there now?"

"Happy thought!" said Jack Silk. Next minute he had lifted Katie on board. How light she felt in his big arms! Then he shoved the boat off, and sprang in as soon as she floated.

After this, what more natural than that he should seize the oars, and begin rowing slowly round the island?

"Oh, Mr. Silk, this is so truly delightful! I feel like one in a dream, a beautiful dream!"

"So do I," said Jack; and he never spoke truer words.

They passed over a sub-marine garden before long, and he drew in the oars, to let Katie gaze and admire.

And oh! the world of beauty and grotesqueness that lay down beneath the crystal sea; the coral rockeries studded over with living flowers of every tint and hue,—sea chrysanthemums Katie called them; the sea-weeds themselves waving their curling fingers to the flow of the tide, olive green, black, pink, or pearl grey; the great medusæ with limbs gemmed with blue and crimson; the strange, uncouth-like fishes, some black as midnight, with weird, fierce, yellow eyes, others painted in all the colours of the rainbow; the patches of white sand amongst the weeds, like clearings in a primrose forest, on which crept, or crawled, or wriggled, or stalked, or walked, creatures so sad, and at times so uncouth and ogre-like, that Katie grew half afraid. Fairy tales, and stories of naiads and mermaids, and what not, began to run in her mind, till she almost believed herself gazing on some scene of enchantment,—those awful-looking, warty crabs being but knights in disguise, and the fairy, floating fishes, maidens in distress. She pressed her hand wearily over her eyes at last, like a child half tired of the glories of a pantomime.

Jack resumed the oars.

"Sing," said Katie.

Jack did. He sang his only song. It was all about stormy winds that blow—i—o! and sails in sight—i—o! but it had the real sea ring about it. Jack Silk had a fine, manly voice of his own, while the rattle of rowlocks and dip of the oars formed an appropriate accompaniment.

"Hullo!" said Jack, when he had finished his song for the second time, for Katie had duly *encored* it. "Hullo! Where are we now?"

The question was a very natural one, under the circumstances, for gone was the silvery beach, with its fringe of waving green; gone was the emerald shoal water; the sub-marine gardens were gone, and only deep, dark water was all around them. They were not far from the shore, however, but its aspect was entirely changed; instead of coral sands, here were coal-black rocks, overhung by rolling clouds of foliage, and away behind were hills, tree-clad to their very summits, though by no means high.

This island, then, was not polypiferous, not entirely coral-built, like most of the Pacific islands. At some remote period, it had very likely been part and parcel of the mainland. Hence its unusual *flora* and *fauna*.

Jack headed away for an opening he saw in the cliffs, and found, not to his surprise, but to Katie's delight, that it led to a lovely little inland sea; and it would be difficult, indeed, to imagine a more charming scene than that presented to their view. It was wholly tropical in character; rocks and cliffs and hills all were covered with trees, all with climbing plants, all with flowers of every hue,—whites, and crimsons, and purples predominating.

Jack Silk was not usually of a very romantic turn of mind; but even he felt the enchanter's spell now, and when they landed at last on a tiny sandy beach, and stood listening to the low, melodious song of birds, mingling with the sound of falling waters, and the whisper of wind-stirred leaves and flowers,—for the south breeze that had commenced to blow gave life and motion to everything,—it seemed nothing more than natural for Jack to say emphatically,—

"I'd like to live here all my life, I would!"

They wandered up the glen, still side-by-side, up and away by the banks of a stream, past the little waterfall, the spray from which, in a rainbow-tinted cloud, rose high above the trees; up and away, till they found themselves in a green place, with glimpses of the blue sea appearing between the flower-clothed branches. It was here, in this very spot, that Jack had an inspiration; that is what he called it, at all events, when afterwards talking to his friend Desmond.

"Miss Kate," he said, almost abruptly, "the view all around us reminds me of a scene in a book I once read."

"It is surely more lovely by far, Mr. Silk, than any scene that could be described."

"Aye, that it is, of course, but still it is similar; and there was a brigand chief in the story, and a beautiful young princess, as if it might be you, Miss Katie, and he was telling her what novelists call the old, old story."

"And what did he say, Mr. Silk? Can you remember that?"

Jack's chance had come.

Usually this young sailor was slow of speech. But it was not so now. Love lent him energy; love lent him wings, on which to soar to realms of eloquence itself; and in earnest, low, impassioned tones, with speaking eye and gesture, he told the story—the story which, though old as paradise, is ever new.

Katie listened in silence, but with slightly heightened colour, till Jack had finished.

"And was that the story of the brigand's love?" she said. "How beautiful! and how well you tell it, Mr. Silk! I believe you are an actor born, and if you were to exchange the quarter deck for the stage, you might make your fortune. Shall we go now? See how low the sun is getting."

Poor Jack Silk! He came tumbling down from his seventh heaven, and did not make a very graceful fall either.

They went silently back to the boat, and Jack rowed all but silently round the island to the coral beach, where they found the rest of the picnic party waiting their arrival with some impatience, and a considerable deal of anxiety.

Before embarking, Miss Graves found time to say just one word to Jack.

The word was—"Well?"

"You're right enough, mother," was Jack Silk's reply. "I *am* a booby,—partly a raven and partly a goose."

The *Oonalaska* had cast anchor in shoal water, fully three miles from this strange and romantic island, so the boat had a long way to pull. Jack sat himself up on the gunwale, as was his wont, and whistled. Both his hands were deep in the pockets of his blue jacket, and he just touched the tiller now and then with his knee. Jack Silk was thinking.

Miss Graves sat the port-side, facing Jack, and looking at him with a half-amused smile on her face. She, too, was thinking.

Next to Miss Graves sat Katie; her face was turned back and away to the island, already getting smaller and beautifully less on the horizon. Was she also deep in thought? And were they pleased thoughts? I cannot tell; but she looked very innocent and very interesting, with that semi-sad, far-away look in her eyes.

Miss Graves glanced from Jack to the girl by her side; then, as if impelled by instinct, for there seemed nothing else to account for the act by any process of psychological reasoning, she placed her hand on that of Katie Graves, and gently patted it. Did soul speak to soul in that magnetic touch? Again, I cannot answer; but there was something so winning, so motherly, so soothing in it, to poor Katie's nerves, that she drew closer to her cousin's side, and her head drooped languidly on her shoulder.

How very calm the sea was! How very clear the sky! Now and then a nautilus—brightest gem of the ocean—went floating by, in its fair, fragile, azure shell; now and then the pinions of a sea-bird glinted white against the sky's sweet blue; but sound there was none, except the steady monotonous click of the oars, as the men bent to their work and the boat went bounding on.

Katie opened her eyes several times very widely indeed, for something seemed to weigh them down, and that something succeeded at last—for Katie slept.

Slept and dreamt. She was in that boat no longer, but back once more on the green island. But what a change appeared to take place as she glanced around! The glen became a gloomy, beast-haunted cañon; the murmuring streamlet with its cascade, that but a short time ago sung so softly in the summer air, was changed to a roaring, foaming torrent; the trees were all leafless and bare, and spread their skeleton fingers against a sky of dark and threatening clouds. Even as she gazed, a storm came howling from the hills, bearing on its wings dry, powdery, suffocating snow, that filled the air around her, as if a thousand whirlwinds were fighting for the mastery.

It was an ugly dream while it lasted, but a well-known voice dispelled it.

It was Jack Silk's, speaking to the men:

"In bow—weigh enough—oars."

And here they were, alongside the *Oonalaska*, and next minute on her quarter-deck.

Katie still felt cold. She hoped she had not screamed in her "silly sleep."

"Haul aft the jib sheet."

How home-like everything looked on board! How rosy the captain's face! How pleasant his smile as he met them.

"Now then, ladies," he cried, as he rubbed his hands together, "yonder comes the breeze. You've brought it with you. We'll pray now for a clear sea, and a fair wind to 'Frisco."

(*To be continued.*)

WORDSWORTH'S TREASURE-HOUSE OF MEMORY.

By J. H. Rose, M.A.

Part IV.

THE memory of past scenes, and its influence on our lives, has been treated more fully by Wordsworth than by any other great poet.

As a first easy instance, see the end of "Yarrow Visited" (Scottish tour, 1814).

> "I know, where'er I go,
> Thy genuine image, Yarrow!
> Will dwell with me—to heighten joy
> And cheer my mind in sorrow."

Wordsworth's life must indeed have been filled with truly bovine contentment, by this wholesome habit of chewing the cud of his old delights in beauteous scenes. Amongst many other instances, see No. xii. of the first "Poems of the Imagination," which begins :—

> "I wandered lonely as a cloud
> That floats on high o'er vales and hills,
> When all at once I saw a crowd,
> A host, of golden daffodils;
> Beside the lake, beneath the trees,
> Fluttering and dancing in the breeze."

The whole piece is one of the most beautiful little poems in our language; for notice the stately flow of the first two lines, in the first verse quoted above, and contrast that with the eager run of the next lines, and the rollicking dance of the last line. The poet's loneliness is gone at once; for he feels that daffodils, out-doing the sparkling waves in glee, are living companions, meant by Nature to cheer him; but the joy is not to be momentary, for the fourth verse gives us a lesson of solid and abiding value. It raises the poem above the level of mere beautiful description, to the height of imagination, for it shows us at once what a treasure-house of wealth we might all carry with us. Mrs. Wordsworth suggested the lines :

> "They flash upon that inward eye
> Which is the bliss of solitude,"

and we should all be thankful to her, not only for the beauty of the thought, but for the new source of peace and strength opened to us in times of care and difficulty, if we cherish the habit of living over again our past delight in the scenes of Nature.

In the last Paper, I quoted some passages to show the silent influence of Nature on the countenance and mind. After again noticing them, turn to "Poems of the Imagination," No. xxvi. ("Tintern Abbey"), which can be quarried into by lovers of Wordsworth, ever with fresh discoveries of new veins of truth.

It is a description of a second visit to the valley of the Wye, after an absence of five years, during which he has passed from heedless youth to thoughtful maturity. A brief analysis will perhaps aid some readers to a fuller understanding of his train of thought :—

Lines 1–22. A minute but artistic description of the scene, with loving re-greeting.

Lines 22–35. Its power in his memory to restore and beautify life,

Lines 35–49, and to give his mind a clear vision of truth.

Lines 50–57. Tribute of thanks to the Wye.

Lines 58–65. Memory is renewed, and lays up a fresh store for future years.

Lines 66–93. His boyish delight in Nature has now grown into a mature joy in her, as man's teacher,

Lines 93–110, and as being everywhere pervaded by God's presence, which thus may stimulate all our senses and thoughts.

Lines 111–end. The inspiration of his sister's sympathetic presence, and prayers that her life may ever be beautified and enriched by Nature's influence.

The most practical lesson in this poem, is in the lines 32–35, and 137–141, where the poet shows us the power for good, which a memory well stocked with beauteous scenes may have.

> "On that best portion of a good man's life,
> His little, nameless, unremembered acts
> Of kindness and of love."

This result of memory is of higher importance than the instance previously quoted from the "Daffodils," because this has reference to—

> "The still, sad music of humanity,

which ought constantly to be in the minds of all earnest men, whether they are poets or not. In the Eighth book of the "Prelude," the poet describes his love of Nature leading up to love of Man; and so it should be with all studies and enthusiasms which are not vain. So, when the poet prays at line 139 of "Tintern Abbey," for his sister :—

> "Thy mind
> Shall be a mansion for all lovely forms,
> Thy memory be as a dwelling-place
> For all sweet sounds and harmonies;"

remember that this is not a prayer that her mind may be well stocked for her own culture and joy, but with a view to her usefulness to the whole human family.

There is a little poem which well describes the influence of remembered feelings and joys on the character, and it also shows how very ordinary sights may lead up to noble thoughts and aspirations. It stands first in "Poems referring to the period of Childhood."

> "My heart leaps up when I behold
> A rainbow in the sky:
> So was it when my life began:
> So is it now I am a man:
> So be it when I shall grow old,
> Or let me die!
> The child is father of the man:
> And I could wish my days to be
> Bound each to each by natural piety."

Here the sight of a rainbow carries the poet back to the same sight, seen with the same rapture in childhood, and he hopes he may not outlive this feeling of exultant greeting, so he thinks of the healthy continuity of feelings and pleasures all through his days. This leads him on to the impressive line :

> "The child is father of the man."

And yet again this thought, that our childhood influences our riper years, slowly filtering through our life day by day, inspires him with the ennobling wish that each day's connecting link may be "natural piety."

Now what started this train of thought? The sight of a rainbow! And yet this not uncommon sight led the poet on, without straining any link, to the ennobling thought at the conclusion. This thought, indeed, is one of the central truths of Wordsworth's poetry; he has shown that he regards it so, by placing it as the text on which is reared his ode: "Intimations of Immortality from recollections of early childhood."

I will close by referring you to one of the finest of Nature's teachings, which the poet's reflection afterwards gleaned from a midnight ascent of Snowdon. It is at the beginning of the last Book of the "Prelude." With a guide and a travelling companion, he climbed up, for an hour or more, in a thick, dripping fog; but at last the ground seemed to brighten more and more,—

> "And lo! as I looked up
> The moon hung naked in a firmament
> Of azure without cloud, and at my feet
> Rested a silent sea of hoary mist.
> A hundred hills their dusky backs upheaved
> All over this still ocean; and beyond
> Far, far beyond, the solid vapours stretched
> In headlands, tongues, and promontory shapes
> Into the main Atlantic;"

and yet through the fog rose the sound of torrents roaring at Snowdon's foot. It is a grand scene grandly described; but what marks Wordsworth off from many other poets, who have given us fine descriptions of scenery is this: Wordsworth views it as a starting-point for ennobling thoughts on human life.

When he had reflected on this glorious vision of the night, it appeared to him like a majestic intellect; and he makes a comparison of the world of sense with the world of thought, which has, perhaps, never been surpassed in our poetic literature. It is difficult to grasp all the details, but the main thought is this :—

Just as Snowdon and his brother mountains raise their heads above the mists of earth into heaven's clear light, and yet brood over the noise of the waters at their base—so, the majestic intellects of great men rise above the tumults and confusions of earth; and yet they intently listen to them, though they themselves are attuned to celestial harmonies—

> "Like angels stopped upon the wing by sound
> Of harmony from Heaven's remotest sphere."

THE WATERSHED OF 1887-8.

By EDWARD BUTLER.

"THE thought of our past years," says Wordsworth, "doth breed in me perpetual benedictions." Ah! But I presume they must be some time "past" before this grateful glow of memory is generated!

A year that is only just gone by, has not had time to gather the rich colouring and soft cushioning of lichen and moss. It is raw. Its agitations are not sunk to rest. Its combatants still have hand on sword-hilt. The purple haze of distance has not slid between us and its troubles. And yet we cannot avoid the retrospect.

The week that begins with Christmas and ends with New Year's Day, is a time consecrated to merriment. Is not Father Christmas amongst us? Are there not processions of boiled turkeys and roast geese, puddings and mincepies? Is there not mirth and music? And yet—— My instinct leads me to think, first, of the young hearts that are also heavy hearts; of tears that gather slowly in dulled eyes, that, by right of years, ought to be sparkling bright. The pealing bells will waken many sad memories, and emphasise the desolation of many a vacant chair. Voices for ever silenced will be heard in the solemn clangours, and pictures of vanished joy will rise before the inward eye. But in this season of the year, the great Healer of all sorrows seems especially present. However dim and solitary our way, even though loss and pain seem to have made the world a wilderness for us, all the symbolism of the time cries to us in resonant, cheerful tones:—

"Make straight in the desert a highway for our God."

He whose breath is love, whose eyes are lamps of hope, and whose strong right hand is omnipotent help, is no buried hero of eighteen centuries ago, but the strong Redeemer of to-day. The light from His face makes rainbows on all our clouds. Taking His proffered hand, we "forget the things that are behind, and press forward." The dawn is before us. Our fears of the future are scattered. The snow-clad mountains and the hills "break forth before us into singing," and even the leafless "trees of the field clap their hands." "Speak unto the children of Israel, that they go forward." It is a kindly voice that urges us.

Sometimes we bemoan the unresting hurry and scud of the years; but should we choose stagnation? Whatever may be our views of evolution, as that word is understood in the battles of the scientists, we know that we are each one the subject of personal evolution; and that, if we eagerly submit to the noble spiritual influences which crave leave to do their glorious work upon our souls, we are being educated and fashioned for some superb blossoming in the skies. The years follow one another faster and faster, with seemingly accelerated speed; but shall they make us melancholy? God forbid! The symbol of a Christian life on earth is the ascending spiral. Every coil is traversed more quickly than the one below, but every coil rises nearer heaven. Forward, then! with song, and not with sigh. The voice which gives spring to our onward step, falls not from the merciless lips of old Time, with scythe and hour-glass; it falls gently from the throne and mercy-seat, through the gold-flooded azure above us, and bids us go, not forward only, but upwards; out of the morass, on to the firm ascending highway; out of the fog, into the purer air and sunlight of the mountain slope.

To "take no anxious thought for the morrow" is a precept we are apt to break, to our exceeding disadvantage, as we stand on the ridge of time, between two years, and scrutinize the obscure windings of the pathway before us. Are they sounds of music or weeping that we hear? Is it purifying but keen fire, or gentle sunlight, that casts that glow upon the road ahead? There is no voice in answer to our questionings, but the Hand that leads us tightens its grasp on ours, and there is a reassuring smile on the face of our Guide.

He "knoweth the way we take." As each step is taken, the next is clear; and, now and again, over the billowy mists, shines on the far horizon, the mount of God, and the city that "hath no need of the sun."

Some day, in some year,—and it may be this,—shall plant our feet on those eternal hills, where earth's shadowy terrors flee before the face of the all-conquering day.

> "So be it; there no shade can last
> In that deep dawn behind the tomb;
> But clear, from marge to marge, shall bloom
> The eternal landscape of the past."

The advent of 1887 was ushered in with the usual joyful clang of bells; and men greeted one another with the customary salutation, "A Happy New Year." The illustrated journals "welcomed the little stranger," and impersonated 1887 in forms of infant innocence and grace. And the world wondered, with a sigh, if 1887 were "the good time coming," and prayed concerning the disappointing and discarded 1886,—

> "Ring out, wild bells, to the wild sky,
> The flying cloud, the frosty light,
> The year is dying in the night;
> Ring out, wild bells, and *let* him die!"

But to how many the infant year was a bloody Nero, a tiger-kitten! Is it not pathetic, the way in which we fondle each new year as it comes, thinking, "This, ah, surely this, at last, shall bring us the joy we long for!" When will men learn that every new year shall, or shall not, exult and triumph with new and permanent joy, according as we do, or do not, graft upon its wild briar stem, new rose shoots from Eden? It lies with our free will to determine whether the new year shall be a weary round, a monotonous repetition of days, blighted with failures and feeble acts of repentance, or a growth in grace and glory—an arena possibly of perpetual struggle, but of exhilarating spiritual success, and joyous progress.

What shall 1888 do for us? and what, by our hands, shall it do for the world? We desire for ourselves and for the world, true progress; and the conviction is strong within us that the world is making progress. Amidst all the turmoil, the eddying, retreating, and again rebounding currents, and the occasional apparent triumphs of reaction, we seem to hear the measured tread of the Divine purposes, unhasting but unresting, ever moving onward in our front. How shall we keep time with those great footsteps? How shall we lead the stream of our poor deeds into that deep-rolling current of Divine intent, so that their "mortality may be swallowed up of life"? The answer lies in a word: in our social, political, private and public life, with the nation as with the individual, the secret is—"Christ in us."

If in any realm of our life there be activity without results, commotion without progress, it is the heavenly wisdom that is a-wanting—the wisdom that is not a quality but a person—"Christ, the wisdom of God, and the power of God."

In our Parliament, our Municipal Councils, our innumerable Boards and Departments, how would our advance towards the goal of justice, freedom, and happiness be accelerated by the welcomed and recognised presence of the Master? The miserable blunder of cutting our life in halves, and confining the Son of God and Son of Man to one half, leaving the other to be ruled by our own maxims, must be shaken off like an asp into the fire.

We raise our ecclesiastical edifices; we sing our *Te Deum;* we intone our prayers that His kingdom may come, and His will be done on earth as it is in heaven; we hold our solemn functions, and are exacting in our ritual; but, as a nation, we still fall terribly short of that unquestioning deference to the Divine Will, which alone can make us worthy to be called a Christian nation, or can stud the new year's sky with stars of promise.

There is one infallible guide of men, which perfectly unites Conservatism and Liberalism; a guide, which, if implicitly followed, will secure the unity of the Empire, the freedom of the subject, reverence for law and self-government; a leader in peaceful revolution, but the uncompromising foe of tyranny, whether of emperor, priest, or mob. It is radical in its uprooting of evil, and constitutional in its demand of instant obedience to the highest law. It is cordially hated by all pretenders, hypocrites, and quacks. It breaks loose indignantly from the bridle and harness of those who would set it to drag the car of any one sect, or community, or scheme of dogmas, or hierarchy, or class. It makes free, and it insists on freedom. It is the charter of true democracy, and gives the patent of true nobility. It glows with the enthusiasm of humanity. Slavery withered under its steady gaze. The sacred claims of the poor, the widow, the fatherless, and "him that hath no helper," it maintains with an authority which all but fools must tremble to gainsay. Hospitals and orphanages, and all manner of institutions designed for the mitigation of human woe, rise at the waving of its wand. Its index-finger is pointed now, with menacing emphasis, to our legislation in Greater Britain for licensed sin, to our haunts of immorality at home, to our opium traffic, to all our national sins and failings. If, through the coming year, we take it for our guide, we may fearlessly scale the slopes of 1888, descend its valleys, skirt its precipices, ford its rivers. The seal of God is on the brow of this guide: it is THE BIBLE.

Brothers and sisters! let us clasp hands with this guide, the sole vicegerent of the Most High, in our confused and darkened, but redeemed world. Let us go forward hand in hand with the Bible, and then, as God lives, we are sure of

A HAPPY NEW YEAR.

PHOTOGRAPHY:

SIMPLIFIED LESSONS FOR AMATEURS.

By A. H. Wall.

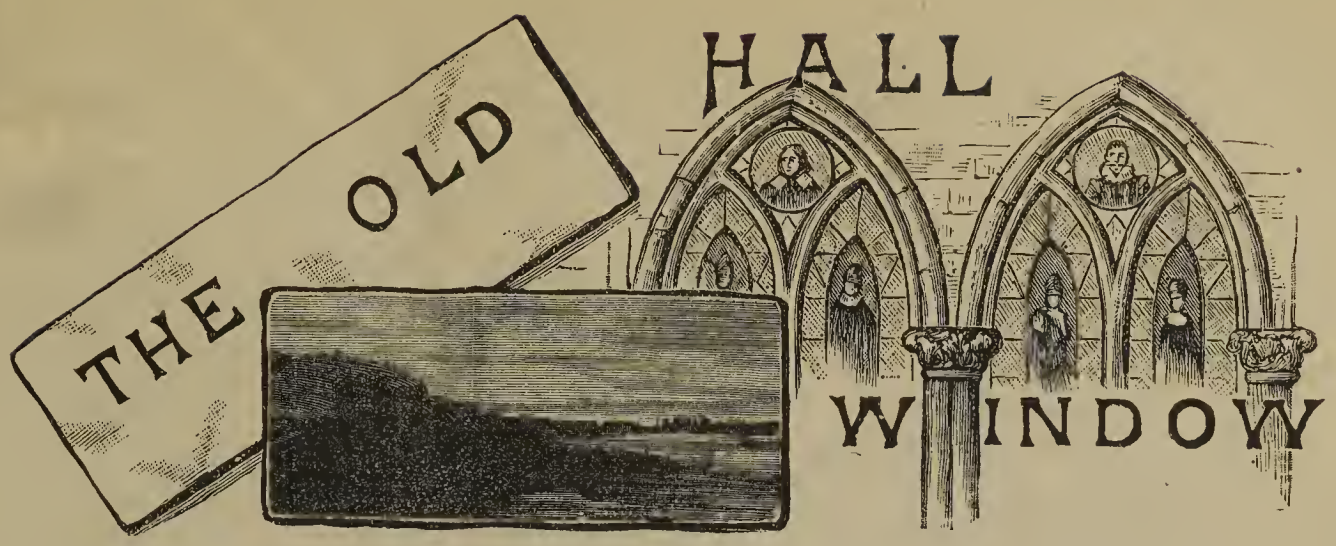
PART IV.—EXPOSING, DEVELOPING, FIXING, AND PRINTING.

EXPOSING.—Over or under exposure is dangerous. If over-exposed, the plate, in the process of development, rapidly blackens over, and the picture is more or less, or entirely, obliterated by the very agent of its production. If unexposed, the development proceeds very slowly, and is imperfect in a degree proportioned to the extent of under-exposure. Properly exposed plates develop neither rapidly nor slowly, but gradually; and when held up, after development, between the eyes and the light, show numerous degrees of transparency and opacity, ranging from bare glass, which prints black, to touches opaque enough, when printed upon, to leave the sensitized paper beneath them, white, or in other words unacted upon. A print from an under-exposed negative would be nearly all black; one from an over-exposed one would be nearly all white. Where the glass is opaque, the action of light is strongest; where the light has been weakest, its chemical action is least powerful. Too much opacity or transparency in a negative, means the absence of those proper gradations of light and shade, which give form and detail, with depth and transparency in the shadows, and to the planes of distance, and objects near and distant, their proper proportions of relief or aërial perspective.

Water, reflecting the light and colour of the sky, is also a difficulty, especially if associated with objects in shadow, which have non-actinic colours, such as act slowly on the chemical surface of the plate. Trees in shadow, especially if their greens are yellowish, or brownish, or have assumed their autumnal tones of red, brown, and yellow, require long exposure, particularly when there is no great body of blue air between them and the lens; in other words, when they come into the foreground.

As to the time of exposure, experience only can be your best guide. One lens is quicker than another. The dry plates you purchase ready prepared for use, vary in their degrees of sensitiveness to chemical action, either professedly, or because of their being prepared by different makers. The lenses vary in their degrees of slow or rapid action, and the above considerations, with those I have previously mentioned (optical and chemical), all step in to modify exposures. A view embracing only bright water and sky, cannot be too quickly exposed, even with a slow lens and the least sensitive plates. Grass, foliage, etc., in sunshine, require about half a second's exposure. A view chiefly composed of foreground trees, may require from one to three seconds; and the gloom of a thicket may necessitate an exposure of from a minute to four or five, and sometimes ten minutes. Interiors of caves, rooms, or churches, or other such subjects, will also require these greatly lengthened exposures. The beginner will find it an excellent plan not to defer the development of his plates until he reaches home. When you are sufficiently experienced, errors in the way of selection and exposure will become few and far between. In the days of learning, they are sure to be somewhat numerous. The plate, when exposed, takes the place of the focussing screen in the camera, and must be in *precisely* and *exactly* the same plane. In drawing up its shutter, allow any motion you may have caused, to subside before you uncover the lens. Cap your lens before you close the shutter of your slide, and cover it with the focussing cloth in removing it. Of course an exposed plate must see no light but that of "the dark room," which is artificial, and of a non-actinic colour. Any room will serve, providing you can exclude daylight from it. If it has not a sink with water laid on, a pail of water and a deal table must take their place. The light is that of the Developing Lamp you have, I presume, purchased with the rest of your apparatus. The plate must be carefully removed from the slide. It is still, apparently, what it was when first manufactured, but the latest picture is there all ready for the next chemical process, which is that of—

Developing, or making it visible and printable. In other words, we continue without light, the chemical action already commenced by light. Great knowledge and manipulatory skill are now required, and it is in the development that you will assuredly make your most frequent failures. The danger is proportioned to the power you exercise, and there is a great deal of it within your reach. In developing, a plate, considerably under or over-exposed, may often be made fairly presentable; parts which are over-exposed, and parts which are under-exposed, on the same plate, may be cleverly "dodged" by development. You may, by clever manipulation, stop the developing action here, while continuing it there, and so bring into more harmonious relationship, land and water, sky and distance, light and shadow. A mass of foreground foliage in shadow, which would otherwise come out black, opaque, and heavy, with no suggestion of light and air in its depths, or of its leaves quivering and its branches swaying in the breeze, may in this way be made more truthfully and beautifully representative and suggestive. For this reason, I would advise all beginners, before they attempt to develop their own negatives, to have the first dozen or so developed for them. Most professional photographers will do this, and return the negative with a print revealing your shortcomings or your triumphs; and will, moreover, explain the why and wherefore of either the one or the other, for a trifling consideration in the way of payment. You may glean, in this way, far more than you could acquire by any other method in the same time.



To resume. The plate being removed from the slide, is now ready for the solutions which are poured into two of the little porcelain dishes belonging to your set of appliances. One of these solutions is made with powdered alum in water. It is what chemists call a saturated solution, that is to say, it contains as much alum as the water can absorb. The other is a solution of hypo-sulphite of soda (five ounces in a pint of water), kept ready for use in a stone jar or bottle, and in a dry place. The hypo. (as it is called) is bought in white, transparent crystals; and as it varies greatly in quality, and should be the best, it is well to purchase it only of some very respectable and reliable chemist.

We next take eight drachms of bromide of potassium, which is a mixture of bromine and caustic potash, from which the oxygen has been removed, and one and a half ounces of liquor ammonia, which is a powerful alkali, and mix them in six and a half ounces of water. Bottle in what chemists call a sixteen-ounce bottle, and fill it with water. Then mix, and treat in the same way, in eight ounces of water, two drachms of citric acid (the acid obtained from certain fruits in a prepared condition), and one ounce of pyro-gallic acid (a powerful deoxidiser). Bottle as before.

From each of these bottles, pour into your measuring-glass (which has a graduated scale duly numbered) one ounce of mixture.

Place your negative in the third of your porcelain or ebonite dishes, with the film uppermost, and pour the mixed solutions rapidly, and with a sweeping motion of the hand, over the plate. When covered, keep the fluid in action, flowing to and fro, smoothly and evenly over the plate, so that no part is uncovered. In the way already explained, you will now perceive whether the plate has been exposed properly. In about eight or nine or more seconds, you should see parts gradually becoming more or less transparent, and others appearing more or less opaque, and, in about four minutes, the development will be complete. The next process is that of removing the plate from its bath, draining, and washing it for some two or three minutes with the water. Now have ready, in another tray or dish, the alum solution; and after a minute or so, remove, drain, wash as before, and place it into the other dish with the hypo. or fixing solution, which acts by removing the semi-opaque whiteness, and leaves the darks transparent. By the bye, this hypo. solution must be kept very carefully from your fingers, and from everything else, or it may prove a source of great chemical mischief. After it has been about nine or ten minutes in this solution, remove and wash it *very thoroughly*, and put it on the rack to get perfectly dry, after which, varnishing completes your negative.

For printing purposes you will have received, in the first place, a glazed wooden frame to hold the negative when exposed to light, with the prepared sensitized paper behind it. It has appliances for keeping paper and glass in close contact; but a little blotting-paper folded and placed over the paper, when it is laid upon the negative, will increase the flattening pressure. The back of this frame opens, so that a hurried glance tells when the printing is dark. A good toning bath may be made by adding one drachm of acetate of soda, and two drachms of chloride of gold, (purchased in tubes of glass) to sixteen ounces of water, to be used not less than twenty-four hours after mixing. The prints taken from the printing-frame are well washed, first in one dish and then in another, until the water ceases to appear milky, and are then placed in a third, perfectly clean dish, with the toning solution. When they assume the right colour and intensity, they are again thoroughly washed, and then receive their bath of hypo-sulphite of soda, to render them permanent. In this bath the print, or prints, remain about twelve minutes, after which a long and thorough washing in repeatedly changed water completes your work; the print is then dried, cut to shape, duly mounted, and, if agreeable, framed and hung up as a specimen.

A THRILLING NEW YEAR'S STORY.

NEW YEAR'S EVE! and a cold and stormy one, even for the wild Cornish coast where Treherne Manor stood, looking bravely down on the huge waves, tossing and thundering on the beach below. The keen north wind swept whistling through the low fir plantation, on the edge of the cliff, until it burst with gathered fury upon the house, whose thick stone walls had mocked at wind and storm for more than a hundred Winters. The estate had belonged to the same family for several centuries, and more than once had this old home, so dear to its owners, been rebuilt, almost from the foundations, on the selfsame spot.

Just now, it wore a specially hospitable look on its grey old face; for, from each wide, low window shone cheery lights, so suggestive of inside warmth and comfort, as to quicken the footsteps of a boy, who, with fur cap pulled over his ears, and hands plunged in his pockets, was making his homeward way over the crisp snow to the Manor House; and yet, in spite of the inviting glow within, and the bitter frost without, for fully five minutes did he stand, gazing earnestly first upon the smooth sheet of snow beneath the old west window, and then at the building itself; and not until the great bell sounded, did he wake from his reverie with a start, and hasten along the path.

Certainly most people, even on such a night as this, would have bestowed at least a passing glance on the grand old stained-glass window, lighted up from within; while the soft mingling of rich colours on the pure carpet of snow without, had a strange, unusual beauty, that might well make one pause, and almost forget the biting wind and frosty air.

But it was not the mere beauty of the scene that had thus held the boy entranced. A feeling deeper than mere admiration had suddenly been awakened; it almost seemed to Noel as if those knights in armour, looking down from the coloured window, were speaking a message to him; and though not very clear, and scarcely even shaped into words, it somehow ran like this:

"Boy! Life may be noble and grand, but only when lived to others; and Death, though terrible, is fair, if bravely met for the sake of fellow-men. Shun sloth and selfishness, if you would be worthy of your name and race."

Though all unspoken, and partly the work of fancy, yet this came indeed as a message to Noel—a message from a long line of noble ancestors; for each painted figure in that window had earned his shrine by falling on the battlefield, when fighting bravely against some form of wrong and oppression. And this it was that made young Noel's heart swell with a vague, undefined longing, and caused the half-formed wish to rise, that he had lived in those old times, before such knightly deeds had become mere legends of the past.

But now the great bell had ceased its clanging, and Noel soon found himself in the dining-hall. Every face brightened as the boy joined the circle standing round the fire, full of eager excuses for being so late.

"Indeed, Muriel, you will forgive me, when you know the reason," said he, turning to his brother's young wife, who now seated herself at the head of the long table. "That unlucky little fellow, Robbie Garth, came down this afternoon, to watch the skating, tumbled over on the ice, and broke his ankle, so he said, though it is only a sprain, I fancy. Anyhow, he could not walk, so I had to carry him back to his mother's cottage; for he set up a perfect roar when he thought he would be left sitting on the bank all night, and miss the New Year's dinner to-morrow."

"Terrible prospect for a small boy!" said his brother Arthur, the young squire of Treherne Manor; while Muriel added that Robbie would have missed more than the good dinner to-morrow, for his father was expected back from a long voyage. The 'Stormy Petrel,'" she added, "is to sail past here to-night, on her way to Trelogan Harbour, and I hear that there are at least a dozen Treherne men on board, Robbie's father amongst them."

It was a small but very merry party that sat down to dinner in the old hall, where the firelight danced on the quaint oak panels, and lighted up the ivy and mistletoe boughs. Noel's elder brother, Arthur, and his young wife, with her father and her little sister, Amy Leicester, made up the number. At last Noel slipped away, and returning with a warm wrap, placed it over Amy's shoulders, begging her to come outside just for a moment, to look at something well worth seeing.

On reaching the west wing of the house, Amy's exclamation of delight at the sight before her quite satisfied Noel, and they stood a while in silent admiration of the almost weird beauty of the scene. Strange, rich colours were thrown from the old hall window upon the smooth snow,—brilliant and distinct, close at hand, but growing fainter and fainter as they lengthened away into the distance, till at the far end of the lawn, they softly tinged with fairy tints the drooping pine-trees, bowed down with their weight of snow.

As they turned to go into the house, Amy, giving a parting glance at the coloured window, asked: "Whose are those six figures, and why is one space left empty?"

"Have you never heard our family legend?" asked Noel, laughing. "Come in, and you shall be enlightened this very evening." So saying, he led the way to the library, and, pulling two arm-chairs close to the fire, he displayed to Amy's wondering eyes a huge old, vellum-bound book, with brazen clasps. Then, partly reading from that, and partly in his own words, he told her how in the days of good King Alfred, a certain Sir Gareth Pentreith, in a time of much trouble and famine, had opened his house to the aged and poor, and from his store, had given food to the hungry little ones, and to the fierce, half-barbarous fisher-folk, for many miles around. At last, when he had exhausted both stores and money by his open-handed generosity, on a cruel, rigorous Christmas Eve, his first child, a little son, was born. Then Sir Gareth could find nothing but coarse, hard food for the Ladye Amyce, his wife, and his grief was great, till, as he sat sorrowfully watching by the embers, he fell asleep, and in his dream it seemed to him that the Christ-Child appeared, and called him. Sir Gareth thought that he arose and followed, and the shining figure led him on and on, till they reached a place near the cliffs, where a sheltered hollow lay between two hills. In the midst of this hollow was a flat, grey stone, and the voice of the Child bade him raise it, and take what lay beneath. With the effort to move it, Sir Gareth awoke, and found himself watching alone by his cold hearthstone. Yet so strangely did it press upon his mind, that he rose up, and with no attendant but his faithful hound, went out by star-light to seek the hollow, which was known to him, though he could not remember the flat grey stone. But truly there it lay, with the glittering frost upon it, one half all buried in the snow. With a mighty effort, Sir Gareth turned it over; and there, beneath, lay a leathern pouch, which was heavy to lift, stiff with age, and filled to overflowing with golden coins of some unknown land. With joy, Sir Gareth hastened back to tell the Ladye Amyce; then

" Fierce shouts from the men on shore showed that he was discovered."

on his swiftest horse he sped to Tintagel, where dwelt many wealthy thanes, who willingly made exchange for his golden coins; and at break of day on Christmas morning, Sir Gareth returned with a train of pack-horses, bearing food for his household, and for the poor around. And to his little son he gave the name of "Noel," because he was born on the eve of Christmas, and also in remembrance of the vision.

After some few years, when the house was burnt to the ground, Sir Gareth built up the new one on the spot where the old grey stone had covered the golden treasure; all the people willingly helped, and there were great rejoicings when it was finished. The little Noel was brought to the feast by his nurse, clad in a tiny suit of chain-armour, with a small sword in his belt; and he walked amongst the people fearlessly, while they praised his beauty and his golden curls; till at last an ancient crone, said to be gifted with strange powers, looked fixedly upon him, and muttered, in a weird, deep voice: "Fair babe, thou comest of a noble race,—noble in their living, and noble in their dying, and before *thee* lies a joyous life. But

'After thee
Shall seven Noels be,
Who will yield their life,
In noble strife,
For Christ and their countrie.'"

And the child wept; for though he knew not what she said, yet her face and manner frightened him; a hush fell on the assembly; the evening grew chill; heavy rain began to fall, and the people went to their homes.

Now the wise mother's prophecy was handed down in the family; yet it did not prevent the name of "Noel" being given to a son of each generation, nor was it till long after, when a certain Sir Noel Pentreith fell, in defending some harmless peasants against a party of free-booters, and some years later, his young son of the same name lost his life in the Holy Land, for refusing to smite the Cross when captured by the Saracens, that the words of the old crone seemed to hold any truth. But when the sixteenth century had come and nearly gone, and the great dining hall was built, with its large west window, the then owner wished to represent in coloured glass, various brave deeds of those earlier knights; and, after searching the family records, the names of four Pentreiths were found, who had met with their death nobly in defence of others. All of these bore the name of "Noel," and as time passed on, two more were added, until but one division remained unfilled.

"Oh, Noel, how beautiful!" cried Amy, when he had finished his story; "but is it really true?"

"Well," said he, "one is bound to believe one's family legend; but I should be sorry to say how much is fact and how much fiction. Of course it can't all be true; but anyhow, there were some fine old fellows amongst those early Pentreiths, and some day I mean to hunt through our history to find a seventh, to fill up the last space; it's a pity to leave it unfinished like that."

"I want to have another look, Noel, now I have heard the legend," said Amy, rising; so once more they went into the garden, and retraced their steps to the old hall window, where they stood for a minute in silence, looking up at the stalwart figures of the brave old knights, standing out against their background of crimson, blue, and amber. Then Amy suddenly exclaimed: "Why, Noel, that seventh place is waiting for *you!*"

He started, and once more there arose within him that great longing that he, too, might do something for his fellow-men, something worthy of the descendant of those whose noble natures had made them choose peril and death, rather than see the weak oppressed, and the helpless suffer wrong.

But, shaking off his dreams, Noel led Amy back to the house, and then, bidding her "Good-bye," ran off to the cottage where little Robbie Garth lived, for he had promised to look in during the evening, with gingerbread and a picture-book, to console him for the "broken ankle." As he made his way along the cliff-path, in the face of a keen wind, he could hear the waves dashing on the rocks of the rugged coast.

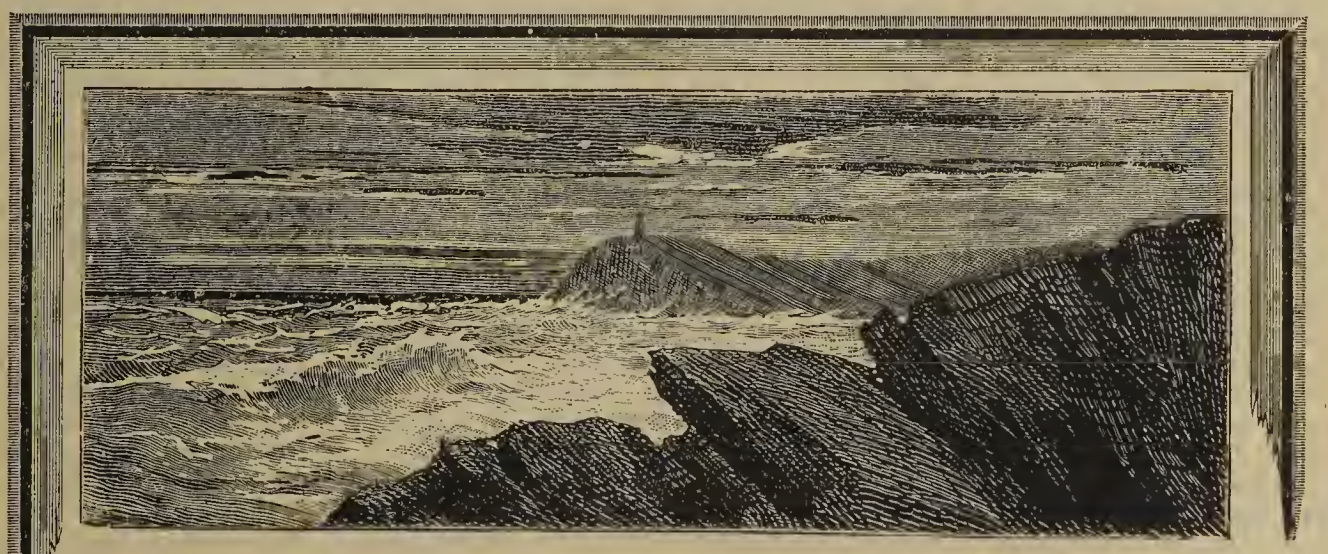
Now this bay was nowhere accessible from above, and only at very low tides from below, so that it was with some surprise that Noel heard the murmur of voices from below, and the tramp of heavy feet upon the shingle. Who could possibly be down there at such a time, and on such a night as this?

Presently, while still wondering, he heard the splash of oars, and a boat was pushed off and rowed away. He stood a few minutes to watch; then, suddenly, a dull red light appeared, and from its movements, he judged that it was being hoisted up the mast of another boat, for soon the first returned, the men drew it up on the beach, and all was still. Much perplexed, Noel passed on his way. "Surely," thought he, "the days of smuggling are over! Yet what can be the object of that strange red light, and why are the men in this lonely bay so late at night?"

However, before he had solved the difficulty, he found himself at the cottage, where Robbie's mother, Jenifer Garth, was putting all in order for her husband, for whom she was beginning to watch and listen. After hearing that little Robbie was peacefully asleep, and that his foot was better, Noel asked Mrs. Garth if she would tell him the meaning of that red light out at sea.

"Away at Trelogan, sir? Why, it's just the Harbour signal. The coast about here is all so much alike, that many a good ship used to come ashore on the rocks below, till the Trinity House gentlemen (as they call them that look after such things) had that Trelogan light put up."

"But we cannot see Trelogan Bay from here," said Noel, "and the light I mean is just below,—right under the cliffs on the Manor grounds."



Jenifer Garth dropped the new blue Jersey she was making for her husband, and the colour slowly faded from her comely face, as with a scared look, and choking voice, she sobbed out: "Oh, sir, oh, sir, what shall us do? It's those wicked wreckers at their plots again! There's a band as goes about these parts, and like enough, they've heard the 'Stormy Petrel' was coming in to-night for Trelogan Harbour."

"What do you mean?" asked Noel; "what can they do?"

"Why, sir, there's a reef of sunk rocks just outside the Manor Bay, and they've hung out a false light, to make them think it's Trelogan, and decoy them on, like they did that French ship, two years agone; and the 'Stormy Petrel' is well laden, as the villains no doubt know. There's my poor man on board, and many another from the village, whose wives will wring their hands to-morrow, for they're as good as dead men now!" and she wept and wailed afresh.

"Can't we get a boat," cried Noel, "and tear down that wretched light?"

But his face fell, on hearing that it would be full two hours before a boat from the village could get round to where the lantern hung, for a far-jutting promontory lay between: the "Stormy Petrel" was, in all probability, even now making for it, as she was due at Trelogan sometime before midnight.

"He could hear the waves dashing on the rocks of the rugged coast."

For a few moments Noel stood deep in thought, then, as if seized by some sudden inspiration, he hastily left the cottage, and hurried back to the spot where he had stopped before to look down upon the little bay. He saw the great lantern, with its dull red glow, swaying with each motion of the boat, as it rose and fell; and he thought of the many lives it was luring on to death and danger on those hidden rocks, while the evil men, whose voices could now and again be heard from the beach below, were gloating already over their promised spoil. Then his resolution was taken.

Another moment, and Jenifer Garth, following behind, was just in time to see the brave boy disappear down the side of the steep and jagged cliff.

Swinging himself from ledge to ledge, now clinging to tufts of coarse grass, now digging his fingers into crannies of the rock, and finally jumping some ten feet, Noel at last found himself at the bottom of the cliff, bleeding, bruised, and sorely shaken. Paus-

ing to take breath, he saw at the farther end of the little bay, a group of powerful-looking men, gathered round a fire, behind the shelter of some rocks. One of them, who stood apart, had a telescope in his hand, directed towards the horizon; and Noel, following its line, was dismayed to see a far-off light, which seemed to be making straight towards the false, red beacon.

No time was to be lost; yet, what could Noel do? The wreckers' boat was drawn up close to their hiding-place; and even if he could secure it, it was far beyond his strength to manage. Clearly, in swimming lay his only hope, and so, thinking of the many lives he hoped to save, and little of the one he perilled, the brave boy plunged into the seething waves, prepared to struggle through the fifty yards that lay between him and that beacon of death.

At first the icy chill benumbed him, and his strokes were slow and feeble; but once outside the line of breakers that made this bay so dangerous, he summoned all his strength, and calling on God to help him, he battled in fierce earnest against the powerful waves, which seemed like conspirators, leagued with the wreckers and the false, red light.

When, at last, he reached the anchored boat, his strength was almost gone; time after time as he vainly sought to climb the side, the force of the water drew his legs underneath, till he was ready to give up in despair. Then suddenly, he caught sight of the lights of the approaching ship, less than a mile away now; while the hidden rocks lay half-way between. With an agonised prayer for help, Noel put forth all his remaining strength, and at last raised himself so high, that he could climb into the boat. For a few minutes he was too much exhausted to move, but the rapidly approaching ship left him no time to spare; so drawing a few deep breaths, he braced himself for his remaining work. High above him hung the lantern, swaying at the end of a pole, which was tied to the head of the mast. At first he tried to climb it,—but in vain, for it was slippery with frozen spray, and Noel was stiff and numb with cold. What could he do? He shook the mast, but his strength was not sufficient to displace it. He thought that by strenuous effort he might over-balance the boat, and make the mast-head dip into the water, but in vain.

While still striving to carry out this intention, fierce shouts from the men on shore showed that he was discovered. By the red glare of the lantern they had seen him, and threatened to shoot him dead instantly, if he touched the light.

Noel heard, and made one desperate attempt to reach the rope that hung dangling from the lantern. Then came a flash of fire, a sudden sharp agony in his side, and the next moment he was struggling in the waves, but he had caught the rope.

Consciousness was nearly gone; only the strong determination remained to cling with all his might to the rope. The lantern fell from the mast, the light was quenched, and its power for evil gone. But his grasp weakened, and his strength ebbed away, till at last the dashing of the waves and the wreckers' shouts seemed to fall on his ears as from an infinite distance; and then he knew no more.

* * * *

Twelve months have passed away, and New Year has come round once more. The old Manor House is again lighted up, and in the dining-hall the guests are listening to the young squire's kind welcome with somewhat subdued faces. Many a sturdy fisherman draws his rough hand across his eyes, as words are spoken in loving remembrance of the bright, young life which, just one year before, had braved the cruel waves and still more cruel wreckers, to save a homeward ship from being dashed on the rocks.

The tears are rolling down the cheeks of many a wife and mother, as she thinks of the handsome lad whose lifeless body was tossed up by the sea last New Year's morning; turning it into a day of heavy sorrow, both for the Manor and the cottage,—and yet, as the young squire reminded them, a day of thankfulness too, that a great ship, with many lives on board, should have escaped the treacherous snare and safely ridden into harbour.

None too soon had that false light been quenched; a very few more minutes and the anguished cries of many drowning men would have gone up to heaven, instead of the sigh of one brave parting spirit.

The listeners' hearts were deeply touched; to many, for the first time, there came that thrill which the nobler nature in us ever feels, when it rises in sudden, warm response to the story of SELF-SACRIFICE,—a story which runs in golden letters down the dark pages of this world's history. For in Christ, the God-Man, self-sacrifice reached its height, and the Divine image in which man was made can never be wholly blotted out.

So intent were all the guests on hearing what the young squire said, that none noticed when a little white figure glided softly from the room,—away from the light and the warmth, out into the cold night air, to where the old hall window was once more throwing its fairy colours on the snow.

There Amy Leicester stood awhile, gazing with tearful pleasure on the now completed window; for the seventh space was no longer empty!

And of all those pictures of brave deeds, done in the spirit of true knighthood, none is more beautiful than the seventh and last, which shows a fair and noble youth alone in a boat on a stormy sea, with one arm round the mast, and his eyes fixed on a distant light, while all the earnestness of a high and noble purpose is shining in his face.

COMPETITION NOTES.

Our Spelling Chase is given *in extenso* on page 142. Its novelty will ensure it a hearty reception. Most people *think* they can spell correctly;—we shall be much interested in noting how many are able to pass our test. The Competition is open for *one week only*, and closes on January 7th, but in order to prevent the need of using the Sunday post, papers need not reach our Office until Tuesday, January 10th.

£100 *Competition*, the third of our Special Christmas Series, will be announced next week.

Our "Acrostic Competition" remains open until February 29th. For Rules, etc., see the Number for December 17th, page 106.

The Literary Competition, with its £14 14*s.* in Prizes, has well-nigh swamped our Office. Hard work for our Examiners! All the same, we are thoroughly cheered by its success. Lists of the successful competitors' names will be published at the earliest possible date.

THE LAST NIGHT OF THE YEAR.

"Every place that the sole of your foot shall tread upon, that have I given you."—JOSH. i. 3.

LORD: the wide tract Thy Providence prepared
That I should traverse here, thus far I've trod;
Mine 'tis become, since mine own foot hath gained
That which to me Thy Royal Charter pledged.
But what avails the territory won,
If it be poor and sterile soil, that yields
Vain leaves, scorched blossoms,* or abortive fruit?
Thou, Lord, didst read the volume of my life
Whilst yet to me its pregnant page uncut;
Thou knew'st my path, and spiedst out my ways.
What landmarks prominent didst Thou descry
But frailties there—and impotence—and sin?
Not "failures," unto Thee dare I miscall
The weak and laggard efforts I have made
To meet my conscience' all too just demands,
And follow up its impulses to right.
Excrescences they were of hybrid growth,
Passing for virtues. Sin-*tinged* as 'twere,
But in man's judgment all they need have been.
Such may not be the off'rings of my heart;
Not such the Temple-tribute the free child
Will pay, who knows they are but "filthy rags."
Nay, take them only at their worth, my Lord,
And if the light of mercies undeserved,
Unsought for and unnoticed—unimproved—
Serve but the more ingratitude t' expose,
Disfigured with its blots, and blurs, and blanks—
Just take my page as 'tis—and *all* forgive.

Maybe, when I shall one day rise to claim
The full fruition of the purchas'd joy
In yonder Holy Land that waits for me,
Some lot, with this life here commensurate,
Will be the lot of mine inheritance—
The "place" by my great Surety there "prepared,"
"Reserved" for me in that exclusive sense
In which the ground I've travelled o'er towards Heaven
I now may call mine own.
Yea, to Thine Hand
I render up the work, all incomplete.
I never may revoke the part that's done—
But pray Thee scan it closely, and in love
Blot out its faults. And for the time to come,
Grant that the Blood on my heart's lintel shown
May fright th' avenging Angel ever hence.
Nor let incipient sin e'er build its nest
Within the altar that my God hath cleans'd.
Restore my soul, in paths of Righteousness to walk,
Whilst yet Thou bidst me go my earthly way,
The bounds of my possession to enlarge.
One stage towards Death's dark goal to-night I've made;
Nay, but one stage towards the height of bliss
And endless dwelling in my Saviour's joy.
So press I forward to the Heavenly Prize,
Whilst saying to the year I leave behind
The willing, hopeful, thankful word—
"Good-bye!"

S. D.

HOMELY HOBBIES.

RECREATIONS IN GEOLOGY.

By W. H. Harris, B.A., B.Sc.

No. 3.—The Bricks of our Houses.

IF we are fortunate enough to live in houses built of stone, it is easy to understand that a geological inquiry, as to the origin and relations of our wall-material, may be full of interest. Sandstones of various kinds, for example, would suggest the breaking up of crystalline rocks by sea-waves, or by frost, rain, and other atmospheric influences; the rounding of fragments, and their continual wearing away by dashing and rolling against one another, till they were reduced to minute grains. Then we should have to think of the spreading out of this sand on the floor of the ocean, layer on layer, till a thickness of many feet had been accumulated. While this process was going on, waifs and strays from land and water would be here and there entombed, each one serving as a letter to be spelled out in the history of the stratum by a geologist, after an indefinite number of ages had passed away.

Next, we should have to imagine a gradual depression of the sea-floor, and the laying down of other strata, till our sand-bed, brought within the reach of the high temperature below the upper layers of the earth's crust, and acted upon by water percolating its mass, and impregnated with oxide of iron or other cementing material, had become compacted into coherence, that is, had been transformed into stone. Once more we must call fancy into play; yet it will only be revealing realities to us, as it pictures oscillations that must have occurred to bring again to the surface the stratum we are considering, and to place it within reach of the energies of man. This bare outline of the story would be filled in with various and wondrous details, according to the age and particular origin of the sandstone with which we might be dealing.

An Aberdonian, in his house of granite, would, in his investigations into the geological nature of his walls, have to go back in thought to a yet more ancient and more extraordinary series of operations, which have gone on deep down below the surface, and far above it; but we may, perhaps, have more to say on this point in a subsequent Paper.

A house built of material from one of our many limestone quarries would suggest facts widely differing from those previously alluded to. Some of these we intend to detail when we come to speak of our mantelpieces and fireplace jambs.

But now, it might be thought that such prosaic, man-made things as bricks can have little worth knowing about, as regards either their composition or geologic history. Yet, common, and it may be ugly, as they are, they will repay us for consideration and inquiry. Let us try to make good this assertion. And first, we shall have to learn the nature of the materials of which bricks are moulded, and whence these are obtained. Then will come the question how these earthy matters were made ready for human use, in the great workshop of Nature; and lastly, we will say a few words as to the processes of their manufacture into brick.

Whatever theory be adopted as to the growth of the simpler arts amongst different peoples, it is easy to see how the fashioning of plastic clays, and their hardening into desired shapes, would arise, even in very primitive conditions of civilization. The commonness of such materials, their easy softening by water, their drying and solidifying under the influence of sun, heat, or fire, would be facts suggestive of their utility to man, in most regions of the globe. It is certain, from the monuments of Babylon, of Egypt, and of China, that brick-making dates back many centuries B.C., and that the materials and workmanship of those remote "brickies" were so good as to defy all the disintegrating influences of the atmosphere, through the many centuries to the present day. We fear that the New Zealander, or other antipodite, who is to survey the ruins of London thousands of years hence, will not be able to speak so well of the materials of our house-walls, as to durability; and this, it must he confessed, not so much on account of inferiority in our clays, as through the badness of the labour expended on them.

This mention of *clays* is indicative of the most important of the mineral constituents with which we have to deal in our present subject. The beds furnishing the best kinds of plastic matter are called "brick-earths." They are found, for the most part, in wide valleys, not very high, and yet distinctly above the present river-plains. The mode of their formation is not difficult to understand. They consist, in fact, of the finer sediments of water-borne materials, washed down from the more elevated parts of a river-basin, and quietly settling, layer upon layer, as the stream slackened in speed, from the slight slope of its bed, or from the opening out of its course into wide, lake-like expansions. In some instances, natural depressions in the surface, met with by rivers, have been entirely silted up, and have given rise to very deep beds of useful clay. In other cases, repeated floods and freshets have brought down mud in large quantities, much of which has been accumulated by settlement on either bank, over wide distances, as the waters subsided into their natural channel.

We have ourselves seen in Switzerland, an instance of the amount thus brought down from higher ground, and of its rapid deposition under favourable circumstances. We were staying not far from Interlaken, and at a house, near which was the bed of a streamlet, fed from the neighbouring mountains. During most of our visit, this was a "course" without water; but one afternoon, during a thunderstorm of two hours' duration, the stream developed into a torrent, which rose eight or nine feet in height, overtopping by a foot or more a substantial bridge of stone and planks, whose predecessor had been swept into Lake Thun, two years before, by a similar freshet. On the next morning, the water had fallen to within the boulder-built banks; but on the bridge was a layer of fine mud, nearly two-thirds of an inch in thickness. It was easy from this to understand what a quantity of sediment had been carried into the neighbouring lake; and how, in the long course of ages, its present bed would be made into dry land. The process, indeed, was plainly seen to be going on effectively on either side of the streamlet's *embouchure*.

Now, although our brick-earths have, in most instances, had a much slower building up than the above-mentioned rate of deposit, yet their origin has, in the main, been similar. Their particles have all been washed down from more elevated strata, and carried along by a river-current till their weight enabled them to settle.

We spoke in our preceding Paper of periods when the land surface of our country was much higher: of its being planed down to its present level by ice, frost, and rain, which agencies gave rise to rivers vastly greater than those which now run through our valleys. By atmospheric and climatic changes, these destructive instruments diminished their violence, but they have left abundant evidence of their former potency. Then, by degrees, as the stream cut its bed deeper and deeper, the extent of the flood-plain would be lessened, till at length a series of terraces, marking its varying extent at different epochs, would be traceable.

But now, it may be asked, what is clay? Mineralogists and chemists tell us that, when pure, it is a bisilicate of alumina, that is, alumina—a compound of the metal aluminium and oxygen—with a double dose (so to speak) of silicic acid—a compound of silicon, the basis of flint, with oxygen. Clays, however, are very rarely pure. As might be expected, their particles, coming from various sources, show us, in addition to argillaceous matter, minute grains of sand and limestone, and frequently of mica, talc, hornblende, and other materials of crystalline rocks. Nor is this a disadvantage, but rather a great gain, in the eyes of the brickmaker. For, first, clay purely aluminous would crack in baking; and secondly, certain amounts of sand and limestone of some sort are useful in the partial fusing together of the particles of the bricks. Frequently, indeed, coarse sand and chalk are added in considerable proportion to natural clays, deficient in siliceous and calcareous material. In many parts, at least in the South of England, brickmakers mix also a quantity of ashes with the other constituents of their manufacture. These ashes consist in part of purely earthy or mineral substances, but in part, too, of coal only half-burnt. This latter ingredient assists much in the subsequent "burning" of the bricks.

We have spoken of the formation of the clay and sand. In a subsequent Paper we shall relate the geologic history of the coal. Now we will devote a paragraph to the wondrous story of the chalk. Its appearance as a white, friable kind of rock, is familiar to every one. It is easily reduced to powder, and when thoroughly pulverized, or "levigated," and allowed to settle from its admixture of water, it forms the substance known as "whitening." When carefully washed and examined with the microscope, it is found to be made up very largely of the remains of the calcareous cases of various lowly organisms, and chiefly of those called *foraminifera*. These creatures consist essentially of exceedingly minute portions of jelly-like substance, having the singular power of abstracting carbonate of lime from sea-water, in which it is dissolved, and building for themselves shelly abodes. They are of many and beautiful shapes.

They still exist in countless millions in

certain parts of the ocean, notably in the N. Atlantic, on the floor of which there is now accumulating an *ooze* precisely similar to chalk in constitution and in origin. There is every reason to believe that the whole of the immense masses of the chalk-formation are chiefly due to these minute and lowly creatures. They live, probably, in the upper parts of the sea, fulfil their days, and then their tiny abodes slowly sink to the bottom. Geologists have reason to believe that a mere film is annually deposited. If, therefore, our readers want a not difficult sum, but a very difficult conception of the time taken for the deposition of, for instance, the Dover Cliffs, or the chalk in any pit with which they are acquainted, they have only to find out how many sheets, say of blotting-paper, would go to an inch in height, and calculate the number of inches in (roughly speaking) six hundred feet of the cretaceous beds; and then it will be easy to reckon the number of years, within a few thousands, occupied in the deposition of this one series of strata.

The process of brick-making is not very complicated. The clay and its admixtures are well kneaded with water in a machine, till a proper consistency and a thorough amalgamation of materials is effected. From this, lumps are cut off and thrown to the "moulder," who with a wooden mould so rapidly shapes the bricks, that from 4,000 to 5,000 are frequently made by one man in a day. They are at once arranged in long rows or planks, turned when firm enough to be handled, then set on edge with spaces between, and row on row, in the form of a loose wall, protected from rain by straw or wooden roofing, and left to dry as much as possible by the air. When this drying is complete, they are put together in huge stacks called *clamps*, with layers of small coal and cinders between the rows, and filling wider spaces called *flues*, sufficient in amount, when once fired, to continue burning till the whole mass of bricks has been cooked to requisite hardness. This part of the process often takes three months for its completion, so slow is the combustion of fuel in and among the bricks. Sometimes the burning is done in kilns. When the clamps have cooled down, a certain separation into various qualities is made, and the bricks are then ready for sale and distribution.

When we remember that every particle of each brick has been taken from the ground, we can imagine same rather large, if not very deep, excavations must have taken place to supply the materials for the hundreds of thousands of our brick habitations.

BRITISH INDUSTRIES.

THE MANUFACTURE OF BOOTS AND SHOES.

By Henry H. Bourn,
Author of "Earth's Diamonds; or, Coal, its Formation and Value."

BOOTS and shoes are articles so constantly moving in all circles of society, that a few words about them may prove of interest.

Boot and shoe making is a very ancient craft. Robert, the eldest son of the Conqueror, acquired the surname of "Short Boots," probably from adopting a style of boot new to the Normans. Sharp-pointed, long-piked shoes became the rage under the Plantagenets, till an enactment of Edward IV. restricted their length to two inches beyond the toes. The nobles, however, were exempted, and to some of them, doubtless, might apply the joke raised against the Roman patricians,—that they carried their nobility in their feet. The loss in length appears to have been gained in breadth, for a proclamation of Queen Mary restricted the expansion of the toe to six inches. Denied extravagance in length and breadth, high heels, and soles of extraordinary thickness, increasing the height of the wearers, came into vogue. To this absurd fashion Hamlet's exclamation doubtless refers,—

"Your ladyship is nearer heaven than when I saw you last, by the altitude of a chopine."

Through the Stuart age, boots with immense pliant folding tops became the glory of the men, till William of Holland introduced the large jack-boot and buckled shoe. The ladies rejoiced in wearing high red wooden heels, till the time of George III.

The cost of a pair of boots for the use of King John, in the year 1213, was ninepence; of a pair of shoes for the leader of Henry III.'s greyhounds, fourpence; of the winter shoes for the fox-hunter to Edward I. and those of his assistants, seven shillings.

At what precise period the boot and shoe trade first took up its abode in Northampton and its neighbourhood, is not certain; it was, at any rate, some centuries ago. An entry in the minute-books of the Corporation for the year 1550, refers to the fact that shoemakers had obtained the franchise, and enjoyed the liberties of the borough as local traders. It was enacted at the same time that every shoe-maker desiring to set up a shop in the town, if he had not been an apprentice to the trade, should pay at his setting up the sum of 30*s.*; or 13*s.* 4*d.* to the Mayor of Northampton, 13*s.* 4*d.* to the Chamberlain, and 3*s.* 4*d.* to the fraternity. So much as to our ancestors' boots and shoes. Let us walk together through a well-ordered factory to-day.

Before proceeding on our tour of inspection, however, we notice that the store-room is well supplied with raw materials—satin-hide; glove-hide; splits and sides from America; bends from the Cape of Good Hope; basils from Australia and New Zealand; buffalo hides from America; crup from Doncaster; seal and levant from Newcastle; kid from London and Leeds; elastic webbings from Leicester and Coventry; linings from Belfast; cloth from Huddersfield; twist and thread from Manchester, Skipton, and Johnston; silk twist from Macclesfield; eyelets and buttons from France and Germany; and other grindery from Birmingham.

In the showroom we find orders being executed for South America, New Zealand, Australia, and many other distant countries. The yearly value of exports from Northampton alone is estimated at one million sterling, to say nothing of the quantity required for the home trade.

In passing through the factory, we first meet with the "clickers," who are busily engaged in cutting out tops of boots, while boys, in the earlier period of their training, are as actively employed in cutting out linings. After seeing the different parts of the uppers and linings tied into bundles, we follow them into a room where a number of women and girls are busy closing the uppers; but what with the noise of the machines, and the loud chatter of their grimy and slatternly attendants, we pass on as quickly as possible, and watch some boys working piercing and eyelet-ing machines. It is interesting to watch the automatic action of the latter, as the eyelets run down a short spouting, and take their proper place in the hole, after which the bur is formed; the operation being so rapid that the eye can scarcely follow it.

We next see machines for cutting soles out of a hide, with one stroke. A man can cut out 100 pairs of soles in an hour. We pass on to another room, where uppers and soles are tied in bundles for the rivetters. In some factories the rivetting is done on the premises, but by far the greater part is done in the shop of a middleman, or at the home of the operative. In some cases, however, only a part can be done at home. It is part of the business of the rivetter to last the boot or shoe; that is, to fasten the upper and the inner sole together. Sometimes he can do this himself, but often he is compelled to take the work to a rivetting shop, where the union is more satisfactorily made. A machine, driven by power, forces a rough cut wire through both upper and sole, then cuts it off, and burs the rivet on both sides. The boots or shoes are then taken to the workman's home, and the outer sole is attached. If they are to be rivetted, the rivetter completes the operation himself, but if they are to be sewn, he has to take or send them to a shop where such work is done. Again taking them back, he covers the stitches, and soon has them ready to be carried to the factory. They are then put into other hands for heeling and finishing; this is done partly by machine, partly by hand.

There is a machine which attaches the heel to the boot, from the inside, with seven or more nails; pares the heel to any shape required; and, at the same time, breasts it—that is, cuts the front part in an instant to any curve required. All these operations are performed, and the boots made ready for finishing, at the rate of from thirty to fifty pairs per hour. The finisher then takes the boots in hand, and makes them fit for sale.

TWO SIDES OF THE SLATE; OR, CHRISTOPHER KERRIL'S ACCOUNTS.

A STORY OF NEW YEAR'S EVE.

CHRIS KERRIL held out his hands towards the fire. "Let me see," said he, "let me see." Now there was no one present to keep him from seeing, so the sentence was uncalled for.

Chris scratched his head—ruffled his hair, if you prefer the phrase—it wasn't good manners, but it was expressive, and seemed to set him more at ease.

The room he sat in was meant to be four-square, but as some one had stolen a corner of it for the adjoining almshouse, it was a kind of triangle,—an odd-looking, comfortless little spot. Still, a man past work, and with no balance at the banker's, may do worse than accept a triangle, rent-free. Chris got one-and-sixpence a week, and a Christmas dinner, as well as the aforesaid geometrical portion of space. The extra glow induced by remembrance of the meaty dinner, was warming him up for his work to-night.

It was New Year's Eve;—though it seems unkind to tack the new-comer's title to the expiring hours of an old familiar friend. The crisp snow outside the almshouse window was pressed by hurrying feet; some going to dance out the old, dance in the new; others going to the Watch-night Service in the chapel hard by. Neither rout nor service drew Christopher Kerril from his fireside; this was to him the most important night of the year. He meant to strike a balance before he got to bed.

He rose and drew a small table in front of his "easy" chair. He went to the cupboard which truncated the acute angle of his room, and produced a large, much-bechipped, frameless slate and a stumpy slate pencil. He turned up the little lamp as high as it would go, and finally seated himself again. From the depths of his trousers pocket he extracted a pair of horn-rimmed glasses, polished them, and set them on his nose. Then he was ready for work.

"Only the simple rules," said Chris to the fire, which cracked cheerily in reply; "only the simple rules, but it takes a deal o' working, 'specially when it's got to be done in double."

Chris propped the slate on a book, and made the first entry: "Simple addition."

"I doubt that," said Chris, drawing a line under the adjective, "at least to such as me. Here I am, with a clean slate, a-going to do my year's addition. I've a power of adding up before me; God and the devil have been very busy all this year. Well, to get the worst over first, I'll take the devil's side of the slate. He's been bad enough himself, a deal of venom he's had, an' a deal of strength, a-comin' at me when I'd least expect him, an' pretendin' to wish me well. The worst of it is, I've given him many a help. His isn't a tidy sum to do at all. He seems to keep the figgers muddled, so as you can't add them up. Never mind, I'll write them out in my best ledger hand, units, tens, hundreds, in the proper place. Eh! I'm afeard there's a goodish bit of sin to go on his side of the scale. Never a big line of figgers—he is too cunning for that—but such a many little ones, and when you come to add them up they——dear me! dear me!" and Chris Kerril wiped the moisture from his brow. "This is fearsome work; the little figgers add up as quick as cockles in a basket. Surely there's some mistake. I'll check 'em through again. That's for lies (the devil never called 'em *that* when he whispered 'em in my ear), and that's for envy, hatred, malice, and all uncharitableness,—dear me! dear me!—and that's for lost opportunities, and that's for the lust of the flesh." Chris stopped dead short. "Now, what *did* he call that at the time? A 'harmless indulgence,' sure enough! Well! well! well! I just dursn't add up the lot."

Chris took off his glasses, and turned down the lamp. He was disappointed; he wanted to think a bit. He just hated the way he had behaved; he seemed to have put all his figures on the wrong side. Then he turned up the lamp so suddenly that it began to smoke, and took the stumpy slate pencil again into his lean, nervous hand.

"Let's have a look at what I've been able to add on the other side," he said; "maybe I've done a good bit there. I've said many a time to myself, 'That'll look well on New Year's Eve.'"

Units, tens, hundreds—he drew out his columns again.

"'Good thoughts,' let me see; dear me! I can't remember many. 'Kind words'—well, I comforted Peter Guire's baby girl when she fell over the tombstone, an' a few other such. 'Self-denial'—um! I sent Sally Browne that beef-tea they gave me from the squire's. 'Attendance at church,'—that don't count for much; for I'd lose the almshouse if I didn't go. Two, four, six—dearie me! *my* part of this sum don't go very far; there's the envy, hatred, malice, an' all uncharitableness, to say nothing of the lost opportunities an' lies all to be made up for! There's only the Lord's part to add to this side now, but that'll bring it even, maybe. Let me see! There's the almshouse, an' the one-an'-sixpence a week (the devil nor me had nothing to do with that), an' the Christmas dinner. An' there's the bottle that took the pain out o' my rheumatics. An' there's—dearie me! 'tis addin' up—the large print Bible parson gave me."

Here Chris stopped and thought.

"Well, to be sure! It's the wrong end I've begun at! Counting the outside blessings first—just like old Chris!"

The old man shut his eyes. He wanted to forget the visible blessings of his triangle, and contemplate the blessings inside.

"Yes!" he said slowly and softly, after a moment's thought, as he began to write again; "it's 'most too good to be true. There's the love of the Lord, who sticks by old Chris Kerril, bad as he is; an' the joy of the Lord, that keeps dancin' in my heart like a sunbeam. There's the peace of the Lord, that baffles the devil himself; an' the grace of the Lord, that holds me up when I'm like to go astray." Chris Kerril stopped and looked at his slate. Every line was full. "I can spare a line at the top," said he, and he rubbed out the "good thoughts."

"There's the Spirit of the Lord that teaches me, an' comforts me by night an' by day; an' now the blood of the Lord that cleanses me, an' the home of the Lord that's waiting for me, an'—an'—the forgiveness of the Lord for this bad old year—they've got to find a place."

Nothing for it but to rub out the "kind words," "self-denial," and the "attendance at church;" then the extra lines went in, and the slate was full.

"Dear me!" said old Chris Kerril; "on one side there's me an' the devil, but the Lord Himself fills up the whole of the other side! Just the same as He did last year. Nothing old Chris does is worth counting beside Him. See now, I'll add them up; the Lord has a big total, after all. Now there's simple subtraction; take one side o' the slate from the other—all that's over is the work o' the Lord. Then there's simple division. I divide that total by what Chris Kerril deserves—a big round O; the total stands the same. Now for simple multiplication—three-score years an' ten the Lord's been the same; eh! that brings the total up—praise the Lord!"

The New Year bells rang out cheerily as old Chris Kerril laid his slate aside, and opened his window to let in the joyous peal.

"The devil gave me a fright to-night," said Chris. "I might have known the Lord wouldn't fail. No more 'rithmetic till this year's gone. May the Lord help me to keep my entries off the devil's side of the slate!"

SERIES OF
SPECIAL CHRISTMAS COMPETITIONS.
£5. 5s. IN PRIZES.

SPELLING-CHASE.

FIRST PRIZE, £1 1s. FOUR SECOND PRIZES OF 5s. EACH

TO THOSE WHO WRITE OUT MOST CORRECTLY THE FOLLOWING PARAGRAPH.

RULES.

I.—The Competition is open to all.
II.—No dictionary may be used, nor is any help to be in any way obtained as to the spelling of any word.
III.—Two consecutive hours is the time allowed for writing out the paragraph. It must not be written from dictation, nor be re-copied after it has once been written out. All writing, indeed each letter, must be so clearly formed as to be unmistakable.
IV.—A certificate, signed by some responsible person, must be appended to the paragraph, as a guarantee that the Rules have been kept.
V.—No MS. can be returned.
VI.—Questions may be asked (stamped addressed envelope for reply), but each needless one will deduct from the total marks awarded to the questioner.

Open for one week only. The Competition closes on January 7th. All Papers, marked "Spelling Chase" outside, must reach the Office of —"A. 1."—62, *Ludgate Hill, London, E.C., on Tuesday, Jan. 10th.*

NOW for the work! We expect quite a swarm of Competitors, and look forward with pleasurable dismay to the task of making our awards. We purpose giving a novel page of Results by and bye, illustrated. If several persons "tie," a further test will be set before the final award. We shall select a good dictionary, and will abide by its decisions in every case. The name of the dictionary will be published when the Competition has closed.

PHILLIP AND HIS DOMAIGNE.

[*The Paragraph which Competitors are required to write out correctly.*]

THEIR was once an ancient castleated manner, envelloped by a mote wherin muscles caught their pray. The parrapet was Elizabethian in stile, and the gargoils were parallel to one another, ocassioning much coment by there archeological symetry.

The posessor of the domaigne was a miner, and his irrascible guardian had irrevoceably decided upon the spoiliation of his estate.

Poor Phillip! rich as he was, his physionomy betrayed that he was peculiarily week from a psychological point of view. He had an irremediable fisher in his palette, and his pretenscious phrasiology added to the unintelligibility of his pronounciation. Phillip had no incite into charactor, and by his demienour he unconsiously insighted his guardian to employ unjustyfiable means to obtain the reciept of his income. Pecuniarry considerations moved his grim custodean to imediate action. Arranging the minutea of his marterdom was not an agreable task, but it was not desireable to ajourn it.

Should he higher an asassin to administer some drams of stricknine in his matitutinal farinacious food, or mix it with the yoke of an egg in his omlette? Should he look in the Pharmacopia for some aneasthetic which would have a sopporific influence, or try the effects of fumigation with incandecent salt peter, which had been recomended to him as a sucessful practise amongst the aborigenal Misissipians?

None of these plans seemed feesible, but it was the 31st of December, and his guardian resolved that Phillip should not see the comencement of another year. Nought but prompt action would avail.

As the hier sat mewsing, and contemplating the cieling, which was decorated with arabesk designs, round the corner by the rabbit borough, came a man with a comendatory letter in his sachel. Phillip rose to recieve him. The letter contained a complement to his purspicasity, and ernestly asked him to council the bearer in reference to a draught on his banker. Phillip heard him redily, and then in concieted silables, preceded to give him some advise. Courtiously acknowleging his kindness, the man said he would esteam it a priviledge to obtain a clarkship. Phillip sinically told him his calliegraphy was so ilegible as to render him ineligible for any post but a synecure.

The man esayed to make a tier ouse from his lackrimal duckt, but finding that imposible, he spoke extemporary, and with some aspiration:

"Bass vilian! I indite you for being acessory to my iretreiveable ruin. Though it reigns heavily, and their is a leek in my umbreller, I will draw my freize coat around me, and cast myself into a lime-kill."

He watched Phillip with the eyes of a links. Dispair was dipickted on his youthful linements. The threat was terific, and like a peripathetic philosopher, he miandered up and down.

"I will give you my etymological collection," said the lad, pausing before a cabbinet of insects, "if you will not asociate me with this peice of navery. I am not a medlar, but a man of metal."

The stranger rased himself to his full heighth, and seizing a knarled beach wand which lay ajacent, he asaulted the lad. From shear surprise, Phillip staid immoveable, and then sank unconcious to the ground.

The asassin, fearing Parlamentory investigation, fled, leaving his victim stationery.

As Phillip slowly became convalecent, he murmured:

"Bring me the encyclope—encyclopœ—encyclopæ—encyclæpædiæ,"—he never could articulate a dipthong, "that I may escape to cousin Lettuce."

He took a seditave draft, and examined his rout.

He found that by hastening along the key to the peer, where his yatch was ancored to prevent her drifting on to a lea shore, he could redily bored her, and sale away at the rate of 12 nots an hour. Picking a spray of fuchsia to remind him of his domesne, he fled to cousin Lettuce, and in her matternal solisitude, found solase for his former greifs.

The remaining Competitions of this Series will appear in following Numbers.

CRISP CORRESPONDENCE
AND
ODDS AND ENDS.

Lucia.—The meaning of "Philareté" is "Lover of Virtue."

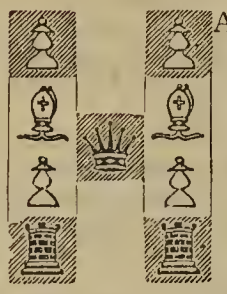
A. R. G. and **E. S.**—No advertisements are bound up with the monthly part of —"A. 1."— Perhaps you would prefer having these bound rather than the single numbers together at the close of the year. Your hearty words are cheering.

Laddow.—Probably your gifts would be acceptable to the Children's Hospital, Great Ormond Street, London.

Sunday-School Superintendent.—Your plan is first rate; we hope hundreds of Sunday School teachers will follow. Giving a copy of —"A. 1."— each Sunday to all the scholars who attend regularly is a stone which kills more than *two* birds! It stimulates the scholar, it sends wholesome, helpful reading once a week into every home, and last (surely not least) it spreads the influence of our Paper. If the teachers in any one school will combine to adopt this plan, we will supply at a special rate. We hope to hear from some teachers.

Medicus.—"Much as you wish it, you cannot make up your mind to trust Christ." Paralysis of the body you know well amongst your patients. Beware! for you are encouraging paralysis of the *will* in yourself. St. John says: "I have written unto you, young men, because ye are strong." Do not deceive yourself; if you are in earnest, God has given you enough will-power to enable you to accept salvation. Unconsciously you are trying to make out that it is *God's fault* that you are not saved. "Young man, I say unto thee, *Arise*." "The Master is come, and calleth for *thee*."

"A. 1.," Brighton, asks, "If only some are elected now, can all be saved who will?" As a speculative question, this involves a difficulty which is perhaps insoluble by human reason, for we have no faculties capable of reconciling the finite with the infinite, the human with the Divine. But as a practical question, it is one that meets us every day of our lives, and that we find no difficulty in answering. Thus, *e.g.*, God has determined the number of our days (Job 14. 5). And yet, as regards the preservation of our health, we find ourselves at perfect liberty to act on our own responsibility, to shorten life by our neglect, or to prolong it by our care. So it is with respect to salvation, which is the health of the soul. Our moral freedom is in no way practically diminished by the Divine Sovereignty, nor is our responsibility for our actions weakened or destroyed by the doctrine of election. "The secret things belong unto the Lord our God: but those things which are revealed belong unto us and to our children."—Deut. 29. 29.



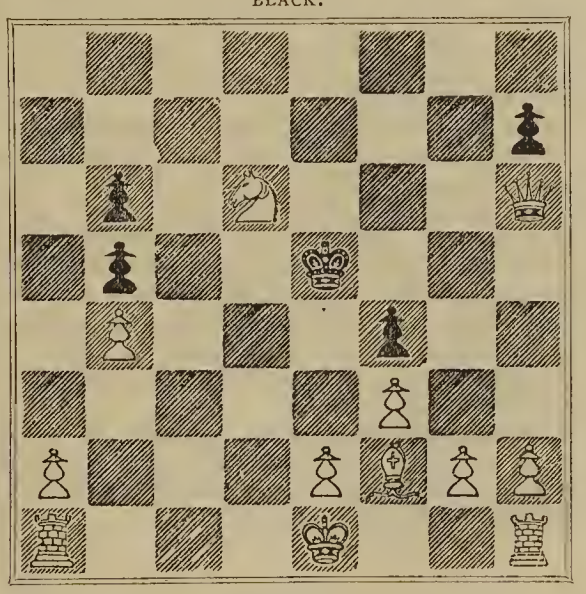
Gordon Homes.—Through the Manager of one of these Homes for lads, a brisk business in —"A. 1."— is carried on in one of our large manufacturing centres. The boys are sent out with the Paper in the neighbourhood of the Factories, where about 12 dozen weekly are thus disposed of. The lads are now well known, having a large —"A. 1."— painted on a piece of canvas. How many a lad might be put in the way of turning an honest penny, and at the same time circulating attractive literature. If this should meet the eye of the Manager above referred to, we return him hearty thanks.

CHESS.

By F. F. ROWLAND.

PART IV.

ILLUSTRATIVE POSITION, NO. 4.



HAVING already cleared the ground, and made much, that at first seemed puzzling, quite clear, we shall in this and the succeeding Papers, take our readers a little further into the science of the game. Having learned the more general moves, nothing but application and perseverance will avail the beginner. Chess is too well worth learning to be quickly acquired.

P × P *en passant*.—The only moves that remain to be explained now are P×P *en passant*, and *castling*. It is known that the moves of the P are one square at a time straight forward, except in the act of making a captive, when it moves diagonally on to a file beside it, to occupy the square from which the captured man is taken. When a P has reached the fifth square, it may take an adverse P on the file beside it, if the latter play two squares for its first move. In the problem we give, White proceeds with P to K4, Black, having a P at KB5, plays P×P *en passant*, that is, he removes White's KP from the board and places his BP at K6.

Castling, which is White's second move in our problem is accomplished with the K and R, and is one of the principal moves in the early part of a game. It is done in order to place the K on a square of greater safety, and to bring the R into instant action. The K may castle on either side of the board. To do so on the K's side, move K to KKtsq, and R at KRsq to KBsq. To do so on Q's side, play K to QBsq, and R at QRsq to Qsq. Castling is not allowed under the following circumstances:—1. If the K is in check. 2. If the K or R had previously moved. 3. If any square the K passes over is covered by the enemy. 4. If a man stands between the K and R.

It is on the Q's side White castles in the problem we give, the solution of which is:—

BLACK.

WHITE.

White to play and mate in three moves, or White to play and draw by perpetual check.

WHITE.	BLACK.
1. P to K4.	1. P×P *en passant*.
2. Castles QR.	2. P moves.
3. P to B4 mate.	

or 3 Kt to B7ch and draws by perpetual check.

A stalemate is a drawn game, and occurs when a player, whose turn it is to play, and whose K is not in check, has no move to make. In the above position it will be observed that the Black becomes stalemated if White plays R to Qsq.

Doubled Pawn.—When a player has two of his own pawns on the one file, the front one is termed a *doubled pawn*. The black P at KKt4 is a *doubled pawn*.

Isolated Pawn.—A pawn standing alone without any support or protection, as the black P at KR2 is, is an *isolated pawn*.

Passed Pawn is one which has no adverse pawn to obstruct its march on the same file, or on either of the next files. After Black plays P×P *en passant*, White's KBP becomes a *passed pawn*.

Forced move.—When a player has only one legal move at his command, it is termed a *forced move*. Black's first move in the problem we give is forced.

Restrictive move is one which curtails the adverse K's liberty. It will be noticed that the black K has one square to play to, White's move of P to K4 *covers* that square, hence it is a restrictive move. This and the following terms are more frequently applied to chess problems than to games.

A *Flight square* is one which the King can play to. In Position No. 3, given in our last, the black K has three flight squares; in the position before us he has one.

Blocked squares are those which are occupied by the player's own men, as Black's KB5 is.

A *Dualmate* is a choice of two ways to mate. For instance, if Black plays 2 P to K7, a *dual mate* occurs by P to B4, or B to Kt3.

(*To be continued.*)

ABOUT OURSELVES.

OUR new paper is thriving and growing fast. Such a hearty welcome as we have had! Little wonder that we are cheered and nerved to fresh effort, and face the coming year with high hopes of blessing and success. We mean, with God's help, to *deserve* the popularity which we already enjoy.

Our next week's Number will be of special excellence. The voyagers in the good ship *Oonalaska* have some novel experiences in San Francisco. We give also the first instalment of a characteristic story, by the Rev. P. B. Power, entitled, "Luck and Pluck," and a complete Scottish tale, "My Friend Angus." "Recreations in Geology," and "Chess," will be continued, and two new serials will be begun: one, "Love, Courtship, Marriage," by Phyllis Browne; the other, "Anatomy Spiritualised," by Rev. J. Hiles Hitchens, D.D. In addition to these the Number will contain a New Year Talk, by the Editor, and a beautifully illustrated poem, "Snowdrops," by M. S. Haycraft.

A column of Notes on the International Sunday School Lesson for the week, which it is believed will prove quite a feature in our paper, will be begun, and the announcements of our special series of Christmas competitions will be continued.

BRITAIN 1800 YEARS AGO.

By Minna Rivers.

WE scarcely realise that when our Saviour walked by the Sea of Galilee, British history had already begun ; and that, possibly, the same Roman centurion who stood watching by the Cross of Jesus Christ, might some ten years later have accompanied the Roman Legions to Britain, and helped to plant her eagles on our shores. Here, too, Titus fought our ancestors, some years before he witnessed the destruction of that city, where was crucified the Lord of Life, and the burning of the temple, where Jesus Christ had walked and taught, which, even he, the son of a Roman Emperor, was powerless to save, when the fiat of Jehovah had gone forth.

Much of the early history of Britain is so mixed with fable, that it is difficult to unravel truth from fiction. Pardon us if we diverge slightly from the given title of this Paper, and try here and there to catch a glimpse of times further back.

It appears certain that the country was known to the Phœnicians, who traded thither for tin, which, mixed with copper, formed the well-known bronze or brass of early days. This metal was largely used in the construction of Solomon's Temple, and the chief worker was Hiram, a man of Tyre (1 Kings 7. 13), one of the cities of the Phœnicians ; and as bronze (the early brass) could not be made without tin, and the latter was only, at that period, to be obtained in Spain and Britain, it is almost certain that the latter country largely furnished one of the materials used in the building of that magnificent temple.

It was those same tin mines, which seem to have called the attention of the Romans to these Islands ; for Roman colonists in conquered Gaul (France), were not long in discovering the treasure so near at hand, and in opening up a lucrative trade.

Many of us have been accustomed to regard the ancient Britons as a race of savages ; but we learn, that at the time of Julius Cæsar's first invasion, B.C. 55, he found the inhabitants of Cantium (Kent) differing but little in their manners from the Gauls, skilled in the arts of dyeing, spinning, and weaving wool, and wearing a dress not unlike that of the Highland Scots of the present day, which, indeed, still retains the name of "the garb of old Gaul." Later, we have an account of the dress of the ill-fated Queen Boadicea, as "robed in plaid of many colours, and wearing a rich gold collar.

At the time of Cæsar's first invasion, there were three grades of civilization. In the South, nearest Gaul, most progress had been made, and the people had long ceased to be savages. Further inland, there were herdsmen, who tended their flocks, and lived on milk, flesh, and game from the woods, but did not sow any corn ; while in the forests of the North still dwelt the wild savage, the veritable tattooed, wood-stained Briton, sleeping in caves and under trees, living by snaring game and eating berries, and, during Winter, wrapped in deerskin. Trained to war from infancy, brave and warlike, the well-disciplined legions of Rome had great difficulty in subduing them, and never has the National motto :

"Britons never will be slaves,"

been more exemplified than in the resistance then given to their conquerors. Their war chariots, armed with huge scythes, cut through many a Roman phalanx ; and had they but recognised that "union is strength," the palm of victory would often have been more doubtful.

Their real rulers were the Druids, who exercised an unbounded sway. Their sacred emblem was the mistletoe ; their sacrifice, the white bull ; though, alas ! they often offered human victims. It is singular to meet, in the records left by Julius Cæsar of their manners, customs, and religion, these words : "They consider that the favour of the immortal gods cannot be conciliated, unless the life of one man be offered for that of another." Surely here we catch a glimpse of the instinctive need felt by man in all ages of a substitute !

The Druids taught the unity and eternity of God, under the figure of a serpent and fire, also the immortality of the soul, but "burdened with the doctrine of transmigration."

Most interesting are the accounts of the various attempts of the Romans to subdue Britain. Each time they returned, it was to find the brave spirit still unquelled. But what Roman valour could not altogether perform, was wrought by other means. Julius Agricola, who won his laurels in Britain, had then studied the character of the people ; and, on being given the supreme command, under the Emperors Vespasian and Titus, he so introduced the luxuries and pleasures of Roman civilization, that the sons of the hardy warriors, who had fought for country and for liberty, became enervated, and were thus more easily taught to obey.

This brings us to about eighteen centuries ago.

It was in the year 78 A.D., that Agricola was made Proprætor (Governor) of Britain. The destruction of Jerusalem had taken place eight years before ; Pompeii and Herculaneum, the buried cities, were still in the full blaze of fashionable pleasure, little thinking of the fate awaiting them within one short year. St. Paul had received his "crown of glory" in martyrdom, about ten years previously ; and the Apostle John may have been in exile at Patmos.

This was the period when Agricola, by arts of peace and wise government, as much as by his warlike campaigns, was gradually converting Britain into a Roman province.

To us, in this nineteenth century, is visible the impress of the Roman civilization of that age. The long, straight Roman roads still traverse our land ; one crossing now a Westmoreland mountain, two thousand feet above the level of the sea. Roman villas, such as that at Brading in the Isle of Wight, show us much of the arrangements of a Roman house, while the discovery of "hypocausts" reveal that it was warmed with heated air, much like our modern conservatories. Neither was drainage neglected, as the remains of huge sewers show. Roman baths remind us that it was an age of luxury and refinement. We get peeps of ladies' dress and ornaments, in bronze brooches and pins for fastening up the hair ; mirrors of polished metal, wooden combs, tweezers, scissors, knives and spoons, locks and keys, and sundry articles, point to the domestic arrangements ; while needles show us that Roman ladies in Britain were not idle.

Even our gardens are indebted to the Romans for sweet-smelling roses and violets, which they are said to have introduced, and now first the luxurious cherry began to mingle its brilliant fruit amongst that of the golden apple and pear, already natives of British soil. Everywhere urns and tombs (sarcophagi) remind us that "death has passed on all ;" and amidst the sad memorials, we look in vain for any *certain* mark that the rich Roman lord, or his British slave, was cheered by the Christian's hope ; though remains of heathen temples are still scattered thickly over the land, and heathen inscriptions are found upon the tombs.

Tradition tells us of a possible visit of the Apostle Paul, and monkish legend credits Joseph of Arimathæa with the planting of the famous Glastonbury thorn. The stories of British martyrs in these very early days are scarcely trustworthy ; yet we may reasonably hope, that as St. Paul had written his Epistle to the Romans more than twenty years before, there were many among those who were humble followers of Jesus Christ, and that the glad tidings may have reached the ears of some British slaves, and cheered their sad lives with the glorious news of a bright home beyond. God had then, as now, His "hidden ones," and it may be that the Great Day will reveal many who, even then, had accepted a Saviour's love ; while there are some, who, in these days of an open Bible and Christian privilege, scornfully reject the "free gift of God, which is eternal life through Jesus Christ our Lord."

Such, in brief detail, was Roman Britain. Our review will not have been fruitless, if it remind us that we, too, are leaving our impress on the lives of others as we pass along ; and that a memorial is being kept in God's book of daily deeds, which one day will be unmasked before the world !

Departed Glory—The Cause Discovered.

JAN. 7, 1888.

"A.1."

ONE PENNY.

WEEKLY — Edited by MRS STEPHEN MENZIES.

"Oonalaska."

by Gordon Stables R.N.

Author of "The Cruise of the 'Snowbird,'" "1300 Miles in My Caravan," "From Pole to Pole," etc., etc.

CHAPTER XIII.

"A MUSHROOM city, as you observe, sir," said Captain Boyd, as he cracked another walnut, and dipped the kernel in salt. "Yes, San Francisco

"'I am going out with you, to help to find the Pole, or whatever other wild goose you are going to chase.'"

is a mushroom city; but where can we find such mushrooms in the old country? Pass the raisins, if you please, Desmond. Yes, steward, I *will* have another cup of coffee. Our cups on board the *Oona* are buckets, compared to this morsel of an egg-shell. Yes, Mr. Graves, America is a great country. Why, it takes, I'm told, two men and a little boy to see the other shore of some of your rivers. Well, sir, we should have just as big rivers in the old country, and as tall mountains, and as broad lakes, if we had room for them. But I'm afraid the Mississippi, for instance, would find itself rather crowded in Cambridgeshire. You may well be proud of your country, Mr. Graves."

The party who sat round the table in the spacious hotel were all men. There were Captain Boyd, Desmond, our bold Jack Silk, Nat Graves, and another new Nat Graves.

The new Nat was nothing more or less than a brother of our Miss Graves. He joined her almost as soon as the *Oonalaska* had dropped anchor in the roadstead off San Francisco.

The new Nat was the elder Nat, however; perhaps not a day under fifty, but wondrous tall, and wondrous straight and wiry. There was many a far younger man than he, who would have thought twice before planting a quarrel on this splendid specimen of an athlete. Nat senior had been everywhere, and done everything; not as your soft-footed Cockney tourists do things, dawdling over the world in well-found steamers, and engaging every comfort capable of keeping them easy, and every conveyance calculated to save their legs. Nat senior was not one of your "after breakfast, please," heroes; he had roughed it in all corners of the globe, where a bit of genuine sport or adventure was to be had; and that, too, by land and by sea. Yet he was an Englishman. Hear his reply to Captain Boyd's remarks.

"Yes, Captain Boyd," he said, "I am proud of it. I am proud of my *adopted* country."

"What! You are not an——"

"No, not an American. My young cousin here, and his sister, belong to the very city in which we now sit. My sister and myself came out here more than twenty years ago. We were young then, and as poor as rats. Needn't be ashamed to own it? We are not, sir. Well, she was plain Mary Graves, and I was Nat, and nothing more. She stayed with her aunt, and taught this young idea here how to shoot, and he thinks he has sprouted to some purpose. San Francisco wasn't much of a spot then, I can tell you; only a few rough shanties, and more Injin element about than most of us care to see. The mushroom city hadn't begun to burst through the earth then. Well, sir, I had as good a constitution in those days as I have now—I can't say better; but I was soft and green. The yellow fever began to show itself soon,—I mean the gold excitement, you know,—and I was the first to fall a victim. For two years, sir, I loafed about, prospecting here and prospecting there, but never making much progress towards success and independence; for I really was in too great a hurry. I presume though, that fortune would have found me out one day—'*Fortuna favet fortibus*,' you know,—but I had an adventure one afternoon, and that turned out a lucky affair for me. I saw two white men abusing an Indian. Now, mind, I don't like Indians; I know them too well. But here were two to one, and that isn't fair, even on a Red-skin. I slipped in, and though I didn't come off Scot free, I saved the Indian. I met him some days afterwards, when I was feeling shockingly down on my luck. I daresay he wanted to show his gratitude; but anyhow, he beckoned me to follow him, and I did. After walking for two whole days, we came to a wild, lonely bit of country—and to gold and silver. The richest mine in California lies there now. No, Cousin Nat; I do *not* wish it were my property. I made my pile. What more do I want? I've enough. I don't want a white elephant, and riches are sometimes quite as cumbersome.

"Well, that's how I made my bit, and I've been trying ever since to see the world. I've been a trapper in the Rockies, and up in British Columbia; I've been in the Australian Bush, the Cape, and on the Pampas; and my sister Mary, sir, has been with me in many a strange country, and in many a strange adventure."

"You surprise me, Mr. Graves," said Captain Boyd. "Your sister never told us anything about her wanderings."

"It isn't Mary's form. Ah! you don't know Mary yet, Captain Boyd. If there be any one in the world I'm proud of, it is sister Mary. She has been as much to me,—although I seem to boast in saying so,—as Livingstone's wife was to him, or Baker's to that wonderful traveller. No, sir, you don't know Mary yet."

"Alas! Mr. Graves, I fear I never will, then, for I hardly expect to stay over a week at 'Frisco on my return."

"But, bless my heart, hasn't she told you?"

"Told me? Told me what?"

"Why, that I'm going out with you to help to find the Pole, or whatever other wild goose you are going to chase. That is, if you'll let me."

Boyd's face beamed like a full moon-orient, as he reached over the table to shake Nat senior by the hand.

"I'm delighted, downright delighted. But, Miss Graves,—Mary, as you call her, is she——"

"*Is* she? Why, of course she is. D'ye think I'd go without her?".

"Hurrah!" cried Jack Silk; "the old ship's mother is going with us, Dess."

"Well," said young Nat, "in that case, I and my sister Kate will want to be part of the party."

"Do you think," said the Captain, turning with a kind of puzzled look to Nat senior, "do you think it would be quite judicious to——"

"To allow Kate to go?" Nat laughed as he replied, "My dear sir, we all belong to a tough old family, and we've been in the habit of having our own way so long, that if you really do not object to have us as passengers, then pray book us."

"That I will," Mr. Graves, right heartily.

"Hurrah!" from Jack again.

But a single "Hurrah!" did not seem sufficient on this auspicious occasion to alleviate this honest sailor's feelings. He must get up and shake hands with everybody all round the table. Then he sat down again, and at once made an attack upon a huge pine-apple, but there was nothing huge about it when Jack laid down his knife.

* * * *

"Now, Sally," said Miss Graves to her maid that same evening, "you are free to go on shore and live here. But if you desire to come with us, and think you are not too old to stand the cold, I shall be delighted to have you."

"Which I'd never think o' deserting you, my dear lady, as has been so kind, and Miss Kate, the purty creacher as is goin' with us, and all. Which I'm not so young, bein' sixty and over, dear lady; and the cold, bless you, what with an extra petticoat and stockin's to match, ma'am, I—what was I going to say? Dearie, dearie, but this is Ameriker, isn't it, ma'am? and to-morrow I'll go on the land and see my darter. Eh! she will be glad."

Miss Graves laughingly dismissed her faithful maid, and Sally waddled forward, feeling all over as happy, she told Turlough, as she had been on her wedding-day.

Both Turlough O'Brady and Boy Bates determined to go on shore with Sally next day, and help her to find her "darter."

They were as good as their word, and probably a more comical-looking trio had never been seen on 'Frisco streets. Turlough was dressed for the occasion in a green tailed coat with buttons of shining brass, a tall, somewhat shabby, and almost rimless hat, stuck jauntily on one side, and a holiday necktie of crimson and yellow. He had a bit of short stick under his right arm, and he stooped gallantly to the left, in order that dumpy old Sally might conveniently lean on his arm. Boy Bates brought up the rear, with his cap on the back of his head, his hands in his breeches pockets, and whistling—quite the irrepressible London lad from top to toe.

Everything was new and strange to Boy Bates, but the possibility that he himself looked odd in the eyes of 'Friskyites never once occurred to him. He seemed bent on enjoying his "houting," as he called it, and set about it in his own fashion. He sprinkled his chaff freely, too, whenever and wherever he had a chance. A spectacled German stopped to look at him, for example.

"Well, old goggles," said the boy, "*you* looks pretty 'ealthy, you does. My! there's a stomacher. Thorley's food? Hey? Never seed a real Henglish gemman afore I dessay, did yer now?

"Hullo! Vere are *you* a shoven to, hey?" This to a Chinaman. "Yes, and I'll pull yer tail again too, if yer valks back'ards and tramps on my corns. Gorlong—yah!

"'A boss shine for five cents,' did yer say, little boy? Don't mind hif I does, as you're so pressin'. Turlough, my beauty, let us patronise one of the hinstyetooshins of this free and enlighteninged country. Sally, old hauntie, ow's yer poor back? Lean agin the wall 'ere, both on yer, till this Briton 'as his boss shine. Bravo! young Day and Martin; that's the way to shine 'em. You'd make yer little fortune in London, you would. W'y, 'ere's a pretty crowd a-getherin' round us. 'Ow d'ye do, my dear? Didn't know I'd come, hey? Glad to see ye hany time on board the *Hoonalaska*. Put on yer best bonnet, my love, when ye comes, and make yer mother comb yer air.

"Keep the change, little boy," he continued, handing the boy a fourpenny-piece, which the lad looked at somewhat doubtfully. "Keep the change, to buy yerself a hopera-glass; yer won't find anythink near about us. Born haristocrats, hall on us, from the shores of Merrie Hengland. Ladies and gemmen, this is my guvnor, and 'ere's my old mother. Bound for a day's houting we are.

'Rule, Britannia, Britannia rules the waves,
Britons, never, NEVER, NEVER, shall be slaves.'

Ladies and gemmen, I now 'and round the 'at. Yer can't hexpect to 'ave all the fun for nuffin. Thank ye, sir; services, ma'am, keep the pot a-boilin'. The hentertainment is just about to kermince. The guvnor is about to sing, arter which the hold lady will dance a 'ornpipe."

How far the entertainment might have proceeded, it is impossible to say, for at that moment the law, in the shape of a policeman, put his hand on Boy Bates' shoulder. But he did not not take the lad's breath away, by any means. Boy Bates' composure was not easily overset.

"Now then, hold cockalorum," cried the boy, "who are ye a shovin' of? and wot d'ye mean by 'git'? If yer wants a feller to move on, w'y don't yer say so, hey? And w'y don't yer lift yer 'at, ven ye finds yourself hunexpectedly thrust into the company of Henglish haristocracy, hey? Hit's a novel hexperience, hain't it?"

"Git," said the man again.

Boy Bates pulled himself up to his full height of five feet nothing-at-all, and eyed the policeman from top to toe with ineffable disdain; then he threw up one hand with a sudden and startling "tsh!" that made the man spring back. The crowd laughed aloud. Boy Bates bowed; then giving his right arm to Sally, on they marched with due solemnity, once more.

There was so much to be seen and wondered at, that hours passed most pleasantly away, and Boy Bates, whose appetite was of the finest, suggested dinner.

"Bizness furst, my bhoy," said Turlough, raising that wonderful hat of his as he spoke, to a pleasant-faced elderly gentleman, who was passing by.

"If ye plaze, sorr, would ye be after informing me where the best photographer's shop in all the city of Sandfrand-Siseky lies?"

The gentleman—he was an editor, so the appellation must be correct—smiled and pointed to a studio near by.

"You'll find that about the best. You're strangers, I presume?"

"Your presumption is roight entirely, sorr. I come myself from the kingdom of Connaught, and this good lady——"

"I come from Barks, sir," said Sally, all smiles and nods. "And a pleasant-lookin' gent you be, sir. A—this is Ameriker, sir, isn't it?"

"Part of it, ma'am."

"And my darter, sir. Poor dear! if she only knew her old mother was so close to her, she—oh! sir——"

Here Sally waxed sentimental, and tried to screw out a tear.

"Does your daughter live in this State?"

"Oh! sir," sighed Sally, "she don't live in no state, sir. She be in a good situation, sir; and if ye sees her, sir, tell her her mother is come."

Sally's search for her "darter" did not end here. She asked the photographer that took their likenesses, and promised, at Sally's request, to stick them in the window for her "darter" to see, and everybody else, everywhere, when a chance presented; but strange to say, nobody seemed to know Sally's "darter."

"Poor dear," said Sally that evening to her mistress, "I do 'ope, ma'am, that nothinks has come over her."

All next day, and all next week, aye, and all the weeks that the *Oonalaska* lay at 'Frisco, poor Sally lived in hopes that her "darter" would appear; but woe is me! she never did. It is but right, however, to mention that Sally was by no means much cast down about the matter; and when Miss Graves informed her that, on the ship's return, a thorough search would be made for the missing lady, she regained all her good spirits at once, and resignedly agreed to wait until that unknown date.

CHAPTER XIV.

"IT IS A LOVELY HOPEFUL CLOUD."

MANY a faster ship has left the Pacific shores, but seldom, I ween, one stronger or better found and fitted than the *Oonalaska*.

She sailed on a lovely morning in May—*sailed*, not steamed; for a breeze was blowing that filled the canvas fore and aft. The ship had been all ready for sea for days before, and might have *steamed* away; but Captain Boyd was a sailor of the old school, and he waited for the wind. And a glorious breeze it was—East, with a few points of South in it. But verily the *Oonalaska* seemed loath to leave that lovely shore, and when the last boat had left her, when the last farewell was said, and the last ringing cheer had died away on the water, it was but slowly at first she forged ahead; then the royals and topsails took firmer hold, and the lower sails filled and bellied out in the wind, the *Oona* shook herself into action, as it were, and long before noon the land was seen far astern, one long, rugged, green-capped line.

The breeze increased to a hearty blow, and there was sufficient roll on to make one feel one really was at sea. The vessel dipped and plunged as the waves played under her stern, raising her head as they went hurrying forward, till her well-scraped jib-boom pointed high over the clouds that lay on the western horizon. But neither dip nor roll had an angry lurch in it. The motion was a steady one, and told every sailor on board that the *Oonalaska* was settling down to business, but that it would not blow a bit harder for that night; mayhap not for days.

Thanks to Jack and Desmond, everything about the good ship's decks and rigging was as neat and clean and taut as eye could wish to see. Not a rope uncoiled; not a pin out of place; the woodwork about the bulwarks glittering in black and brown; the brasswork shining like silver; the deck planks so white that it was a pleasure to walk on them; the capstan bars scoured and neatly stowed; the capstan itself neatly capped in canvas.

Everybody was on deck in the evening; it would have seemed a sin to be below in such glorious weather. Almost every idle eye was turned astern. When would these adventurers look upon that lovely land again? Some of them—never.

The day faded slowly away. It felt a positive relief to many when the sun went down at last, sinking through the blue-grey haze like a burnished copper shield, rayless and red.

Just one more look at the land; the stars come out in the east, and it is lost to view.

Godfrey was up on the bridge. His back was turned to the distant shore; his face was turned west away, where the sun had just gone down, leaving the sea all leaden and dull—not more leaden and dull than his joyless heart, from which hope seemed for ever fled.

But all was not leaden and dull in the west. No, not *all;* for even as Godfrey gazed, one little cloud, that till now had lain fleecy and white, high up in the heaven's blue, suddenly assumed a bright crimson glory that was almost dazzling.

He was looking at it, with a new-born feeling akin to joy; he was almost praying it would not fade.

"Mr. Godfrey!"

He turned quickly round, and found Miss Graves by his side. She had a snow-white, cloud-like shawl around her shoulders, and her eyes were bent on Godfrey with a look of earnestness that almost startled him.

Only for a moment though; then she glanced upwards at that crimson dove's wing in the west, and smiled.

"Mr. Godfrey," she said, "that is a good omen. Do you regard it as such?"

"Miss Graves, that is a strange question. Pray what—what mean you? Good omen of what—to whom?"

She looked at him archly now.

"Of a fine day to-morrow. Come, give me your arm, Mr. Godfrey. Take me down to supper. But," she added, glancing westward once again, "it is a lovely *hopeful* cloud. *We* will not forget it, will we?"

"N—no!"

"Come."

The two passed silently along the bridge. Godfrey handed her down to the deck; then they went below.

Every one was bright and cheerful around the table that evening; but brightest and cheerfulest of any were Captain Boyd and the ship's mother.

"I declare to you honestly, Miss Graves," said the former, as he prepared to attack a huge round of roast beef in front of him, from which a cloud of savoury steam was rising, his own face looking over it like a full moon—"I declare to you, Miss Graves——"

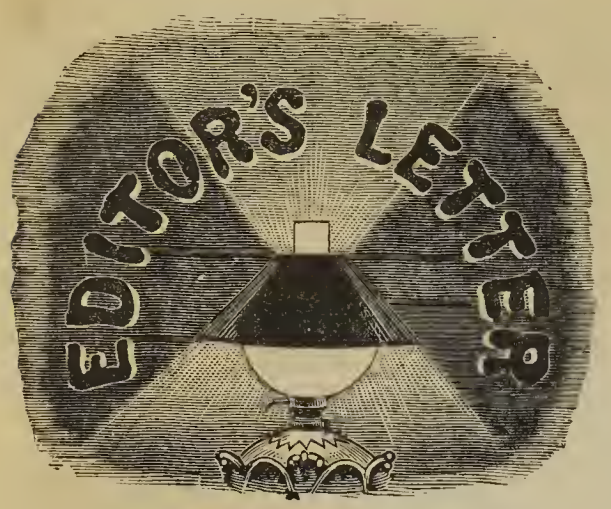
"Mother, please!"

"Well, mother—that the older I get, the happier I seem to become. When we sailed away from old Bristol, we didn't expect to have such pleasant company beyond 'Frisco, I do assure you. We thought we'd land you ladies there, and that then the boys and I would be all alone. Instead of that, 'Frisco gives us a brother; and there you sit, mother, and there sits Katie, and here we all sit, looking as happy all round this table as—as a black man in a barrel of treacle. Jack Silk, my boy, aren't you glad and pleased, eh?"

Jack just glanced up once from his plate, but his face spoke volumes. It was not by any means a pretty face, but it was a wonderfully good-natured one.

"There, there, lad; don't speak; don't answer. I can read your soul from your figure-head. Besides, you're slow of speech at the best."

"Oh! by the way, Captain Boyd," cried Katie, "after we have all settled down a little, may we not get up some concerts and recitations; I feel sure we have quite a deal of talent on board. I——" She paused; Jack Silk seized upon the opportunity, and, somewhat uncavalierly and certainly unromantically, exclaimed:—



"Captain Boyd, I'll trouble you for some more beef; steward, take my plate round, and tell Captain Boyd that he needn't cut it quite so thin—it is not for a lady."

Miss Graves shook her head and smiled at Jack, and Jack shook his and smiled somewhat defiantly. Whereupon big Nathaniel felt bound to look first at the one and then at the other, somewhat puzzled. Then he went on with his dinner.

"There is some little secret between Jack Silk and Mary," he thought to himself; "but it is no business of mine; whatever Mary does is bound to be right."

Nathaniel had the most perfect faith—aye, and pride—in this sister of his; and if you had asked him the reason, he would have told you that it was because Mary was so very unlike any other woman he ever knew. He would have launched right away out into a speech, descriptive of her many good qualities, her deeds and doing, her cleverness, and her strange, matter-of-fact ways, and ended by saying, "You don't know Mary yet."

(*To be continued.*)

THE NEW YEAR, 1888.

OUR MONTHLY TALK.

BY THE EDITOR.

MY DEAR FRIENDS,—

I think we may all congratulate ourselves upon the excellent—I may almost say exceptional—start which our Paper has made. To reach within the first four weeks of its publication an issue of over 20,000 was beyond our expectation; yet this will soon be surpassed, judging from the letters of hearty greeting, and the promises of unflagging co-operation which pour in day after day. If these are not acknowledged as promptly as the writers and ourselves could wish, our correspondents will kindly understand that it is from no lack of appreciation, but because we are devoting all our energies to our Editorial responsibilities.

Our—"A.1."—is attracting also the notice of men in influential circles, who sympathize with its aim and tone, and are ready to lend to this enterprise the weight of their name and position. We cite the testimony of two such leading men as the Rev. Prebendary Macdonald, of Manchester, and the Rev. C. H. Spurgeon.

The latter writes:

"We have seen an advance copy of the first Number of 'A.1.', and we like the look of it. It is lively and gracious. There is no mistake about the ring of the Paper; it is true metal, but it is not heavy; it is devout, but not dull. If it can be kept up to the quality of the first Number, it will fill an orbit of its own, and spread light far and wide."

The Rev. Prebendary Macdonald writes:

"The character of after life depends very much on how a young man's or young woman's leisure time is spent, and the number of persons who spend much of their leisure in reading, is increasing every year. A grave responsibility rests on Christian people to be beforehand, and to occupy the soil with such seed as may be expected to yield the harvest of useful lives and happy homes. A literature such as Dr. Arnold (Rugby) longed to see, was never more urgently needed than to-day,—in which themes of everyday life which come home to men's business and hearts, should be treated on a basis of Christian principle, and pervaded with a religious tone.

"This is the character of two excellent Magazines: 'OUR OWN GAZETTE' and its Weekly companion, just launched, 'A.1.' It is safe to predict success. It promises to be 'Sound, Strong, and Seaworthy.' So far, it is characterized by Christian wisdom—variety of useful matter, with freshness and vigour, and genial sympathy, which is sure to find its way into the hearts of its readers."

Hearty words of greeting have also reached us from Lord Polwarth, the Rev. G. Handley Moule, the Rev. Hugh Price Hughes, Rev. C. Garrett, Rev. Mark Guy Pearse, Lawrence Gane, Esq., M.P., Q.C., and others.

With testimonials such as these we may well go forward with renewed activity, determined to make our Paper more worthy of its unique, ambitious title,—yes! designedly ambitious, because we would ever be aiming at increased excellence; and if, as they have already so manifestly done, our young men and young women will still put their shoulder to the wheel, and each enlist a new subscriber, we shall make rapid bounds towards a world-wide influence. Let us be enthusiastic about *our* Paper; let us be ambitious for its success, but still more for its power and influence; let us, above all, be united in constantly praying that God will use it as a channel of life-giving messages to many.

To-day we stand on that narrow threshold of time which divides the Old Year from the New. We look back and sigh. We look back and deplore; we look forward and resolve. How little of the past would we recall! And yet what a record of faithfulness and lovingkindness—of realised hopes—of averted sorrows. Shall we withhold the full, glad tribute of hearts led captive by the love of Christ, and cleansed by His blood? for the past *is* under the blood; and "as far as the east *is from* the west, so far hath He removed our transgressions from us."

> "Therefore with quickened steps
> We'll tread our heavenward way,
> Until the shadows vanish,
> Until the break of day."

And as we enter upon another stage of life's journey, shall it not be in the fixed assurance that the failure of the past need not be the inevitable rule of the future—that the nets in which our feet *have been* taken this year, need not ensnare us to-morrow? The inspired Psalmist told of great deliverance when he said, "Mine eyes are ever toward the Lord, for He shall pluck my feet out of the net" (Psa. 25. 15). But more blessed still was the secret of victory learned by him who could triumphantly say: "The Lord shall be thy confidence, and shall keep thy foot *from* being taken" (Prov. 3. 26). He who died to save, now lives to keep; "He will keep the feet of His saints."

Friend, He can—He *will*—keep *your* feet; in that moment of temptation, when you are weak and the enemy is strong, when the foe presses your soul and you feel desperate,—you think you must yield,—but why? when the Captain of the Lord's host is by your side; He fought and conquered in this very battle, and the enemy you dread is already beneath your feet. Gird on your armour,—put your hand upon your sword. It is written, "Sin shall *not* have dominion over you." The appealing glance of faith shall bring the Lord as your ever-present Shield, 'twixt you and the enemy, and you shall be more than conqueror. Then you too shall exultingly exclaim: "Thou hast delivered my soul from death, and my feet from falling."—"The Lord is thy Keeper" is a blessed and practical reality—alike for the Young Man at the University, or in the Counting House,—or as Partner of a Business Firm. And not alone from the world without, but from the traitor foe *within*, can the Lord shield you. That heart of thine—whence are the issues of life,— is a citadel safe only in *His* keeping. Hand it right over; bid the King enter; give Him absolute and undisputed sway,—and then not only of His Government, but of *your* peace also, there shall be no end. Blessed Keeper—blessed keeping; may we more and more know the One, and realise the other, through every coming day of this New Year.

Am I writing to one who is venturing to enter alone the dark, mysterious portals of another Year? How *can* you walk alone? How can you engage the foe, lying in wait at every corner? How meet the dread solemnities of Eternity,—with that millstone of unpardoned sin around your neck? Repentance,—resolutions,—reformation, none of these can avail, so long as the old score remains unsquared. Shall swiftly fleeting moments of the old year leave you still without God—without Christ—without hope? Will you not rather—ere they close—get you to the stronghold, where alone that naked, exposed soul of yours can be hidden within the shelter of a Saviour's embrace, and that guilty soul of yours be for ever cleansed by His precious blood? Then "thou shalt call Me 'My Father,'" and you shall enter upon the New Year possessing a new life, and rejoicing in a new-found Friend—with whom you shall journey in closest fellowship, until you enter eternally upon the new inheritance, and join the ranks of those who sing "the New Song." "Behold, I make all things *New*."

And not for *yourself* alone will you thus walk in light, and enjoy rich spiritual blessing. How shall your influence tell in the coming year? What souls are to be *your* joy and crown of rejoicing in the Day of the Lord Jesus? Will you not lay yourself afresh upon the altar, a living sacrifice,—time, talents, influence, wealth, position,—all surrendered to be used *of* God and *for* God.

Thus shall we realise in its fulness, the fulfilment of the promise: "And the Lord shall guide thee continually, and satisfy thy soul . . . and thou shalt be like . . . a spring of water, whose waters fail not."

That this year, 1888, may be emphatically a New Year of gladness and fruitfulness, deepening day by day, is the earnest desire of

Your true friend,

M. Jane Menzies.

January, 1888. (*Mrs. Stephen Menzies.*)

TOLD IN A LINE

"A PROSPEROUS New Year to [A.]1 and all,"—so we are fain to modify the wonted wish.

We have advertised this week's Number as "special,"—readers will agree that we were right.

Our Spelling Chase closes to-day. Results in the earliest possible Number. Competitors should be on the *qui vive*.

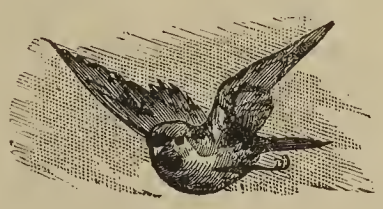
The third of our Special Series of Christmas Competitions is announced on page 158.

Our Notes for Sunday School teachers, on page 158, will be a new feature of interest.

We want readers—readers want a good brisk Paper. Send a friend's name and address to 62, Ludgate Hill, for a specimen copy of —"A. 1."—

Very hearty thanks to our very hearty helpers. We shall soon publish a column of "What They Say."

Snowdrops.



By Margaret Scott Haycraft.

INFANT band of beauty,
Flowers of love and faith,
Witnesses of triumph
Over seeming death,—
Rise and wave your banners
O'er the shadowed lea;
Spring is faintly breathing,—
Nature shall be free.
In your valley-pulpits,
Surpliced pure and white,
Preach of resurrection,
O ye buds of light!

Soon a host will waken
At your quiet voice;
Blossoms bright and golden
Newly shall rejoice.
Daffodil and cowslip
Shall with primrose stand,—
Violets come creeping
Through the fragrant land.
Now, though chill and lonely,
Yours is glory's dower,
Holding consolation
In each quivering flower.

Teach us to be patient,
Blossom-hearts of peace!
Though the winter tarry,
Bid our doubtings cease;
Teach us all to hearken
To the Master's word,
"Comfort ye My people—
Witness of the Lord:"
Bearing grail of gladness,
Hope and trust for aye,
Heaven make our spirits
Snowdrop-white this day!

HOMELY HOBBIES: RECREATIONS IN GEOLOGY.

By W. H. Harris, B.A., B.Sc.

No. 4.—The Slates of our Roofs.

ARTISTS and the lovers of Arcadian simplicity and beauty, naturally prefer the roof of thatch, with its varied tints and lowly forms of vegetation creeping over it: with its associations of rustic life, and with its suggestions of warmth in Winter and coolness in Summer. But the dwellers under such coverings would have something to say of co-tenants, in the way of sparrows, and possibly also of rats, and of insects of various genera, not conducive to the comfort of the human occupants below. The landlords of such tenements, moreover, looking at affairs from the practical points of security and endurance, would tell us of the dangers from sparks escaping from chimneys, of the spread of conflagrations in villages from a single cottage, on fire, distributing pieces of burning material in all directions, and of the difficulty of extinguishing thatch when once well alight. We should hear, also, of the frequency of repairs, and the repeated renewal of the whole of the straw, necessitated by the gradual but sure decay of the vegetable substance. Hence we cannot be surprised that more substantial and less dangerous materials than thatch have been sought for, to furnish roofing for our houses and buildings generally. Nor has the search been by any means in vain. At the present time we may see slates, tiles, flagstones, corrugated iron, tarred felt, and even prepared paper, used as coverings for structures more or less permanent. For houses, however, in most parts of the country, slates are more extensively employed than any other of the above-mentioned substances.

The reasons for this are quite easy to discover. Slates are light in weight, easily handled and fixed, very durable, and impervious to the abundant rains of our climate. They do not readily allow water to soak into them, and hence do not split by frosts. They are readily removable if alterations of roofs are required, and are replaced without difficulty if they slip from their positions. If imperfect or broken, sound ones can be substituted with little trouble; in addition to all these benefits, slates are now very cheap. Hence the probability that the majority of our readers are living under this kind of house-roofing.

Now, while thatch may have its artistic beauties and its poetic associations, it must not be thought that slate is wholly ugly, and without suggestiveness. Mr. Ruskin, indeed, of all people in the world, has said that, where there is a brick wall and a slate roof, there need be no want of rich colour in an English landscape. It would not be difficult to show how the various tints of slate, under sunshine and rain, April showers and December frost, with occasional little patches of yellow lichen showing here and there, may be worthy of even an artist's admiration. But when we set ourselves to learn the history of a piece of slate, we enter on a field of exploration of wondrous interest, and of indefinite extent. We have to take a flight on fancy's wings, which might become fatiguing even to that marvellously fleet steed of thought. We must travel back to a period so remote in our earth's existence, that our minds fail utterly in the effort to grasp the idea of the years that have elapsed; we shall find ourselves face to face with problems, which have yielded their solution only to some of the most patient workers and deepest thinkers of our day.

Let us try to make good these somewhat startling statements. First, then, as to the age of our slates. They are quarried from almost the oldest of the geological formations. They come chiefly from the Cambrian and Silurian systems. What that means, as expressed in *ages*, we will not attempt to estimate. To get an approximate notion of the time would baffle the greatest human intellect. The millions of years have been long enough for the whole animal and vegetable creations to have been slowly, but entirely, changed over and over again. Mountains and valleys, lakes, rivers, seas, and lands,—even the very continents and oceans, have repeatedly changed places on the surface of our globe, since the materials of the slates of our roofs were brought together, and consolidated into the form in which we make use of them. "As old as the hills" would be a feeble emblem of the antiquity of our palæozoic strata. They were venerable in their untold years, "before our mountains were brought forth."

But, now, what agencies have given birth to these immensely ancient and useful substances? The quarryman who separates them from their rock-masses; the workmen who cleave them, or who fix them on our houses; possibly the builder himself; and certainly most people who know nothing of geology would say, if asked about the origin of slate, that, of course, it was made when the world was created, and was put just where we find it.

A very slight investigation, however, is sufficient to invalidate that theory, and there are several ways of setting about our inquiry. In the first place, if we go to a slate-producing district, and notice what is called the "weathering" of the rock, we shall find that it crumbles into a tolerably fine dust in dry weather, and makes a very decided mud or clay, under the action of rain. We can, indeed, make slate into mud or clay for ourselves, by pounding it up very small, and mixing water with it; and then, if we examine the product chemically, or with the microscope, we shall see that it is made up of the same components as clay. This means, in other words, that slate consists of very small particles of older rocks, which have been ground to powder, and carried down by rivers as mud to some sea-bottom. So much for its origin.

Now we come to that property which renders slate so exceedingly useful for the purposes of man; viz., its quality of splitting easily into thin parallel plates. The scientific mind is what has been aptly termed "an animated note of interrogation." Of course, therefore, this question of slaty "cleavage," as it is called, attracted the attention of geologists, and led to inquiries as to the reason of it. Naturally the first idea entertained was, that the division into laminæ took place along the original lines of "bedding" or deposition. But this theory was soon shattered by the certainty that, in many districts, the directions of bedding and cleavage crossed each other at all angles, and that the latter was apparently quite unaffected by the former. Professor Sedgwick, who entirely refuted this first theory, came to the conclusion that, after the deposition and partial consolidation of the original mud or clay, certain crystalline forces caused a special arrangement of the component particles, and especially of the plates of mica, and that hence, just as certain flagstones—or, to take a much homelier illustration, a piece of sugar-candy—will split more easily in certain directions than in others, so slates similarly assumed a crystalline structure. This was called the *molecular* theory, because it had to do with the ultimate atoms of the materials.

Further observations, however, revealed the fact that fossils embedded in slate had often undergone curious distortion, and this always in the lines of the *cleavage*, not of the *bedding*. Then Messrs. Sharpe and Sorby, following up these facts—the latter aiding his investigations by the microscope—found further evidence of pressure and squeezing, and hence arose the *mechanical* theory of slaty cleavage. Still, Mr. Sorby thought that the splitting was greatly dependent on the re-arrangement of the mica particles and scales of oxide of iron, consequent on the pressure to which the strata had been subjected. Subsequently, Professor Tyndall conducted a series of experiments, which led him to the conclusion that pressure alone would account for all the facts. He showed that a lump of white wax—a purely homogeneous substance—when submitted to great pressure, split into plates of surprising thinness. He adduced as a very familiar instance of similar effects from a like cause, the fact that certain kinds of pastry, when well rolled by the cook, become flaky after baking. He also instanced the case of iron, which, when taken from the puddling furnace, is spongy to some extent; but, when passed under heavy rollers, it becomes fibrous. We are all familiar, also, with the flaking of the metals of our rails at stations where the heavy trains often slide along, instead of rolling, as the brake stops them. We may then take it as established, that slaty cleavage has resulted from pressure, and that the lines of cleavage are always at right angles to the direction of the squeezing force.

Next comes the question, What agencies have been able to exert the enormous power required thus to change a consolidated mud into a flaky slate? We will mention two, as having probably been those most effective in this matter. First, in the great slate districts we find abundant evidence of old volcanic activity. The rocks have been pierced by "dykes" of molten material. Here and there ashes, of a similar kind to those thrown out from existing craters, are found among the slate beds, and it is not difficult to imagine that dislocations, and upheavals, and distortions, attended by immense pressure in certain directions, resulted from these subterranean energies.

Secondly—and this opens up a wide field for thought and scientific imagination—there is good reason to believe that, from the time when our globe first began its revolution about the sun, it has been giving out heat into space. Now, what would be the result of this? We know that nearly all substances expand as they are heated, and contract as they cool. A bar of iron which just passes through a ring when cold, will not go through it if heated to redness. Again, a similar bar, which, when red hot, fits tightly into a tube, will, when cold, slip easily up and down this same tube. In like manner, rocky materials swell when heated, and contract as they are allowed to cool. Hence we conclude that, supposing the earth's crust to have fitted, originally, an under nucleus of molten material, as the outer portions cooled, and so shrank, they would become wrinkled and puckered, giving rise to mountain chains of various heights. For this remarkable, and we may say, magnificent conception, we are indebted to an eminent French geologist,

M. Elie de Beaumont. Should the theory be thought extravagant, we have only to consider the exceedingly small proportion which the loftiest heights on our earth's surface bear to its whole mass. The roughness on the skin of an orange would be immensely too great to illustrate the relation. It would be much more truthfully exemplified by an ordinary grain of sand on a globe twelve feet in diameter. This consideration serves to show how very small a wrinkling of the crust, compared with the whole bulk of the earth, would suffice to make vast elevations on the surface. Now, if we combine these two theories, and suppose volcanic action to produce, at certain spots, great increase of temperature and consequent expansion, followed by contraction as the interior heat escaped, or went in some other direction, we shall have, we consider, three *veræ causæ* of the pressure which has resulted in slaty cleavage.

LOVE, COURTSHIP, AND MARRIAGE.

By PHYLLIS BROWNE.

No. 1.—Young Men and Maidens.

A GOOD old man, who had lived for many years in happy wedlock, was once asked how it was that he came to fall in love.

"I never did fall in love," was his reply; "I walked gently and deliberately into it."

Tumbles of any sort are never very agreeable experiences; they always involve getting up again, and they generally leave an unpleasant bump or scar behind them. Tumbles into love are no exception to the rule. They are to be avoided. If young men and women were always steady on their feet, and not liable to become giddy now and again, we should never hear of them.

One reason why people fall in love so unconcernedly is, that they have come to think that to get married is the end of life, and that to miss being married is to miss the best and the sweetest thing in it. To an extent they are right. If all marriages were perfect marriages, founded on love and judgment, there would be nothing better than marriage known to mortals. But, unfortunately, all marriages are not perfect. On the contrary, perfect marriages are very rare, perhaps as rare as perfect personal beauty. We very seldom see either a man or a woman who is perfectly beautiful. We see one who has good eyes; another who has a straight nose; another who has a graceful figure; another with abundant flowing locks; but in all there is something that falls short. In describing them we say, "Such a one is very handsome, *but*——"

So it is with marriages. There is scarcely one, concerning which, if we were to speak honestly, we should not bring in the "but." The "buts" spoil everything, and the "buts" would not be nearly so common if people would walk down gently into love, instead of falling into it.

Yet there are very many happy marriages. Poets and philosophers of all ages have agreed in this. The poet Cowper says that "domestic happiness is the only bliss that has survived the fall." The great Martin Luther said, speaking of marriage: "The utmost blessing that God can confer on a man is the possession of a good and pious wife;" and again he said, "To rise betimes and to marry young are what no man ever repents of doing." One old English poet pronounced a true marriage "a pattern of celestial peace," and another called it "heaven on earth." It would indeed be easy to write whole pages of quotations, from the writings of wise men, in praise of true marriage. We all number amongst our acquaintance just one or two couples who are thoroughly happy in their marriage; and these people are so strong, so cheerful, so thoroughly contented, that it is no wonder that young folks feel inclined to follow their example, and try to secure married happiness on their own account.

This leads them to look out for some one with whom they may fall in love. Curiously enough, however, what we call the perfect marriages are never made by people who look out for them and scheme for them. They are always brought about naturally. It follows, therefore, that with regard to marriage, the best thing young people can do, is to refuse to scheme and plan for it, and to do their work well. If one of these best marriages is in store for them, it will come. There is no need to drag it into their lives. The marriages that are dragged in, are the sham marriages, which are to be dreaded both by men and women,—the marriages in which two people are tied together, merely to be a hindrance and a continual pain to each other. Compared with such a marriage, to be an old bachelor or an old maid is freedom and bliss.

Some girls have a great terror of being old maids. Certainly it is difficult to be a successful old maid. An American humorist once said that "everybody seems to look upon old maids as they do on dried herbs,—articles which ought to be kept in a garret as handy for sickness." Yet even this individual went on to say that "it would be better for a woman to be an old maid for four thousand years, than to marry the wrong man."

Young men now-a-days are not so much afraid of being "old bachelors" as girls are of being "old maids." Some foolish ones amongst them think it is rather grand to be free: they have a notion that at any time they can throw down their handkerchief, and two or three girls will run to pick it up. Perhaps, if the truth were known, it would be found that there are not twenty self-satisfied old bachelors in England at the present time, who have not, at one time or other of their lives, been refused by some woman. Also, it would be found that of the two, old bachelors have more reason to regret their loneliness, when youth is gone and age approaches, than even old maids have. Women can generally, if they will, find a corner where they can nestle down; but men have not so often this power. Solitary human beings are always sorry objects; but a solitary man is more to be pitied than a solitary woman. Now and then we meet with elderly, staid, serious-minded people, who seem to think that young men and young women ought to act as if they did not know there was such a condition as marriage. This is impossible. It is true that in these days young folks allow their thoughts to dwell too much on the subject. They read stories which give them quite untrue pictures of life, which show marriage as the be-all and end-all of human life, and mortals as puppets who prepare for the wedding-day, and then retire into the back-ground, and are no more heard of. The staid, serious-minded, elderly people, and the romantic young ones, are equally mistaken. There is such a state as marriage. A knowledge of it—yes, even an expectation of it—is natural to both young men and maidens. In time, the large majority of these young people will enter it; those who remain outside will be quite a small minority. Thus it has been since the world was made, and thus it will be so long as the world lasts.

It has been said that the large majority of the young people who succeed each other on our planet will enter the marriage state, but it is also true that the fate of these young people will be largely determined by the kind of marriage they make. Their hopes, their fears, their characters, their happiness, their usefulness, will depend very much upon whether they are married or not, and the kind of marriage they make. A young man may work hard in business, but, as the old proverb says, "he will have to ask his wife's leave before he can get on." A young woman may determine to live for the highest, try to do her duty, and make the best of this life and of all life; but if she is bound to a partner who does not "see with her," it will be as if she spent her days and years trying to roll a large stone up a steep mountain. For both men and women, there can be nothing but pain, weariness, disappointment, and failure, when the marriage has been a mistake. But though marriage is thus momentous in its consequences, young men and maidens look upon it as a joke. They treat it as fun, they *fall* in love, they frolic through courtship, and when brought face to face with marriage, think chiefly of the dress they shall wear at their weddings.

Would it not be more sensible if they were to look at the subject quietly, throw the light of common-sense upon it, and try to learn wisdom from the teachings of experience? It is in the belief that this is so, that I am beginning to write these Papers; and if young men and young women will read what I have to say, I will try to give them the best advice which is at my command concerning Love, Courtship, and Marriage; at least, I will try to help them to see these things as they really are.

WHAT SHALL I BE?

THIS is the all-important question that ninety-nine young men out of every hundred ask themselves on leaving school for business life. I had a long chat the other day with a shrewd, wide-awake man of business (who had tried many different lines of trade), on the choice of employment for young men. I asked my friend which he considered the best for a young man to do,—having the opportunity to enter a large wholesale House, should he choose the office work, or the business of selling goods? Said he: "It would be better, in my opinion, for a young man to start business life dusting buttons at eight shillings a week, than to go into the office and receive three times that amount. The life of a salesman is far preferable to that of the man who sits upon a high stool, with a cash-book before him from morning till night. A salesman is out and about, and has the chance of making friends and acquaintances whom he can use in after life. Of course men's natures differ; some are fitted for office work, others for salesmen. But, if ever I have a son, I will put him to selling goods in some good wholesale House, and if there is anything in him, he will be bound to work himself up."

"LUCK" AND "PLUCK;" OR, "ONE LETTER DID IT."

By the Rev. P. B. Power, M.A.,
Author of "The Oiled Feather," "The Talking Fire-Irons," etc.

"'What does this make it spell?' asked Mr. Barbel, as he again flourished the chalk."

"THERE'S only one letter difference, my girl," said old Timothy Barbel, to a bright young girl of about sixteen,—"one letter, my girl; but that one makes all the difference, just as one figure would make all the difference, provided only you put it in the right place. Here now, here are half a dozen noughts for you," and old Timothy got up, and chalked six great "O's" on the floor before him. "How much are they, my girl?"

"Nothing, grandfather."

Then Mr. Barbel, making three or four flourishes in the air with his piece of chalk, which made that chalk say, "When next I make a mark, look out, for it will mean something," at last descended on that floor, like a hawk on some little bird, and clapped a "1" in front of the row of noughts.

"Now, Betsey, my girl, how much is it?"

"Units, tens, hundreds, thousands, tens of thousands, hundreds of thousands—a million," said Betsey; for, not having much to do with millions in life, she had to count up on her fingers before she could hit the number off. But that we shan't trouble about; Betsey got it right, and that is the main point.

"Now, my girl, you see what a little thing will do, if 'tis only put in the right place. A little figure—and a little letter will do the same. What does that spell?" said Mr. Barbel, chalking the letters "L, U, C, K," upon the floor.

"Luck," said Betsey, getting rather red in the face as she said it.

"And what does this make it spell?" asked Mr. Barbel, as he again flourished the chalk, and made it descend suddenly upon the ground, this time to deposit a "P" in front of the other letters. "Now, my girl, let us have it spelt."

"P, L, U, C, K," spelled out Betsey, getting redder and redder as she pronounced each letter.

"Say out the whole word," said Bet's grandfather; "the letters are no good unless you put them all together; and even then they're no good, unless you go and work them out."

"Pluck," jerked out Betsey, as if some one had given her a slap on the back, and knocked the word clean out of her mouth.

"That's it, my girl; that 'P' will do the business—not without God's blessing, you know; without Him 'nothing is strong, and nothing is holy,' as it says in the Collect; but with that, with the blessing, if I wagered—which I never do, and am not fool enough to do—I'd lay 100 to 1 on that 'P' in the

right place. The end of the race would be, 'Pluck,' ridden by Betsey Barbel, came in first; and 'Luck,' ridden by Jenny Light, was nowhere. Hah! hah!" laughed out Grandfather Barbel, "I can read an account of the race," and snatching up his newspaper, the old man pretended to read:

"'Luck' was the favourite. Ten to one was bet on her freely; and, indeed, her appearance justified her backers in their confidence. She came to the post with her coat shining like polished marble, and her jockey—Light—was full of confidence. Her competitor, 'Pluck,' was too heavily built, in the opinion of most. That she had good staying powers every one confessed; but she did not appear to have the speed. The race seemed a foregone conclusion for 'Luck.' But things turned out very differently from what was expected. 'Luck' pranced about a good deal at the start, but finally went off with a rush. Her running was very uneven, going a great pace at times, and then almost dropping into a trot; while 'Pluck' started as if she meant business from the beginning. She soon gathered herself up, and went forward at a good steady pace, evidently full of most dogged perseverance. This stood her in good stead. When the horses came to the heavy ground, 'Luck' dropped behind, and finally broke her leg. She had to be shot where she fell, and her jockey walked in without her. 'Pluck's' jockey received a regular ovation, and the horse is likely to be heard of again.

"Hah! hah!" laughed old Timothy Barbel, "I was one of the fools that used to go horse-racing and betting, when I was young. I know all about their jargon. That's the way, Bet, they'd put it down in the newspapers. And now, my girl, here's the race of life to be run, and you're fretting because Jenny Light is a lucky girl, and you think you are not. You think Jenny has a better mount than you; but I'm an old man now, and have seen a good deal of the world, and I can tell you this, that if you'll be content to ride 'Pluck,' instead of 'Luck,' as sure as my name's Timothy Barbel, and as sure as my father's name was Timothy Barbel, and as sure as his father before him was also T.B., so surely will you do better than Jenny Light—that is, if she goes in for 'Luck' only."

Now, the reader must be put into possession of how it was old Timothy Barbel and his grand-daughter came to be conversing on this subject at all; and this will account for how it was that, in spelling the word "Luck," our friend Betsey had coloured up to the roots of her hair.

Betsey Barbel was very much put out just now, because an acquaintance—and, indeed, a kind of friend—had come in for a sum of £20, by the death of an old aunt. "Just like her 'luck,'" said Betsey; "and she's turned out the finest girl in the mill, and Bob Spanker has offered to her. There's no denying that she looks wonderfully well in her new hat."

Had Jenny looked badly in the hat, I am afraid—such is the evil of poor human nature—the vexation would not have been half so bad to Betsey; but what with her high colour from excitement, and her bright manner, and the hat itself,—no doubt in the world of it, she looked very well.

Then there was Bob Spanker; there was no denying that Jenny had the smartest young man in the mill. All this was too much for Betsey Barbel to endure in silence; so she told her grandfather all about it, and this was what made the old gentleman do all that figuring on the floor.

"List to me, my Bet," said the old man, as he took his grand-daughter's hand between his two; "list to an old man, who has seen many go up, and many come down, in his lifetime; and who has seen many who were up, stay up, and many who came down, never get up again. Never trouble yourself about other folk's luck; mind yourself, and your own business. Do your best in whatever station of life you are; and whether you seem to get all you want or not, stick to your duty, regularly, honestly, determinedly, Pluckily—mind the 'P' Betsey—'pluckily,' and it will come out well in the end. Now, look here, my girl, I know Jenny Light well enough, and I know a bit about you, too; and if I had to make a wager, I'd bet not ten to one, but a hundred to one, that you will come out better in the end than she will. You have more grit in you—more backbone, more 'make-up-one's-mind-to-it' in you—than she has. With God's blessing, 'Pluck' will carry you where 'Luck' will never carry her. 'Pluck' will keep you where 'Luck' will never keep her. 'Pluck' will stick to you, long after 'Luck' has left her. For one's 'Pluck,' one has within oneself, and is one's own; but one's 'Luck,' nobody knows what it is, and it may be here to-day, and gone to-morrow; and if the one who had it had nothing else, she may find herself left without anything at all."

We don't always take in things in a moment, and it required a little time before Betsey Barbel could quite fall in with her grandfather's notions, especially as Jenny Light took every opportunity of looking in upon her. On these occasions she not only exhibited herself, and her hat, and its feather, but also Bob Spanker, and his new waistcoat, and his new necktie, all of which—(I don't mean Bob Spanker himself, but the waistcoat and the tie)—had come out of Jenny's £20, which was fast coming to an end.

Now it is a grand thing to think—think—think, to ask of this and that, whether these things be so, to come at the bottom of things. And Betsey Barbel went in for thinking; as soon as the pettishness wore away the thinking process immediately began.

"It was Betsey Barbel . . . with plenty of pluck in her stiff backbone."

"Well," said Betsey to herself, "grandfather has seen a good deal in his day; folk about here think he has a deal of sense; they're always coming to ask his advice about this and that, and as he says 'Pluck' is better than 'Luck,' I'll go in for it."

"But what about your being *only a girl?*" said something inside her, for as you know, good reader, whenever anything of any value begins to spring up and sprout in the mind, there's sure to be some evil bird about, to try and pick at it, or some thorn or thistle to choke it. But Betsey was equal to the occasion. "Only 'a girl' indeed! And why should I think 'only' a girl? Hasn't a girl hands, and feet, and a head, and a heart, the same as a man? There are plenty of women in the world as well as men. Some folk say there are a great many more, and a deal of the hard work in life comes to them too. I'll tell you what it is," said Betsey to herself, "I'll go in for what grandfather says. As to 'Luck,' it may be here or there, or it may not; I'll go in for 'Pluck,' for I know where that may be—that is, in myself."

From this day out Betsey Barbel, as she said herself, "got up a stiff backbone," and determined to put "Pluck" into her life. She soon had a chance of putting her new principle into practice.

"Now then, girls," said the foreman at Banwell Mills, "we have to make a push for it this week; 'twill be a hardish bit of work, but if we do it, we'll get more orders from where this came from."

Not a stir amongst the girls. Some few might have been inclined to fall in with the foreman's views, but they were afraid, afraid of such girls as Jenny Light, or of such Bob Spankers as there were in the mill; they had not the grit—the backbone in them, to say out what they thought.

At last a girl at the far end of the room stood up; she looked pale, for she was making a great effort, but she made it, and succeeded too. She said, "I'll lend a hand."

All eyes were turned towards the speaker. It was Betsey Barbel, who was standing up with her stiff backbone, and plenty of "Pluck" in her heart and her voice. There she stood, not as if she were ashamed, or afraid, or likely to knock under if she stood there for a month. Presently up got another, and then another, until at last some thirty girls stood up, leaving some twenty, amongst whom was Jenny Light, refusing to do an extra stroke.

"That will do," said the foreman; "I can carry it through with you," and the work was done at the week's end. The pull was pretty severe, and more than one girl seemed likely to give in; but Betsey kept her eye on all round her. She cheered and encouraged them; she said, "Let us put what 'go' we have into it; we'll carry it through; we'll show them what women—what girls can do;" and Betsey came out of that affair the leader of all the girls worth having in Banwell Mills. She and her thirty kept the winter's orders for the mill, every penny of which would have gone to Germany, if this order had not been taken in hand, and bravely and promptly carried through.

The owner of Banwell Mills knew to whom he was indebted for the order being carried out, and Betsey's pluck put her, in three months' time, into a place in the mill with at least half as much wages again.

No doubt Jenny Light thought herself a most lucky girl to get Bob Spanker;—every girl thinks herself very lucky when she gets a lover, and finally a husband; but I have my own doubts sometimes about this luck. I have seen the luck turn to what was very unlucky indeed; and I think Jenny Light would have been much more lucky, in reality, if she had never seen Bob Spanker, even though he did make such a beautiful appearance in that sprigged waistcoat and red necktie. For Bob Spanker had no religion in him,—that was the worst of all; but neither had he grit, pluck, backbone, stick-to-it, or anything in him to make him last; and if I were a girl, I should go in for a man that had some of these things in him, that I should. No sprigged waistcoats or red neckties for me, unless inside the waistcoat was a good, sound heart, and inside the red tie a good, honest throat, that could do something more than swallow beer and sing songs; one that could say "No," when "No" was the proper thing to be said, and say "Yes," when "Yes" was the proper thing; and then stick to them as if he were fixed to them by a hundred of nails.

But next week I shall be able to tell you how this extra "P" worked in the matter of a husband.

(*To be continued.*)

ANATOMY SPIRITUALISED.

By the Rev. J. Hiles Hitchens, D.D., F.S.Sc.

Author of "*Ecce Veritas*," "The Young Men of Scripture," etc.

No. 1. The Head: or, Responsibility of Thinking.

Fable says that when the gods created man, they made a lamentable oversight. They constructed a marvellous body, endowed that body with a vigorous intellect, and provided for both body and mind suitable employment. But they overlooked the necessity for recreation. No amusements were furnished. So the deities met in solemn conclave, and, after due discussion, decided that men should find their enjoyment in the study of one another.

This classical myth is doubtless based upon the fact, that untold pleasure and profit have been ever derived from the thoughtful observation of the characters, habits, and acts of men. The matter for study is inexhaustible. Pope well writes:

"Know then thyself, presume not God to scan,
The proper study of mankind is man."

In Scripture, every power and part of humanity is claimed for God. Every faculty is earnestly appealed to. As from the crown of the head to the sole of the foot, man is represented as spiritually and morally diseased and emasculated, so the whole man is to be brought into subjection to the law and love of the Eternal One. We purpose, by a little spiritual anatomy, to try to enlarge acquaintance with ourselves, and our relations to God and man.

We begin with the *head*, which Addison says Nature has designed to be the "cupola to the most glorious of her works." Being the uppermost part of man, and regarded as the seat of thought, the head is often taken, in the grand old Book, as indicative of the entire person.

The difference between man and the brute is very conspicuous in the head. The Creator has made the lower part of the human face to bear a smaller proportion to the forehead than in brutes. Man has been given height and proportion of forehead surpassing all other creatures,—a brain, which is the organ of the mind, and the seat of nervous energy, and the facial nerves and muscles, to convey to the face the prevailing passions, or sudden emotions of the mind. It is not that the brain perceives, reflects, or determines. Thinking is *not* a property of the brain. All its material properties are possessed as much when we are not thinking as when we think—as much when we sleep as when we are awake. It is the mind that employs the brain as a sensorium, and uses it as a medium. Yes, the Divine Proprietor has bestowed upon us an immortal and expansive mind, capable of looking outward, inward, around, and above—capable of ranging over the fields of the past and gathering treasures for present possession and future service—capable of circumnavigating the globe, sounding the depths of oceans, rising on the beams of the sun, and resolving those solar rays into their constituent colours—capable of weighing the marvellous but merciful utterances of Infinite wisdom, of soaring into the Divine presence and gazing upon the ineffable glory—and yet, alas! liable to grope in ignorance, to be stunted by custom, to be misled by hellish cunning, to be poisoned by the tempting draught of Beelzebub, and thus to reduce the whole man to a state on which good men cannot look without shame, and angels cannot gaze without surprise. It is because the mind chiefly operates through the brain—plays upon it as a musician plays upon a piano—that the head has the dignity and value it possesses.

"It is not from his form in which we trace,
Strength join'd with beauty, dignity with grace,
That man, the master of this globe, derives
His right of empire over all that lives;
That form, indeed, the associate of a mind
Vast in its powers, ethereal in its kind;
That form, the labour of Almighty skill,
Framed for the service of a free-born will,
Asserts precedence, and bespeaks control,
But borrows all its grandeur from the soul.
Here is the state, the splendour, and the throne,
An intellectual kingdom all her own."

The thinking done by men is of varied kinds. We become more or less acquainted with

our fellow-creatures' thoughts, and the disclosure thought makes of itself by words and actions. But there are many, many thoughts which pass through or dwell in the mind that make no discovery of themselves, either on the face—the soul's dial-plate—or at the lips, the portal of the soul's temple. Every man is an unknown world to his fellow-man. Beneath all that we see and know of one another there is a secret life, of which we know nothing. But the Great Artificer has the key to the secret and mysterious cabinet of the human mind. He discerneth the thoughts and intents of the heart. The *weakest* thought that flits across the spirit, like the fleecy cloud which passes almost unobserved over the azure of the summer sky, and the *weighty* thought which accumulates like an autumn nimbus, giving a sombre and depressing aspect to all the surroundings; the *good* thought that shakes itself from the dust of the earth, like a feathered songster, and soars toward its native skies, and the *evil* thought that, serpent like, coils around the flowers of the heart, and leaves its trail on all the fruits of the intellect; the *presumptuous* thought, that rushes like a maniac into the presence of the Infinite Monarch; the *uncharitable* thought that lurks in the highway of life, to wound a passing pilgrim; the *covetous* thought that goads the man to fraud, injustice, and oppression; the *ambitious* thought that bars the entrance of contentment into the city of the soul; the *murmuring* thought that with vile ingratitude tramples upon Heaven's priceless gifts; the *idle* thought that, like excessive foliage in a fruit tree, carries off the strength and energy of the mind—all, all lie open to the searching gaze of our Divine Father. Every imagination, wish, or purpose is as legible to His vision as if written by a sunbeam. This should comfort and strengthen those persons who *try* to think and act aright, but are misunderstood by men—those who desire to serve the cause of truth, but cannot give utterance to their thoughts because words fail, ideas slip from the mental grasp, and the feelings are voiceless. On the other hand, the fact that God reads every rising thought should startle and stop those who knowingly indulge evil imaginings. To know that *He* is fully acquainted with the thoughts of dishonesty, sensuality, fabrication, misrepresentation, hypocrisy, hatred, cruelty, and crime should be enough to check sin, and bring us to our knees in sincere contrition.

Let it be remembered that our thoughts affect our dispositions and characters, and so influence our eternal destiny.

> "All our actions take
> Their hues from the complexion of the heart,
> As landscapes their variety from light."

He whose mind is wont to be engrossed with the things of this world, will contract a character of a worldly cast. He whose thoughts run riot in the realms of crime will soon become dissolute and reprobate in life. He who dwells mainly upon the fashions and frivolities of society will speedily lack all solidity and solemnity. If a man indulge evil thoughts, they will add links to the chain which fetters him to earth. But if he encourage good thoughts, they will be as living germs, which will produce tenfold their own quantity. Whether good or bad, no wave of thought can visit the continent of the mind without leaving a deposit on the shores of life, either beneficial or baneful. The unholy thought will give a hue to the disposition, and leave a spot upon the memory, which life itself will never see wholly eradicated; but the holy, honourable, orderly thought will yield a sweet perfume which, like aromatic leaves in a jar, shall retain their pleasant aroma to perpetuity.

> "You may break, you may shatter the vase as you will,
> But the scent of the roses will cling to it still."

Further, let it not be forgotten that our thoughts are far-reaching and undying. No thought ever yet truly perished. There is an immortality about our thoughts. There are certain seeds that can endure an extraordinary amount of unnatural heat and unusual cold without losing their vitality. Some have passed through processes of boiling and fermentation, and when thrown away as useless, have vegetated and produced fruit. Such seeds are emblems of the vital power of human thoughts. The children in the fields carefully pluck the little downy head that takes the place of the dandelion petals, and then blow the winged seeds from the tender stem. Away—away in diverse directions those tiny seeds are borne, and little do the youngsters think how they are propagating the gaudy flower in a hundred meadows and gardens. So we think and give expression to our thoughts, but cannot tell how, right round the sea-girt globe, those thoughts will find an avenue to other minds, and how, on and on, to the final epochal hour in earth's history, the effects will be felt. Haughty, envious ambition—"restless, ruthless fiend"—takes possession of a man's mind, and that stubborn, uncurbed thought stains continents with human gore, and hands on to posterity a terrible heritage of national woe, weakness, and ill-will. Fierce and intolerant bigotry takes hold of a man's mind, and the baleful thought leads to divisions, persecutions, and social jealousies for generations. Sensuality possesses the mind, and the loathsome thoughts kindle the fires of vice in the breasts of thousands of mortals. On the other hand, a benevolent thought is conceived by one, and the cheer it accords to the sad, the relief it affords to the troubled, is inconceivable. An ambitious thought led to the fall of our entire race. A bigoted thought led to the crucifixion of the Son of Man. A benevolent thought led to the establishment of our numerous societies and institutions for the instruction and relief of men. A holy thought led to the composition of those invaluable treatises which will be ever prized. A thought led Tom Paine to write what has ruined many a precious soul. A thought led John Bunyan to pen his inimitable "Pilgrim's Progress." Thus thought is a blessing or a curse, not to us only, but to others; and the responsibility of thinking is therefore terribly great and solemn.

Then, reader, carefully guard your mind. The things which enter your mind come either from *above* or from *beneath*. Every idea conveyed to our intellectual capacities must be from one or other of these sources, so far as their moral effect is concerned. The Evil One and his emissaries are ever on the alert to cast some noxious weeds of error into the garden of the soul. It is our fault if we allow those evils to stay there. Be it ours, then, never to permit an evil thought to *dwell* in our minds. Let the saying of the heathen abide with us: "What ought not to be done, do not even think of doing." But let every good thought be welcomed as a hallowed guest. The thoughts which God conveys to the mind will prove to be unseen Seraphim, transforming our heart into a temple, and perfuming that temple with holy incense.

GOD IS HOME.

By EDWARD CLIFFORD.

WHAT a word "home" is. It will bear treasuring in the heart, and saying over and over again.

Home! What home have you loved best? Look back and think about it.

My first home was a common enough house in Bristol, one of a long row—26, Somerset Street. But to this day I love even its doorstep, and its brass bell, and its window blinds. I love the bannisters where I broke my arm, as I slid down them one day. I love the gum cistus in the garden, and the snapdragons on the garden wall, and the sound that all the church bells of Bristol make, ringing together on Sunday morning and on Sunday evening. Above all, I love the dear father and mother who made it home, and the sister who played with me. She and I loved to adventure out into grander places, and to find treats and wonderments in the outer world; but we always were joyful to come back home.

There all was familiar and natural; it was the place we belonged to, and it belonged to us. There all company manners and company restraint were put away.

Perhaps you never had such a home, but in your heart you understand all about it.

And now I have exactly the same feeling about God. He is Home. In Him I find quiet, natural, refreshing, comforting rest. In Him all things are ours—life and death, and angels, and all good gifts of joy or sorrow. We can love Thee, O God, for Thou only art our Home. As the tree to the turtle-dove, as the air to the frigate-bird, as the desert to the ostrich, as the earth to the acorn, as the water to the fish, as the meadow to the lamb, as the mother to the babe, so is God to the man who seeks Him.

In this Home of homes there is no fear, no constraint; all is love, and wisdom, and power, and tenderness.

Escape, then, into your home, poor hunted soul; sin and the devil, fear of death and fear of hell,—above all, the hated self that you have discarded, how they worry you!

Wounded, bruised, lame, and poisoned though you may be, sink into God, your Home, and be made whole. And if you ask how to get there, know that Christ is the Way, and Christ is the Door.

Another word—that Home is Love. That also is a word to hide in your heart and to live upon, for love is the one great reality, for God is Love. I hope we all know what it is to hear those three words,—"I love you," said to us by one whom we love.

They are lovely words to pass between parent and child, or between friend and friend, or between husband and wife, or between God and man. "I love you. I love you."

What a new thrill they give to life!

I am glad to think that our Lord knew the joy of having those three words said to Him, during those thirty-three years spent in our sorrowful world.

"She loved much," He testified of her who bathed His feet with her tears.

"Ye have loved Me," He said to His disciples on the night of His betrayal.

And three times before He ascended, He craved to hear those three blessed words—"I love Thee," from Peter's mouth.

Do you sometimes tell the Lord, when you are alone with Him, that you love Him? Do you say to Him, "I love Thee"?

If you do, this will happen—your love will become brighter and stronger.

MY FRIEND ANGUS; A SCOTTISH TALE.

By Josiah Forester.

YES, to be sure, he was a Scotchman, and a Highlander to boot; but neither he nor I ever saw any reason to be ashamed of that fact. He was born under the shadow of the Grampian Hills, where literally his "father fed his flocks—a frugal swain." I am bound to say that Angus' reasons were so novel and so striking, and were presented with such an accent of conviction, and with such fervid eloquence, that to doubt the conclusion to which they tended would have been treason; the more so, that I fear I have a good deal more Scotch than English blood within my own veins.

Angus' father was only a shepherd on the Scotch mountains, but he was no ordinary man, for all that. His father, old Angus Macpherson, had been owner of the very hills on which his son tended his flocks; but every farthing of his wealth, and every inch of his land, had gone in the cause of "Bonnie Prince Charlie." Strange to say, his son, so far from being angry at the cause of his poverty, found only one other fact to be prouder of, and that was that he was named Charles Stuart Macpherson, after the Pretender, who, some said, was present when the babe was baptized. To his last days—and he lived to be an old man of ninety-one—Charles Stuart Macpherson was a strong Jacobite, and mourned bitterly the sad times on which his unhappy country had fallen.

When my friend Angus was a boy at home, he has told me that there were days when his father seemed to be seized with a kind of Jacobite madness. He would suddenly appear from the hills, rush into the miserable hovel which he called home, take down the bagpipes, and spend hours striding up and down the glen, or on the hill-sides, blowing pibrochs and slogans as if he meant to call the clans from their very graves to fight the Prince's battles over again. It has even been said that he had more than once buckled on his father's claymore, lighted the fiery cross, and spent the whole night in scouring the country with the burning brand; but of this Angus could not speak positively.

According to Angus, his mother was a more extraordinary character, even, than his father. To the Jacobite fervour she added an imagination the most lively, a memory the most retentive, and a voice which, had it been cultivated, would have made her rank amongst the finest singers of the world. On winter evenings, when the sheep had been looked after, the whole family would gather round the great peat fire, and for hours the mother would keep the whole family open-eyed with wonder and delight, as she sang or recited Jacobite song and ballad, graphically described the battlefields of Scotland, the feuds of the clans, or told marvellous stories of ghosts, brownies, skelpies, and other such unearthly creatures, until the children were afraid to stir from their stools.

My friend Angus very early displayed a strong predilection for music and mischief. If he were not busily engaged in the one, he was sure to be in the other. By the time he was six, he could whistle like the mavis, play on the shepherd's pipe, and make it too, like Pan, and could even play a reel or strathspey upon the bagpipes, to his father's delight.

"He would take down the bagpipes, and spend hours striding up and down the glen."

That was a red letter day in his history, when his father brought home from the fair, twenty miles distant, a penny tin whistle. Until it was hopelessly battered in the daily struggle for its possession with his jealous brothers and sisters, it never was more than a foot away from his hand, day or night, and wonderful were the strains the boy could bring out of it.

The day of days, however, in Angus' history was unquestionably his ninth birthday. It so happened, that on this memorable day his father forgathered, as the Scotch say, with another shepherd on the hills, and the conversation turning on family matters, Angus' name came up. The father was expatiating upon his boy's wonderful musical faculty, when his hearer interrupted him to say that there was an old fiddle in a green bag, lying idle and useless in his own house, and if the boy cared to have it, he was very welcome. Angus' father thanked his friend, and said oracularly, that if there was any music anywhere in the thing, Angus was the boy to bring it out, even if he had never set eyes on the kind of instrument before.

It was dusk when the shepherd got home to deliver his piece of good news; but the words were hardly out of his lips when Angus, with a cry of delight, started to fetch home the new treasure. It was full six miles to the other shepherd's cot; but what was that? He would have gone, if it had been twenty, and though he had no earthly idea what a violin was like. Everybody laughed the way he shot out, without waiting so much as to pick up his bonnet, for it was quite characteristic. His brother Donald ran after him with it, but it was a hopeless task, in spite of his shouting and fleetness of foot. Angus only turned his head once, and, thinking Donald was sent to bring him back, he doubled his speed, and was soon out of sight.

Angus says his father's cot was a miserable enough dwelling that night. The violin could boast of just one string, and rub as he might with the bow, he only succeeded in frightening his youngest brother into fits, and reducing himself to despair. His father was almost as miserable as he was himself; for, willing as he was, he could see no way to supply the missing strings. The nearest place where they were to be had was twenty miles distant, and he was afraid they would cost more money than ever he could afford to part with. Angus, when he heard this, went to bed and cried himself to sleep.

When the family awoke in the morning, both Angus and the fiddle had disappeared. The day passed without his appearing, and it was getting dusk when Angus, footsore, but brimming over with excitement, dashed in, flourishing aloft the fiddle with its full complement of strings.

Awaking very early on the morning after the advent of the new instrument, the lad had made a sudden resolution to take his tin Savings Bank, and walk the twenty miles to see if he could not exchange his pennies for the needed strings. He walked every foot of the way there, and was successful above his expectations. The music-seller was so

taken with the enthusiasm of the lad, that he not only refused to investigate the contents of the bank, but overhauled the instrument, which he pronounced to be a very good one indeed. Footsore and tired Angus was, when he set out on the return journey; but as he got a lift for several miles on the way, and above all, had the fiddle all right under his arm, he thought little or nothing of the pain and hunger he was suffering; he had got what he wanted—that was enough.

In a marvellously short time, Angus, without any helper, learned to play his instrument in a way which astonished everybody, especially the schoolmaster, who was himself a bit of an amateur musician, and very fond of the violin. This good man persuaded Angus' father to let the boy continue at school; for he had been taken away to help with the sheep. The schoolmaster not only proffered to receive Angus without fee, but to teach him what he himself knew of the theory of music; and though that was not very much, it seemed a marvellous opening.

Angus had been about a year under the kind tuition of the schoolmaster, when a hunting party, returning from the hills one day, stopped to rest at the schoolhouse. It so happened that Angus was playing at the moment the party knocked at the master's house door; and the style of playing struck one of the gentlemen, who was a professional musician, as exceptionally good. So great was his surprise at finding the player to be a lad, and a peasant to boot, that he was loud in his praises, and emphatic in his prophecies of a great future for him. Before he left, he even hinted to the schoolmaster that there were more unlikely things than that he should send for the boy, and give him all the advantages that a training in London, under the best masters, could afford.

In a weak moment the master mentioned this hazy promise to Angus. The prospect intoxicated him with delight; by day he divided his time by thinking of it, and by playing on his instrument, and by night he dreamed of nothing else but London, and triumphs of musical skill. Two years of hope deferred passed without a word from the great London musician; and Angus, now sixteen years of age, resolved upon taking his fortune into his own hands. He would go to London, find out the musician, and remind him of his promise; and then success would be sure to follow. Remonstrances from parents and well-wishers, instead of shaking his resolution, only served to confirm it. He was determined to search for his promised friend.

At last the eventful day came, when he was to turn his back upon his home and his native hills, and seek his fortune in the great city. Armed with his violin, five solitary shillings, and the great musician's address, and followed by his inseparable companion, a collie dog, which he had reared from puppyhood, Angus set out on foot for the El Dorado of his dreams,—the great lonely city of London.

I have not space to detail the experiences of the memorable journey, full of strangeness and painfulness as they were; suffice it to say, he reached the Metropolis, and lost no time in making his way to the musician's house.

Passing along a West End street one day, a friend of mine observed a lad sitting crouched upon the doorstep of a stately mansion, his head wrapped in a faded tartan plaid, and his breast heaving with sobs. A green baize bag, with the bow of a violin sticking out of it, lay beside him, as if thrown down in disgust; a large collie dog looked with great wistful, pitying eyes at his broken-hearted master. My friend, who is a Scotchman to the tip of his fingers, soon extracted the story of the unkind, not to say brutal rebuff he had received from the once laudatory and prophetic musician. Angus' tale transformed his hearer at once into a good Samaritan. The boy was taken to a comfortable home, and a place was found for him in the city warehouse, where my friend held a responsible situation. Thus it was I came to know Angus, and learned so much of the touching details of his story.

Angus' new friend encouraged him in every way to go on with his beloved art, and rested not until he had found a man who was willing, for a trifle, to give the young musician lessons after business hours. A more unfortunate choice of a teacher could not have been made. True, the man was competent enough as a teacher, but his moral character would not bear investigation. His bad influence upon Angus was not long in becoming apparent. First of all, he would assist his master at music halls of a doubtful character, and then, at the old man's suggestion, he occupied a post in the orchestra of one of the leading London theatres. Over this he had a rupture with the friend who had given him a home, when alone and helpless in London; and the next step was, that he lost his situation in my friend's house of business. The next we heard was, that Angus, to eke out his living, had accepted a post in the orchestra of a large Roman Catholic church, and there he played on Sundays. There was no question about Angus' power over his beloved instrument growing with rapid strides; but, alas! there was equally no doubt about his moral fibre degenerating. There was reason to fear that the serpent of intemperance was tightening its folds about him. He was not a drunkard yet, but we feared for him.

We had lost sight of him for some time, when one day my friend called upon me and said: "I want you to go to St. Bartholomew's Hospital with me to-day. Come, now, put on your hat, and ask no questions until you get there." I obeyed, and never to my dying day shall I forget the scene in that ward that day. Yes, there upon the bed was Angus, white and ghastly with pain and suffering, while his eyes were distended with an agony which was of the soul more than of the body. My friend, enjoining silence upon the sufferer, told me the story. Coming home from the theatre one night, slightly dazed with drink, Angus was thrown down by a hansom cab, and his right arm became so crushed that amputation at the elbow was necessary.

"And I shall never, never play any more," burst out the poor young fellow, the hot tears coursing down his cheeks. "O God, let me die! let me die! I can't live and not play. O, God Almighty! I cannot, I cannot! Oh, let me die!"

Never in all my life have I found it so difficult to soothe and comfort a poor sufferer as it was on that memorable day. Comfort of hope he would have none. We both continued to visit him, and did a little to cheer him, with the assurance that all was not yet lost. But the one to do him the most good was a devoted Presbyterian minister, now in heaven. Through the charmed medium of Angus' mother tongue (Gaelic), the man of God found a way to the sufferer's heart, and led that bleeding, sinning heart to the Saviour.

Angus came out of the hospital a new man. The violin had to be discarded; manual labour was impossible, but he and his friends awoke to the fact that he possessed, in addition to a ready flow of speech, a wonderful richness and melody of voice. After some months spent in training both mind and voice, with which, I am proud to say, I had something to do, he accepted the position offered him by a devoted Christian lady, of Scripture Reader and Evangelist in a certain district of the Highlands. I had the pleasure of meeting him amongst his native hills, and hearing him say that he thanked God for the plucking off of his right arm, for he had thereby entered into life,—a brighter life than he had ever known in the careless past.

THE OBLIGING SKELETON.

By EDWARD BUTLER.

THE difficulties which poverty presents to progress in knowledge may often be overcome by an alert seizure of opportunities. A young man, of whom I have read, furnishes me with an illustration. I do not vouch for the truth of the story; there is room for hesitation in accepting it as authentic; the lesson it conveys may be received freely.

This young man was a student of anatomy, but had not access to a real human skeleton. He heard, however, that in a certain churchyard at night, a skeleton was accustomed to appear to such belated travellers as took the churchyard path. This seemed to offer gratuitous instruction to the impecunious devotee of science. He took a lantern one night and sought the resting-place of the dead, of whom one was so very restless. The skeleton appeared.

"Oh, thank you," said the student; "pray be seated on that horizontal stone—or stand if you prefer it. May I come a little closer? Now I can observe. Your skull seems quite perfect. I note the thorax, formed by the twelve dorsal vertebræ, ribs, and sternum. I think I can see all I want to see of the vertebræ, from cervical to lumbar, without troubling you to turn round. If you would kindly bend down towards me, I could master the relative positions of the frontal bone, parietal and temporal bones, and occipital bone. You lift your right hand to the sky. Very impressive. Please do it again. It enables me to make a study of the humerus, radius, and ulna, and the movement of the humerus in the glenoid cavity. What! must you go? Well, I suppose you have an appointment to keep elsewhere. Would it be too much to ask you to be here to-morrow night at the same hour? I trust that even in your present circumstances of total deprivation, you are able to feel some pleasure in being useful. I do not know whereabouts you feel it, but that is a mere detail. Good-night."

I am sure it is unnecessary to say that that diligent young man was well rewarded for stopping up late at night, though early hours are the most healthy. Need I assure any of my readers that he rose to a high rank in his profession? and though he lived to have many skeletons of his own (in cupboards), yet he always gratefully remembered the service rendered to him in his youth by this peripatetic inhabitant of the old churchyard; and it was always understood that these kindly feelings were reciprocated by the midnight wanderer.

Young men! seize your opportunities of acquiring knowledge, and let no false delicacy stand in your way.

Nothing to do.—When time hangs heavy on our hands, it is a sign of either mental, moral, or physical malady. To have nothing to do implies blindness on our part, or wilful ignorance of our responsibilities.

Motives.—We may be thankful that our motives are not visible to our fellows, or else the edge of much-admired actions would often be taken off; but He that searcheth the heart knoweth all about them.

Brooding.—To brood over misfortune, or to dwell on an ailment, is the sure way to increase it. The best remedy for all trouble is to get out of ourselves. Occupy the mind and heart with something else.

No man can be provident of his time who is not provident in regard to his companions.

"£100 COMPETITION."

£1. 1s. IN PRIZES.

HAVING already announced two of our special Christmas series of Competitions, in which Prizes to the amount of £5 5s. are offered, we should like this week to test our readers' perceptions of the value of money, and their ideas as to the best way of making it. We leave them perfectly free to imagine any circumstances or surroundings they please; we shall base our rewards on the grounds of practical common sense.

We offer a

First Prize of 10s. 6d.,
and Two Second Prizes of 5s. each,

for the two best paragraphs on—

1. How to *make* £100.
2. How to *spend* £100.

RULES.

1. Each paragraph must not exceed 1,000 words in length.
2. Each competitor must write a paragraph on *both* the above subjects.
3. The paragraphs must be fastened together, and must bear name and *full address* of competitor.
4. The work must be wholly original.
5. No MSS. can be returned.
6. Competitors may ask questions (stamped envelope for reply), but we ask that needless questions may be avoided.

The Competition (open to all) will close on February 4th, on or before which date all MSS., marked outside "£100 Competition," must be sent to the Office of —"A. 1.,"—
62, Ludgate Hill, London, E.C.

OUTLINE OF INTERNATIONAL SUNDAY SCHOOL LESSON.

JANUARY 8TH.

THE MULTITUDE FED.—*Matthew* 14. 13–21.

GOLDEN TEXT: "I am the Bread of Life.—*John* 6. 35.

THIS lesson a contrast to last Sunday's. A sunny scene. The *only* miracle recorded by all four Evangelists. Closely connected with previous lesson. John's disciples come and tell their sorrow to the One we love to call the MASTER.

He was *sorrowful;* the news would be sure to cause Him grief, and make the thoughts of His own death press heavily upon Him.

He was *weary* (see Mark 6. 31). The incessant mental strain was telling upon His body.

He was *compassionate.* Did not leave His disciples to work while He rested. "Come *ye yourselves*, and rest awhile." "And when He saw the people, He had *compassion*" (Mark 6. 34). Did not simply mean "mouth-mercy," but compassion shown in deed.

He was *ever ready* to help. The interrupted leisure was used to the best of His powers in teaching and healing. Not one hint of Christ ever being annoyed by people thwarting His plans, and never too tired to work for His Father.

How *surprised* must He have been, considering Him only in His humanity, when He came out from the cabin of the boat in which they had crossed the little inland sea, to see, waiting His arrival, the MULTITUDE.

They were so *anxious* to hear Him, that when they missed Him, and saw one of His friends' little boats out on the water, those that had boats followed; others *ran* round by the land so fast, they got there first. Those that had sick friends bore them along as best they could. Some were on their way to attend Passover at Jerusalem. When the heart wants to find Jesus, it will surely find a way to get at Him.

How dear to them ever afterwards would be the MEETING-PLACE—a Bethel, a place where Memory would erect many an Ebenezer stone. Matthew calls it a "desert place," or uninhabited; John, "a mountain"; Luke, "belonging to the city called Bethsaida." Says Dr. Morrison: "At the south-east corner of the plain of Bethsaida, there is just such a desert place as will accord with all the circumstances of the evangelist's narrative." "The mountain," says Dr. Thomson, in his "Land and Book," "shuts down upon the lake bleak and barren. It was doubtless desert then, as now, for it is not capable of cultivation." Both Mark and John tell us there was grass growing, and at the southern base is a spot which would form a splendid dining-ground.

"On this beautiful sward," continues Dr. Thomson, writing from the spot, "at the base of the rocky hill, the people were seated to receive from the hands of the Son of God the miraculous bread."

There occurred the MIRACLE.

Night began to throw its shadows over the scene. People hungry. Disciples advise they be sent away. Christ's command: "Give ye them to eat." How could they? It would cost over seven pounds to buy such a multitude bread! For illustration, see 2 Kings 4. 43. A lad followed the crowd out of curiosity. Thoughtful mother had supplied him with five thin barley cakes, food which Romans despised, and two small salted fish, something like sardines. He tells Philip of his little hoard. Philip tells Jesus. Jesus *took it, gave thanks* (see Acts 27. 55), *blessed* it, and *broke it*, standing in the midst. All eyes fixed on Him. Like the meal in the barrel, the loaves and fishes never grew smaller. Then began the MEAL.

Commanded to sit down, that none—especially the children—might be overlooked. In fifties. Christ, the God of order. Picture the hungry people eating, but still looking at the holy hands of Christ.

"There is no end to the loaves and fishes yet," they whisper to each other in awe-struck voices.

The wonderful story the boy who gave the loaves and fishes would tell his mother at night. How she would hardly believe it, till neighbours corroborated his tale! How she would ever think of the wonderful fate of those loaves every time she baked her bread!

"Gather up the fragments." Christ an economist. "Twelve baskets full." Each disciple had a basket. More than what they started with. Now for the MEANING of it all.

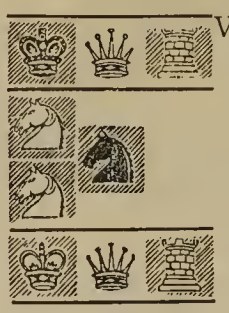
With God all things are possible.
Thy God will supply all thy need.
Every meal is a miracle.
Christ will take our smallest gifts, and make of them great blessings.
We receive in order to give.
Christ is the Bread of life.

C. C. SKINNER.

FURTHER NOTES,
By REV. J. H. THORPE, M.A.

The Lessons to be drawn cluster round three centres.

OUR LORD "went into a desert place." St. Matthew connects this with the death of John the Baptist. Jesus desired retirement; perhaps His spirit was sad at the cruel treatment of His forerunner. See here the love and tenderness of Christ for all His servants. (2.) Note *the patience and gentleness of Christ.* He desired retirement; but yet, when the multitudes came, not a word of complaint or impatience (see St. John's account in R.V.: "He welcomed them." Learn, Jesus is willing to hear and bless at all times. Remember, Jesus never sent one seeker away. (3.) Note the *thoughtfulness of Christ.* Who first suggested food for the crowd (see John 6. 5)? Jesus, not His disciples. He knows our necessities before we ask. "In due time Christ died for the ungodly." Why did He order the men to sit down in companies? That there might be no confusion, and so the women and children would not be overlooked in the crush. Christ never forgets the weakest who trust Him. (4.) Note the *use Christ makes of difficulties.* Why did He ask Philip the question? (See St. John). "He Himself knew what He would do," but He wanted to lead Philip to think of His power. Difficulties are sent us to send us to God for power. Our difficulties are God's opportunities. (5.) Note the *character of His blessings.* "Did eat and were filled." Jesus can "satisfy us with good things."



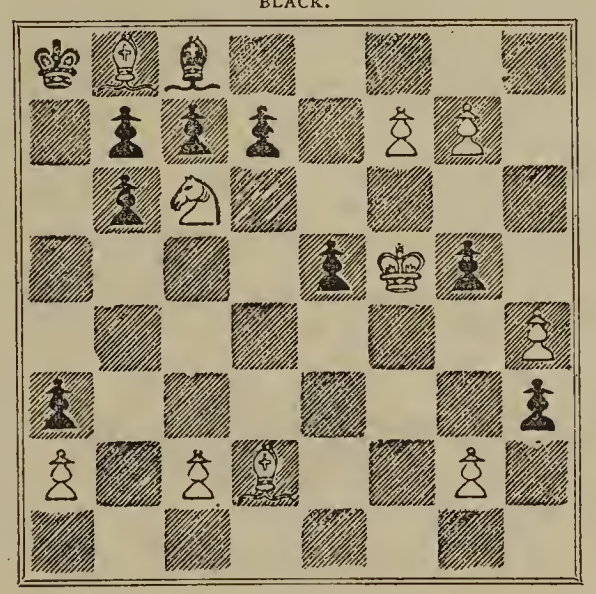
THE DISCIPLES. (1.) Note their *forgetfulness* (*v.* 17). They thought what food they had, too little. Had they not forgotten Cana of Galilee, and the water turned into wine? (2.) *What they learned* (*v.* 18). "Bring them hither to Me." Their small abilities, brought under the power of Christ, became able to do what was needed. Antigonus heard two of his soldiers conversing the night before a battle, and comparing their small numbers with the host of the enemy, when he rushed in and shouted, "But how many do *I* count for?" Where God is, there is the power, the success, the majority.

THE MULTITUDE. (1.) Note, "*their* sick." See the wealth of suggestion in the pronoun. Their sick brought them to Jesus, and so they received a blessing for themselves. See how much of loving ministry is in the word. (2.) Note in their case we have a fulfilment of Matt. 6. 33. They sought Jesus for their own sake, their friends' sake, and to hear Him; they thought not of provisions, but it was "added unto them," according to their need.

CHESS.

By F. F. ROWLAND.

PART V.



EVERYTHING depends on the careful observance of the laws of the game, which we give as established at a meeting of the British Chess Association, held during the International Chess Congress, London, 1862.

I. THE CHESS-BOARD.—The board must be so placed during play, that each combatant has a white square in his right-hand corner. If, during the progress of a game, either player discovers that the board has been improperly placed, he may insist on its being adjusted.

II. THE CHESSMEN.—If, at any time in the course of a game, it is found that the men were not properly placed, or that one or more of them were omitted at the beginning, the game in question must be annulled. If at any time it is discovered that a man has been dropped off the board, and moves have been made during its absence, such moves shall be retracted and the man restored. If the players cannot agree as to the square on which it should be replaced, the game must be annulled.

POSITION ILLUSTRATING LAW V.

Black has made two moves in succession. What was the latter of these moves? When found, retract it; and say in how many moves can White effect mate.

III. RIGHT OF MOVE AND CHOICE OF COLOUR.—The right of making the first move, and (if either player require it) of choosing the colour, which shall be retained throughout the sitting, must be decided by lot. In any series of games between the same players at one sitting, each shall have the first move alternately in all the games, whether won or drawn. In an annulled game, the player who had the first move in that game shall move first in the next.

IV. BEGINNING OUT OF TURN.—If a player make the first move in a game, when it is not his turn to do so, the game must be annulled, if the error has been noticed before both players have completed the fourth move. After four moves on each side have been made, the game must be played out as it stands.

V. PLAYING TWO MOVES IN SUCCESSION.—If, in the course of a game, a player move a man when it is not his turn to play, he must retract the said move; and after his adversary has moved, must play the man wrongly moved, if it can be legally played.

VI. TOUCH AND MOVE.—A player must never touch any of the men, except when it is his turn to play, or except when he touches a man for the purpose of adjusting it; in which latter case, he must, before touching it, say: "I adjust," or words to that effect. A player who touches with his hand (except accidentally) one of his own men when it is his turn to play, must move it, if it can be legally moved, unless, before touching it, he say, "I adjust," as above; and a player who touches one of his adversary's men, under the same conditions, must take it, if he can legally do so. If, in either case, the move cannot be legally made, the offender must move his king; but in the event of the king having no legal move, there shall be no penalty. If a player hold a man in his hand, undecided on which square to play it, his adversary may require him to replace it until he has decided on its destination; that man, however, must be moved. If a player, when it is his turn to play, touch with his hand (except accidentally or in castling) more than one of his own men, he must play any one of them legally movable that his opponent selects. If, under the same circumstances, he touches two or more of his adversary's men, he must capture whichever of them his antagonist chooses, provided it can be legally taken. If it happen that none of the men so touched can be moved or captured, the offender must move his king; but if the king cannot be legally moved, there shall be no penalty.

VII. FALSE MOVES AND ILLEGAL MOVES.—If a player make a false move—that is, either by playing a man of his own to a square to which it cannot be legally moved, or by capturing an adverse man by a move which cannot be legally made—he must, at the choice of his opponent, and according to the case, either move his own man legally, capture the man legally, or move any other man legally movable. If, in the course of a game, an illegality be discovered (not involving a king being in check), and the move on which it was committed has been replied to, and not more than four moves on each side have been made subsequently, all these latter moves, including that on which the illegality was committed, must be retracted. If more than four moves on each side have been made, the game must be played out.

MORAL CYPHERS.

HAVE you ever noticed the position a "cypher" takes in arithmetic? There it stands by itself, of no value and significance. It is naught pounds, shillings, or pence; just one round figure "0" and nothing more; a mere cypher. Are there not a great many people like cyphers, filling up space, without power, value, or influence?

To such we say, "Be something." Take king David's advice to his son Solomon:—"Be courageous, and show yourself a man." Don't let life be a blank, your days spent in idleness, with no record in life's diary for you; but be, do, feel, and think. No longer be a round "0," but have a figure before it, and be ten, one hundred, one thousand.

A STYLISH COACH; OR, MY GRANDMOTHER'S ADVENTURE.

LET me tell you what my grandmother once told us. She was one of the most lively story-tellers I ever met with. As we sat round the fire on winter evenings, she would often amuse a large admiring audience with tales of what had befallen her when she was young. But I think the most laughable of her little adventures took place when she was a somewhat portly, middle-aged matron.

"One bright July, girls," she said, "about thirty years ago, the town where your grandfather and I were then living, was in a state of great excitement over the coming marriage of our good Member's daughter with the eldest son of a noble duke, who lived only fifteen miles away. Great festivities were to be held, and we, in common with the other tenants of the bride's father, were presented with tickets of admission to the grand old abbey church, where the ceremony was to be performed. Wednesday was the wedding-day, and on the previous Monday I suddenly determined to make a trip to a village several miles distant, to see a valued servant, who had gone to stay with her parents for a change of air.

"Accordingly, on Tuesday morning, off I started by coach, for railroads were then unknown. I paid my visit, but, in returning, I managed, to my great chagrin, to miss the last coach, and was obliged to spend the night at Mary's cottage. I was somewhat consoled, however, by hearing that it would be quite possible for me to reach home in good time for the wedding next morning. Determined not to be again left behind, I started very early to cross some fields which led to the high-road. What was my consternation, before I had got half-way, to see the coach coming along at full speed! If I kept to the path, I knew I should never be in time to attract the guard's attention, so, tucking up my gown, and frantically waving my umbrella, I rushed across a field, calling: 'Stop, stop!' I must have been anything but dignified; but what cared I, so long as I caught the coach? At last, some of the passengers saw me; they certainly could not have heard me for the noise of horns and trumpets they kept up. I could only afford an outside fare, so, though somewhat disconcerted to find that all my fellow-travellers were gentlemen, I was bravely preparing to mount to the top of the vehicle, when a young gentleman, who had politely dismounted on perceiving my approach, opened the door with a flourish, and, bowing low, begged to be allowed to help me in, at the same time remarking that the price for inside and outside passengers was precisely the same. Congratulating myself on my good fortune, I stepped into the coach.

"Away dashed the horses, and louder grew the noise of laughing and trumpeting. We stopped nowhere; but as we passed through the villages, people rushed out to see us go by, and to bob and curtsey respectfully to the distinguished lady inside. At last, as we drew near the city, I began to wish that my lively friends would behave themselves in a more seemly manner, if only out of consideration for my feelings. But no—instead of being quieter, they seemed bent on attracting all the attention possible. We drove down the principal street, the horses galloping, the people cheering and hurrahing, and craning their necks to get a glimpse of the lady who was being driven about in such style. We passed the office where I ought to have been set down, madly dashing up one thoroughfare only to turn down another, till I was nearly frantic. At last I put my head out of the window, and tried to attract their attention, first by shouting, and then by thumping with my umbrella; but they either could not or would not hear, and on we went, until, to my horror and surprise, we drew up at the Member's house, which was gay with the wedding decorations. Footmen rushed forward to open the door, and to assist me to dismount; but the young gentleman himself interposed, and I had to alight before the wondering gaze of a large party of gaily dressed ladies and gentlemen, who had come into the hall to welcome the occupants of the coach. 'Sir,' I exclaimed, in great confusion, 'why did you not tell me of my mistake?' 'Madam,' he returned, 'we feel much honoured to have been able to assist you. The Duke wishes me to ask what refreshment you will take before going further?'

"You may be sure I hurried away from the eager throng, who were busy quizzing the lady who had arrived with the bridegroom and his friends. How your grandfather laughed when he heard how I had actually mistaken the duke's coach for the regular stage! And he would have it that the young gentlemen had driven me about out of pure fun and wickedness; and I privately thought it extremely likely. Notwithstanding my exciting drive, I went to see the wedding; and a very pretty sight it was, and very happy looked the little bride and her frolicsome bridegroom, who turned out to be, after all, 'the best of husbands.'"

"UNION IS STRENGTH"; OR, ANTS AND THEIR ANTICS.

SOME of the most clever, persevering little insects are certainly the tiny *Formicæ* or Ants. Let me tell you two stories respecting them which are perfectly true, for they were witnessed by two gentlemen, chaplains in the Navy, who were on board H.M.S. *London* and H.M.S. *Tartar*, where the following occurred.

Ships are often infested with these little insects; and many find it most interesting to beguile the time by watching their habits. Their regularity and order is quite marvellous; and the patience and perseverance with which they set about their work deserves success. So much for introduction, and now for the story.

On board H.M.S. *London* there was a skylight, not often opened, above the wardroom, let into the deck, and a spider had fastened his web securely all round the sash, completely covering the glass. In the centre of his fairy-like home he had carefully placed a collection of Cockroaches' eggs, on which he intended to feast when he felt disposed; but, alas! for his hopes. One day a little ant espied these dainty delicacies, and longed to have a taste. It communicated this desire to its comrades, and awoke in their minds an ardent longing to become possessed of the contents of the spider's larder; for the one thing they loved was the egg of a cockroach. Spider and ants being on anything but friendly terms, they deemed "all is fair in love and war," and therefore one morning, from all parts of the woodwork appeared advanced guards of ants; more followed, and on all uniting, they divided into parties and surrounded the web in order to cut the threads which connected it with the sash. At a given signal they all commenced biting them, greatly to the dismay of the spider, who, seeing himself thus encompassed by enemies, ran from side to side of the web, trying to glue the threads again to the sash. However, all his efforts proved unavailing. Numbers gained the day; and the web having been separated from the sash, fell on to the glass. But the ants could not yet attain their hearts' desire, for they could not cross the web to reach the eggs which they beheld in the distance; and so, with the utmost precision, the clever little things began to roll it up! Frantically the spider, who saw its last hopes crushed, tried to spread terror and confusion amongst the ranks of the enemy by darting every now and then on an invader, and killing it by rolling it in the web. But it was all of no avail—as soon as one was seized, another took its place, and at last the unlucky spider, convinced that "discretion is the better part of valour," determined to evacuate his long-defended fortress, and, charging through his relentless foes, he escaped, leaving the victorious ants to regale themselves on the feast they had so cleverly concontrived to obtain.

The other little incident took place in a small crevice, inside a port-hole where an unfortunate cockroach had got jammed up, so to speak, and could not get free. Now ants are almost as fond of cockroaches as of their eggs, and information that one of their prey was thus in durance vile, spread among the ants who inhabited the framework surrounding the port. Great excitement ensued, and it was determined to try to take him prisoner. So, silently, quietly, there issued from their quarters a band of ants. They advanced to where the poor cockroach, unsuspicious of the sad fate in store for him, was drowsily dreaming—if a cockroach can dream—the hours away, and immediately arranged themselves in order of attack.

With stern determination they entered the crevice, and flung themselves upon the foe. First—for they were afraid that perchance it might escape them by using its wings — they began literally and deliberately to eat it up, bit by bit! One wing was demolished; then the other. With the courage of a martyr the cockroach tried to defend himself; but he was cramped and hindered by the narrow space he was confined in. The ants continued, unmoved, their cruel work. They nibbled off his feet, and then his legs, till it might be said of him—"And when his legs were smitten off, he fought upon his stumps." Poor cockroach! He prepared to die—and when, after finishing their piecemeal operation, the ants, gathering their forces together with almost superhuman effort, lifted all that was left of him, and carried him off to their headquarters, he expired, feeling that fate had been very cruel to him. Though one cannot help admiring the cleverness and patience exhibited by these ants, one cannot refrain from pitying the poor victim, who suffered such a slow, torturing death.

"OONALASKA:" A TALE OF A FAR NORTH LAND.

By GORDON STABLES, C.M., M.D., R.N.,
Author of "The Cruise of the 'Snowbird,'" "Thirteen Hundred Miles in My Caravan," "From Pole to Pole," etc., etc.

"'Hullo!' he cried, as he now noticed a figure creeping towards him along the bridge."

CHAPTER XV.

"BLOW HIGH, BLOW LOW."

WHATEVER may be the feelings of the passengers of a ship starting on a long voyage, in a short time all calm and tone down, and life moves on with regularity; and regularity that, if individuals had not within themselves the resources of enjoyment, would become monotonous.

In little over a week, things had quite settled down on board the *Oonalaska*. Everything was ship-shape, and routine reigned supreme. The very dogs, called Great Danes, under the supervision of Boy Bates, knew

their way about, and if anything unusual occurred,—a whale in sight, for instance, a shoal of porpoises, or a shark, they mounted the bridge with everybody else, or stood up against the bulwarks and barked so loud and fiercely, that it was evident they considered themselves part and parcel of the ship's defence.

Right abaft the saloon, and with two great windows overlooking the sea, was the captain's private snuggery; the other cabins were off the saloon, and two were forward in what was called the half-deck. Although a door led from the captain's quarters into the saloon, this was mostly kept shut, because a private winding staircase had been devised at the suggestion of Jack Silk; and a great convenience this was found to be, the officer of the watch being thus enabled to communicate at any time with Captain Boyd, without going through the saloon and disturbing the passengers.

And what a snug little snuggery it was, to be sure! Katie Graves spoke of it as though it had been the last thing out in new bonnets, and called it "a love of a room."

As the ship was now steered north by west, the weather before long got cold enough, early Summer though it was, to make a bit of fire in the stoves seem not out of place after sundown. The captain's stove always looked extra comfortable in the evenings; so Katie thought, when occasionally she was permitted to come there, and read a book beside it. You see it was of polished brass, with a large coffee urn, also of brass, over it, and the steward took pains to keep both as bright as a watch; then there was an easy chair, with a nicely cushioned and softly upholstered couch, and a great lamp with a coloured shade depending from the roof, and bear-skins or goat-skins everywhere, to say nothing of a bookcase and a small piano. But discipline was so far kept up that not even Katie Graves herself, entered the snuggery without first knocking and asking leave. One individual only had free run of the place, going and coming just as it suited him, and this was Robin Hood, one of the Great Danes. The other dog lived forward, and as often as not, shared his bed with Boy Bates. But Robin greatly appreciated the comforts of a bear-skin, and as soon as the dinner-bell rang, he used to find his way down the private staircase—generally tumbling down the last three or four steps—and curl up in a corner, where he was sure of a nap till dinner was done.

As the quarter-deck dog was called Robin Hood, it stood to reason that his companion and canine shipmate should be known by the name of Little John. Not that there was a deal of difference in their height; apart, you could hardly have told them one from the other, but when standing cheek-by-jowl, Robin had it. Tremendous in strength, and fully thirty inches and two at the shoulder, slate-grey all over, even to the bright little funny eyes, these splendid creatures lived in the greatest amity, and in the matter of bones even, respected each other's property.

But Little John never came to the captain's quarters unless he thought it was time for a romp; then he would stand at the companion and give one loud bark, which went rolling all over the ship from stem to stern. And if Robin Hood was not most particularly engaged indeed, discussing the remains of a cold fowl, for instance, he never failed to respond to that signal. Up he would rush. Then the fun began. With their little pricked ears laid back on their necks, and a grin of merriment on each of their faces, round and round the decks they would fly, engaging every now and then in mimic warfare, that looked terribly real while it lasted, until they were completely done, when, with red ribbons of tongues lolling out, they would lie down and look at each other, till both fell fast asleep.

When Robin and John were having a bit of fun, it was no joke to cross their hawse; whoever did, went rolling to the deck, and was more cautious ever after.

Yet, on ordinary occasions, two more sedate-looking members of the canine race could scarcely be conceived. Behold them there, for example, walking with slow and almost solemn steps, behind Captain Boyd and Nat Graves, senior, whom in future we shall call Nathaniel.

Whenever the men wheel, the dogs wheel, and it would scarcely be difficult to believe that they were listening. The conversation had been earnest enough, at all events. Both men were smoking, for it was the evening of a lovely day, and dinner had been discussed a good hour ago.

There was a merry party in the saloon, evidently; Miss Graves was seated at the piano, and up through the skylight came the rolling tones of Jack Silk's voice. He was singing his one song.

"Blow high, blow low, let tempests tear
The mainmast by the board,
My heart with thoughts of thee, my dear,
And love well stored,
Shall brave all danger, scorn all fear—
The roaring winds and raging sea,—
In hopes on shore
To be once more
Safe moored with thee.
Aloft, while mountains high we go,
The whistling winds that send along,
And surges roaring all below,
Shall my signal be,
To think of thee,
And this shall be my song—
Blow high, blow low."

"Well, Mr. Graves," said Captain Boyd, quietly breaking in upon the company, "you seem to rule my fate this voyage, or it seems you want to; come below anyhow, and have a peep at the chart, and I'll tell you more."

Below they went. Little John trotted off forward, and Robin Hood dived after Captain Boyd; it really was a dive, because he went head first, and tumbled down the last four steps, as usual; I do not believe he would have been happy had he not done so.

"Sit down, my friend. Now then, here is the chart of the Arctic regions, including Alaska and Kamschatka too."

"A glorious chart of a glorious country," said Nathaniel.

"You've been there?"

"Never."

"Well, let me tell you that all the glory you'll get in the Arctic will be hardly earned."

"There is a glory and a mystery about it, nevertheless; a mystery many and many a good and brave life has been laid down to solve."

"A mystery, Mr. Graves, neither you nor I shall seek to solve this cruise."

"One day the stars and stripes will float *there*."

He put his finger on the Pole as he spoke.

"We won't object a bit," said Boyd, laughing, "because the Union Jack will have been hoisted on the same spot years before."

"A noble rivalry between the two noblest nations in the world."

"Well now, as I was telling you on deck, the boys and myself have come round here on a bit of a speculation. Seals are played out; whales are nowhere; so we thought we would go in for a little fur-hunting and a little exploring at one and the same time: run up through the Aleutian Islands, visit Kamschatka, sail up some of the great Alaska rivers and back again, and——"

"And home, eh?"

"Yes; with a good paying cargo of sea-otter skins."

"But, my dear sir, Alaska doesn't belong to the British."

"It doesn't belong to the Yankees."

"No; but it soon will. Meanwhile, it is the land of the Czar of all the Russias."

"Ah! my dear sir, we don't mind that much; we will go farther north than Russia ever showed a face. Yes, sir; the boys and I have it all cut and dry, Mr. Graves."

"Well, I'm with you, heart and soul; only my plan, I think, bids fair to give you all the hunting you're likely to want, and to give me the opportunity I have long wished for—that of seeing this far north land.

"See here," he continued, "on this chart is Behring Sea; we pass over that, through the Straits of Behring, and, turning east, we skirt the northern shores of Alaska. On our way we can do both hunting and exploring. It is a wondrous land,—so travellers have told me."

"Travellers do tell tales. Then you would return?"

"Nay, Captain Boyd; my ambition does not end here. I would bear north still, north and east to Banks Land. There it lies. Then east through Banks Straits to Melville Sound, or through Lancaster Tower to Baffin's Sea; south now through Davis Straits into the broad Atlantic, and so *home*."

"With good luck, and an open summer, it might be done, Mr. Graves; but would you care to lead your sister——"

"Oh, sir, she would glory in it. You don't know Mary yet; she would be wild with delight if the subject were only broached in her presence."

Captain Boyd was silent. He knew the risk was very great. He was wavering. He got up presently, and took a turn or two across the floor; then he stopped in front of Nathaniel.

"Put into plain business English," he said, smiling, "you want to charter the ship. Well, the boys and I came out on speculation, and if we secure success, it doesn't matter a pin-head where the success comes from. That is my idea."

"Spoken like a man!"

"Well, I'm willing, if the boys are. Let us send for them."

"Honolulu!" cried Jack, when he heard of the project; "a better plan couldn't be conceived. Mr. Graves, you are a brick. Now, Dess, what do you say? and you, Godfrey?"

"I give in my adhesion at once," said Desmond.

Godfrey smiled, and simply nodded.

He was thinking, somewhat sadly, that it mattered but little to him where his future home should be. To England again, he never meant to return.

"Now, you fellows, just sit here and yarn, will you? I shall go and break the news to the ladies; besides, 'mother' is going to teach me a new song. She's going to complete my musical education, old 'mother' is. 'Blow high, blow low——'"

And away went Jack Silk, singing to himself.

It did blow high and blow low too, though, before morning, and poor Jack had to keep the middle watch with oilskins and a sou'-

wester on—the latter tied under his chin—and a battered old speaking-trumpet in his hand, to shout orders through.

Jack Silk got in all the sail he could, and close-reefed the rest ; and as she was all but dead before the wind, she clove through the water like a thunderbolt, shipping big seas that nearly drowned the binnacle lamp.

"Blow high, blow low !" Yes, it was a dirty night ; and though, away behind those murky blankets of clouds, there was a morsel of a moon, it gave no show, any glimmering of light there was, coming from the froth of the breaking waves, that careered after the good ship like wild horses.

Sometimes, as if to vary the play of the storm, there came quick, vivid flashes of lightning, followed by rr—rr—rr—rattling peals of thunder, and accompanied by hail, that cut across the men's bare hands and faces like whip-thongs.

"Blow high, blow low!" How the wind did roar, to be sure. The masts must have been bending like fishing-rods, only nobody could see them, and the waves were flying over the funnel and washing the main-top. Jack staggered to the binnacle ; he could hardly see how her head was, for the glass was sadly dimmed, and his eyes felt sticky with the salt water.

"Keep her as she goes."

"Aye, aye, sir."

"Another hand to the wheel." This command was shouted through the trumpet. It was obeyed almost at once.

Crack—rack—rack—rr—rr—rr. A sail had gone.

Matters were getting more serious.

"Blow high, blow low !" The noise was indescribable,—incessant.

"I might have laid to," Jack thought. "Now if the rest of the sails should go ! But it isn't *very* likely. Only—the ladies !"

Jack Silk waited a moment till a big sea went curling over him, then—

"Now for it," he said to himself. "I'll be on the bridge before the next comes."

So he was.

"Below there !" he shouted through the tube.

"All right, sir."

"Can you get up steam soon ?"

"In half an hour. Sooner, perhaps."

"Bravo, McPherson ! *Sooner*, if you can."

"Jock," cried the engineer to his assistant, "licht the fires. Haven't you got a pound or twa o' bacon, gey an' fat ?"

"Lots of it."

"Stick it in, then, for it's an awfu' nicht. The sooner steam's up the better. My wife'll no be a weedow if I can help it."

"Blow high, blow low!" Yes, but what was happening now? There had come no lull in the storm, the wind still went shrieking and tearing through the rigging, but to a large extent there was a sudden cessation of motion, and the waves no longer broke over the ship, or beat against her sides. Had some mighty magician stretched his wand over the troubled, tempest-tossed ocean, or what had happened?

Jack Silk gazed around him in astonishment, not unmixed with a feeling of awe. The moon at the same moment broke through a rift in the clouds. Far behind was the raging, boiling sea, but to starboard and port and away ahead was nothing but a heaving sheet of leaden grey.

The mystery was easily explained. The vessel had entered upon a vast stream of slush or partly melted snow. Jack remembered having read of something of the kind, and he took speedy advantage of it.

"Away aloft," he shouted. "Clew that rattling sail."

A few of the hardiest fellows on board, men who had been in the *Oonalaska* before in Arctic regions, and in many an Arctic storm, sprang speedily into the rigging, and tough though the job was—some of the oldest sailors amongst them turning giddy and squeamish with the awful heaving—the canvas was soon made fast and secure.

The sky was clearing, and the smoke was now rolling in round black clouds over the funnel, cut clean off by the wind, however, as it issued, and carried away ahead over the grey snow-clad sea, and Jack Silk heaved a sigh of relief.

"Hullo !" he cried, as he now noticed a little figure creeping towards him along the bridge, guiding itself by the life-lines.

It looked like a sprite, and not a pretty one either.

"Honolulu ! what or who is it ?"

Jack Silk, like most seafarers, was just a trifle superstitious.

"Don't be afeared, sir," said the sprite, creeping nearer, "it's only me, sir. Boy Bates, sir, as ever was."

"And what on earth are you doing here, boy ?"

"W'y, nuffin much, sir ; I brought yer this 'ere drop o' 'ot coffee in a bottle, sir."

"Thank ye, my lad ; did—a—did anybody send you on this message ?"

"No, sir ; honour, no, I 'opes no offence, sir, but bless yer, sir, I knows wot it is to be hout o' nights, hunder a harch maybe, or all along on a door-step, rainin' and blowin' like Billy-O, and the bobbie a chivyin' of ye hevery arf-hour."

"Well, Bates, you're a good lad, and I won't forget you."

"Oh ! I 'opes yer will forget, sir. Don't make hany bones about a drop o' coffee. I didn't do it for that, sir."

"Is it your watch ?"

"'Es, sir."

"Well, go and turn in ; you're wet to the skin."

"Please, sir, which I'd rayther not."

"Why not, lad ?"

"'Cause, sir, I don't want my mates to come for to go for to call me a duffer. That's 'ow, sir."

"Then do as you like, my boy."

"That's better, sir. Done wi' the bottle ? Thank 'ee. Good-night, sir."

And away went this young cockney sailor, to weather out the storm.

In less than half an hour steam was up. No fear of pooping now.

Towards the end of his watch, Jack Silk crept down below into the captain's snuggery. There was a light burning there, and in his glittering wet oilskins this young sailor looked a very uncanny spectre indeed. Robin Hood knew him, and wagged him a welcome with his monstrous tail.

Jack went to the state room, and cautiously drawing back the curtain, peeped in and said, "Ahem !"

"I'm not asleep, Mr. Silk."

"All right, sir ; I didn't want to disturb you, only I thought I might just tell you that there is no danger *now*."

"Thank you very much, Mr. Silk. You've got up steam, and quite right too."

"Well sir, we carried away a good bit of the canvas. We hadn't much more than a close reefed foresail to get along with, and if that had gone, we might have broached to."

"Ah ! well," said Captain Boyd, "I knew *you* were on deck, Mr. Silk, so I was easy."

"Thank you, sir."

"And now, Jack"—note that Captain Boyd called him *Jack* now, for duty was over—"now Jack, lad, have a drop of coffee. Any ice about ?"

"No ; only that field of slush stuff."

"We'll have plenty of that ere long. Now go and turn in. You can sleep, I suppose ?"

"Sleep, sir ! rather," Jack said. "Good-night," and went away laughing. He found Desmond already on deck.

"Keep a look-out for squalls, Dess, old man, and I shouldn't wonder if there were stray bits of ice about. So just keep your weather-eye skinned."

But no more of ice was either seen or felt. Next morning at breakfast all the talk was about the wonderful snow stream.

"I felt it," said Miss Graves ; "the strange sensation woke me. It seemed unaccountable, and for a time I thought I must be dreaming. There was the dismal wind still howling through the shrouds—don't you call them shrouds, Jack Silk ?"

"We call certain bits of the rigging shrouds, mother. You're quite right."

"Well, it is a ghostly sort of a name at best, but I heard the wind, and now and then I heard your voice, Jack, but the sea appeared as calm as if a thousand barrels of oil had been spilled on it, and motion itself appeared to have ceased. It was dreadful."

"Oh !" cried Katie enthusiastically, "I should have liked to have been on deck, and seen this wonderful snow stream."

Jack laughed, but hastened to say,—

"There wasn't much to be seen, Miss Katie, only just for a moment or two, when the moon got an oar in, then it was a queer sight enough. The waves were houses high, but they were muffled and draped in dismal grey, only where the light lay on them, and those parts like—like——"

Jack was feeling around for a simile.

He pulled a big silver chronometer watch out of his pocket at last, and turned the back of it to Katie—

"Like that, Miss Katie," he said. "Steward, I'll have another red herring."

Every one laughed, but Jack Silk did not mind that. Poetry was not his strong point.

"But," said Nathaniel Graves, "is it not somewhat strange to meet ice so far south, Captain Boyd, at this season ? We are hardly yet abreast of Kamschatka."

"There is nothing certain at sea, Mr. Graves, but the unexpected. And when I am sailing north, I make up my mind not to be astonished at anything. True, however, though stray icebergs are often seen here,—runaways from the far north, that soon disappear when they meet the warmer waters that swish round from the shores of the seas of Japan,—to fall in with a snow stream is very unusual."

"How is such a stream formed?" asked Katie.

"In this way, Miss Graves. A large portion of the sea near the land gets frozen over in early spring. The ice may be a foot or eighteen inches thick, but it is called bay-ice. Well, secondly, snow falls ; and thirdly, a storm or a heavy swell comes in, and breaks it up, and away it goes afloat. This same stream we have come through may have come from a thousand miles to the nor'ard, and it betokens heavy ice beyond the Arctic circle."

"'Coming events cast their shadows before,'" added Miss Graves.

Captain Boyd looked at her with a quick, subdued smile on his face, then went on with his breakfast.

(*To be continued.*)

RECREATION.

By MAJOR SETON CHURCHILL,
Author of "Stepping Stones," etc.

IT is an important thing to instil into the minds of young people that there is a great difference between worldliness and lawful recreation. There are plenty of very worldly-minded people who are what young fellows call "duffers" at all games, and on the other hand there are many who can hold their own at sports of all kinds, who are, nevertheless, *not* worldlings. Dr. Culross says with truth that "Life will not be less earnest and solemn to us, or less full of glorious purpose, nor will God's love be less the joy of our hearts, that we have our seasons of innocent and healthful recreation." It is well for young people to clearly distinguish between that which is injurious to their spiritual life, and that which helps to develop physical health and strength.

The former they should carefully avoid and the latter they should cultivate vigorously. From not clearly understanding this subject, some young people take their pleasures in a very dull way, as they are not quite sure whether or not they are doing right in going in for games. Now, it is one thing to live for pleasure, but something quite different to utilise pleasure as a means to an end. There is nothing so sad as to see young men and women growing up with no higher object in life than the search after pleasure. Recreation thus abused brings its own penalty, for, strange as it may sound to say so, mere pleasure-seekers are seldom, if ever, happy. Pleasure should never be made the object of life, as she is coy, and recoils from those who woo her too vigorously. The happiest are those who have higher objects in life than to flit about from pleasure to pleasure like a butterfly. Having a definite object set before them, they never know what *ennui* is, and the pleasures they are enabled to enter into are enjoyed, with a zest of which the mere pleasure-seeker knows nothing. How often poor people are compensated for their poverty, by pleasures to which the rich are complete strangers! The pleasure to a poor man of purchasing a book to which he has been looking forward, and for which he has been saving up for a long time, is quite unknown to his rich neighbour, who can obtain as many as he likes. The pleasure of a holiday trip into the country, or to the seaside, to a poor man, who can only now and then at long intervals enjoy such a treat, is something the rich man cannot understand. It is true that the pleasure to the poor man extends over but a short space of time, but as it comes in a more concentrated form, it is all the more real while it lasts.

In the same way, although in a far greater degree, does the hard-working man enjoy his recreation when he gets it. The time in his life devoted to mere pleasure may be, comparatively speaking, small, as compared with the time set apart by the pleasure-seeker, but it comes in a form which makes it far more enjoyable, being such a thorough contrast to the ordinary duties of life. Added to which, he who only indulges in pleasure for the sake of true recreation, does not know that terrible reproach of conscience, telling him that his is a wasted life.

Recreation of some sort is an absolute necessity, and the word itself teaches us a scientific truth. There is a waste of tissue and energy going on in each of us daily, which arises from the wear and tear of life; and what we need as an antidote is a something that will *recreate* in us that which will supply the loss. It stands to reason, therefore, that what is recreation to one is not the same to another. A game of cricket is great recreation to a man of sedentary habits, whose duties bind him down to an office life; but such a form of occupation would not be recreation to a professional bowler, whose duty it was to play cricket every day.

It is said that once an old 'bus conductor, who had never had a holiday for twenty years, was granted one by his generous employers! So little did he know how to make use of it, that he jumped up into a 'bus conducted by a friend of his, and drove about with him! There are some men in life who have neglected to cultivate the science of recreation, and thus, having defied nature's laws, what can they expect but sooner or later to be called to account for their folly?

No man can get on well in any calling of life without a fair amount of health and strength, and nothing helps to develop these very desirable acquisitions so much as games and healthy recreation. "All work and no play makes Jack a dull boy." Consequently, every Christian lad who wants to do good in life, should make a point of going in vigorously for manly, healthy games. There are now so many forms in which young fellows can obtain pleasant recreation, that it would be impossible for any one man to excel in all; but he should take every opportunity of going in for as many as possible, and as far as possible he should try to hold his own in those he does take up. The field of selection is large, as his lot must indeed be unfortunate who cannot get one or more of the following:—Cricket, boating, gymnastics, hockey, la crosse, archery, fives, lawn-tennis, riding, shooting, bicycling, skating, athletic sports, swimming, fishing, or football. The more studious a person is, the more important it is that he should utilise every spare moment of his time for rest and recreation, and healthy, innocent amusements of the above-mentioned kind. Many a young fellow has wrecked his constitution, and failed to grasp the prize for which he strove so hard, simply because he did not work wisely. No constitution, least of all that of a young man, can stand a too excessive strain; and many a hard-working lad has been saved by his love of games.

A simple walk by way of recreation is of course better than nothing, but at best it is but a poor substitute for healthy out-of-door games. The object of recreation is, to a very great extent, to divert the mind from the topics on which it has been dwelling throughout the day. This, a walk frequently fails to do. Of course, if games cannot be obtained, a walk is, as a rule, the only substitute, but even then it should not be a *lonely* walk. A pleasant companion, whose conversation will change the current of thought, adds very materially to a walk, as a form of recreation. What is true of a walk is more or less true of a ride. A companion in a ride is not only welcome for his own sake, but is a desirable acquisition, as a means of diverting the thoughts from the engrossing work on which the mind has been dwelling throughout the day. An old hymn writer says that—

> "Satan finds some mischief still
> For idle hands to do."

The truth of this statement is never so clearly exemplified as in the case of young men and lads. There is a certain amount of youthful energy which is common more or less to all young people, but more especially to boys and men. Games, and healthy recreation of all sorts, work off this superfluous energy, and, at the same time, tend to develop a more or less manly character, as character itself is often formed by the surroundings with which a youth's early life is associated. Often when parents are unwise, and fail to obtain healthy recreation for their boys, they become muffs, and have no single amusement which they can take up *con amore*. Having nothing definite to occupy their spare time, the chances are very much in favour of their being led into different forms of temptation.

The muff is by no means a lad who can be expected to avoid the grosser sins of manhood. He frequently develops into a weak, irresolute character, little able to exercise self-control, or to resist evil. When, on the other hand, a youth excels in one or more games, he acquires a taste for them, and takes them up vigorously. Consequently, so much of his spare time is fully occupied, that he avoids many temptations of every-day life. Added to which, it very frequently happens that much of the energy and vigour with which a young fellow takes up certain games, becomes a part of his character, a kind of second nature, and it is introduced into everything else that occupies his mind. It is a matter of common observation how many of the earnest young Christian men at Oxford and Cambridge (such, for instance, as the three brothers Studd), have excelled in cricket, boating, and rifle-shooting. Of course all cannot expect to excel, but there is no reason why, because a man becomes a true child of God, he should not at least attempt to hold his own in the ordinary games of his own age. Whatever a fellow takes up, he should devote his whole energies to it for the time being. Those who work hard indoors, should play hard out of doors.

Some never take up anything with energy. They neither work hard nor play hard. It is sometimes said concerning certain men, who have done well in some calling, that it is a matter of surprise that they are also very good at some one game. Whereas, as a matter of fact, it was perhaps the skill at the game that helped them to bear the mental strain required in the profession. Each one should look out, and cultivate that game, or different kind of recreation, which suits his circumstances best, as those that are convenient to some, are unsuited to others. Above all, let each one realise that recreation, in moderation, is not only a pleasure, but a duty to God who made him.

HOMELY HOBBIES: RECREATIONS IN GEOLOGY.

By W. H. Harris, B.A., B.Sc.

No. 5.—The Mortar of our Walls and Plaster of our Ceilings.

DAYS there were, long, long ago, when men seem to have had reasonable leisure for their work, and could afford to do everything slowly and well. Many of their stone erections were built without mortars or cements. Each block was so carefully shaped and so accurately fitted, that the lines of junction were scarcely visible, and yet the structures were secure enough to last thousands of years. But when various circumstances led to the use of smaller masses of natural or manufactured material, it became necessary that those should be made to cohere, if a substantial edifice were to be constructed.

At first, no doubt, clay was in general use for this purpose. Its abundance, its plasticity, its smoothness, and the ease with which it could be worked, rendered it suitable, especially in dry and warm climates. Where much rain, or frost, or both prevailed, it would soon be found a disadvantageous material. We learn that bitumen was often also employed, where it was found naturally existing.

It would be interesting to know how lime came first to be employed. In all probability its special properties were discovered by accident. It is easy to imagine that, in many parts of the world, men might be using pieces of rock for enclosing their fires, or for making their rude ovens. From time to time it would happen that, when limestone had been thus subjected to considerable heat, perhaps over and over again, and water had afterwards been spilt or thrown upon it, startling results would be seen to follow. First, there would be a swelling of the stone, then a great rise in temperature, accompanied by the giving off of volumes of steam; when this had gone on for some minutes, the previously hard material would be found crumbling to pieces of its own accord. That this series of phenomena was somewhat startling to our own ancestors seems indicated by the terms "quick," *i.e.*, "living," which they applied to limestone thus behaving when "slacked," or "slaked" with water. The former of these terms, according to etymologists, has to do with the *loosening* process which takes place; the second, to the mixture of water with the lime. And here we may remark that something more than a mechanical mixture really is effected. An actual chemical combination occurs between the lime and water, and this is the reason why so much heat is evolved in the slaking. We shall refer again to this point, which is practically important, as affecting the drying of mortar and plaster.

But now, before explaining any further the qualities and manufacture of lime, we must speak of the geological nature of a few of the rocks from which it is made. In a subsequent article on "The Marbles of our Mantel-pieces, and Fire-place Jambs," we shall have to notice limestones which have undergone so much *metamorphism*, or change from their original structure, as to have become crystalline. In speaking, therefore, of our mortars and plasters, we will select, for a few particulars as to their origin, some of the less compact and altered varieties. Chalk, the lias limestones, and gypsum, will answer our purpose.

The two former of these belong to what are known as carbonates of lime, or—according to more recent nomenclature—calcium carbonates. In other words, they consist of carbonic acid (or carbon-oxide), in combination with lime or its metallic basis, calcium. They have, in a sense, all been derived from the same source, viz., the mineral matter dissolved in the waters of the ocean. But it must not be supposed that these solid substances have been deposited into rock-masses by settlement, or as encrustations, such as take place in our boilers and kettles. The carbonates, at least, are due to the marvellous power possessed by certain animal membranes of extracting, and fixing in a solid form, the salts of lime from sea-water. We have such membranes in our own body. These secrete the bony matter of our teeth and skeleton. Similar structures enable oysters, mussels, cockles, and periwinkles to encase themselves in hard shells. The power seems to reside in exceedingly minute cells, to which the term *bio-plasts* has been given. These exist in enormous—we may say, inconceivably great — numbers in all living animals, and their functions are very varied. They, in fact, build up all the various tissues of which animals consist, and secrete the different substances which, in the lower orders of creatures, envelope and protect their softer parts. We are wholly unable to say why one set of these cells should take from blood, for instance, the ingredients of bone, and build up the hard portion of a limb, while another set will fashion nerves, and a third set, veins. Nor can we explain why some should draw from sea-water the lovely coloured materials of our tropical shells; while others, again, form the numerous organs of the living creatures themselves. Still the fact remains.

But what is, in some sense, most wonderful is, that in certain cases the agents in limestone-forming have been little more than tiny pieces of animated jelly, possessed of the faculty of attracting to themselves the invisible particles of calcium carbonate, dissolved in sea-water. We have referred to this point already, when speaking of chalk in a previous Paper. We may here just mention that the name of these minute, but immensely effective workers, is derived from the circumstance that their shells, or cases, are pierced with very numerous openings (*foramina*, Lat.), through which they thrust thread-like prolongations of their body tissue. These "pseudopodia," or *false-feet*, as they are named by naturalists, in some instances coalesce at their bases, and continue their limestone secreting energies, building up the tiny shell-cases into complex and beautiful forms. These, in numbers perfectly inconceivable, contributed all over the globe to form rock masses in past geologic ages. Not only so, but we know that their remains are, at the present day, being distributed on the floor of the ocean in many places, and over extensive areas.

There are, however, other creatures more advanced in structure, which have taken no inconspicuous share in building the limestones of which we make use. All our readers are familiar with the appearance of different sorts of coral; but some, it may be, are not aware that these stony masses have been built up by animals, often erroneously called coral "insects." They have no claim whatever to the last term. The railway-porter, who made the famous classification, "cats is dogs, and rabbits is dogs, and so is parrots; but this here tortoise is a hin-seck, and so there ain't no charge for 'im"—was not more wildly wrong. The proper term for the coral-builders is polyps. In structure they are closely allied to the sea anemones, with which zoophytes we are all familiar in rock-pools of our beaches, or in aquaria. They consist, practically, of a fleshy substance hollowed out into what serves as a stomach, opening below into the general body-cavity, which is further divided into a number of vertical compartments, by partitions, which, in many instances, become stony plates, through the secretion of calcium carbonate. This substance they still further elaborate into a calcareous skeleton or framework, thus making what we call *coral*. These creatures live in vast colonies, increasing chiefly by a process of budding, as if they were rather vegetables than animals. Their name,—"Zoophytes," meaning "animal-plants,"—points to their alliances to both kingdoms of the organic world.

From the ocean floor, but at no very great depth, they build up *fringing*-reefs, *barrier*-reefs, and *atolls*. We cannot afford space to detail the interesting theories connected with the making of each of these. Any modern work on Physical Geography will supply the requisite information. The point we wish just now to bring out is, that in long past ages in the world's history, similar creatures to those of which we have been speaking, have over and over again added masses of limestone to the earth's crust.

There are many other kinds of animals which have also had a share in this work. Shell-fish, as they are commonly called, but they should be spoken of as *molluscs*—having soft bodies protected by hard shells; echinoderms, rough or prickly-coated creatures like sea-urchins and star-fishes, together with their relatives; the crinoids, or stone-lilies, have enormously contributed, by their calcareous coverings, to the limestones of various epochs.

Now it is time to return to the making of lime, and to an explanation of the differences between it and the rocks from which it is derived. We will consider the second of these points first. To put the matter into a few words, the cardinal difference between the two is, the presence of carbon-dioxide in the native rock-masses, and its absence from lime. This is got rid of by the simple process of baking. Lime is prepared for building and other purposes by heating some sort of limestone in kilns, by means of either coal or bituminous shales. The carbon-dioxide is thus driven off, and *quick* or *caustic* lime remains. In some districts, peat or wood is used instead of coal; and for some sorts of limestone, it is said, impure or shaly fuel is better than the purer kinds, because the stone burns with it more slowly

and evenly, and is less liable to slag or melt. The quantity of combustible material used is about one ton to four or five tons of rock. The amount of lime by weight obtained is from 55 to 60 per cent. All the loss is accounted for by the expulsion of the carbon-dioxide.

For making mortar, the quicklime is slaked with water, in the proportion of one volume of the liquid to three of the solid matter. The lime then crumbles to pieces, as before described. By the addition of more water, it is made into a sort of paste, to which is added three or four times its bulk of sharp sand. The mixture is thoroughly worked up into a stiff sort of pulp, and is then ready for use.

Now arises the question—What makes mortar *set*, or become hard? There appear to be two chemical processes involved in this. Firstly, the lime in part attracts to itself carbon-dioxide from the air, in which the gas exists to the amount of $\frac{1}{2500}$. This reunion of the two substances makes, once more, a compact limestone. But, in addition to this, a combination takes place, to some extent, between the lime and the sand, giving rise to a material so hard, that in some of the edifices erected by builders in our own country 200 or 300 years ago, it is easier to break the stones, strong though they are, than the mortar which was used to connect them.

Two or three paragraphs must be given to the subject of the plasters of our ceilings. These are made of various substances, according to the immediate use to be served, and the rapidity of drying required. They are generally prepared from the more carefully made limes, and the best sands, *i.e.*, those whose minute particles are least rounded by attrition. Greater attention than is needed for mortars, must be paid to the complete slaking of the lime, and the thorough mixing of the sand. If small pieces of the former are left unslaked, they gradually absorb water after the plaster is used, and swell, or "blow," as plasterers say. Hair from tan-yards is often mixed with the other two ingredients, so as to give greater cohesiveness, and enable the material to hold on more firmly to laths or to brickwork. These ordinary plasters dry slowly, giving out their chemically combined water in place of carbon-dioxide absorbed from the air. Hence their hardening is partly a chemical process, and not a merely evaporative one. In newly built rooms, it is not uncommon to assist the drying process by braziers, in which charcoal is burnt. The combustion of the fuel forms carbon-dioxide, in quantities which would be fatal to human beings sleeping or remaining long in such rooms; but it is not at all unlikely that the extra amount of this poisonous gas, thus produced, aids in the chemical part of the plaster-drying.

When rapid "setting" is necessary, some "plaster of Paris," that is, sulphate of lime, deprived of its naturally contained water, is added. This substance has, in a most remarkable degree, the property of incorporating water with its particles, so that what is at first quite a thin paste, will in two or three minutes become of firm and almost stony consistence. Hence a small quantity of plaster of Paris will greatly increase the drying power of ordinary lime-plaster.

When walls and ceilings are being covered, the coarser layers are first applied, then the finer, and lastly, a perfectly smooth surface is made by what is called a "floating" of cream-like consistence. Special modifications of plasters, known by various names, owe their properties to mixtures of various chemicals in the process of manufacture; such substances as alum, borax, and pearl ash, being incorporated with plaster of Paris.

LOVE, COURTSHIP, AND MARRIAGE.

By PHYLLIS BROWNE.

No. 2.—MAKING ACQUAINTANCE.

LORD Tennyson once wrote a poem called "The Northern Farmer," which is supposed to repeat the advice given by a money-loving father to his son, about marriage. This advice, shortly spoken, was, "Don't marry for money, but go where money is." The farmer was very wise in his day and generation, from his own point of view. He thought money was the best thing any one could have, so he recommended his son to choose his acquaintance amongst people who had money; then he would be likely to meet with some one who, taking his fancy in other respects, would yet possess the one desirable qualification.

From this poem, even those who are not like the farmer may learn a lesson. It is wise to choose acquaintances of young people of the sort we should like to marry. Apart altogether from marriage, it is a very good thing for young people of both sexes to meet frequently; it does both sides good. It is a great pity when either boys or girls have to grow up without companions of the opposite sex. Boys who do not mix with girls become awkward in their manners, rough and uncouth. Girls who do not mix with boys are in danger of caring for nothing but tittle-tattle; they become narrow and uncharitable. It would be hard to say whether girls or boys benefit most by intimacy with each other, because both benefit so very much.

Some parents are greatly afraid of their girls mixing with boys, and of their boys mixing with girls; they fear the consequence will be imprudent marriages, and love difficulties of one sort or another. Really, however, there is much more danger of complications of this kind when young people are kept in retirement, than when they meet as a matter of course; because the young folks thus restrained have no opportunity of comparing one individual with another, and so forming a true opinion. A young man who never sees anything of girls, is much more likely to think the first girl he encounters a mysterious angel, than is the youth who has been intimate with his sister's friends for years, and who has learnt, from observation, that there are girls and girls. So the girl who has played from childhood with her brother's friends, and who is therefore accustomed to the society of boys, is much less liable to be attracted by mere surface qualities, than is the girl who has not learnt from experience how very easily surface qualities rub off. In America, parents and guardians have been so completely convinced of the advantage of bringing children of both sexes up together, that they send boys and girls to the same schools. Even in England we are beginning to venture on the same daring course, and there are one or two colleges where male and female students work together. There are also a limited number of schools where the same method is adopted, and authorities tell us that these mixed schools are more successful than any. The girls humanise the boys, and the boys make the girls learn. Nor can we wonder that this should be. When we put boys and girls together, we follow Nature's plan, and we need to be very wise indeed, if we are to improve upon Nature. Nature does not separate the sexes. She sends brothers and sisters into the same family, and she makes the man incomplete without the woman, the woman without the man. Why should man put asunder what God has joined together? There is every sign that in the future the sexes will be brought together, in social every-day companionship, more closely than they have been in the past. The old restrictions are breaking down, and the old barriers are being removed. We cannot stop this by refusing to believe it. It *is* so, and if we look at things as they are, we shall be compelled to acknowledge it. We may say it is unfortunate, but our complaint will not alter the fact.

We may all, however, do our part to make it a benefit, rather than an evil.

In this matter, both young men and young women have a duty to society. The duty which rests upon young men in this crisis is, that they should respect women as women. The wisest, purest, and best men have, in every age, been distinguished for this respect; the coarsest, rudest, most vicious, and most infamous men have ever been distinguished for their lack of it. The more civilized a nation is, the more its women are guarded and honoured; and the more savage a nation is, the more its women are degraded. There is no surer test of the character of a young man than the way in which he speaks and thinks about women. Some young men scorn women, and sneer at them, imagining that thus they "put women in their right place," as they call it, and exhibit their own superiority. On the contrary, they do nothing but make a needless exhibition of their own littleness and narrow-mindedness.

The duty which rests upon young women is, that they should be worthy of respect, and that they should make the best and highest use of their influence. Men are stronger than women, but women of the right sort are more spiritually-minded than men. By this I mean, that in them con-

science speaks more quickly; they are more open to religious appeals; and they are more disposed to hold fast to religious ideas than men are. Thus we find that it is very usual for the women of a family to think seriously, when the men of the same family are careless and trifling. When children grow up with earnest thoughts of God and duty, we generally find that their mother taught them to do so. There are countries where the men have learnt to think lightly of religion; but even here the women cling to it still. They may have mistaken ideas about it, but they are loth to give it up. It would almost seem as if to women had been committed the guardianship of religion; and it is very, very sad when women or girls are faithless to their trust in this direction. When a girl allows her companions to joke and sneer at sacred subjects in her presence; when she allows swearing or coarse language to be used without rebuke, she is thus faithless to her trust. There is not much to make us hope for the best in a company where the young women do not stand up for what is honest, and pure, and of good repute; while, at the same time, there is little hope for the girls themselves, who turn away from their duty in this respect. Young men are always most ready to honour girls who lead, instead of being led. They are generally ready to amuse themselves, and have a little fun with the girls who can be led to do anything; but these are not the girls whom they hold in highest honour.

The question we are now considering, however, is not so much how men and women should behave to each other, but rather, how should they make acquaintance with each other, and get to know one another well, so that pleasant friendships and agreeable companionships may be formed between them? Some people are very slow to make acquaintance. They are afraid to speak to strangers; they look askance at every one who is different from themselves, and they dread being imposed on in any way. Others are quick to make friends. They are willing to trust every one they meet, ask no questions, but are ready to answer any number. Both these kinds of people make mistakes, because they go to an extreme; of the two, however, the cautious ones are the wiser. The friendships that are worth having are made slowly; those that are made in a day pass away in a day.

"The friends thou hast, and their adoption tried,
Grapple them to thy soul with hooks of steel;
But do not dull thy palm with entertainment
Of each new hatch'd, unfledged comrade."

Young folks who trust easily, quarrel easily, and their love is no more to be counted on than their dislike is to be dreaded. Both are of mushroom growth, and speedily die away. There is a secret connected with making friendships worth having, which few have discovered. It is stated loudly, often enough, but it is not welcome news, and so it is only believed once and again. Here it is, however, spoken out once more in broad daylight, and young people who feel lonely and forlorn are invited to listen.

If you want to make friends worth having, look for them amongst the people with whom you work, not amongst the people with whom you play. Young people make a mistake, in that they do just the opposite. They look for their friends when they are on a pleasure trip, when they are out for a holiday, when they are busy only in idling; and the consequence is, that their friends are only of the butterfly sort, very much on the spot when the sun shines, but nowhere to be seen when the rain-drops fall, and the clouds look heavy and lowering. Yet companionship in mere pleasure very seldom unites people closely; companionship in work does, and companionship in sorrow does more than all. We always trust those most who have been with us when we were in trouble. We put on our gayest attire and our brightest smiles for the holiday friends, but we make no effort to appear different from what we are every day for the friends with whom we work. Be sure of this, the working friends are best worth having; and as for most of us, life is made up much more of work than it is of play, we shall be much safer if we take our life-companion from the workers.

Our greatest English poet, Shakspeare, in one of his dramas, called "Much Ado about Nothing," told a story of a young lady called Beatrice, who, besides being very beautiful, was very clever, very witty, and very sensible. She was wooed by a fine Spanish prince, named Don Pedro, and after a time, this Don Pedro asked her if she would marry him. She replied, "No, my lord; not unless I might have another husband for working days; your Grace is too costly to wear every day." Young folks who are seeking to form acquaintance should think of this speech of Beatrice. Friends, to be a comfort and a strength, must be friends for every day, not for high-days and feasts. Of all the work in which young men and young women engage, there is none which brings them together in pleasanter intimacy than Work for Others,—Charitable Work. Work of this kind is mostly carried on in connection with religious communities, and this is why so many friendships, delightful in themselves and full of promise for the future, have their origin in churches and chapels. It is probable that more acquaintances which have ended in marriage engagements have been commenced when attending churches and chapels, than any other way. There is this to be said for such engagements: they have, for the most part, ended happily; they have not so often led to misery and pain in the future, as have the engagements formed in scenes of pleasure and gaiety.

People who engage, perseveringly and zealously, in work for the same object, and that an unselfish one, must, to an extent, be like-minded; and what more reasonable basis for future congenial companionship can there be than harmony of taste and sentiment? The secret of happiness in marriage is that a wedded pair should pull together; and there is no more reliable sign that they will do so, when joined together, than the fact that, when apart, they naturally pulled in the same direction. It follows then, that where earnestly disposed young people wish to make acquaintances who will bring brightness and inspiration into their daily life, the best thing they can do is to take their part in unselfish work for others. When doing this, they are almost certain to encounter individuals of an earnest temperament and disposition, like their own. If, in the future, the acquaintanceship thus formed should ripen into something closer and dearer, there will be as little fear that harm and disappointment will follow, as there can be in anything in this strange condition that we call life. If no such intimacy should grow out of the friendship, at least there will be reason to rejoice that useful, honest work has been done; and the consciousness thereof will be abundantly satisfactory.

OUR SPECIAL SERIES OF CHRISTMAS COMPETITIONS.

£5. 5s. in Prizes.

WE have now come to the fourth and last Competition, which we trust may prove no less interesting than the others. The subject seems an easy, perhaps even a semi-humorous one; but we have a very serious purpose underneath. It cannot but be interesting to note the ideal of womanhood which a young man has before him, as well as the ideal of manhood which a girl pictures to herself. We do not ask for a definition of the most fascinating friend or lover, but rather for a sketch of one possessing those qualities which will prove a permanent joy and blessing in the home. We do not want competitors to be unduly solemn; we want them to look at this subject from the highest standpoint, and then they may be as pleasant as they please.

First Prize of 10s. 6d.,

Two Second Prizes of 5s. each,

for the best definition of

A MODEL HUSBAND.	A MODEL WIFE.
By a Lady.	By a Gentleman.

1. Definitions *must* be original; they may be either in prose or verse.
2. Papers limited to 1,000 words.
3. Competitor's name and address must be written on each MS.
4. No MS. can be returned.
5. Questions may be asked, if stamped envelope be enclosed for reply.

The Competition closes on February 11th, on or before which date all Papers, marked outside "Fourth Christmas Competition," must reach the Office of —"A. L.,"—

62, Ludgate Hill, London, E.C.

WINTER.

"WHAT is the winter?" I asked, and one
Answered, "With me, it is sport and fun,
Skimming the ice in the bracing blast,
My only trouble—frost goes so fast.
Meeting again with the friends who are dear,
By roaring fires, and with Christmas cheer,
While the world is wrapped in glist'ring rime,
Hurrah for the jolly winter time!"

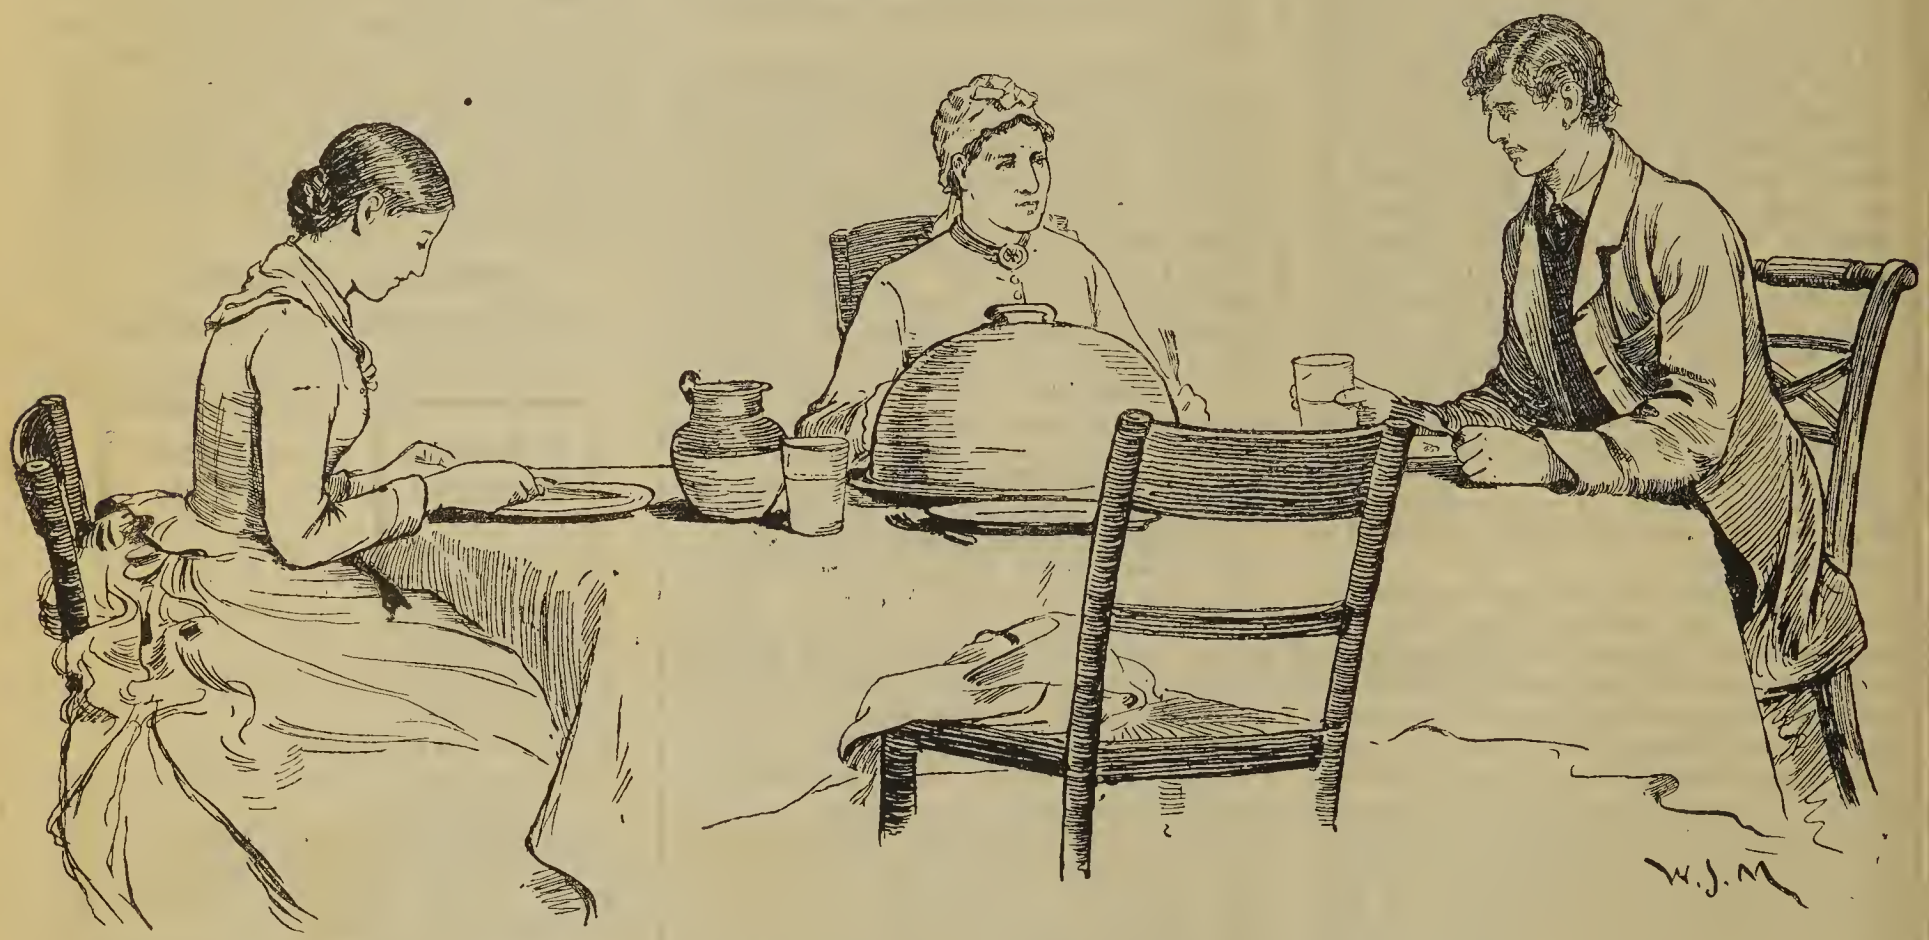
"What is winter?" I asked another—
A heavy-eyed and pale-faced mother.
"Winter," she murmured, "is pain and care,
Little to eat and little to wear,
Shivering children and hopeless mate,
Stitching early and stitching late,
Cowering close o'er the fitful blaze.
Alas, for the dreary winter days!"

Is it not always thus in our life?
One has the vict'ry, one the strife.
Ever is Dives feasting in state,
Ever is Laz'rus laid at his gate.
Yet, though poverty ne'er shall cease,
It matters little, so love increase.

Since life is wasted if lived for pelf,
And worse than wasted if lived for self,
Shall we not each have a brother's heart?
Shall we not each do a brother's part?
Thus mingled voices of joy and praise
Shall rise to God through the winter days.

"LUCK" AND "PLUCK;" OR, "ONE LETTER DID IT."

By the Rev. P. B. Power, M.A.,



Author of "The Oiled Feather," "The Talking Fire-Irons," etc., etc.

PART II.

BETSEY BARBEL'S "Pluck" put her in the way of real "Luck." The foreman at the Banwell Mills kept his eye on Betsey, was nicely twiddled about at the corners, so that he looked like a man who could say pleasant things; and his chin was on the square, which meant that he was a young man who had some determination in him. Indeed, he might be said to be somewhat in the same boat as Betsey Barbel, for it was by his pluck he was in his present position. It was he who had the pluck to go in amongst the men at the mill one day, when there was almost a riot, and, by a few sensible and determined words, put an end to it. Mr. P., junior, had not played fast and loose with his constitution; he was no beer-cask; and so he had a good, sound constitution. He looked healthy, and he was healthy. He could rattle off a beefsteak with any young fellow of his own age, and digest it too; and if any one wanted to know where his beefsteaks and other wholesome food went, Mr. P., junior, had only to tuck up his shirt sleeves, and show the inquiring gentleman the muscles of his arms, professing, if he were not satisfied, to give him a taste of their quality. We all have our weaknesses, and I am bound to say that, having nice, small feet, Mr. P., junior, *was* particular about his boots, even going so far as to have his own lasts; the heels were moderate, for he knew that too high heels throw the body out of shape, and produce, in some cases, the most lamentable results.

Every Sunday did these two,—that is, Betsey Barbel and Mr. P., junior,—sit opposite each other at dinner; and every Sunday did Betsey eat the slice of beef which was next to Mr. P.'s on the joint, and Mr. P. ate the one which was next to Miss Barbel's.

Now I want to know, good reader, what you think? For my part, I never can account

"Every Sunday did these two . . . sit opposite to each other at dinner."

and got her promoted yet further to the overseership of one department of the mill. Finding her, as people say, "game,"—*i.e.*, plucky for meeting every difficulty as it arose,—he began to think she must be a girl worth something; indeed, the idea struck him that she would make a capital wife. Now Mr. Preston, having already a wife, could not personally do anything for Betsey in this line; but Mr. P. had a son, and he felt that if that son only married a good wife, it would be a great comfort to Mrs. P. and to himself. And so he began taking stock of Betsey, to see whether she would not make a capital Mrs. P., junior. Not that he was going to make a match—oh dear, no! He knew that match-making was a very ticklish business; but he might let the young people see each other; there was no harm in that. So Mr. Preston asked Betsey Barbel to his house, and there of course Mr. P., junior, saw her.

Now I must tell you that Mr. P., junior, was a very nice young man. I'll tell you precisely what he was like. He stood exactly 5 feet 10 inches and three quarters in his stockings—that made a trifle over 5 feet 11 inches in his boots; his hair was brown, and inclined to be a little bit curly; he had dark-grey eyes, and his nose was a little hooky (which would come in handy when he was older, and would require specs); his mouth

for these things. There's some kind of a mystery in them. Why,—if you know why, do tell me,—why, after they had thus eaten fifty-two slices each—one hundred and four in all—*i.e.*, after fifty-two Sundays had elapsed, since these two sat at the same table, did they not look at each other straight in the face as they used to do, but only take an occasional peep from under their eyebrows, and be dreadfully ashamed when they were caught?

Why, after the fifty-second Sunday had passed, did Mrs. Preston ask Betsey to spend all Sunday with them, breakfast included? and can you tell me whether it could be because Betsey now began to eat the very next slice of bread at breakfast to Mr. P., junior's, as well as the next slice of beef at dinner, that matters hurried on so quickly?

If you know why, no doubt you also know why Mrs. Preston took to calling Betsey "dear"; and why she began to tell her how happy Mr. P. and she had been; and how she thought people were happiest in the married estate, when they were properly, suitably, and really well married. And apparently unlocking herself somewhere inside, Mrs. P. took Betsey into confidence about her Tom; and how she was anxious that Tom should settle; and then she said she thought Tom himself was anxious to settle. But then she was full of anxiety lest

Tom should make a mistake—and indeed, Tom himself was rather nervous on that point; and if only she could meet with the very suitable person for Tom, and if only Tom himself could meet with her, how happy they both would be!

Once set fairly a-going, there was no stopping old Mrs. Preston. She must have been a wonderfully active old lady, for she made a sudden spring from Tom to Betsey, and began to tell her the kind of girl she should like for Tom, and indeed what she knew Tom would like for himself. Then she began to describe Betsey to herself, until one would have thought the old lady had taken to photographing, and was at that moment taking Betsey Barbel's likeness. "He does like a girl, my dear, who is modest in her looks and in her dress. He does like a girl, my dear, who knows the right, and is *determined* to do it; he knows that's the girl to make a home happy. He doesn't want any nonsense, my Tom. He has plenty of fun in him, my dear—that's seen in the corners of his mouth; but no nonsense or humbug—that's seen in the square of his chin. They say he's very like me, my dear; at least he was when he was a child. He wants a girl with a head and with a heart; and his father and I—and I believe he himself, too—have seen the very girl for him."

Poor Betsey! at these last words her heart, which had been going at a pitty-pat while she had been hearing herself thus described, seemed suddenly motionless; were all the slices of beef and all the slices of bread coming to nothing? 'Twas only for a moment; old Mrs. Preston had something better than a smelling-bottle at hand. On she went:—

"Said I out loud, as Tom and I were sitting by the fire yesterday, 'I love my love with an A, because she's amiable.' Go on, Tom. Tom looks at me a moment, and then twiddles up his mouth, and says, 'Shall I tell you, mother, the real reason why I love my love with a B? Would you believe it, my dear? he hits off in one go what I had been thinking of for three months. He doesn't say, 'I love my love with a B, because she is beautiful'; but, 'I love my love with a B, because she's Barbel.' Then he jumps up from his chair, and kisses me, and squeezes my hand; and in a moment it all came into my mind. At last I've found the girl to give my grandmother's silver teapot to, and the six egg-spoons to match. You shall have teapot and spoons, for they go with Tom—and Tom himself, and father, and me; you shall have us all, Betsey, if only we may have you."

"Yes!" said Papa Preston, who came in at this juncture, "Tom's just been telling me about it; and I doubt if I haven't broken the poor boy's knuckles, I've given him such a squeeze."

Now you know, good reader, that the strongest of us are weak at times, and plucky as Betsey was, you'll hardly believe it, but she began to cry. Then Papa Preston kissed her, and Mamma Preston kissed her; and they only stopped her by telling her that, if she kept on crying, they must then and there send for Tom, who perhaps might kiss her too.

This was too much for Betsey; so, gradually she turned over to smiling, and then to laughing, and then to wishing that Tom should be sent for, or in some way or other should come.

But Tom did not appear; in spite of his square chin, somehow or other he wasn't up to the mark in "pluck." And the silly fellow, contrary to all his principles, would keep thinking of his "luck."

I never heard how the affair was managed. I believe old Mrs. Preston went in search of her spectacles at the very moment Tom came in to tea, and took an hour to find them, which is not wonderful, seeing they were on her nose all the time. And when this great discovery was made, it was found on her return to the parlour that very little bread and butter had been eaten. The tea was cold, the fire was nearly out, and Tom Preston and Betsey Barbel were going to be man and wife.

And so, Betsey, even in this respect you reaped the reward of good honest pluck. I have scarcely mentioned anything about this pluck, except your standing up for an effort to keep English work for English girls; but there had been plenty of pluck besides. Many's the day when you went to the mill determined to do your work, though you were not up to it that day, when others in like circumstances stayed away. You were known as a dependable girl. Many a time, with a brave heart and a cheerful face, you bore all the sneers and jeers of other girls in their tawdry finery, because you *would* have what was within your means, and modest-looking and good. Many a saucy word you put down, so that the lads around were obliged to respect you, whether they liked it or not; and when you stood up before that young man, whom you saw misleading one of your fellow mill-girls, and told him to his face what he was, you saved a fellow-creature, and showed what good mettle you were made of.

And long after, when you were Mrs. Preston, it was your pluck in keeping up night after night with your husband, never giving in, that saved his life; it was your pluck that saved the mill itself, when it was in difficulties; and you went yourself to London, and brought down with you the man who could and would have sold it up. Seeing is believing, and he saw that there was plenty of security for his money, and he let it lie until the mill worked round.

As to you, poor Jenny Light, no doubt you became Mrs. Bob Spanker; but what of that? what good did that do you? No good

"Apparently unlocking herself somewhere inside, Mrs. P. took Betsey into her confidence about Tom."

at all, but a great deal of harm. And no doubt you had several strokes of what is called luck, but I want to know what good they did you? None, that I ever heard of. You were left as much as £200 in all, by one relation and another, but no good came of it. And when last I heard of you, you were on the look-out for some more "luck," but I'm very doubtful as to whether you'll meet with it; and even if you do, I doubt whether much will come of it. You were ever so much cleverer than Betsey Barbel, ever so much prettier, ever so much more lucky, but ever so much less plucky; and where are you, Jenny Light? I beg your pardon, Jenny Spanker; and where is she?

The pluck to go about her house when she was as ailing as you, kept everything in order, and made her husband love his home; when your giving in, and hoping that you'd have the luck to have some neighbour look in to give you a hand, left your home often untidy and miserable.

The pluck that made Betsey Barbel go to worship God, even though other girls and Bob Spanker laughed at her, strengthened her for resisting her temptations and performing her duties; while you, staying at home rather than to be laughed at, had no strength, and so easily came short, here, and there, and everywhere. And now, where is Betsey Barbel, and where are you?

It may be that some people think that "pluck" is not a word for girls, but I am sure it is a far better one for them than "luck." I don't see why boys and men should have all the pluck in the world to themselves. And I am very sure, my fine fellows, that you have not. I know lots of plucky women and plucky girls, and they are just as nice and much nicer than many who have no go in them at all. And, moreover, I know where the right kind of pluck is to be got: "Be strong *in the Lord*, and in the power of His might"; "I can do all things through Christ, which strengtheneth me." The pluck, the courage that God gives, is the genuine thing; and give me any day—

"PLUCK MORE THAN LUCK."

OUR CHRISTMAS COMPETITIONS.

WE would again remind our readers that we give in this Number the fourth and last of our series of "£5. 5. 0 Christmas Competitions." For the advantage of new subscribers this year (who may not be able easily to procure the back Numbers), we would recapitulate :—

Our "Acrostic Competition," announced Dec. 24th, will close Feb. 29th.

Our "Spelling Chase," announced Dec. 31st, closed Jan. 10th.

Our "£100 Competition," announced Jan. 7th, will close Feb. 4th.

Our "Definition Competition," announced in this Number, will not close until Feb. 11th.

In the announcement of our Competitions, we shall always arrange that subscribers to our Monthly Parts (of whom we have already a large number), will have ample time to compete.

We congratulate ourselves upon the return MSS. having already taxed our Post-Office Department, and we fear we may also have to draw upon the patience both of our examiners and subscribers. Results will be announced as speedily as possible.

GIRDING UP THE LOINS.

By THEODORE L. CUYLER.

"GIRD up the loins of your mind." Stirring words of one who once girded his fisherman's tunic about him, and leaped out of the boat to swim to his master. The ancients wore loose, flowing garments, and when any strenuous exertion was required, they gathered up the folds of their drapery, and bound a girdle about their waist. A similar process is essential to a vigorous Christian life.

Jesus Christ does not put you or me into His Church just to make us comfortable. Getting to heaven is not the sole object, or even the chief object of becoming a Christian. Obedience to Jesus Christ is the first thing. This is the core of Christianity. The phrase "girding the loins," implies readiness for duty. On that last night in Egypt, the Israelites were commanded to stand with girt loins, and sandelled feet, and staves in their hands, *ready* to be off at a moment's notice. Paul, at the start, inquired: "Lord, what wilt Thou have me to do?" At the finish, he exclaimed, "Now I am ready to be offered up!" We pastors soon discover who are the minute men in our churches. Whether it be work, or money, or service of any kind that is required of any Christian, their cheerful response proves that Christ has the first hold on their hearts. Eagerness for the fight marks the true soldier; eagerness for the run made the successful Olympic racer; eagerness to do Christ's will, or even to endure hard blows for his Master, marks the happy, ready-hearted Christian.

Another idea suggested is the compacting of all our powers upon the work we have in hand. *Consecration* is not enough without *concentration*. Paul's "this *one* thing I do," tightened his resolves, and kept him from frittering away life on trifles. Sir Isaac Newton's secret of success was "fixing his mind upon the thing." Pericles only knew one street in Athens, the street that led from his own house to the Executive Chamber. At this chilly season of the year, the feeble sun-rays may be so focussed by a burning-glass as to *set wood on fire*. Many men and women of moderate abilities, under the concentrating power of the love of Christ, make wonderfully useful Christians. This compacting of one's self for the duty at hand is well described by the current phrase of a man's "pulling himself together." Some Christians go to pieces for want of a stout girdle.

Loin-girding also implies a wholesome idea of *restraint*. Laxity is the curse of the times. Loose thinking leads to loose living. We cannot do just as we like. A robust Christian, like a robust soldier, understands the value of drill and discipline, and learns to obey. It is not a good sign when a follower of Christ begins to loosen his girdle. He is preparing to shirk, skulk, or go to sleep. Tighten the loins, brother or sister, and make up your mind that a victorious Christian life is not the easiest thing in the world. Easy things, like many cheap things, are of small value. The best attainments must be paid for. God has put some pretty steep hills on His road to heaven, and you will need girded loins if you expect to climb them. He provides the girdle; you have but to clasp it about you. He offers you a belt with these words on it: "My grace is sufficient for you." Clasp it on, and you will find that the things which seem impossible, become possible to a resolute, unshrinking faith. Mr. Moody's negro woman was about right when she said that if God ordered her to jump through a stone wall, the jumping was her part, and the getting through was His. God promises that He will "gird us with strength," and that strength is always equal to the load to be carried, or the cliff to be clambered.

Life is not a frolic, and the service of our crucified Lord is not child's play. The end of all things is at hand with each of us. There is an exultant joy in the daring and the dash, the push and the climb of a well-girded soul on his way to his crown. The prize is for the racer, and none else. They who would fain go to heaven in, what Rutherford calls, a "close-covered chariot," may not gain admission at the gate; or if they do, they will be ashamed to look God's heroes there in the face: "Let your loins be girded about, and your lights burning; and ye yourselves like unto men who wait for their Lord."

YALE *V.* OXFORD OR CAMBRIDGE.

"I MAINTAIN that there is no question but that Yale can send out a crew to England, that will not only defeat any crew Oxford or Cambridge can pit against them, but any crew of amateurs that rows in England." The speaker was Captain "Bob" Cook, the coach of the racing eight of Yale College in the U.S.A. Some years ago, Captain Cook passed six weeks at Oxford, studying the long stroke method of rowing, as practised by the English University crew. On his return to the United States, Captain Cook taught the Yale eight to pull the long stroke, and this gave Yale the "pull" over her rival—Harvard. Last Summer Captain Keys, of the Harvard 'Varsity eight, has mixed with English oarsmen, picking up points in order to strengthen Harvard's form next season. Speaking on the subject of the position of the thole-pins in the racing "shells," Captain Cook said: "The rigging in England is pushed too far back of the thole-pin, and they will never change its position, until they are defeated by an acknowledged representative crew of American amateurs. Putting the thole-pin exactly opposite the rower, brings the power of the entire eight more to a uniform level than is obtained in any other position, and a much greater evenness of action is the result. In England they have not yet applied this principle. We have. In this we are as superior to them as they were to us in their long stroke before we adopted it."

While I am writing about Yale, it may be of interest to our young men readers, if I give a few facts about this great American University. To spend a year at Yale costs a young man between £60 and £70; but when the tuition charges are remitted, as they are in the case of any worthy student, then £40 will cover expenses. There are about 100 scholarships annually distributed, which cover the cost of tuition. A yearly fund of a little over £2,000 is also at the command of the Corporation, and is applied to the relief of indigent and deserving students. Then there is a loan fund for the benefit of needy students. Serving the college, as assistants in the libraries, monitors, and similar capacities, are quite a number of men, who thus earn from £15 to £30 a year without interfering seriously with their studies.

WASPS.

By the Rev. J. G. Wood, F.L.S.,
Author of "Homes without Hands," "Strange Dwellings," etc.

WHAT are wasps? How shall we know them? What do they do?

Wasps, like bees and ants, belong to the very remarkable group of insects, called Hymenoptera, and known by the fact that when they fly, the upper and lower wings of each side are connected together by a set of hooklets on the lower wings, and a groove-like fold on the upper wings. When the insect is at rest, or on foot, the four wings are mostly disjoined, so as to be conspicuously separate. This can easily be seen by watching a bee on a flower, or a wasp while it is crawling in search of food or building material. But there is one peculiarity in the front wings of the wasps, which at once distinguishes them from the bees. These wings, when separated, are folded longitudinally, so as to reduce them to half their width.

What do wasps do? The answer to this question depends very much on the species, as we shall soon see. There are solitary and social wasps, just as is the case with the bees and ants. The habits of the solitary species are comparatively devoid of interest, and I will therefore restrict myself to the social species, giving the chief part of the space to those which inhabit this country.

There are seven acknowledged British social wasps, some of which inhabit the ground, and others make their nests on branches; while one species prefers hollow trees, and similar sheltered situations. As is the case with the hive bee, the bulk of each colony consists of the partially developed females, which are appropriately called Workers, as by them the whole of the work is done.

The foundress of the community is a single female, called the queen; the males are comparatively few in number, only appear in the Autumn, and have but a short life. Here, however, the resemblance ends, as the queen bee never has anything to do except lay eggs, and be waited on throughout the whole of her life; while the entire labour of founding a new colony falls upon the queen wasp, until her young are strong enough to help their mother.

Let us watch the progress of a new wasp-nest from its beginning to its completion, taking the common field-wasp (*Vespa vulgaris*) as our example. Most of the workers, and all the males, die at the end of Autumn; a few workers which have attained full development, hiding themselves in some sheltered spot during the Winter, and passing into that singular phase of existence called hibernation.

When the Spring has fairly set in, a wasp issues from her hiding-place, and hunts about for a favourable locality for a new nest. As far as is known, she never returns to the nest in which she was bred, but starts an entirely new establishment. This is always in a hole in the ground, generally the abandoned burrow of a field-mouse, such as Burns turned out of its nest with his plough. At the extremity of the hole there are sure to be some roots of plants, especially if, as is often the case, the nest is made in a bank. To these roots the wasp affixes the rudiments of her nest. First, she has to procure materials. The nest of the wasp is not made of wax,—the insect not being able to secrete that substance,—but of a fabric made by masticating woody fibres, so that in fact the wasps were paper-makers long before man learned that art. True, the paper made by our wasps is of the roughest description, but the nests of some of the tropical wasps are as white, smooth, and hard, as if they had been made of good cardboard.

The wasp mostly obtains its fibres from decaying wood, and all through the Spring and Summer, wasps may be seen in numbers on any old post or decaying tree, busily engaged in nibbling off the fibres and masticating them. They are so absorbed in their task, that they will even allow themselves to be watched through a magnifying glass.

Having procured a supply of material, the wasp makes with it a single cell of very small dimensions, and fixes an egg into it; then sets off for more material, and places three similar cells round the first, depositing an egg in each. All these cells are attached to a stout footstalk, which the queen strengthens as she finds necessary. Her next task is to make over the cells a sort of umbrella of paper, so as to guard them from falling earth. By this time the eggs are hatched into grubs, and then the queen has to become nurse as well as builder, and to be continually engaged in feeding her young. They grow very fast; and in proportion to their growth, the mother adds to the walls of the cells. Besides these labours, she continually builds new cells, deposits eggs in them, and increases the size of the umbrella.

At last the grubs that were first hatched are full fed, and are about to change to the pupal form. This they do in the cells, spinning over the mouth of each cell a silken cover, more or less white, and always convex. In due time they become perfect wasps, issue from their cells, and do the work which was before the task of their mother alone, leaving her little to do except lay eggs.

In proportion as the wasps are developed, the nest increases, the earth being continually carried out of the burrow, so as to make room for the nest. A second layer of cells is then made below the first, much larger in diameter, and suspended by a series of footstalks like the first. The umbrella is also increased in like manner, and so the nest goes on until completed.

Towards the end of Autumn, the males, or drones, make their appearance, and become the husbands of the young females, which, as I have already mentioned, attain full development. When the cold weather begins to make itself felt, the workers, knowing that they can no longer supply the grubs with food, pull them out of their cells, drag them from the nest, and drop them on the ground outside, where they speedily die. With this task, the lives of the workers end. The males are already dead, and then those of the young females who are destined to become the queens of new colonies, abandon the nest, and betake themselves to their hiding-places, where they will remain until the following Spring.

Like the cells of the hive bee, those of the wasp are hexagonal, though, as they are not wanted to retain honey, they do not possess the singular plates at their bases which are so distinctive of the waxen cell. To my mind, the paper cell of an exotic wasp is peculiarly valuable.

There are always persons who cannot receive the idea of instinct according to its right definition, and try to account for everything by the "laws of matter," or some such phrase. Now, the mathematically accurate angles of the bee-cell have always been a stumbling-block to such minds. They refuse to believe in the unconscious action of Divine wisdom through the insects, and so have been driven to invent a series of theories, two of which are still upheld at the present day, though they are mutually subversive of each other. These theories are called by the names of "Equal Pressure" and "Opposite Sculpture." The first theory maintains that the cells were at first cylindrical, and were forced into hexagonal shape by pressure against each other. The second theory asserts that the bees first raise lumps, or walls of wax, and then, standing at exactly regulated distances from each other, they scoop away the wax as far as they can, and so make the cells. Neither of these theories accounts for the real wonder of the bee-cell, *i.e.*, the three diamond-shaped plates at the base of each cell, which form the key to the whole structure, and which cannot be due either to sculpture or pressure. Then, how are the bees to see each other on opposite sides of a thick cake of wax, and in almost total darkness? How do they manage to place themselves at mathematically exact distances apart, and retain those distances through the whole of their work? Certainly not by reason; and if by instinct, the question is yielded at once. But, supposing that we could find hexagonal cells composed of soft material, where no pressure exists, and where opposite sculpture is impossible; we must admit that cells can be hexagonal without either of these explanations.

Now, there are in the British Museum some specimens of a nest made by a South African wasp, belonging to the genus *Icaria*. In these nests are long and perfect cells, some of which are only connected together by one side, and have five other sides with their angles sharply marked, and yet wholly unconnected with any other cell. The late Mr. F. Smith, of the British Museum, the most accomplished hymenopterist of his time, held Equal Pressure and Opposite Sculpture in the supremest contempt, and was wont to point to the Icaria nest as an indisputable refutation of both theories. Another very common species, *Vespa germanical*, builds almost exactly in the same manner, except that it uses sound instead of decayed wood for its nest.

Mr. Stone (who kept wasps as other people keep bees, and had a number of nests in full work in his own room) mixed two swarms of these species, and supplied them with both kinds of wood. They made a joint nest, which presented a curiously mottled appearance; the brown and yellow of the sound wood contrasting with the grey of the decayed fibres. I happened to be speaking to Mr. T. Smith in the insect-room of the British Musem, when Mr. Stone brought the nest for inspection. He could do almost anything with wasps. He made a single swarm of wasps build six nests successively, each differing from its predecessor, and being in some fantastic shape, such as a claret bottle, the cave of Staffa, etc.; and when I last saw him, he said that in the course of the following Summer, he meant to join a number of nests together, and make the wasps build a model of St. Paul's Cathedral. His lamented death, however, prevented this bold design from being carried out, and no one since his death has been able to fill his place.

A remarkable example of mixed material was seen during the Crimean war. Every tree and shrub had been cut down for the use of the troops, and the wasps had no wood wherewith to make their nests. So they availed themselves of the paper covers of expended cartridges, and worked them up into their nests. Now, the English cartridges

Our Ranche Hut up the Creek.

were made of white paper, and those of the French with blue, so that the cells were striped with blue and white, according to the kind of cartridge found by the wasps.

Some wasps build their nests in, or rather on, the branches of trees; the nests being seldom larger than an ordinary orange, and much of the same shape. They are entirely covered with paper, and, if a section be made, one or two umbrellas are to be seen inside, so as to afford an additional protection against rain. The aperture through which the wasps enter and leave the nests is always at the bottom.

The Hornet (*Vespa crabro*), the largest of our wasps, mostly builds its nest in hollow trees, though it often avails itself of an old building, or the space between the upper rooms and the roof. In all important respects, the nest of the hornet is the same as that of the wasp, but the insect has an awkward habit of working by night as well as by day, so that to take its nest is a difficult task, through the insect being very strong and active. Some years ago I wanted some specimens for dissection, and having found a nest, I stationed myself as near as I dared, and with a net, captured the hornets as they left the nest. Though I rolled the insect in the net as it was caught, and killed it immediately, there was not one of them which had not bitten a hole in the net and got its head out. Had one of them escaped, I should have run away as fast as I could, for the insect would have gone back to the nest, and brought its companions on me.

The hornet may be at once distinguished by the colour of its dark spots and stripes.

"COLLEGIAN" TO "COWBOY."

A STORY OF INFLUENCES.

By M. F. Billington.

IT is a dreadfully cold, foggy, winter's night. I am very tired, and somewhat sick at heart after a long day's visiting in the great South-London parish of which I am curate. My little sitting-room looks cheery enough as I enter. Tea is on the table; the savoury scent of a mutton chop greets my nose, and the fire blazes brightly. A letter, however, in deepest black-edge, lies on the mantel-piece. The writing is quite unknown to me, but it is in a delicate, lady-like hand, of the period before the present, when all young ladies wrote alike, in great back-handed scrawls. I tear it open in haste, and I find it contains a foreign enclosure; but I read the lady's note first. It runs thus:—

Birmingham, *Nov. 29th*, 188—

Dear Mr. Lucas,—

You were such a friend of our darling Walter's, that I am sure you will read with the deepest sorrow the letter I enclose. The grief that it causes to his father, sisters, and myself, I can never tell you; but perhaps you can conceive a mother's anguish at her only son's lonely death in the far prairies. The blank seems irreparable. I can only look above, to Him who is acquainted with grief. Forgive more now. I scarce know what I write.

Believe me, ever for his sake, your friend,

Lucy F. Howell.

With sickened fear I unfolded the thin sheets, and read:—

Blacktail Camp,

—— Co., Montana, U.S.A.,

Oct. 25th, 188—

Dear Mr. and Mrs. Howell,—

I am not much of a hand at writing letters: it does not come very natural to a fellow who spends all his days in the saddle, so if I tell you my news—and I do wish it was better to tell—in short words, you must forgive me. I can't put in texts and verses, so my story will seem plain. Well, I must tell you what happened a week ago. Jim Steere, Walter, and me,—we were to be off to go to the station right up the creek, and to bring in all the cows—they're all cows, out here—on that part of the Ranche, for we meant to fat all the best in the stalls, for the next drove East. We guessed it would be about a ten days' job, and we took up blankets, flour, pork, and all the rest of it on a wagon. Day after we were fixed in there, Walter and Jim were riding hard after a wild heifer, and I saw Walter's horse go down, and him off over its head. He never seemed quite up to these horses out here, somehow. Jim jumped off, and I went up to him, for we saw something was wrong. The horse had broken its foreleg by putting it into a hole, so I put my six-shooter behind his ear, and *he* lay dead. But poor Walter didn't move. He was kinder faint, and didn't speak when we asked him what was the matter. We picked him up, and carried him to the station, just as gentle as we could. I remembered there was a can of Swiss milk, and I made him some tea and put some in, but it was an hour or two before he opened his eyes. I said, "Where are you hurt?" and he answered, "All over. My head is bad, and my back ain't right." "I guess," I said, "whether this ain't a bad job?" "You're right," he answers, "old boss. It will be a good many weeks before I'm right." Jim shot a deer up the creek, and I made some soup, and we tried our level best for him for two days. He lay there quite quiet, but he couldn't move a bit. Second night, I said, "Think whether you'll get over this? Hadn't I better read a bit out of my Testament?"

I never was what they call religious, but when I started out West, I promised my old mother I would never leave that little book behind, and I never did. Sometimes I'd read it to myself by the fire, and I'd think, "Some day I'll learn more what's in it; it's real good." But Walter answered quite sharp, "I don't want your reading. There's nothing any good in the Bible. I don't believe in it." Well, I didn't say any more just then; but it was the fourth day after his accident, and I was cleaning my gun, and Walter said,—"Boss, isn't there rather a nice piece somewhere in the Testament about the Good Shepherd?" "Yes," I says, "my old mother's read it many times; but I don't know where it comes in, I'll have it sometime." So I sat down, pulled out my Testament, and—perhaps you'll not believe me, but it's true—I opened it at that very page, and I read it, and I read on two or three chapters. Walter said presently, "Do you think that's true? I should like to think it was. It wouldn't seem quite so bad to die, if I thought I wasn't too black and poor a sheep for the Shepherd to go after."

I wished to say more, but I ain't learned. I only said, "Yes, Walter, I know it is true. A good shepherd would go after any of his flock, and I know somewhere it says, He came for the lost—I guess that means *all* the lost. They must all be brought in, else the account won't be right." Every day he

got worse. His legs were as cold as ice, and he had no more power with them than a baby. He liked the reading. Jim or me was almost always reading to him, and sometimes he'd cry out and say, "I wish I'd known this before. I don't think Jesus would have thought it worth being crucified to save me. Heaven can be filled with better than me." "There'll be room there for us all, I reckon," I answered. But I can't go on telling you all the talks we had. I'm only Boss of a station, and I couldn't explain as well as I wanted to. By this time, you must know that I have to tell you of his death. It was afternoon, and Jim and me was sitting by him. Jim had been reading about the Prodigal Son, and Walter didn't speak when it was done. Presently he said, "It's all over now. The Good Shepherd's found me, and I'm going into the Fold. Good-bye, Jim; good-bye, Boss; you'll write and tell my father and mother at home, that I'd come back at last to the fold I'd strayed out of. Give them my love, and say I died trusting in Him." Jim shook hands with him, so did I, but he kept mine in his, and thanked us both, and he whispered of the Shepherd again once, and very soon was dead. Jim and me felt mighty queer and lonesome. We'd all been good friends, and he'd always acted straight. Next day we buried him. There wasn't a minister within call, so I read about the Good Shepherd over his grave, though a lump in my throat seemed near choking me all the time, and Jim said, "Ain't there a verse somewhere about the sea giving up the dead?" so we read that, and a bit more about the New Jerusalem. It didn't seem so bad to leave him there then. We built a pile of white stones over his grave, and came back, and now I'm writing to you. Jim and me are real sorry to have to write such bad news. He is as much cut up as me.

I remain, yours very sincerely,

JOHN F. HUNTLEY.

P.S.—We shall send you his watch and chain, and other things; but Jim wants to keep his pipe, and I would like his knife.

J. F. H.

I put down the letter, utterly dazed with grief and remorse. For *I* was his murderer! Yes, I, the hardworking curate of Saint Mark's, here in England, was morally just as much his murderer as if I had shot or poisoned him. Poor handsome Walter Howell—my greatest friend—dying alone, save for the rough humanity of two cow-boys, on the distant banks of a Montana stream! As I sit with my head on my hands, my fire burns low, and old Cambridge days rise before me with a vividness of reality almost painful.

* * * *

I was an undergraduate of a small College, which, for convenience' sake, I shall designate St. Paul's. I had been there a year when Walter Howell arrived as a freshman. In the course of that year, I had joined a little private society, which had for aim the study of German metaphysics and "higher" Biblical criticism. I was not an "atheist" in the usual sense. Perhaps I shall best define my religious views at that period if I say they were "modern and advanced." They did not steady me in the least; and I am afraid that I did a great many things that did not redound at all to my credit. I gambled considerably, both at cards and horse-racing; and though it is a very grave offence in University eyes, and is not permitted, I managed on more than one occasion to go to Newmarket. I called on Walter Howell, and liked him at once. There was a dash and pluck about him that was lacking in me; and he did things thoroughly, whether for good or for ill. He was an extremely able linguist, and I introduced him to our Society, where, instead of stopping at an illogical semi-negation of religious truth, he soon somewhat startled us by avowing himself a complete infidel.

I must admit that I felt rather uncomfortable about this; for I knew that he had been sent to Cambridge in the hope that he would take Theological Honours, and, in any case, read with a view to becoming ultimately a clergyman. It was not long before his extreme views became generally known; for he never attempted to conceal them, and indeed openly ridiculed the daily "chapels" and sacred ordinances of all kinds.

He was more than once gravely remonstrated with, to which arguments he always listened with an air of assumed pity for the holders of such antiquated doctrines. Not satisfied with having blasted his parents' hopes of a career of ministerial usefulness, I further initiated him into my own vices and follies, and rendered him thoroughly idle. Though his talents were very high, in some points he could not satisfy the examiners without working; and to his own mortification, but to no one's surprise, he failed to pass his Little-go. When he came up again, at first he worked fairly steadily; but in the course of a few weeks my bad counsels, and the seductions of the rowdy set into which he had drifted, soon brought him into his old ways. He was "sent for" by the Dean, but no remonstrances did him good; and it was not long before he found himself "gated" for the rest of the term, for not "keeping" his due number of "chapels" during the week.

One evening in the May term, Walter and two or three other men were in my rooms, and amongst them was a fellow named Hall, whom we described always as an "awfully pious chap." He did not belong to St. Paul's, but to another College. He was perfectly sincere in his convictions, and moreover was a very good athlete, and was in his College boat. He had a class of big lads in the Sunday School, and was deservedly popular. Both Walter and I obtruded some of our views upon him on this occasion, and he took the opportunity of expressing his opinions of our doctrines in terms the reverse of flattering to ourselves.

I must admit, too, that he "shut us up" very much; and our pride was wounded that it should have been done in the presence of the other men, who, we could see, were considerably amused at our discomfiture. One of Hall's "manias," as we termed it—I offer no comment here as to whether it was altogether advisable or not—was to preach or conduct a short Gospel service on Sunday nights on Parker's Piece; and, as he went out, it flashed into my mind that we might somehow wreak a vengeance on him through this.

"What a beastly prig that fellow is!" I said; "it's enough to make one ill to think of him, tub-thumping and shouting Moody and Sankey on the Piece on Sunday nights. Howell, can't we conduct an opposition meeting, and banish him somehow?"

"I warrant you don't shut him up," answered Crewe, one of the party. "He's more popular than you think."

"I'll warrant I do," replied Howell; "he wants a jolly good take-down."

It was not long before Crewe and Jackson went out, and I urged Howell to render the service or sermon next Sunday an impossibility.

I was a miserable coward about it myself; for though my own University character was not openly a good one, yet it was nothing like as besmeared as Howell's.

With heartless selfishness, I argued to myself that he had little to lose in the matter, if it caused a serious row, while I had more at stake. So I resolved not to arrive in time to be actually in the disturbance, and then to deplore that I had mistaken the time.

Sunday night came. Hall was addressing a large crowd, and suddenly Howell appeared on the scene with a miscellaneous troop, some of whom had drums or brass instruments, which they played vociferously. Hall made a quiet and gentlemanly appeal for order, but it was disregarded; and before many minutes had passed, the opposing factors were in collision. A very noisy *fracas* ensued, during which the Proctor arrived quite unobserved; and after a second's pause, he quietly stepped up to Howell, asking him in the usual formula, "Your name and College, sir?" The crowd melted almost by magic at the sight of the dreaded representative of University regulations and

"Walter and Jim were riding hard after a wild heifer."

order; and very crestfallen indeed was Howell when told to "Come to me, sir, to-morrow morning."

Walter came to my rooms, and told me what had occurred. I felt like a brute as I made my own plausible excuses, and knew the trouble he was in. We agreed that it was a most unfortunate business; and we knew that, under the circumstances, he would assuredly be rusticated for at least a term. But Hall was a favourite everywhere, Howell was not. Everything was against him, and the "Dons" therefore pronounced sentence of rustication for a whole year.

It was a terrible blow to Walter's family. His father came up and saw the tutor, and arranged to take his name off the College books at the end of the year. Their whole hopes centred in him were thus blighted; and I certainly realised what remorse meant, when I saw how deeply grieved and disappointed his excellent old father was. He was very kind to me, and I felt bitterly ashamed of the cruel injustice that my bad influence had worked towards them. For no one else had had the influence over him that I had; but I did not let Mr. Howell know how evil this had been; and with horrible hypocrisy, I posed before him as the counsellor whose words had been neglected. Walter was far too chivalrous to enlighten him.

Well, I have told my story. My wretched example and counsels had closed the door of Walter's life-hopes of a profession, and had sent him to the Far West as the only alternative. He was unfitted for the life, and it killed him. Yes, I am his murderer! O God of pity, I can only thank Thee for calling him back to the fold again, whence I had driven him out.

Perhaps you wonder that my own life is so changed. God employed Hall, now my fellow-curate at St. Mark's, as His means to convince me of the error of my ways; and most thankful am I for the happiness I know now. But to the end of my days I must carry a burden of anguish and sorrow that I can never—no, never!—lose; and the thought of that lonely grave in that distant State will be my daily cross. I shudder as I think how much heavier it might have been, but for the Divine Mercy that interposed to remove the most cruel work of my fatal influence.

The triennial Conference of the representatives of the Y.M.C.A.'s of the entire world, will be held in Stockholm, Sweden, in the month of August, next year.

The latest invention in hat-lining is a map of the city of London, printed on silk, so that any stranger may see at a glance if cabby is taking him the nearest route.

I once saw a shepherd, who used to divert himself in his solitudes with tossing up eggs and catching them again without breaking them, in which he had arrived to so great a degree of perfection that he would keep up four at a time for several minutes playing in the air, and falling into his hands by turns. I think I never saw a greater severity than in this man's face, for by his wonderful perseverance and application, he had contracted the seriousness and gravity of a privy counsellor; and could not but reflect within myself that the same assiduity and attention, had they been rightly applied, might have made him a greater mathematician than Archimedes.—*Spectator.*

CRISP CORRESPONDENCE.

R. F.—Have any of your Homœopathic readers found any medicine of service for chronic enlargement of the tonsils?

"A Suggestion."—We beg the writer to accept our hearty thanks for his hearty and practical interest in our Paper. We specially welcome such communications from young men—they will always receive thoughtful consideration.

J. W. H.—You will find in future that great care is being taken so to arrange our Competitions and the date of their closing, that subscribers to the Monthly Part shall have equal advantage with those who take our Weekly Numbers. Accept our sincere thanks.

"A Reader."—The difficulty will be entirely obviated by purchasing the Monthly Parts instead of the Weekly Numbers, for binding at the end of the year.

"A Young Man over 21."—We thoroughly endorse your opinion, that mere witticisms and common-place jokes are a mark of folly rather than wisdom. Conversation "seasoned with salt" becomes a young man, and this is cultivated by the reading of thoughtful and elevating literature, and, above all, by the daily, prayerful and humble study of God's Word. How many are drifting from their moorings in these days of subtle heresies and open departure from the Truth,—because not established and grounded upon this Rock. God bless you in your work amongst the lads.

"Hythe."—If confession of sin to the one you have injured be *possible*, this is enjoined by God's Word. If this be impossible, then pardon and peace may be realised at once, on seeking the cleansing of the blood of Jesus. We decidedly consider it wrong for a Total Abstainer to repair to stimulants when feeling tired or weak. A tonic or good beef-tea, etc., ought to suffice. If not, seek medical advice. To fly to a stimulant is most dangerous. Our sympathies are entirely on the side of Total Abstinence as distinguished from *Temperance.* "Teetotal 'tween drinks" is no clause in *our* creed.

"Housekeeping on 10/- per Week."—Impossible to give any information without full details of circumstances. Send us these, and we will gladly reply.

"A Hewer of Broken Cisterns."—So by this very pseudonym you admit that the cisterns at which you have vainly tried to slake your soul-thirst are "*broken,*" holding no water. Then why not seek *the Fountain* of the river of the water of life? "HE SATISFIETH,"—yes, He satisfieth all the infinite yearning of your whole being, whether mental or spiritual. But the spiritual need must be met *first.* Here lies your grand mistake. You are seeking to satisfy your mind, your intellect; you must needs have God's wondrous plan cut and dried, all square to your finite comprehension. Nay, friend; let all this remain aside for the present. There is a deadly disease at work in your system; it is not arguments nor theories with which you must deal in your perilous condition; it is the Physician Himself you need. Repair straight to Christ; one touch of His life-giving hand, and you shall be whole; one word of pardon, "Son, thy sins be forgiven thee," and the crushing load of unforgiven sin shall be lifted from your conscience. Personal contact with the living Christ shall bring life out of death, light out of darkness, and you shall step out in the courage of *faith* into the glorious liberty of the children of God. We should be glad to write at greater length if we had your address.

"A Seeker of Truth."—We trust our readers seeking, like yourself, spiritual help through our columns, will never be disappointed. In 1 John 2. 15, 16, it is THE LOVE of the world which indicates a worldly-minded person. If you have no *love* for the world and worldly pursuits, you will sit very loosely to them, you will use them with jealous moderation, and it will cost you very little effort to avoid them altogether if they in any way conflict with your own close walking with God. Re-created men and women want very little "recreation," so-called; they find their *rest* in change of work for their heavenly Master.

"Amicus."—Though not possible for you to compete for "OUR OWN GAZETTE" Scripture prizes, you will be glad to know that we propose issuing a special series of questions shortly in "A.I." Meanwhile you will find our Notes on the International Lessons very suggestive for private Bible study. It is a good sign when our young men turn to their Bibles. Your hearty words are very welcome.

"Fretworker."—We are glad to give further information as follows:—

Wood for fretwork can be purchased from the following hardwood merchants:—

L. Marshall, 14 and 15, James Street, Old Street, London, E.C. Richmond and Graveson, 8, Clifton Street, Finsbury. Short Brothers, 256, Old Street. Westlake and Sons, 51, Tabernacle Street.

Fretwork is largely used by organ builders, church furnishers, musical instrument makers, etc., and such trades would be the likeliest market for such a product.

OUTLINE OF INTERNATIONAL SUNDAY SCHOOL LESSON.

JANUARY 15TH.

JESUS WALKING ON THE SEA.—*Matthew* 14. 22-36.

GOLDEN TEXT: "Be of good cheer; it is I."—*Matthew* 14. 27.

Miracle given by three Evangelists. One seeming contradiction; Mark says they were going to *Bethsaida;* John to *Capernaum.* No discrepancy whatever, they were to keep near the shore, passing Bethsaida on the way to Capernaum.

For result of miracle studied last week, see John 6. 15. The people wanted to make Christ king. His determined refusal. Why? John 19. Sends His disciples away in a boat; He goes up the hill, at the base of which the people had been fed, and there, in one of its clefts, spends the time in prayer. If we would be great in faith or work, must be often in prayer. Illustrate from Scripture characters.

"On *The Sea.*" Different names it had. Note surroundings: mountains, cities, villages, pebbly beaches. Its commerce. Its present state—desolate.

Bible references to Sea: Exod. 14., Jonah 1., Isa. 51., Rev. 20. Emblem of life.

"ON The Sea." Descriptive of most varied experiences.

Five points in this lesson.

1. "*Sorrow* on the Sea" (Jer. 49. 23).

Picture the little boat putting off (sad sights at starting of emigrant ship). Such sad faces. No happy boating song kept time with the splash of their oars. See the boat slowly disappearing in the twilight. Why sad? Disappointed, their Master would not be made king; sad, because He had sent them away alone. Was it right for them to be sad? No; Christ was praying for them, watching them, planning everything for their good. He *was* with them. We often have similar sorrow; think things are going wrong, because they are not as we wish; think that Christ has left us. Great mistakes.

2. *Storm* on the Sea.

Wind arose. The bright day had a stormy ending. They got frightened. Little boat tossed and whirled about. Darkness and dread. Storms in life. Every life has its troubles; but storms purify the atmosphere. When troubles come, never let fear magnify them; never lose faith or courage.

3. CHRIST on the Sea.

Describe the white figure on the top of the white-crested waves. Disciples thought it a spirit, more frightened than ever. A miracle (Ps. 77. 19; Job 9. 8; Hab. 3. 15). Nothing impossible with God. Christ's cheering words, translated by some, in spite of the grammar, into the tender, homely phrase, "It's only Me; don't be frightened." "It is I"—majestic king, "I" who created the sea. "Man's extremity is God's opportunity." In the dark hour Christ will come.

4. *Saved* on the Sea.

One man in that little boat, very excitable and impetuous, wanted to go to Christ; could not wait. A little word borne by the wind to him, "Come." He was very courageous, got out of the boat. Perhaps some of his comrades tried to keep him in. Soon got frightened, when he looked at the waves. Christ's call to him; Christ's hand catches him. Christ saves him. (The five words in English Bible, "O thou of little faith," are in the Greek given as one compound word, meaning "Little-faith," the name given by Christ to Peter. Years afterwards he was Master *Great*-faith.) Christ's call to us is, "Come." Christ's hand ever outstretched to help.

5. *Sunshine* on the Sea.

It was about six o'clock in the morning, in the month corresponding to our April. As soon as Christ got in the boat, the storm ceased. Where Christ comes to dwell, there is eternal sunshine.

Further Notes by REV. J. H. THORPE, M.A.

THE whole passage (with the exception of Peter's action, recorded only by St. Matthew), is common to Matthew, Mark, and John. Note 26th verse in the Revised Ver.: "It is an apparition." Peter's words, "Lord, if it be Thou," do not imply doubt, but may be taken to mean "Since it is thou." Note the coincidence between the accounts in St. Matthew and St. John. The former tells us the "wind was contrary" to the disciples; therefore, of course, they could not use a sail; so the account of the latter is most natural, "when they had *rowed*." Note *v.* 24—"the ship was . . . in the midst of the sea"—two or three miles from land, showing that Christ could not have been walking on the shore, as some have contended.

Christ will teach us harder lessons as we go on in His service. This was not the first storm the disciples had been in. See Matt. 8. 24; but then it was day, and they had Jesus with them; now it is night, and Jesus is not with them. The whole passage is like a string of pearls,—we can only select a few. From our Lord's dealings, we learn—

1. *His humility.* Ver. 22. St. John tells us why. He "perceived," etc. *He* was clothed with humility, and no garment so well becomes His servants. Humility is to religion what the bushel is to the heap of corn—its measure. 2. *His use of prayer.* He prayed at the *end* of the day's ministry. Do not some think it enough to pray at the *beginning* of their work? 3. *His knowledge.* The disciples were far out at sea. It was a stormy night, yet (see St. Mark 6. 48) "He saw them toiling in rowing." Remember, Jesus knows all, and in His own time will bring relief. 4. *A lesson about His providence.* He sometimes does not send help till the last moment (see *v.* 25). He came to them in the fourth watch—the last. It was "when they wanted wine" at Cana, and when Peter was "beginning to sink," He put forth His power. "Tarry *thou* the Lord's leisure." He may send you help in the way you least expect it. 5. *Note how Jesus comforts.* He said, "It is I." He comforts by revealing Himself.

From the disciples, learn:—(1) *Trial times often follow times of privilege.* Graces are given to use, not to possess. Afflictions and curses are the grindstones by which God sharpens His instruments. (2) *We are not always good judges of what is most for God's glory.* Thus it was with them, when they wanted to make Christ an earthly king. (3) *To trust Christ, though we may not see Him.* There is a faith, which can see in the dark. Get it. (4) You too will have your storms, your waves of trouble; if He is in your heart by faith, they cannot harm you.

From St. Peter, *learn that the only safe way is to walk "Looking unto Jesus."* You need not fear failure, if you trust in and look to Him, Whom "winds and sea obey."

From "them that were in the ship," learn that deliverance should be followed by worship of the Deliverer.

International Lesson Notes, continued.

Disciples.

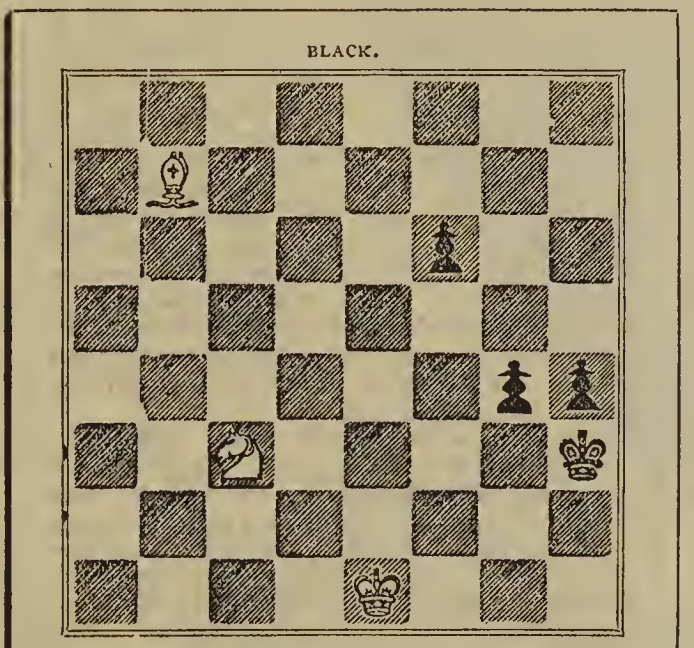
1. Influenced by His power, ver. 22.
2. Watched by His eye, Mark 6. 48.
3. Troubled at His presence, ver. 26.
4. Cheered by His voice, ver. 27.
5. Invited to Himself—"Come," ver. 29.
6. Crying to Him in distress, ver. 30.
7. Object of their worship, ver. 33.

"Be of good cheer."

1. The good cheer of His *Presence*, Matt. 14. 27.
2. The good cheer of His *power*, John 16. 33.
3. The good cheer of *progress*, Acts 23. 11.
4. The good cheer of *promise*, Acts 27. 22.
5. The good cheer of *pardon*, Matt. 9. 2.

"He said, Come," ver. 29.

Seven Comes.



1. Come *down*, Luke 19. 5—*Conviction.*
2. Come *forth*, John 11. 43—*Conversion.*
3. Come *to Me*, Matt. 11. 28—*Consolation.*
4. Come *apart*, Mark 6. 31—*Communion.*
5. Come *out*, 2 Cor. 6. 17—*Command.*
6. Come and *take*, Mark 10. 21—*Conformity.*
7. Come *away*, Cant. 2. 10—*Coming One.*

CHESS.

By F. F. ROWLAND.

PART VI.

POSITION ILLUSTRATING LAW X.

White to play and mate in three moves.

THE LAWS OF THE GAME *(continued)*.

VIII. CHECK.—A player must audibly say "check" when he makes a move which puts the hostile King in check. The mere announcement of check shall have no signification, if check be not actually given. If check be given, but not announced, and the adversary makes a move which obviates the check, the move must stand. If check be given and announced, and the adversary neglects to obviate it, he shall not have the option of capturing the checking piece, or of covering, but must "move his King" out of check; but if the King have no legal move, there shall be no penalty. If in the course of a game it be discovered that a King has been left in check, for one or more moves on either side, all the moves, subsequent to that on which check was given, must be retracted, or the game annulled.

IX. ENFORCING PENALTIES.—A player is not bound to enforce a penalty. A penalty can only be enforced by a player, before he has touched a man in reply. Should he touch a man in reply, in consequence of a false or illegal move of his opponent, or a false cry of check, he shall not be compelled to move that man, and his right to enforce a penalty shall remain. When the King is moved as a penalty, it cannot castle on that move.

X. CASTLING.—In castling, the player shall move King and Rook simultaneously, or shall touch the King first. If he touch the Rook first, he must not quit it before having touched the King; or his opponent may claim the move of the Rook as a complete move. When the odds of either Rook or both Rooks are given, the player giving the odds shall be allowed to move his King as in castling, and as though the Rooks were on the board.

XI. COUNTING FIFTY MOVES.—A player may call upon his opponent to draw the game, or to mate him within fifty moves on each side, whenever his opponent persists in repeating a particular check, or series of checks, or the same line of play, or whenever he has a King alone on the board, or—

King and Queen,
King and Rook,
King and Bishop,
King and Knight,
} against an equal or superior force;

King and two Bishops,
King and two Knights,
King, Bishop, and Knight,
} against King and Queen.

and in all analogous;

and whenever one player considers that his opponent can force the game, or that neither side can win it, he has the right of submitting the case to the umpire or by-standers, who shall decide whether it is one for the fifty-move counting; should he not be mated within the fifty moves, he may claim the game shall proceed.

XII. PAWN TAKING IN PASSING.—Should a player be left with no other move than to take a Pawn in passing, he shall be bound to play that move.

XIII. QUEENING A PAWN.—When a Pawn has reached the eighth square, the player has the option of selecting a piece, whether such piece has been previously lost or not, whose name and powers it shall then assume, or of deciding that it shall remain a Pawn.

XIV. ABANDONING THE GAME.—If a player abandon the game, discontinue his moves, voluntarily resign, wilfully upset the board, or refuse to abide by these laws, or to submit to the decision of the umpire, he must be considered to have lost the game.

XV. THE UMPIRE OR BY-STANDERS.—The umpire shall have authority to decide any question whatever that may arise in the course of a game, but must never interfere, except when appealed to. He must always apply the laws as herein expressed, and neither assume the power of modifying them, nor of deviating from them in particular cases, according to his own judgment. When a question is submitted to the umpire, or to by-standers, it must be by both players. The term "by-stander" shall comprise any impartial player of eminence who can be appealed to, absent or present.

SOLUTION TO POSITION ILLUSTRATING LAW V.

The only move Black could have made last, is P at QKt5 takes Kt. Retract that move then, it being White's turn to play, he announces mate in two moves. To effect this, White plays 1Kt to Kt5. Black must, according to Law V., play 1P to Kt6. White then mates by Kt×P.

PENS, INK, AND PAPER;

OR,

THE STORY OF OUR WRITING MATERIALS.

By Rev. D. Cooper Hunt, M.A.

WRITING is one of the commonest methods by which we convey our thoughts and feelings to others. Almost every one in a civilized country, such as England, France, or Germany, can write; although there are a few who, through lack of education, or inability to learn, are unable thus to express themselves.

How did writing commence? who invented the Alphabet? and how did our present mode of writing arrive at its present state of perfection? These are very interesting questions; and though it is not possible to answer them fully, owing to the scantiness of the information we possess, still there is much which we can gather to satisfy inquiry.

The letters at present used are not the same as those employed many hundred years ago. Ancient writing was picture-writing. This mode of writing was not very easily carried out, and very little could be expressed by it at a time. Of this kind were the Egyptian hieroglyphics, which at first were series of pictures, very difficult to read, and at one time thought to be undecipherable and understood only by the priests; hence the name, from *Hieros*, meaning *sacred*, and *glypho*, *to carve*. Writing, therefore, amongst the Egyptians must have been a very tedious process; and we are not surprised to find that the elaborate picture-writing gave way to a simpler form, when the mere outline of the figures was given; and at length a sign, or kind of mark, only was employed, which was universally adopted.

The symbolic appears to have been the connecting link between the hieroglyphic and the alphabetic manner of writing. The alphabet was supposed to have been invented by Thoth, a son or descendant of Mizraim, the father of the Egyptians. No one can doubt the great benefit which the invention has conferred upon the world. It diminished to an enormous extent the difficulty of writing; it shortened the labour of memory; and was capable of expressing all subjects, all ideas, every possible thought, with the greatest variety and ease. The Phœnicians appear to have been the first who obtained a knowledge of the new system. They imparted it to the Jews and Arabians, and carried it over into Greece. From that country it was sent, or conveyed, to other lands, and spread eventually over the whole world. The Chinese alone rejected, and still continue to reject, the valuable discovery, and adhere to their ancient mode, which, though somewhat modified from what it once was, is in reality the same symbolic, hieroglyphic form.

The materials used for writing upon were various. As far as we can gather, leaves were first employed; and probably this was the reason why the divided sheets of paper, which are bound together in a book, are called *leaves*. Later on other materials, such as stones, sheets of metal, plates of lead or copper, were adopted. Thin pieces of wood or tables were also used, covered with a coating of wax; upon which marks were made with a piece of iron, called a stylus, pointed at one end, with which the letters were formed; and blunt or flat at the other, which was used for rubbing out what had been written, either when it was necessary to make an alteration, or to use the table or tablet for other writings. By a good or bad *style*, therefore, was meant, at first, simply the quality of the instrument with which the writing was made. The term was afterwards employed to describe the *character* of the language itself.

The Egyptians early prepared the Papyrus, a reed, or flag, growing very plentifully on the swampy banks of the Nile. Sheets were obtained from the stem of this plant; and upon these sheets, letters were engraved with an instrument similar to that used for writing upon wax. The substance so prepared was called *Charta*, from a city of Tyre of that name, near which the plant was also found. From the word *Papyrus* we derive our word *Paper*.

Another material, brought into the service of writing, was the interior bark of certain trees, prepared by beating it, and then cementing it together by a solution of gum. The inner bark of trees was called *liber;* and this gave the name to the book made from the material—a name which is still used in the word *library*, a collection of volumes or books. *Vellum*, or the skins of animals—called also *parchment*—was subsequently employed; the use of which seems to have originated from a curious circumstance. The King of Pergamos, being denied the supply of papyri from Egypt, caused the preparation of the skins of sheep to be made, which preparation was called *vellum*, signifying a fleece or skin; it was also called *parchment*, from Pergamos, the place where the art of preparing the skins in this manner was discovered and improved, and first brought into general use.

Linen, silken and cotton cloths, were afterwards manufactured into paper. Paper is by no means a modern invention. The Chinese have known how to make it for a very long time from raw hemp, or the rind of either the mulberry tree or the bamboo, a cane growing very extensively in their country. The Romans were also great paper-makers. The natives of Mexico, before Mexico was taken by the Spaniards, prepared their paper from the leaves of a tree called *Agave*. Later still cotton was employed, instead of leaves or the bark of trees. The Arabians made paper from cotton as early as A.D. 700. Cotton gave place to linen; and it is now made from a variety of materials.

An early writer gives a brief but very comprehensive description of the manner in which paper was made from the Papyrus plant. The stem of the plant was divided with a kind of needle into thin plates or sheets, and as these were separated, they were extended on a table, and laid across each other at right angles. In this position they were moistened, and, while wet, put under a press, and afterwards exposed to the rays of the sun.

The pen employed in writing has not always been the same. Mention has been made of the *stylus*. Another kind was the reed, or bulrush, cut in the shape of a quill. The word *pen* was originally *penna*, which signified a quill. The reed was cut to a point and slit, very similarly to our own pens. The Chinese use a camel's hair pencil brush, which they hold perpendicularly, and with it they write exceedingly quickly. The Hebrews appear to have used a reed.

Great attention was paid to the manufacture of ancient ink. The material was prepared chiefly from lamp black, with the addition of gum. The ancient Roman ink was for the most part made of these ingredients. The Chinese use the same. Inks were made of various colours. It is said that the works of Homer were written in letters of gold upon a roll 120 feet long, formed of the intestines of serpents.

There has been in the matter of writing, what we see in all other branches of knowledge—a gradual growth. Our present easy mode of conveying on paper our thoughts and impressions did not arise all at once. Many centuries passed, many plans were adopted. Step by step improvement was made, until at the present day it is the exception for any one not to write. At one time writing was confined to the few; and these were regarded as remarkable personages. Now that one is singular who cannot write.

By written documents, we have been enabled to improve upon the past. Past experience has been recorded, and by means of it we have been enabled to step still upward in the path of knowledge. At one time everything was inscribed with the pen; even books were thus written. and copies of them made, which necessarily rendered them very expensive.

Many of these ancient volumes, or manuscripts, are still in existence, and are, owing to their age and scarcity, very valuable. The printing press has brought about a complete revolution in literature, and now, what required such a great deal of time to produce, is accomplished in a few days, or even hours. Writing is by no means so laborious as it used to be; and what with the introduction of shorthand, of which there are several systems, as well as the perfection to which printing has attained, it is possible to have the words of speakers, as well as writers, recorded easily, and very inexpensively; so that knowledge is increased, and we may hope, much good is thereby done.

CHAPTER XVI.

MIST.

CONSTANT longing of the mind for knowledge and for change, sends so many of us wandering abroad, and contributes to our enjoyment while visiting new countries, or sailing over unfamiliar seas. And the more complete the change, the greater the enjoyment.

If this be true,—and I think it is,—then the reason is not hard to find why travelling in the Arctic regions exerts so great a change and charm over the minds of those who have spent one winter in those wild, weird climes.

Now, two of the most successful physicians this world knows,—or ever did or will know,—are Dr. Hope and Dr. Change. Give a man hope, and you half cure him. Send a chronically sick person abroad, or even to the seaside of our own country, and you often give him a new lease of life. Is it change of air that does this? No, but change of scene and change of thought. Why! an invalid has change of air every morning; winds from the west, south, east, or north; and winds from betwixt and between; bracing winds, relaxing winds, irritating winds,—all sorts and conditions of winds and air,—but what good can they do the human body, if it sticks, like a vegetable, in one hole?

Here was the *Oonalaska*, feeling around in the middle of the great sea of Behring, in a fog as dense and dismal as ever puzzled a mariner, or bothered the eye of the man at the wheel. Not a breath of wind was blowing,—not enough to fill the vane at the main-truck yonder. For well-nigh a week she had been enveloped in this cloud of ghostly mist in a great swelling sea;—a fog so thick that, viewed from the quarter-deck, a man standing by the wheel was simply a shape; and the jib-boom, or bowsprit itself, for that matter, was apparently away in another world. And all day long, and all night as well, the horn kept constantly hooting, till verily seals and walruses occasionally rose up from the dark water to gaze and wonder at the strange sound.

The ship was on the very confines of what, to the great majority on board, was akin to a new world, and every one was impatient for the mist to lift, and the sun to shine.

"I'm going to have the crow's-nest hoisted to-day. It is all ready, is it not, Desmond?"

"Yes, sir. The carpenter and sailmaker have been busy at it the last three days."

Katie looked puzzled, glancing first at Desmond, then at Captain Boyd. The latter laughed.

"You've never seen a crow's-nest?"

"Not what *you* call a crow's-nest, I'm afraid."

"You will to-day, if you can venture up amid the fog."

It was not only aft, but forward among the men also, that excitement prevailed about the history of this crow's-nest. And when the huge barrel was brought up, and the ropes were bent on to it, and it finally began to steadily rise and rise, guided by a man or two aloft, and a stay from the deck, then the crew, who had all crowded on deck, as full of joyful expectancy as children going to a school treat, must needs take off their caps, and give vent to three such rousing cheers as, probably, neither the seals nor the walruses had ever listened to before.

Very little, it must be admitted, interests the mariner at sea; but the hoisting of the crow's-nest was no ordinary event, and indeed it seemed to give rise in every breast to a kind of joyous expectancy.

"The fog will fly away now, I feel certain," said Katie, catching hold of Jack's arm to avoid falling, from the ship's uncertain motion. Jack made this an excuse for a walk up and down the quarter-deck.

"Well," he replied, "I hope you're right; putting the nest up is a gentle hint to it, I think, don't you?"

Katie did not answer directly. There was no occasion, for Jack Silk was simply speaking because he thought it was the correct thing.

"Why!" she said, after a pause, "how this last month seems to have flown by!"

"It has, indeed." Jack was speaking from his heart now.

"And what a change!" continued the girl, as if she were thinking aloud. "Three weeks ago, or little over, we were in the tropics, on that lovely island in the midst of a scene of real enchantment. Oh! it must have been enchantment, for if I awake in the night even yet, when all is still, and suffer my thoughts to revert to it, I fall asleep almost at once. But *it* does not depart; no, it remains in my dreams. I can see the blue, blue sea stretching far, far away, and its waves coming lisping up and losing themselves, as it were, one by one on the coral sands; and the drowsy music of the cascade mingling with the winds whispering in the trees; and the songs—oh, yes, the songs—of those beautiful birds!"

"What are you two talking about so *very* seriously?" asked Miss Graves, as she and Captain Boyd met them.

"Why, nothing, cousin; that is, nothing conversationally; for now I think of it, I fear I have been doing all the speaking."

"And I'm sure," said Miss Graves, "Jack was longing to 'put his oar in,' to use his own elegant phraseology."

"There!" said Captain Boyd, "who's going to first set foot in the crow's nest?"

"I'll have a try," said Jack. "I'm better with my toes than with my tongue. Desmond, old man," he added, "I challenge you."

"Done!" said Desmond, boldly. "I pick up the gauntlet. Are you ready?"

"Hold on a moment, boys," said Captain Boyd. "We must have everything shipshape and according to Cocker. Let the men have a hand in the game as well as the officers. Lay aft here, lads; then call, somebody, for the ship's fiddler."

The fiddler came up at the call, tuned and made ready, and one of the men lashed him loosely against the mast, so that his hands were free.

"But," cried Nat senior, "there must be a prize, and the ladies must give it."

Your sister must knit the victor a helmet, and your cousin, Katie, must make him a sealskin purse."

The ladies laughed, and being assured there was no danger in the game, it was allowed to proceed. Jack stood on deck, close to the starboard main rigging, and Desmond by the port.

"Gentlemen, you will move at the last sound of the word. Stand by—now—away—aloft!"

The young men swung themselves into the rigging, as nimble as monkeys, and up they swarmed, hand over hand, while the fiddler played a merry tune. Over the main-top to a head, up the top-mast rigging to a head and neck. But that head and neck was Jack's, and before he had reached the ladder which singly conducts to the nest, Dess had given up in despair; and when Jack, dimly seen, waved his cap over the top, the cheering that rewarded him was something worth listening to.

But the sport was only beginning. Nathaniel looked towards the captain and laughed.

"Hold on," cried plain Jack Boyd, "if I don't have you as I am;" and away went the two seniors. It was the best race, after all. The men stood silent and amazed. It was shoulders opposite shoulders as far as the main top-mast cross-trees, then Nat began to flag, and the captain, with one garnd spurt, left him behind and gained the nest.

The crew were not content with cheering this time—the men must pitch their caps into the air, and shout like sailors demented. They were proud of their bold, old, white-headed skipper. The fun got fast and furious after that. Of all things in the world a barrel was brought up, full of red herrings, as prizes, and for two whole hours, amid such shouting and laughing as never had been heard before on board the *Oonalaska*, the game was kept up, till there was not a herring left in the cask.

CHAPTER XVII.

MYSTERY.

BY sunset that same evening, the swell had gone down, and it had become sensibly colder. The fog went rolling away south, and the sky became partially clear. Almost at the same time, a shout came from the crow's nest,—

"Land ho!"

Land? Yes; but, perhaps, land had never presented itself to mariners' eyes in a wierder, stranger, or more beautiful form.

Let me try to paint the scene, though words must fail. The sea all round the ship was a blue, dull-grey colour, with just the ghost of a frost-fog hovering over it like smoke. All along the western horizon lay a ridge of darker hue, and above this, reaching halfway to the zenith, was a glow of richest orange light, merging into pale blue, flushed with crimson, and floating, as it were, high up in the sky. Just where the orange light joined the bank of cloud, appeared the summit of some mighty mountain, wedge-shaped, snow-clad, and tipped on one side with a tint of carmine.

"Oh, how inexpressibly lovely!" cried Miss Graves.

"Is it very far away, Captain?" The question was put by Katie.

"My dear child, yes; the air in these regions is very deceptive. That mountain which you see is fifty miles away, by our reckoning, at the very least."

That night Captain Boyd took Katie up to see the stars, and they looked so very large, and so very near and bright, it seemed as though the waving nest could almost touch them. The night was very still and cold, yet it was a pleasure to walk up and down.

When Katie came on deck next morning, full of joyous expectancy, she found that ship and ocean were once more shrouded in impenetrable fog. The mist was white and frosty, and the ship was everywhere a sight to see. The rigging and ropes, and even the masts, seemed all made out of coral, the funnel alone, from which dark smoke was rolling, had escaped the embellishments of the artist, Frost; but the men's hair and beards were all as white as snow. Katie could not help smiling, it seemed as though every man on board was eighty years of age, at least—quite a patriarchal crew.

All that day the fog continued thick, and even appeared to get denser towards sunset. When darkness fell at last, the scene on deck was strange, mysterious, and weird. The light, streaming out from the companion hatches and from the deck lanterns, appeared to cut a way for itself, straight through the thick, white fog, and only in front of these rays was anything visible.

It looked like a phantom ship, with a phantom crew. Katie had one little turn upstairs, as she called it, but that was quite enough, for the cold mist on her face felt as if some invisible hand were rubbing it with ice.

She went below and enjoyed her books in the captain's easy chair. Next day something new occurred. The fog was as dense as ever, but a little wind had sprung up during the night, enough to fill the sails and raise a gentle ripple on the water. So fires were burnt, and the *Oonalaska* moved slowly through the waves on almost an even keel.

The fog-horn was blown very frequently, and now and then, by way of a change, the ship's bell gave tongue. The former instrument was performed on by Thurlow, while Boy Bates himself was proud to have charge of the bell.

But all that day strange voices sounded up out of the mist. Very startling at first they seemed to Katie, who, as usual, was having her forenoon promenade with Captain Boyd. For, all at once, the silence was broken by a wild, uncanny-like scream, shrill, quavering, prolonged. It really sounded so unearthly that she stopped short in her walk and turned a little pale. But the captain's smile reassured her. He was about to speak, when once again that sharp scream rang out, but nearer now, and followed, almost immediately, by such a chorus of merry, childlike laughter, that Katie began to doubt the evidence of her senses, and would hardly have been more surprised if the great fog-curtain had lifted, and revealed a bevy of happy bairnies just let loose from school.

"Come and listen here," said Captain Boyd, and leading her right aft, they both leant over the bulwark. For a short time there was silence. It was broken presently, however, in a way that was truly wonderful. First the same merry laughing chorus seemed to come nearer and nearer, then sounded all about and around them, and finally died away in the distance. Another short period of deep silence, then the sound, apparently, of voices in earnest conversation,—the low, deep bass of men, and the shriller, more musical notes of women.

Katie glanced half-fearfully round her, then out to sea again. The voices sounded louder, nearer, more mysterious,—now swelling into angry tones, then sinking into laughter, low and derisive,—and these soon ended in plaintive wailings and mournful shrieks, then died away, and all was still once more.

"Oh, Captain, do tell me what it all means. We really appear to be sailing into enchantment. I know that it is ridiculous; but look, look—what was that?"

She clung now in real terror to the captain's arm, for just a few yards from the ship, but well out of her frothy wake, a huge black head and shoulders slowly emerged from the sea, glared at them for a moment with wild, threatening eyes, then as slowly sank again.

The fog doubtless made it look double the size, but it really was a terrible apparition.

The captain had been about to reply to Katie when the great head rose out of the water, but now, with a look of some anxiety, he stepped forward on the quarter-deck and shouted,

"Ready about there, Mr. O'Neil. Stand by."

"All right, sir."

"Now then," he continued, "sound that horn."

"Don't be alarmed, my child," he added, turning to Katie, "at anything you may hear now."

It was well he had warned the girl, for hardly had the long, discordant note ceased, when, as if in answer to it, there came from the direction of the weather-bow, a chorus of hoarse and horrible bellowing, so loud and prolonged that hardly, for a time, could the captain's voice be heard.

Down went the helm, and round went the ship, just as a man in the chains sang, "And a half-five," which showed that she was within a reasonable distance of a shore of some kind.

"Mr. O'Neil!"

"Yes, sir."

"Can we get up steam quickly if required?"

"Yes, in ten minutes almost."

"Then you may haul the fore-yard aback. We'll keep *dodging* here a bit. The sky looks clearer over-head."

"Very good, sir."

"And now," said Katie, seeing the captain disengaged, "do explain all about the voices and the dreadful sounds that followed the blowing of the horn."

CHAPTER XVIII.

THE HAUNTED SEAS.

"My dear child," replied Captain Boyd to Katie's question, "there really isn't a deal to explain, after all. The voices you heard in the mist were those of birds, and the awful roaring that followed Turlough's elegant tune on the fog-horn came from sea lions."

"Sea lions! Captain Boyd? how strange! Are they very dreadful?"

"You shall see for yourself, I trust, before twenty-four hours are over. I may just tell you this much, that the old bulls are no beauties to look at; and I have no doubt that, in their own element, an African land lion would have very little chance against one. Any other question I can answer, as long as I am in the box?"

"Captain Boyd, you are quizzical. Here comes the doctor; I'll ask him things. Dr. M'Phee, have you been in these mysterious regions before?"

"I've been in Arctic seas before, Miss Katie; never here, though. There is one man in the ship, however, knows more about the countries round the pole than all of us put together."

"Ah! by the bye, how is poor old Chips? Nothing serious, I hope."

"Oh no, sir; I don't think anything would kill old Chips; but he'll have to keep his bunk for a few days."

"Any one ill, Dr. M'Phee?"

"Only old Chips, Miss Katie. Fell down the hatch in a lee lurch when we were going about, and hurt his back, that's all."

"Is he very, *very* old, Captain Boyd?" asked Katie, when Dr. M'Phee had gone below.

"Well, sure, he isn't a spring chicken. He must be some distance on the other side of seventy."

"And still going to sea!"

"Bless you, do you not know that Chips couldn't live on shore? He doesn't know any one there; he'll die on the ocean wave."

"I hope not. Now tell me this, and I'll promise not to tease you any more—to-day anyhow."

"Well, what is it?"

"What have you been keeping that awful fog-horn blowing for?"

"In case we ran down anything. Isn't that enough?"

"No; I mean, there was another reason."

Captain Boyd smiled, and patted the little hand that lay on his sleeve, as he replied:—

"How I wish you were the skipper's little daughter. I'd never go to sea without you; and I'd make a sailor of you in a year. Yes, Katie, there *was* another reason. You see, we've been searching around for a batch of mysterious islands that lie in this sea. Many a mariner long ago stumbled across them by chance, and came back with such stories about them that no one believed a word they said. And no wonder, for according to these ancient mariners, some of the islands were inhabited by creatures that, to put it mildly, were far from 'canny,' others by monsters unspeakable and sea-serpents, that lay basking on the beech whenever there was a bit of sunshine, and could be seen riding on the surf when storm winds blew and the breakers were high. But worse than ever, according to these old sailors, there were flying dragons, that tacked or half tacked in the air by night or in the mist, laughing and jabbering at them, till at last, when a fair wind came, these bold mariners would hoist all sail, and steer away from the haunted seas."

"And are we now in these haunted seas?"

"We are, and near to the haunted islands. At least," he added, "I hope we are not too near them. I think the voices we heard a short time ago came from bull lions that had not yet taken to the rocks for the season. They have regular places of rendezvous, where they meet every year as soon as summer has commenced."

"Meet, Captain Boyd? Where do they come from? Where have they been? What have they been doing?"

"I say, child," replied the bluff old captain laughingly, as he looked down at Katie's upturned face, "couldn't you throw in a few more questions, all of a heap like? It is so much better to answer them by the batch, especially when they are such easy little ones as you ask."

"Captain Boyd, I shall report you to the ship's mother for insubordination."

"Well, I am sorry already, but here comes Jack Silk; I'm sure he will be glad to throw some light on the subject."

"Jack Silk!" cried Captain Boyd.

"Sir to you!" said Jack.

"Here's a young lady wanting information."

Now if Jack had thought he was about to enjoy a nice promenade and a pretty conversation, he was mistaken for once in a way.

He could *not* supply the information desired, so was dismissed, summarily.

About half an hour after this, Chips was lying in a kind of pleasant dose, 'twixt sleeping and waking, when he heard what he took to be an angel calling him.

"Chips, Chips, Chips!"

Next moment Katie's bright face appeared at the bunk side. She carried a little basket in her hand. "I've had such a difficulty in finding you, poor man. I've brought you some grapes, and some jelly. Do you feel very ill?"

"Thank you, Miss Katie," said the white-haired old sailor, "there's nothing the matter with me whatsomever; leastways, not much. Them doctor chaps, Miss Katie, they will allus make the worst o' a bad job. Thankin' you kindly, miss, all the same."

"Well, now, would you like me to read to you?"

"Ah! bless ye, yes; your eyes are younger than mine."

For a whole hour Katie sat reading. It was Scott's "Lady of the Lake" she had chosen. But until she looked up she had no idea of the audience around her, for one after another had come quietly in and brought themselves silently to an anchor, sitting or reclining as the case might be, but all as mute and mum as the traditional mouse. In their rough jackets and with their hirsute faces, those men looked uncouth enough, yet they were far too much of gentlemen to applaud; this they *felt* would have been out of place, but the "spectioneer" thanked Katie for reading, and begged she would come again.

It was an earnest, heartfelt invitation. Katie thought for a moment, then replied:

"Yes, sometimes I will come."

Was it instinct, I wonder, that gained for Katie the key to a sailor's heart. If Baby, as Captain Boyd sometimes called her, was not a skipper's daughter, she ought at least to have been on the ocean wave.

Old Chips surely was a favourite, for in the afternoon no less a personage than Sally herself came to see him. Sally's remarks were by no means flattering to the medical profession. They ran somewhat as follows, and were rather disconnected and intermingled with many a gasp or sigh, which in the text is signified by the interjection, "Ah!"

"Ah! and 'ow be ye now, sir? ah! poor old soul, that hasn't a mother, either. Which I've been a martyr to my poor back for twenty years, Mr. Chips, sir, since ever my darter went to Ameriker. Ah! and them doctors, what does they know, I wonder, givin' theirselves airs? Ah! but there's nothink like a Burgundy plaister, which I always says, Ah! it's the rheumatiz."

And so, on she rattled for half an hour, and would have kept on longer, had not a boat been called away, and the noise of lowering caused the old lady to think the "ship were a tumbling overboard." So bidding Chips goodbye, and promising to come back another time, if so be nothing happened, she went waddling off with many a gasp and many a sigh.

The boat was gone for two hours, during which time the bell had been kept ringing constantly, till Boy Bates declared his "harm ached fit to split."

Then a gun was fired, and if Captain Boyd had had the slightest doubt he was near an island, it was now effectually dispelled, for the echo returned the report, multiplied by ten.

Presently the boat itself loomed out through the fog, and a minute or two afterwards, Desmond was aft in consultation with the captain. Soon after this, there was more shouting on deck, and this was followed by the grating roar of the cable as the anchor was let go.

(*To be continued.*)

PRACTICAL POINTS FOR CYCLISTS.

By J. Eaton Fearn.

THE writer intends this Paper on wheeling joys and woes to take a practical form, as he wishes it to be of some real service to those who are contemplating investing in an "iron horse." Doubtless, it would be an easy matter to write a highly imaginative, exciting narrative of some hair-breadth escape on wheels, which had no foundation save in the author's vivid brain; but that would serve no purpose, except affording an idle half-hour's amusement. It is reserved for other pens to narrate in glowing phrases "A Spin down the Alps," or some other impossible feat!

Cycling has sprung into public favour by leaps and bounds; and not only does it retain its deservedly-won popularity, but attracts crowds of converts every season, for the invention of the safe "three-wheeler" has brought a delightful method of locomotion within the reach of all—the aged as well as the young.

Its votaries are no longer objects of ridicule, the pitiable victims of stray dogs and ragged urchins, but are now reasonably regarded as sensible folk in quest of health and pleasure.

The giddy-looking bicycle has naturally begun to be discarded, for no sane person would court a broken neck or a dislocated shoulder unnecessarily; while there is but little fear to be entertained that the ridiculous-looking "safety" will ever oust the tricycle out of its present favoured position. With three wheels, cycling is absolutely safe, and, in point of speed, is not far behind its dangerous progenitor.

The purport, therefore, of this Essay is to give definite information on many points connected with wheeling, which arise naturally in the minds of those desirous of taking up this new popular hobby, but who require a little more light on the topic before laying out their money.

Is it healthy? Is it not fatiguing? Is it expensive? Is it really dangerous? What is the approximate speed to be obtained with one? We are already aware of its charms, but what are its particular drawbacks? And which is the best machine? And why? These, and countless other points, it is the object of the writer to deal with, and his experience, extending over five years, with a variety of machines, should place him, he thinks, in a position to give satisfactory answers to the same.

First, then, respecting the expenses a cyclist is liable to. The primary outlay is the principal cost. A good machine, with ordinary care, will require only a trifling sum per annum to keep it in repair. There is no need whatever to break a single spoke, and the only expenses incurred will be, now and then, to replace a worn-out screw, or a missing nut, in some particular part where a little extra wear and tear goes on. Of course, tricycles, like everything else, are liable to accidents; but, in the hands of a cautious rider, these need never occur, as most cycling disasters are either the result of gross recklessness, or arise from the dangerous practice of "rushing" hills. There is very little actual wear on a good tricycle. In fact, the many thousands of miles which may be traversed across country with little injury to the machine, is simply astonishing. The rubber-tyres will wear many years, even with abuse, and, when worn out, may be replaced at very little outlay.

Certainly, with a cheap machine, or a broken-down second-hand one, the reverse of all this will be nearer the truth. Nothing but annoyance, danger, and expense must be expected with a third-rate machine. Add to these evils, the ever-glorious uncertainty of a broken neck, owing to some important part snapping at a critical moment—say, in descending a steep incline at great speed. A really first-class, new machine can be purchased for about £18, and will be found to be by far the cheapest in the end.

This last remark suggests the all-important question—Which is the best machine? Every season the numerous cycle manufacturers put forth their tempting wares in bewildering variety, in patterns and styles to suit the requirements of the most fastidious.

Perhaps no one single tricycle can be picked out, from the many good machines in the market, as really *the* best. Every machine has its especial good points, and all that can be laid down are certain general principles, the embodiment of which should be looked for in a machine before purchase. Given these, the would-be purchaser must

select a mount in accordance with his pocket, his tastes, and his judgment.

My first advice is, Avoid rear-steerers,—*i.e.*, those machines which are steered by means of the rear-wheel. If, however, you are anxious to experience what are known to wheelmen, as "cycling croppers" or "gravel-rash," then, by all means, purchase one. Set off at full speed down bank, or over stony, rutty ground, apply your brake quickly, and without the risk of failure, you will have your wish gratified! But if you will take my advice (and my first mount was a £20, popular, rear-steering machine, made by a well-known and highly respectable firm), you will refuse one, even at a gift!

Whatever particular make of machine, therefore, you purchase, be sure it is a front-steerer. It should also be what is known as a "double-driver," that is to say, the force applied to propel the machine should be equally distributed to both large wheels.

The next point to mind is, that your machine has fitted to it a *band brake*—the most effective brake possible, applying the power to the axle, and not, like the wheel-brake, to the tyre. The latter is highly dangerous, besides doing your tyre considerably more injury than even actual wear and tear in riding. Every first-class machine has fitted to it a "balance gear," which prevents the machine capsizing when turning a curve sharply. The best one is that patented by Messrs. Starley Brothers, and can be fitted to any of the better class machines, the different manufacturers paying the inventors a royalty for the privilege.

Prefer a saddle to an ordinary seat. Be sure to see, too, that this is fitted on an L-pin and Arab cradle spring, two simple contrivances affording the quintessence of comfort. High-wheeled tricycles are rapidly making their disappearance. New purchasers, however, must be careful not to fall into the opposite error of ordering machines with too low wheels. Wheels forty-six inches in diameter, geared level, will be found large enough for the average rider, and forty-eight for those who are above the ordinary height.

The "Royal Salvo" of Starley Brothers is a splendid wearing machine, and cannot be matched for rough country roads; the "Imperial Club," manufactured by the Coventry Machinists' Company, forms an elegant mount for a lady, or a gentleman of light weight. Perhaps the "Sparkbrook" would be preferred by some, on account of its being fitted with two gears, which makes it an easy hill-climber; while the young, and those who like to "make records," would be delighted with the "Humber," manufactured at Beeston, near Nottingham.

To those who live in crowded cities, the two-tracked "Rudge" will be a boon, owing to its narrow width.

Any one of the above mounts will give the highest satisfaction. Of course, the ones cited are not *all* the best machines in the market, but there are few, if any, superior.

We now pass on to the question whether cycling is really advantageous to health or not. A very important question this.

So far as my own experience goes—and it agrees with the unanimous verdict of most wheelmen — cycling is the most healthful exercise which can be taken. To any who are constant sufferers from that prevalent and dreadful infliction, dyspepsia, it is invaluable. A good spin will remove it all, when ordinary walking fails; for, too often, one's mental worries dog our footsteps like baneful shadows, and, do what we will, we cannot free our mind from their injurious presence. But when cycling, one forgets everything save the exhilarating exercise, which, as Sims Reeves so graphically puts it, "makes one joyous." The small necessary attentions our "horse" demands, throw all other thoughts out of our mind. Nature, even when we are on wheels, appears as she never does to the pedestrian. One feels quite poetical as one glides past picturesque farmhouses, running streams, and charming copses.

The only fear is, that the beginner is tempted to take too much of this delightful form of exercise. Those who are in the habit of taking a daily "constitutional," never dream of exceeding the limit of their usual walk, four or six miles, or whatever it may be; but the enthusiastic cyclist, in the first days of wheeling love, is often tempted to take a fifty mile spin before his muscles have been properly trained to the new work demanded of them. The result is, that excess is followed by reaction, and the following two or three days, the unwise beginner feels shooting rheumatic pains in his offended joints, their owner having, for the time being, a serious objection to walking upstairs.

Commence with small journeys, increasing the distances gradually, and, in a little while, you will cycle fifty miles, on a fairly good road, with as little fatigue as you used to walk ten.

People who suffer from varicose veins, or a weak heart, must be very moderate, both in their speed and distances.

An eminent physician thus sums up the benefits of cycling:—"It causes the chest to fill and empty freely without undue labour; it leads to a good oxygenation of blood; it produces a genial and equable circulation through the skin; it induces, when duly moderated, an agreeable sense of fatigue; it relieves depression of mind; it promotes a healthy desire for wholesome food; and it invites, naturally, good and refreshing sleep."

And this leads us to our next point; namely, how to learn to ride.

It appears to the uninitiated, a child's task to ride a tricycle, and yet, like many other seemingly easy feats, it is not such a simple matter, after all.

The tyro's feet at first have a trick of slipping off the pedals—not always is the steering handle turned in the right direction—and too frequently, when occasion requires, is the brake not applied at the correctly critical moment. A buckled wheel is often the consequence, for tricycles are not made of sufficient strength to come into forcible antagonism with a farmer's heavy wagon, or some other formidable obstacle. The best way of learning to ride is to take the machine on a broad, level road, where there is but little, if any, traffic, and, by slowly pedalling the machine, to become gradually acquainted with all the little important etceteras connected with riding. It should have been mentioned, that, at first, the learner should not attempt riding up anything like steep inclines.

When proficient, and aspiring to "do a tour," be sure to take with you your lamp, well trimmed, your bell, a good supply of oil for lubricating, a few spare duplicate nuts and screws, your spanner, a piece of wire, and a pair of pliers. It is just possible that you may not require these things, but should some little contingency arise,—say, the loss of a nut from an important working part of the machine, with no village blacksmith near,—such simple articles would be of the highest value.

In hot weather, the tourist should always "break the back" of his journey in the early part of the day, before the sun becomes oppressive. The middle of the day should be spent in resting, and after an early cup of tea, he may resume his journey. No cyclist needs to be told that flannel is the best thing to ride in, or how delicious a warm bath is, after a long day's ride. As little food as possible should be taken during riding, dinner being put off till the day's "march" is completed.

Some inquiring mind will be sure to ask, at this stage, How many miles a day can a tricyclist really accomplish, without the expenditure of very much energy? Well, on this point, no hard and fast line can be drawn.

One man can outrun another, or walk, without any extra fatigue, just double the length of miles. So is it with cycling. An athletic, go-a-head sort of young man would cover more ground before breakfast, than another would accomplish in the whole day. Everything depends on build, on the suppleness of the muscles, on age, the quality of the machine, and so on. On the question of speed, each person must be a law unto himself. However, some idea can be given on this point. A journey of fifty miles a day is within the grasp of the most indolent. Six miles an hour might truly be described as "child's play."

John Hunter, the famous anatomist, was fourteen days in riding from Edinburgh to London on a good horse,—a feat considered quite a "big thing" at the time. Now a bicyclist would do it easily in four.

"It was considered," says Dr. Richardson, the eminent cyclist, "a wonderful feat that Mrs. Siddons should one night play in London, and the next night appear (thanks to the post-chaise), on the stage of the theatre at Bath. In these days a trained lady tricyclist might perform the same feat by her own muscular efforts." Yes, and in considerably less time!

As a matter of fact, whoever takes to cycling will have no fault to find with the speed he can travel, as the ease with which the wheels are driven along is something astonishing,—indeed, almost magical.

HIS LAST CHARGE.

By G. Vickars Gaskell.

"HANG it all! Dick, I have the very roughest luck of any fellow in the service;" and Lieutenant Guy Manston, of the 200th Hussars, flung himself down into one of the two basketwork chairs which his captain's room boasted, with an oath.

"What is up now?" asked his friend, pushing aside the letter he was writing, and facing round with an amused look on his handsome face.

"That wretched colt, *Slasher*, has gone wrong; of course I have got a pot of money on him,—just my sort of luck all over!"

"So you are still at that fool's game, Guy, in spite of the one or two sharp lessons you have had lately. Why don't you cut the whole thing, and have done with the turf once for all?"

"Oh, it's all very well for you to talk like that, but I don't profess to be a saint, you know, and must have my fling like the rest," grumbled the younger man.

A smile played round the mouth, almost hidden by the long drooping moustache, as the other answered,—

"My dear fellow, neither do I profess to be a *saint*, but I know what that devil's doctrine of 'having your fling' means. It means 'sowing the wind to reap the whirlwind.'"

"Well, don't begin that yarn, there's a good fellow, Dick; you know I don't hold with pious folk,—saving yourself,—and it beats me out and out what you see in religion;" and Manston, lighting a cigar, puffed it well aglow.

"I see in it a good deal, my boy, as I hope you will some day; for it is the one thing which can keep a man straight in this world, and fit him for the next."

"Ah, yes, of course that is the regulation theory which I have heard often enough, but I can't help thinking that this same religion makes men into milksops—saving yourself again, Captain mine."

"But it ought not."

"But it does! Once let a fellow get converted, as you call it, and he is good for nothing but prayer meetings, and turning his toes in."

"Well I don't think that I play polo, cricket, and tennis less, or row the worse, or ride badly, because I am a Christian; and if ever we are under fire, I shall go in as cheerfully as any of you, I fancy," was the ready rejoinder.

"Ah, but you are so different to the ordinary run of 'good young men;' you are not a muff."

"Thanks," laughed the captain; "but there are muffs everywhere, Guy, and you don't judge the service by the duffers in it, do you? Take B troop, for instance; it is the smart 'non-coms' and privates, like Tomkyns and Burton, who really show what we are, and not the careless blockheads, like Smith and Toulson, who will not learn the drills properly, and who only half understand orders. Don't make any mistake, Christ does not want milksops, but *men*, in His service; and a real honest Christian is bound to do everything as well as ever he can, whether it be fighting, working, or playing; for all he does is to the glory of God."

"Yes, I know that is the theory, but I have not seen it practised much," objected the lieutenant, "or else I might think something about it."

"You will some day, Guy, and become as good a soldier under the Great Captain as you are under our Gracious Sovereign Lady, Queen Victoria. But now about this hole you are in; how much will see you out?"

"A century will lift me enough just now, but I am not going to let you in."

"Don't be an ass; I can let you have the coin easily, and you can take your time with me, which you cannot with any of the Moses clan."

For some time the other stood out, but his captain was equally determined, and at last carried his point with, "You know you have too much stamped paper fluttering about already, and for your father's sake, if not for your own, you will take this and cash it, and square your book."

Guy Manston for a few moments hesitated, then he folded up the little slip of blue paper, on which *Bullion & Bullion*, the bankers, were bidden to pay him, or his order, the sum of £150, and said, as he put it into his pocket, "You are an old brick, Dick. I can't say my thanks, but I'll be shot if I would take it from any other fellow in the regiment."

Captain Collingham was a cadet of a noble north country house, which had for many generations sent gallant sons to serve its sovereigns, in camp and field, at sea, and in the state. He was one of the most dashing *sabreurs* in that very *crack* Light Cavalry regiment, the 200th Hussars. Merry, light-hearted, but a soldier to the core, he was as popular amongst the men of his troop, as with the whole mess, from the V.C. colonel to the last-joined "sub." The best boxer, the finest steeple-chaser, and the gayest of comrades, he was always to the fore, and a bomb thrown into the ante-room could not have startled its inmates half as much as did the news, that "Dick Collingham has turned religious!"

At first no one believed it, but when the senior captain, as spokesman, asked him point blank, Dick boldly said the news was true, and that very evening proved it, when for the first time in his life he refused to take a hand at unlimited loo. At first his brother officers tried to laugh him out of it, but without the least result; finally, they left him to go his own way, and live his religion quietly in their midst; for he rightly knew that his comrades gauged a man by the life he led, and not by the creed which he recited,—by what he did, and not by what he said. Although his defection from the card-table, the racing saddle, the ring, and other more questionable resorts, was loudly bemoaned, and his "queer fancy" pitied, yet Major Willow represented the general opinion of the mess when he said:—

"I can stand Collingham's piety, for he does not everlastingly preach at you, or try and stick it down your throat; and yet any one can see he lives up to what he professes. Then he never is glum, or looks *smug*, but is always jovial and ready to do any poor beggar a turn. I would sooner trust Dick than any man I know, for he is as straight as a die."

* * * *

A week had not passed since Guy Manston cashed his cheque, before Fosseford Barracks were in a whirl of bustle and excitement; there was war in Egypt. The 200th Hussars were ordered for active service, and, within a few short days, marched out of the little town to the lively strains of "The girl I left behind me." Wives sobbed, sweethearts clung to the stirrups, and many a stalwart trooper dragged his helmet well over eyes, in which a mist gathered. Then came weary days of discomfort, whilst the great transport ploughed her way through tossing seas, and bore them Eastward, Ho! to the land of the Pharaohs, hot sun, and scorching sands.

It was afternoon, and the whole camp was dozing in the heat. Suddenly a trumpet call rang out in the sultry air, and was answered by another and another. Instantly all was life, as the men fell in and stood to their arms, grumbling loudly that, "The General might let poor chaps have a bit of rest," and wondering "what was up." Presently word was passed that a large force of the enemy had been seen in motion beyond the sand-hills, and it was believed that they were going to attack, commanded by Arabi in person. Soon the crack of rifles came from the pickets, which were falling steadily back, and then the guns on the right opened fire, sending shell after shell screaming across the blue sky into the midst of the moving masses of the enemy, as they came recklessly on. Then a long belt of flame broke all along the front of the British line, as the Highland Brigade fired volley after volley into the dusky hordes, and checked the rush of the human tide. The 200th Hussars saw all this, as they stood in the centre of the hollow square.

"Our turn now, gentlemen," cried Colonel Fairfax, as an orderly dashed up.

The next moment came the quick short words of command,—

"Stand by your horses! Mount! Walk! Trot!'" and then, with a gallant clatter, the Hussars moved forward, in a cloud of dust, to the front, the bridle chains jingling, the scabbards jangling, and the men and horses full of life and dash. As they got into the open, the Arabs poured a hot fire into their ranks, and there was more than one gap in the line, empty saddle and riderless horse.

"Steady, lads, steady!" cried Captain Collingham, as he rode gaily along in front of his troop.

"Gallop!" sounded the trumpet, and the men gathered up their bridle-reins and fingered their sabres. "Charge!"

Then the lines widened out, and as the horses sprang forward, the troopers got ready for the shock of onset. Some drove their feet home in the stirrups, others kicked them altogether clear; here a stalwart sergeant shook off his helmet till it was only held round his throat by the chin-strap; there a young corporal rapidly rolled up his tunic sleeve; whilst, in the eyes of all, the fierce battle-light flashed out, as they broke like a whirlwind on the foe.

Collingham, on his roan mare, was first into the press; and as his men followed hard after him, they saw his sword whirl like a meteor round his head, as he rode straight at a tall sheik in the midst of a group of fanatical dervishes, who instantly closed round the Hussar.

"Give it the black villains!" yelled Lieutenant Manston, as, followed by half a dozen troopers, he dashed to his captain's help; but ere he could reach him, Collingham reeled in his saddle, for a spear was driven deep into his side, and fell headlong to the trampled ground. The charge swept over him as the cavalry men sent the Arabs flying before them.

* * * *

The day had gone down, and the stars were glowing in a steel-blue heaven, as Captain Collingham's almost lifeless body was laid in his tent.

"No chance for him; he can't last an hour," said the surgeon, hurrying off to the next case.

"Are you there, Guy?" gasped the dying soldier, opening his blue eyes, already dimming fast.

"Yes, dear lad; what is it?" tenderly answered the figure bending over him.

"Was—our—our charge—successful?"

"Rather! we broke them completely, and every one says that you led the regiment splendidly, Dick; the Colonel is badly hit, or would be here to tell you so himself. But I am afraid that cursed Arab spear has cost you awfully dear."

"Ah, I'm glad—I did—my duty all right. You'll say—goodbye to—the fellows—for me, and—are you there, Guy?"

"Yes, old chap."

"Tell—tell them—I hope we—we shall all stand together—at—at the Great Roll Call. Are you still near, Guy? Give me your hand—I'm very sleepy—and—tired."

The cold fingers closed over the hot throbbing ones, the old smile came back to the bloodless lips, life went out gently in a long-drawn sigh; and Guy Manston, as he dashed the tears from his eyes, knew that Captain Collingham's gallant spirit had gone to join the noble army yonder. For once at least, he had seen a noble Christian hero, whose memory left a life-long impression upon Guy Manston.

LOVE, COURTSHIP, AND MARRIAGE.

By Phyllis Browne.

No. 3.—Flirtation.

A GOOD many people (and most of them are men) are very fond of saying that young men in these days are chary of getting married, and that the reason is, that the girls of the present day are not so domesticated as their mothers and grandmothers were, and more fond of dress, foolishness, and flirtation, and so are not qualified to make good wives. I confess that I think talk of this sort is largely made up of pure nonsense. Of course there are foolish girls to be found, but there are sensible ones also; and we state the facts under the mark when we say that there are fully as many sensible girls as there are sensible men. In our grandmothers' days there were girls of various characters, as there are now, and the foolish virgins outnumbered the wise ones, even beyond what they do in these days. For some of us would be very unhappy if we did not hope and believe that gradually the world was getting a little better; and that certainly the women in it are very decidedly improving. This is a bold statement to make, but persons of wide experience will confirm it.

One other statement may be made, which despairing individuals will be astonished to hear, but which is nevertheless true; it is, that the more sensible a girl is, the more modest, the more true-hearted, earnest, and brave, the less likely she is to marry. The reason of this is that she respects herself, refuses to flirt, and also will not consent to marry a man who is not like-minded with herself. Such men are rare, and therefore the girl who is superior to her companions frequently remains single. If, however, such a thing should happen as that this girl should meet with a man who is her equal, and the two should enter into wedlock, there would be a marriage so blissful and so beautiful, that it would be enough to gladden our hearts. These marriages occur, it is true, now and again, but they are not frequent, because there are so few couples of the kind who can compose them.

Flirtation,—real, unadulterated, downright flirtation,—is a most abominable vice, and the young man or young woman who could practise it, must be a heartless, cruel, and deceitful person. But there is one comfort about it—much that is called flirtation is nothing but youthful animal spirits, desire for a little change, thoughtlessness, and love of fun. We ought all to be very careful how we charge young people with being flirts, because in doing so we may be doing them a great injustice.

Much also of the talk against flirtation means nothing but that the talkers are disappointed themselves, and have not the grace to be glad because others are happy. For we have to confess that it requires grace to rejoice in others' joy. We are all sorry when others are in trouble; but when others are in the sunshine, and we are left out in the cold, we are apt to feel a little envious, and this makes us look at our friends with unkindly eyes. When all is said and done, we are all, young men and young women both, very poor creatures, very small, very mean, and very foolish. We only escape from this wretched jealousy when we have the Spirit of Christ within us, and enter into the eternal life which those have who possess that spirit. Amongst the best signs of this eternal life are love, and joy, and the peace that comes from doing as Christ did—giving up our own will, and living for others.

What then, it may be asked, is real unadulterated, downright flirtation? It has been very cleverly described as "attention without intention." An actual flirt is one who consciously plays with another person's feelings. There are men and women who do this, and find it amusing. But it would be idle to speak to them. As a great writer expressed it, "What they need is to be made over again, and made different," before they will be of any worth. Those to whom it may be of use to speak, are the thoughtless ones who *play* at flirting; who seek the company of those for whom they do not care, and are never likely to care, for the sake of excitement; who offer or receive attentions which mean nothing, but which may be misunderstood. If those of us who know what it all means might speak plainly to such young people, we should say, "You are playing with edged tools; you are on a dangerous road; you may mean no harm, but there is fear that you will bring about great misery, both to yourself and others. Stop while yet there is time."

There are three evils likely to arise when we allow ourselves to play at flirting. The first and greatest is, that we may bring abiding pain into the life of another. To do this is a real misfortune for any one; besides, it is a misfortune that can never be got over. All young folks, as they grow into old ones, make closer and closer acquaintance with sorrow; they lose dear friends by death and estrangement; they have disappointment, pain, and sickness; but with time and through submission all these wounds may be healed. Not so for those who selfishly bring abiding pain into the lives of others. For this, at one time or another, sooner or later, they will have to pay the penalty. "With what measure ye mete, it shall be measured to you again." These were true words, and they have been proved true again and again. If we selfishly bring abiding pain and loss into the life of another, abiding pain and loss will come to ourselves. We cannot say when or how the punishment will arrive; it may be in some most unexpected form; it may be in a shape quite different to the wrong committed; but it will come, and there will be no evading it. Perhaps it will be thought that this is a very serious way of looking at flirtation, which is generally treated as a joke. But it is the true way, nevertheless. Retribution does not by any means invariably follow foolish flirtation, because in numberless instances no abiding pain is wrought thereby. But where deep feeling is ruthlessly trifled with, and abiding pain is wrought, the individual who has worked the evil suffers proportionate loss.

The second evil of which there is a danger where foolish flirtations are carried on is, that the flirt may marry the wrong person. This mischance constantly occurs where young people have carried on in a thoughtless, giddy sort of way. The poor little flirt goes too far, is caught in the toils more deeply than was intended, and cannot escape. So we have unhappy marriages. A cynical individual once said, that if husbands and wives could be taken on trial, *three-fourths* of them would be returned at the end of twelve months. But this is exactly what cannot be. A husband or wife, once taken, has to be kept. There is no returning the article because it does not suit. This is why we ought to be careful that we take the right one.

The third evil of which foolish flirts run the risk, is not only that they may get the wrong partner, but also that they miss the right ones, which might have been theirs if they had behaved differently. A true lover is generally distrustful of his own power to please, and seeing the object of affection occupied with some one else, he naturally turns away and loses heart. In this way flirtation is one of the most costly amusements that was ever invented. Those who

The Gabled House at Northbury

By A. STUART FLETCHER.

"'*Thy hands are capable hands,' said Rachel, taking up one.*"

engage in it never know how much they have had to pay for it.

But we often hear it said that flirts, when once they are married, make the best of wives and husbands. This may be true of girls, because girls who are said to flirt, do so more frequently out of cheerfulness, and harmless love of fun, than men do, and when once the affections of a girl of this kind are engaged, she gives up flirtation entirely, takes up her duty with her whole heart, and becomes a reformed character; while the bright spirit which led her astray, when rightly directed, makes her pleasant and sweet. The remark is very rarely true, however, of the male flirts. These individuals make most unsatisfactory husbands, and sensible girls will avoid them. The majority, however, do not marry. They become discontented old bachelors, and they are the people who are most loud in their condemnation of the girls of to-day. A male flirt is almost always a vain man, and also a man who loves himself so much, that he cannot find room in his heart to enthrone a girl there. One of the best things we can say for marriage is, that it is better calculated to take the vanity and self-love out of a man or woman than any other discipline we know.

Surely most people will agree, that to play at flirtation *is* to play with edged tools.

CHAPTER I.

NORTHBURY High Street lay in the full glare of the July sun; blinds hid the shop windows, but offered no hospitable shelter to the passers-by. In a narrow strip of shade, a dog lay with legs outstretched and tongue protruding, and blinked lazily at the solitary occupant of the pavement—a girl, whose heavy black garments seemed to emphasize the heat, and throw into relief all the glare of the white pavements. She passed wearily along, and, reaching the market-place, glanced upwards at the projecting clock.

"An hour too soon," she said to herself; "I must find shelter somewhere, and wait till three."

At right angles to the High Street ran a row of old-fashioned gabled houses, whose projecting fronts threw a refreshing line of shade across the pathway; and, on the opposite side of the way, an ivy-covered wall, over-topped with tall trees, added another touch of comfort and coolness to the picture. With a sigh of relief, Madeline Hardy turned into the shade, and stopped in front of the first house, whose broad, low windows, shaded with a narrow blind of fluted white muslin, exhibited on a glass shelf a few bottles of jelly and raspberry vinegar, and a dish of tempting-looking cakes.

"'*What* will *Dr. Mayhew say?' had been her first thought.*"

"It looks like a shop," she said, gazing over the low curtain; "and oh, how deliciously cool it seems."

Then she turned the door-handle, and entered a large, low room containing a snowy covered table, holding cakes of all descriptions, and some small tables and chairs. By a large table sat a middle-aged woman, with a placid face and smooth brown hair, covered with a cap of delicate muslin. A soft grey stuff dress, and a little white handkerchief folded across her chest, completed her costume. She looked up as the door opened, and, laying down her knitting, rose and drew forward a chair, saying, as Madeline sank into it, "Thee looks tired and hot, but thee will soon get cool in here."

"Oh, it is delicious," said Madeline; then, with a smile, "Are the cakes to sell?"

The Quakeress smiled too.

"Thee art a stranger in Northbury, or thee would know Rachel Fleming's cakes. Try these; we call them Northbury maids, and my daughter Ruth considers them the best of her making."

To Madeline, Rachel Fleming, as she moved quietly about, seemed the embodiment of peace and rest, and the cake and glass of water she set before her, the sweetest food the girl had ever tasted. As she sat and ate, the stillness and the peaceful presence suggested contrasting thoughts of her own narrow London home, and her own mother, always anxious, harassed, and fretful. If Madeline had but known, the contrast was made the greater by the fact that a few years ago, both Rachel Fleming and Mrs. Hardy were left widows in straitened circumstances; but while Rachel had left the house she could no longer afford to keep, and had boldly turned her accomplishment of dainty cooking to account, to procure a respectable livelihood for herself and daughter, Mrs. Hardy had spent her life in striving to keep up the appearance of her former living, on a third of the means. They could not "go down in the world" by taking a smaller house, so boarders were taken in, and home comfort sacrificed. Her daughters had never expected to have to earn their living, so they stayed at home and tried, by rigid economy and scheming, to "keep up appearances." But even with all the managing, both ends could not be made to meet, and Madeline had at last won from her mother a reluctant consent to seek a situation as governess. Very hopeful did Madeline feel as she answered the first advertisement; almost hopeless was she to-day, as she came to Northbury in answer to the twelfth. For she had discovered that governesses were very plentiful; and while her fellow-candidates were prepared to undertake the teaching of English, French, German, Latin, music and painting, and other things besides, she was obliged in honesty to own that her own acquirements consisted of a little music, a little French, and an imperfect knowledge of English.

Rachel Fleming saw that her visitor had fallen into a reverie, and, as she knitted, she watched the varying lights and shadows, as they succeeded each other on the girl's face, and thought: "She is about the age of my Ruth. She has truthful eyes and a sensitive mouth, and a smile as sweet as Ruth's own; but there is a look of anxiety one should not see on so young a face. Does she know the secret of bearing life's troubles, I wonder?"

Madeline recalled herself presently with a start.

"I am afraid I must go. I am beautifully cool and rested, but I have an appointment at three." Then something in Rachel's gentle face drew forth the unwonted burst of confidence: "I have come from London to see Mrs. Deane, at Moor House, about a situation as governess."

"Thee looks young to be governess to those boys of Mrs. Deane's," said Rachel, dubiously.

"I am afraid I do not stand very much chance," said Madeline; "but Mrs. Deane selected mine and two others out of many applications, so perhaps I may get the post."

"And does thee go back to London to-night?" asked Rachel.

"Yes, when I have seen Mrs. Deane."

"Then come in on thy way back, and I will have a cup of tea for thee, and I shall know if thee art likely to come and live here."

"Thank you," said Madeline, to whom the frankly given invitation sounded very pleasant, "I should like to come;" and with a "farewell" from Rachel, she left the house.

Rachel Fleming's tea-table was laid in a room behind that which was used as a shop. It, too, was large and low, and on one side was a long window with a cushioned window-seat. A paper, with long trailing sprays of pale rose-buds on a grey ground, covered the walls, and pale roses clustered and hung around the open window. A dark oak cabinet, full of old china, filled one corner, and more of the same delicate old china was spread out on the table on a cloth, which was of Rachel's grandmother's weaving, while in the centre stood a big bowl of roses, flanked by some of the daintiest of Rachel's culinary productions.

Madeline drew a long breath of enjoyment, as she sat down in the chintz-covered armchair which Rachel drew forward.

"Thee art welcome," said the Quakeress; "and has thee got the situation?"

In spite of all she could do, Madeline's eyes filled with tears.

"Madeline stood by the kitchen window. . . . smoothing, sprinkling, folding, too engrossed to notice John Appleton and his friend."

"I was too young," she said, and, she added bitterly, "too incompetent."

"Thy hands are capable hands," said Rachel, taking up one, "and thy mouth," laying her finger gently upon it, "says thee has purpose. There is *some* work thee can do; do not call thyself incompetent, child."

The tender tone in which the last word was spoken, was too much for Madeline's composure; all the disappointment and hope deferred of the past weeks had their way, and leaning forward she burst into tears.

After that, Rachel heard the whole story of their straitened circumstances, and Madeline's hopes and disappointments.

"I can never hope to get a governess's situation, I am afraid," Madeline concluded.

"Is there nothing else thee can do? Can thee make dresses?" asked Rachel.

"My sisters make ours, and I can do nothing but the plain parts," Madeline answered.

Rachel was silent, then asked abruptly: "Can thee cook?"

Madeline blushed.

"Mamma does not like us to do anything in the kitchen; but, of course, having only one servant, we have to help sometimes, and," here the blush deepened, "I rather like it."

"Thee knows I told thee that my daughter Ruth made the cakes and confectionery we sell. Our servant, Martha, does what thee would call 'the plain part,' but Ruth and I do all the rest. And we have a great deal of business; for people like our cakes, and buy them instead of making their own, which I think is a pity for them. Now, next year, Ruth will marry, if the Lord prosper John Appleton, to whom she is promised. John would have me to live with them, but I prefer my own little home, and they will be but young and not rich, and I would not hamper their beginnings. Meanwhile, Ruth has much needlework to do, and John, too, sometimes likes her to be with him—that is but natural—so that our business is somewhat more than we can manage; and now thee sees what I am going to say. I thought, and Ruth too, that it would be well to have some friend to help her now, and take her place next year. I have not known thee many hours, but I think thee might do, if thy mother would like it, and thee would like to come. It is work which no woman need be ashamed to do, and I think thee could do it."

Many thoughts surged through Madeline's brain, while Rachel was speaking. To live in the midst of this peace and purity, after the scramble and restlessness of the past few years; to breathe this pure air, and feel the sense of largeness and space about her, after the closeness of their crowded London house, this seemed an almost ideal lot. But there were other things behind; she could not decide at once.

"I think I should like to come," she said; "but I must speak to mamma about it, and," she added honestly, "you do not know if I would do, or anything about me but what I have told you."

"I shall know as much about thee as Mrs. Deane, who might have entrusted thee with her children; and besides, thee knows, I do nothing without the Lord's direction, and it has been borne in upon me that thee art to come."

A light step sounded in the front room, and Rachel exclaimed: "Here is my daughter Ruth. She has been to Stanham, to John Appleton's mother."

Madeline looked up, as a tall, grey-clad girl entered.

"Ruth, I think this is the friend about whom thee and I were speaking, when we said that we must have some one to help us with the work; but there is much to be settled before we are sure."

Ruth, who had looked puzzled for an instant, now came forward, and took Madeline's hand, with a smile worthy of her mother.

"I will tell thee all when Madeline has gone," said Rachel. "Speak to thy mother to-night, dear, and to-morrow I will write to her, and after that thee can let me know if thee still thinks to come. But now it is time for thee to catch thy train."

CHAPTER II.

SIBLEY STREET, N.W., is not the place in which one would choose to spend a sultry summer evening; but to the inhabitants of No. 14, necessity offered little choice. The small back parlour where Mrs. Hardy and her three daughters sat, was hot and close, and although the window was wide open, the air from the little, high-walled garden seemed scarcely less oppressive than that within. Clara Hardy stood near the window, and fanned herself despairingly.

"Well, mamma, according to Maddie's description, the Northbury baker's would be an improvement upon this, and I am sure Blanche and I would be glad of a room to ourselves these hot nights."

"Clara, it is not a baker's; don't deepen that impression on mamma's mind."

"I know, child," said Mrs. Hardy languidly, "though I can't see such distinction between a baker's and a confectioner's myself. And to think that a child of mine should set her mind on serving in a confectioner's shop!"

"Nobody need know where she had gone," Clara continued; "we would tell people she was staying with friends in the country, and that would be literally true. I confess it doesn't seem half a bad idea to me, if Maddie wants to go. This baker person offers in her letter quite as much as a nursery governess gets, and I've no doubt the position would be infinitely preferable, if it weren't for the name of the thing."

Madeline sat in silence during her sister's unexpected advocacy. Mrs. Hardy had at first been indignant at the prospal, then pathetic when she thought of the "descent" it involved. Clara and Blanche had laughed at the idea; but the advantages of dividing their allowance between two instead of three, and the hope of the few pounds which Madeline would doubtless send them, as well as the relief it would be to have at a greater distance a sister, many of whose ideas differed so materially from their own, had grown in importance in Clara's mind, until she began to advocate the plan. Blanche said nothing, until suddenly she looked up from the hat she was trimming, with: "What will Dr. Mayhew say?"

Madeline's face crimsoned, and Mrs. Hardy said: "Yes, indeed, we may be quite sure he would not think again of Madeline, if he heard she had gone as a confectioner's assistant."

Madeline rose quickly, and left the room. Safe in her own room, she locked the door, and buried her burning face in her hands.

"What will Dr. Mayhew say?" had been her first thought, too; for Frank Mayhew's opinion had been her criterion ever since the days when, as a school-boy, he had climbed the pear-tree in his father's garden, and thrown pears over the fence into her pinafore. Maddie was his little pet and plaything, until he went to College; while he was away attending his medical course, the Hardys' reverses came, but young Mayhew (Dr. as yet only by courtesy) was one of their first visitors in their new circumstances. He was still Maddie's friend; and though no words had been said, Madeline felt in her secret heart that, when the growth of Dr. Mayhew's practice justified him in taking a wife, it would be his old friend of the pear-tree he would ask. But she did not dream that her mother and sisters calculated on this; they had never before spoken of it to her, and her cheeks burned anew as she thought of it. Then the question repeated itself,—What *would* he say? If he cared for her, would this make any difference? If he were the Frank Mayhew of her girlhood, would he not rather she did any honest work than stay at home, unneeded and useless? But she could not think or reason clearly upon the matter; she only felt now, that if her mother consented, she must go.

"Rachel Fleming said she did nothing without the Lord's direction. Oh, that He would direct me!" she reflected.

Presently she smoothed her hair, and went down. Supper was ready, and, keeping her eyes on her plate, Madeline said, "Mamma, I think you see the force of what Clara said; if you have no serious objection, I should like to go to Northbury."

"Well, as Clara says, nobody need know," replied Mrs. Hardy; "but Dr. Mayhew is sure to find out."

Madeline did not look up, but her voice was steady as she replied, "Dr. Mayhew has never said anything to me, mamma, which can justify us in considering him at all about it, if he asks."

"Well, Madeline, it is of no use shutting one's eyes to facts," began Mrs. Hardy, when Clara took pity on Madeline's burning cheeks, and said,—

"Mamma, let her go, and leave Dr. Mayhew to me; I'll manage him."

Madeline's face flamed still more, but she commanded her voice to say: "Clara, I beg as a favour, that if Dr. Mayhew asks, you will tell him all the truth."

Clara shrugged her shoulders and turned the conversation, and Madeline knew that the subject was virtually concluded, and her mother's consent obtained.

There was no need for delay, for Rachel Fleming was anxious to have her new helper at once, and in a week after her first visit, Madeline found herself once more in Northbury, at the gabled house. A little white room next to Ruth's was given her, and she found in Ruth a pleasant companion, full of youthful hopes and enthusiasm, in spite of her demure exterior. Rachel Fleming's manner never changed, except to become more affectionate and tender, but was just as courteous and truly friendly as before Madeline became what people would call "a paid dependent" in her household.

Madeline pushed all questions into the background, and entered so heartily into her work, that Rachel's epithet of "capable hands" was soon fully justified. And the life was pleasant, too. It was pleasant to leave her dainty room in the morning, and descend to the equally dainty kitchen, where Martha kept watch and ward in a realm of shining pans and freshly-scrubbed tables. It was pleasant to prepare breakfast and lay out the delicate china and homespun linen, while the roses nodded in at the window and

filled the air with their perfume. Pleasant, too, to go bed-making with Ruth ; for somehow the girls never talked more confidentially than when they were spreading white sheets to an absolute smoothness, and patting feather pillows into the most comfort-yielding position. Then the cake and biscuit making was almost exciting, and Madeline had never a prouder moment than that in which Ruth said laughingly, that she should retire in peace, sure of a worthy successor. Even serving in the shop, from which Madeline had at first shrunk, became an additional interest and pleasure. Rachel Fleming had a standing of her own in the town ; people did not dream of patronising her. Her quiet, dignified manner seemed to say: "I give the time and the skill and the materials ; you give the money—we are quits. There is no favour on either side."

Madeline, of whom Rachel always spoke as "friend," stood on the same footing with the townspeople as Ruth did, and like Ruth, she soon had a friendly interest in the frequenters of the gabled house.

John Appleton was a daily visitor at Rachel Fleming's. He was a manly young fellow, with far too much fun in him to agree with Madeline's idea of a typical Quaker. John was an enthusiastic bicyclist, and a member of a London cyclists' club. A long run on his bicycle formed part of nearly every day's programme, but the run, in whatever direction it tended, always began or ended at the gabled house. John's mode of entrance was through the garden, and the girls, looking up through the open windows of the spotless kitchen, saw first a cheery face smiling at them from the garden wall, as its owner sped rapidly by ; and then, a few minutes after, a grey-coated, grey stockinged figure appeared among the roses. Then Madeline would find work in another room, and leave Ruth demurely tossing her pastry, while John leaned through the window, and carried on that interminable conversation in which Madeline had no part.

And so the happy, uneventful days went smoothly by, when one morning, as Madeline came in from the garden, she heard Rachel's voice calling her.

"Here is a letter for thee, Madeline. I have also one from thy mother, and doubtless thine concerns the same matter. Take it to thy room and consider it, and then I will talk with thee."

Madeline took the letter with some palpitation of heart, and went to her room. Seated in her white dimity-covered chair she read :

"DEAR MADDIE,—Here is such a chance for you. Mrs. Knighton called yesterday, and asked mamma if she could spare you as her companion, for since Ethel married, she has felt lonely. Of course mamma was delighted, the Knightons are so well connected, and it would be such a good chance for you. Mamma said you were on a visit, but could come home at once, and she has written to Mrs. Fleming to ask if you may come before the quarter is up. Of course she may be awkward about it, but you must try and manage her. Mrs. K. said you should have all the advantages of her own daughter ; I wish I were in your shoes, Mad.! I think you ought to be on the spot too, for another reason. Absence doesn't make the heart grow fonder with some people. I shall not tell you what I mean ; you must come and see for yourself.

"P.S.—If you are so enamoured of a country life that you don't want to come, there may be a chance for me.—CLARA."

Madeline sat long and thought. Such a life as Ethel Knighton's would at one time have seemed a delightful prospect. Theatres, balls, parties, pretty dresses—of what had Ethel's life consisted besides these? These certainly had been her only subjects of conversation, and Madeline and Clara had at one time listened for hours, and envied her. But the prospect had lost much of its attractiveness ; the life of useful work and the atmosphere of calm goodness in which she now lived, seemed preferable. But would this feeling last? would she not regret it if she let this opportunity slip? Madeline looked into her heart, and knew that the influence of Rachel's life and Ruth's had caused her to set up another standard of living. "Like Christ," had become her mark.

"But you can live a Christ-like life in Ethel Knighton's place," whispered a voice within her. "If I were already there, it would be different," replied Madeline's better self; "but I must not put myself into temptation." Then there was Clara's hint. "That shall not influence me," said Madeline ; "and if absence can change people, perhaps it is better that I should find it out soon."

Rachel looked up with a smile when Madeline went down. "Well, has thee decided?"

"Rachel, I know mamma won't press it. I'll stay with you."

Rachel said nothing, but gently drew Madeline down and kissed her on the forehead, and Madeline felt that her decision was sealed.

Late roses still lingered in Rachel Fleming's garden when, one afternoon, Madeline stood by the kitchen window, folding clothes. Sprinkling, smoothing, folding, she stood, singing dreamily the while, too engrossed to notice John Appleton's head swiftly pass the garden wall, or to see that he was accompanied by another person.

"There are not many prettier runs than from London to Northbury," said John Appleton to his companion, as they alighted at the gate. "Down this path ; Ruth is in the kitchen ; I saw her when we went by."

"But are you sure Miss Ruth will like such an unceremonious introduction?" asked the stranger.

"Ah, Mayhew ; you are used to London ladies and London kitchens. You would miss the prettiest sight in Northbury, if you did not see Rachel Fleming's kitchen and Ruth in it. Stay here behind the rose bushes, the window is wide open, and Ruth, —why, Ruth isn't there," he added, turning a rueful countenance on Frank Mayhew. But to his astonishment, Frank Mayhew never heard him ; he had entered, and with outstretched hands took Madeline's hands in his, and after one bewildered glance at the two faces, a look of comprehension crossed John's own, and a sense of fellow-feeling sent him to seek an entrance into the house by another door.

"Then you were not shocked to find what I was doing?" asked Madeline, when later in the day she walked with Frank in the garden. Said Frank : "I think the only thing wanted to make my little Madeline perfect, was a training in housekeeping at Rachel Fleming's."

A happy party sat round Rachel Fleming's supper table that night. "So thee wants Madeline soon, Friend Mayhew," said Rachel. "Well, it is natural, and Madeline, thee may go with an easy conscience, for the shop will be closed. The Lord has prospered John Appleton, and I have decided to make my home with him and Ruth. They will come here to live, but Ruth and I will keep our skill in cookery for John and our poorer neighbours."

BETWEEN SIXTEEN AND TWENTY-TWO.

A WORD TO YOUNG MEN.

By the Rev. THAIN DAVIDSON, D.D.

I DO not hesitate to say that with most men, these six precious golden years are the formative period, when character is shaped, and the future course determined. Incalculable are the issues dependent on them. If habits of indolence are acquired ; if languor and irregularity are indulged ; if selfishness and conceit are encouraged ; I want no other horologue to forecast your future : almost in all certainty, your life will be a failure ; you will come to no good ; you will drag along a humdrum and melancholy existence ; and at last will go down

> "To the vile dust from whence you sprung,
> Unwept, unhonour'd, and unsung."

Some young fellows set about whatever they have to do in a lukewarm, indifferent, and perfunctory fashion, as if they had not a particle of interest in the task assigned to them. You never heard of such men making their mark on society, or accomplishing any good. They trifle and dawdle through life, and might as well have never lived at all. They seem to have no backbone in them. You feel inclined to prick them, or empty a tub full of cold water over them, or in some other way wake them up out of their dreamy listlessness.

In the advertisement column of a Metropolitan newspaper,—a single issue,—I recently observed the following demands :—"Wanted, an energetic young man ;" "a smart young man," "a total abstainer ;" "a steady and obliging young man," "a vigorous young man."

Well, this may give us an idea of the kind of youth most in demand in our day ; and I am struck with the emphasis put upon promptness and energy.

If *you* are half asleep, the world around you is not. If you do not look alive, you will be left far behind in the race.

There are no "sleepy hollows" in modern commerce ; the man who carries the day is he whose strong sense of personal duty and responsibility replies, in the words of his Divine Master, to all who tempt him to idleness or self-indulgence, "Wist ye not that I must be about my Father's business?" "*Must*"—it speaks of strong decision of

character. It indicates the determination to be thorough in everything. "When I take the humour of a thing," says one of the characters in an old play, "I am like your tailor's needle, I go *through*."

Why, even in the way that a shop-lad ties up brown paper parcels I can often read his character, and venture a prophecy as to his future career.

I am not quite sure that what Emerson said a good many years ago could be still said of our country. "Of all men," remarked he, "I find Englishmen the men who stand firmest in their shoes. They have in themselves what they value in their horses—mettle." It is a quality which, in common life, Englishmen delight to call "pluck," a combination of resolution, courage, and perseverance; the determination to succeed; at least, to secure that, if success is wanting, it shall not be through any fault of ours.

"I must be about . . . *business*," said the Divine Youth, who is our only perfect model. We are not sent into this world for play, nor for self-indulgent ease; Jesus was not.

We are not sent here to enjoy the *maximum* of pleasure with the *minimum* of toil; that is a wrong conception of life altogether; work is not a mere means to an end, a hardship to be submitted to as an avenue to enjoyment; nay, the world is intended to be a great workshop, and each of us is to take his own share, and find his own fitting department.

To many a young man it has been far from a blessing that his father left him a competency, or some dear old aunt bequeathed him a fortune; it has simply been his ruin. He would have been a far better and happier man, if he had had to earn his own living. I have known of well-to-do gentlemen who have hoarded up their gains, just for the sake of hoarding, and that hoarded wealth has proved a legacy of curse to their sons. Better far had they spent that money to good purpose whilst they lived, and brought up their boys to some useful calling.

It is a common, but foolish mistake to imagine that labour is the curse of the fall. Before Adam had yet sinned, indeed, before the woman was formed who tempted him to disobedience, "the Lord God put him into the garden of Eden, to dress it and to keep it." Industry was an ordained law of his existence.

Talk of "men of business," if ever there was a man of business, it was Jesus; early at work, ever at work; His hands fully occupied; His life one unbroken term of varied and beneficent activity.

What is the reason that some young men are so dull and spiritless? It is because they regard work as a drudgery, and do not throw their whole heart and soul into it. They have no liking for business, and would turn life into one long, unbroken holiday; the consequence is, not only that their work is badly done, but that the relish is taken out of their leisure and recreation. Believe me, there is nothing so fatal to the true enjoyment of life, as the relaxed condition of an indolent mind. Busy hours are indispensable to make holiday hours delightful.

Moreover, as Isaac Barrow says, "industry is a fence to virtue." Well do you know that never are you so open to the assaults of temptation, as when you have nothing to do. Then it is that Satan is most likely to get you into mischief. Many is the lad whose moral ruin may be traced back to the fact of his having too much spare time.

But I would further remind you that if you are Christians, your daily work, whatever it be, is to be viewed as your Divine Father's business. When a man says, "I must be about my Father's business," that is not to be taken as meaning that he must be off to a prayer-meeting, or that he must go to read his Bible, or engage in private devotions, or visit the sick, or teach a Sunday class, or distribute tracts, or conduct a service, or, indeed, engage in any specific religious duty whatever; the language may apply to his secular calling, his common daily employ. If you are a man of God, every single act of your life should be viewed as a part of your Father's business.

Indeed, the most effective of all ways in which God is served, is this living to Him in everything, consecrating to His glory all the details of our ordinary prosaic life. There are but few people who fully realise this blessed truth. Unhappily, the bulk even of professedly Christian men separate their own business from their Divine Father's business, that is, their secular occupation from their religion, in a way that is not to the advantage of either.

Over their office door or shop door, they write, "Business is business"; and over their church door they write, "Religion is religion"; but they have no notion that the two should intermingle.

They forget that religion is not a thing by itself, which may be added or tacked on to a man's life *ab extra*, but an all-persuasive influence, flowing out from the centre of a regenerate heart into all one's daily acts and occupations.

Do not for a moment suppose that it is principally the preacher in the pulpit, or the teacher in the Sunday-school, or the Christian visitor in the sick-room, or the saint upon his knees, that is doing the Father's business; not less may the carpenter at the bench be doing it, the compositor at his printing-frame, the shop-man at the counter, the clerk at the desk; provided each of these realises the presence of God, and strives, to the best of his power, to fulfil, to the Divine glory, the task assigned to him.

There is not a situation so humble, nor a job so common-place, that may not mean real work for God; and that work, faithfully done, shall have His approbation and reward.

Were this truth more commonly realised, it would go far to sweep the market-place of fraud and imposture; it would purify our commerce; would put an end to adulterations, and shams, and false labels, and scamping of every kind.

The last Blue-book on the Merchandise Market tells a humbling tale, for it reveals a rottenness of business customs, and a gross commercial immorality, that are likely to be a thousand times more damaging to English trade, in the long run, than a succession of bad seasons or a wasteful war.

The record it gives of the evidence brought before the Select Committee of the House of Commons, discloses a series of persistent efforts, in all sorts of enterprises, to palm off upon the public, goods which are not what they profess to be. Will men dare to call such a style of trade "their Father's business"? Ah! apply this test, and, like Ithuriel's spear, it will lay bare much that is a disgrace to our commerce.

Young men! Have nothing to do with such practices. Let not the withering blight of them touch anything that you are concerned with. Let that only be your business which you can call "your Father's business," too.

Whilst this view of the text is unchallengeable, and all your life is, in a sense, to be given to God, remember that, if you can call Him "Father," you are bound, in a stricter view of the words, to do some specific work for Him; some sacred, self-denying, philanthropic work; some work to benefit your fellows, and to extend His kingdom.

It is a poor, contemptible life, that is spent all for self. Why, if you are a Christian, scarcely a single day should pass in which you have not done some business for God. If you are on the outlook for such work, and cannot find it, I shall undertake to remove this difficulty. May heaven's rich blessing descend upon all of you who are so employed!

Now, let me give you a motto for the coming year; and whenever the arch-tempter or base companions would entice you to indolence or vice, may you be ready with the prompt reply, "Wist ye not that I must be about my Father's business?"

HOMELY HOBBIES: RECREATIONS IN GEOLOGY.

By W. H. HARRIS, B.A., B.Sc.

No. 6.—THE MATERIALS OF OUR MANTEL-PIECES AND FIRE-PLACE JAMBS.

IN recommending geological questions and pursuits as a hobby, we are quite aware that it is impossible for most people to go very deeply, merely in their leisure time, into a subject so vast as the history and contents of the earth's crust. But, just as those who take up "pigeon-fancying" as an amusement, most frequently restrict themselves to one or two particular breeds; as poultry-rearers usually confine themselves to some special varieties; as insect-collectors generally have a pet "order" to which they devote their inquiries and their search; there is no reason why certain distinct departments of geology should not become hobbies for those who are fond of this branch of natural science. For example, how full of interest a cabinet would be, which contained specimens of stones, polished and unpolished, used for the purposes mentioned in the heading of this Paper! There would be granites of many hues; serpentines of wondrous colours; limestones of a dozen kinds, each with a history of intense interest, and tolerably easy to make out; slates, enamelled with much skill, to simulate other stones; while a place would also be found for more beautiful and expensive materials, like malachite, amygdaloids, and other crystalline minerals.

We must not pursue this suggestion further; but we may, perhaps, usefully enforce it by giving a few particulars relating to the materials to which we have just alluded. First, then, with regard to granite. Possibly all our readers do not know that it consists, for the most part, of quartz, felspar, and mica. Sometimes a mineral called "hornblende" replaces the mica, and then the rock is named "Syenite," from Syene, a town in Egypt, where it was once largely quarried.

The proportions of the ingredients of granite vary largely. This is especially the case with the felspar, whose own composition, also, is far from constant. The result of this is seen in the numerous tints assumed by granite, it being sometimes flesh-red, sometimes grey, or greyish-white, with many intermediate hues. Again, the size and general prevalence of the felspathic crystals is often so marked, that we have what are called "porphyries." Then, as a rule, the crystalline constituents are without any definite arrangement, but we occasionally find a more or less distinctly banded structure. The rock is then called a "gneiss." This last-mentioned fact has led modern geologists to the conclusion, that gneiss must be placed among the "metamorphic" series, *i.e.*, with those beds which have undergone great change since their formation. In other words, it is believed by many, that these now completely crystalline rocks were once *stratified*, like our clays and sandstones, but that, owing to immense pressure and heat, probably acting with water at an exceedingly high temperature, a great alteration has taken place in the nature and arrangement of their component minerals. But if this be true of gneiss, the gradations of the latter into granite by such extremely gentle stages, naturally lead us to conclude that there can be no essential difference of origin between them. A further deduction is, that the granitic series is probably not confined to any particular geologic "age"; that in all periods of the history of the earth's crust these rocks have been forming, and that, at the present moment, miles below the surface, the potent agencies, to which we have alluded, may be changing and re-arranging, chemically and mineralogically, materials once subject to the influences of sea-waves and river-action, sunshine and frost, rain and wind. In such speculations as these, what a wondrous field has been opened up for the work of what has been aptly termed, "the scientific imagination"!

The use of the granites for mantel-pieces and fire-place jambs is, naturally, limited to buildings in which cost is a secondary consideration. Their sparkle and beauty of tints, their hardness, durability, and susceptibility to a high "polish" render them attractive; but the expense of carriage from mountainous or hilly districts, and the time and labour required for their working, make them a somewhat costly luxury. Hence the more frequent employment of limestones.

In two previous Papers, we have referred to some of the means by which this latter class of rocks has been formed; for it must be remembered, that no single method has been concerned in their working. They differ widely in this respect from the sandstones, for example, which are all due to the breaking up of older rocks into minute grains, and the subsequent cementation or consolidation of these into a compact and massive condition. But there is another respect, also, in which limestones differ from many other kinds of rock material. This is that, so far as at present known, all our calcareous formations, however they may vary in texture and appearance, seem to be the result of *organic* agency. It may appear astonishing that white crystalline marble, for instance, which looks so pure and homogeneous, and without a trace of animal or vegetable matter, should once have teemed with life. Yet when we remember the origin of chalk, and what amount of metamorphism is found to occur in minerals under the influence of heat and pressure, all difficulty as to the origin of white marble disappears.

But to the ways in which our numerous kinds of marble have been formed, a few more facts must be added. We have spoken in our previous Papers of the contributions to rock-masses made by foraminifera and coral-polyps. To these lowly workers, we probably owe the greatest amounts of our limestone beds; but they have not been, by any means, alone in their labours. In some districts in our country, notably in Lancashire, Derbyshire, and at Dent, in Yorkshire, marble is found, consisting almost wholly of the remains of encrinites, or "stone-lilies," as they have been called. These creatures belong to the *echinodermata*, which include the more familiar forms of the star-fishes and sea-urchins. From these, their remote cousins, they differ, however, in some important aspects. They are at first freely swimming organisms, but, at an early period in their life, they come to anchor on some firm ground, and henceforth remain fixed to that spot. They soon begin to develop a jointed and flexible stalk, on which they mount higher and higher, till a length of a good many inches is attained. In a cup-like depression enclosed by calcareous plates, and called the "calyx," lives the animal itself, encircled by wondrously branching "arms," constructed, like the stalk, of a great number of articulations, dividing and sub-dividing, and diminishing in size, until they resemble delicate calcareous filaments. It has been estimated that, in some specimens of these crinoids, there existed as many as 140,000 separable joints, which, as the animal matter connecting them decayed, would fall confusedly together. Thus, as generation after generation flourished and died in the same area, the total of their remains, in the course of long periods of time, built up large masses of limestone. The individual joints of stalks and arms may often be picked up on beaches where "encrinital-limestone" cliffs are disintegrating. In former days they were sometimes threaded into rosaries—for they have a central perforation—and in the north of England they are called even now "St. Cuthbert's beads." Sir Walter Scott thus refers to this fact:—

> "But fain St. Hilda's nuns would learn
> If, on a rock by Lindisfarn,
> St. Cuthbert sits, and toils to frame
> The sea-born beads that bear his name."

Very few specimens of crinoids have been found still living, and it would seem, for some reason with which we are unacquainted, that they no longer exist in the remarkable profusion they attained in bygone periods.

"Encrinital" marble takes a good polish, and owes its very varied and pleasing markings to the different angles at which portions of the original calcareous structure are cut through, by the shaping and polishing of the stone.

From South Devonshire come marbles of different shades of grey, and having veins running through them, variously coloured—white, yellow, or reddish. Frequently, too, are to be found, distinct traces of the special coralline structure, called "madrepore." From the quarries in the north of the same county are obtained black marbles with bold white veinings. A similar kind is found at Ashford, in Derbyshire. In this latter county, at Bakewell, there occurs a brown variety, called the "rosewood." Excellent marbles are also got from Ireland—black in Kilkenny and Galway; grey in Cork, King's County, and Galway; and mottled in Limerick. Some of the most beautifully tinted kinds come from foreign countries. The purest white is from Carrara, in North Italy; a rich yellowish brown, with lighter veins and cloudings, is quarried at Siena, in Tuscany. Other sorts are known as *verde antique*—a cloudy green, mixed with serpentine; *rosso antico*—a deep blood red, with lighter tinted veins; and *lumachello*, or "fire-marble"—a dark-brown variety, with spots showing reflections like "mother-of-pearl," and due to the nacreous matter of the inner portions of shells, cut through in the polishing process. These various colours are due to matters mingled with the calcareous ingredients, chiefly compounds of iron; but in the case of the black marbles, bituminous substances, from animal or vegetable sources, have imparted the deep, dark hue. In all the cases above mentioned, there has been much "metamorphism," owing in many instances to the intrusion of dikes or molten masses, at enormously high temperatures, from far below the surface. Such masses, making their way in huge pipes or veins, would naturally alter the texture of the rocks amidst which they found a passage.

From what has been said, it might appear that all marbles have had their origin from marine animals. No doubt the greater proportion of our limestones were formed in the ocean, but in Sussex and in Dorsetshire, there have been found calcareous beds, of no

great thickness however, consisting almost wholly of the remains of fresh-water molluscs, chiefly univalves, *i.e.*, possessing a single shell, like the snail, instead of two separate valves, like the oyster. These varieties are known as Petworth, Purbeck, and Paludina marble, the last being the name of the particular germs of "shell-fish," which have most largely contributed to the formation of these beds. In colour they are dull grey, and their markings are due to the "whorls" of the shells, cut through at different angles.

Our commoner mantel-pieces and fire-place jambs are made of "oolites" of different textures. The word means "egg-stones," and was given from the rounded particles of calcareous matter, distinguishable by the unaided eye, and bearing a fancied resemblance to the roe, or eggs, of fish. The formation of these oolitic limestones has been due to the accretion of minute amounts of carbonate of lime, from water highly charged with it, around tiny nuclei, furnished from various sources.

Space does not permit us to devote more than a few sentences to "malachite."

It is a green carbonate of copper, found in Russia, North America, and at the Burra Burra mines in Australia. It is too expensive for common use in large pieces, but it is frequently inlaid into other kinds of rocky material, and its effects are recognised as so pleasing, that the slate-enameller often imitates its well-known colour and appearance in parts of the jambs of our fire-places.

FORTY WRESTLERS; or, CHRISTIAN HEROISM.

WHEN the Emperor Licinius was persecuting the Christians in Armenia, the Thundering Legion was stationed at Sebaste. Forty men in that Legion declared themselves Christians, and were sentenced to be exposed naked all night on a frozen pool; for it was winter, and bitter cold. In a house on the edge of the pool a large fire was kindled, and food and wine and a warm bath were prepared, under the charge of Sempronius, a centurion, and a guard of soldiers; and it was announced to the forty, that if any of them entered the house, they would be considered to have denied Christ.

So night came on, and the keen wind from Mount Caucasus made the citizens close their windows and doors more tightly, and heap up the fuel on their hearths. And on the frozen pool were the forty warriors, some standing lost in prayer, some walking quickly to and fro, some already sleeping that sleep which only ends in death. And ever and again, as the hours went slowly by, they prayed: "O Lord, forty wrestlers have come forth to fight for Thee: grant that forty wrestlers may receive the crown of victory."

And now, as the cold grew more intense, one of the forty could endure no longer, and he left the pool and came to the house where Sempronius and his men were keeping guard. But still the martyrs' prayer went up to heaven: "O God, forty wrestlers have come forth to fight for Thee; grant that forty wrestlers may receive the crown of victory."

The prayer was answered. Sempronius, the centurion, was touched by his comrades' bravery. He declared himself a Christian, and took his place on the frozen pool. And when the cold had done its work, and forty corpses lay upon the ice, forty glorious spirits, with Sempronius among them, entered into the presence of their King.

ALMOST SAVED!

By Eva Travers Evered Poole.

HOW the cry rings out: "A man drowning!" How it all happened, nobody knew; in the confusion and excitement, people forgot to ask. All that the hurrying crowd realised was, that a man had fallen off the pierhead into the sea, and that there he was, struggling for dear life in the dark waves.

Look! You can just see his head for a moment. Eyes are strained, and women hold their breath, standing on tip-toe to catch a glimpse of the dark spot in the water, that might be the hand or head of their drowning fellow-creature, lifted in prayer for help.

There! he has caught the rope which those men yonder have thrown to him. He has it! No; he has just missed it. How long they are getting a boat! Ah! that great wave has carried him farther out on its white, angry bosom. No rope can reach him now. There is a smothered cry from the women, and a low groan from many a strong man standing by, as they realise this. Oh, if he had but caught the rope when it was close to him!

"And he was so nearly saved!" breaks from the lips of a sturdy, honest fisherman, as he dashes a tear from his eye with the back of his rough, toil-worn hand.

"Why, once I could have sworn the rope touched his hand, and I saw his fingers close upon it."

Aye; that made it all the worse, to think of the poor fellow being drowned, after all, when he was almost saved! Doesn't it seem a pitiful, sorrowful thing to be so *nearly* saved, and yet to be lost?

Hush! I fancy I hear a low, murmuring sigh. What is it? Is it the cry of a lost soul?

Yes; it comes on the breath of eternity, from the other world.

"I was once so nearly saved. I had almost decided to accept Christ, almost resolved to close with His offer of mercy; but though the rope touched me, I never grasped it, and the dark wave of sin engulfed me! Lost! lost! Too late! and for ever! Oh! if I could only once more be so close to Jesus! How I would cling to His outstretched hand! How I would grasp at His promises! Oh, to be *nearly saved*, and yet lost for ever!"

'Tis the wail of a lost soul. Perhaps *you* are now within touch of Christ—close to a new and better life, within reach of heaven. I don't know what may be holding you back from grasping salvation. I only know that Satan is perfectly satisfied to have you close to Christ, as long as you do not touch Him. But time is going. A little more delay will cost you your soul. Settle the matter between you and your Saviour; and *now*, while He stands stretching out to you the hand that will save you, *grasp it*. Conscience has bidden you do this a thousand times. Heaven and hell are waiting your decision. Which shall it be? *Almost saved?* or altogether?

Calumny would soon starve and die, if nobody took it in and gave it a lodging.

Love works out deep and difficult problems in life; hatred tangles all it touches.

Godliness in the Heart produces a strong character; godliness worn as a cloak produces a weak one.

That was a good Prayer of the old deacon—"Lord, make me willing to run on little errands for Thee."

PRACTICAL FAITH.

AN ocean steamer is anchored in the Mersey. A man stands on the pier gazing at it. He says, "That is a noble vessel. She is the staunchest and swiftest steamer that ploughs the Atlantic. I know all about naval architecture, and I pronounce her well-built. I know all about machinery, and I regard her engines as perfect. Her captain, too, is a model officer. If anybody wants to go to New York, he cannot do better than to embark on that vessel." Who would ask for a fuller and more satisfactory confession of faith than that? But the man stands on the pier. He does not go on board. And now a messenger comes from the captain, offering him a free passage. But he does not accept. He does not get into the boat that is fastened to the pier, and let the sailors take him on board. You say to him, "Sir, don't you want to go to New York?" "Yes," he replies; "but not just now, and not in that steamer." What does such faith amount to? There is nothing practical in it.

But here comes another man, with bag in hand. He also looks from the pier at the steamer. He says, "I want to go to New York. I don't know much about naval architecture, or about machinery, but that vessel looks strong, I am assured that she has carried thousands in safety, and I am going to trust myself to her." He does not ask for a free passage. He buys a ticket, gets into the boat, and is taken on board. No one can doubt the reality of his faith. He shows it by what he does. It is not faith in the steamer, as staunch and swift, and a good vessel for others to embark in, but faith in it for himself, faith that leads him to prefer it to any other vessel in the harbour, to entrust his life to it.

BIBLE JOTTINGS.

Matt. 15. 21–31.

"Great faith."

There are no "kinds of faith," but there are degrees in faith.

1.	Faith	Eph. 2. 8.
2.	Little faith	Matt. 16. 8.
3.	Great faith	Matt. 15. 28.
4.	So great faith	Matt. 8. 10.
5.	Weak faith	Rom. 4. 19.
6.	Strong faith	Rom. 4. 20.
7.	Full of faith	Acts 6. 8.

"At Jesus' feet" (ver. 30).

1.	The *scholar's* place. . . .	Luke 10. 39.
2.	The *sorrower's* place . . .	John 11. 32.
3.	The *sacrificing* one's place .	Luke 17. 16.
4.	The *suppliant's* place . . .	Mark 5. 22.
5.	The *sick* one's place . . .	Matt. 15. 30.
6.	The *subdued* one's place . .	Luke 8. 35.
7.	The *servant's* place . . .	Luke 5. 8.
8.	The *sinner's* place	Luke 7. 38.

OUTLINE OF INTERNATIONAL SUNDAY SCHOOL LESSON.

JANUARY 22ND.

JESUS AND THE AFFLICTED.—*Matthew* 15. 21–31.

GOLDEN TEXT: "Is any among you afflicted? Let him pray."—*James* 5. 13.

CHRIST'S object in retiring to borders of Tyre and Sidon—temporary rest. Mark says (chap. 7. 4), "He would have no man know it."

"He could not be hid." Real goodness need never *seek publicity;* its difficulty will be to *avoid* it.

Wherever we go, we may find opportunities of doing good. Christ retires, yet work follows Him.

A Gentile woman seeks Christ, while the Jews reject Him. The most privileged are sometimes the most careless.

This woman is anxious about her daughter's welfare. Would that all parents were equally anxious about their children's souls.

This woman takes her daughter's case to Christ. An example to parents and teachers.

The woman meets with discouragement, yet she perseveres.

Christ's silence does not mean unkindness or indifference. It is love, combined with wisdom.

The woman erred in the *manner* of her address; she blundered in coming. YET SHE CAME. Better to come thus, than not at all.

Christ did not refuse her, but He *taught* her. He taught her first, then granted her prayer. So Christ will teach us.

She was mistaken in claiming help from Christ as Son of David. This title gave her no ground to claim anything. Christ taught her her true position.

Let us aim to be intelligent in our prayers; but don't cease to pray, because you are not intelligent. Christ is very patient. It is better to make mistakes in prayer, than to make the greater mistake of not praying.

Observe—Christ did not call the woman a dog; He simply hinted at the popular estimation in which Gentiles were held.

She had great faith in the riches of Christ. After the Jews were satisfied, there was enough for the Gentiles.

See how pleased Christ is with our faith. We are far more likely to grieve Him by our unbelief than by our presumption.

JAMES L. STANLEY.

FURTHER NOTES

By the Rev. J. H. THORPE, M.A., Cork.

THE teacher will not fail to compare the account in St. Mark, and explain the apparent discrepancy. St. Matthew (ver. 23) appears to describe an incident on the road, and St. Mark (chap. 7. 24) in the house. Mark takes up the latter part of the story, which would appear to have taken place in the house, while Matthew gives the whole from the beginning. St. Mark tells us more fully that her religion was a Greek (see margin), and her country Syro-Phenicia. There is no contradiction with St. Matthew, for the same country was at one time called Canaan, at another, Syro-Phenicia.

The original for "dogs" is "little dogs," and is not so harsh as would at first appear, for it refers to domesticated dogs.

I. Note some precious things about Jesus,—

Something about Himself. Mark, "He could not be hid," the "Sun of Righteousness." The sun may be obscured, but you can see its light and feel its heat—it cannot be hid. You may hide a rose, but you cannot conceal its fragrance. If Jesus is in our heart, our friends know it.

He does not deal with all cases alike. Some He answered at once, some He anticipated; this woman He held back.

How patient He was. The disciples were tired of her cries, but Jesus was not. Jesus loved her, they did not. Love is never impatient. Love is like a large ship which carries a cargo that would sink little boats. Great love shows great patience.

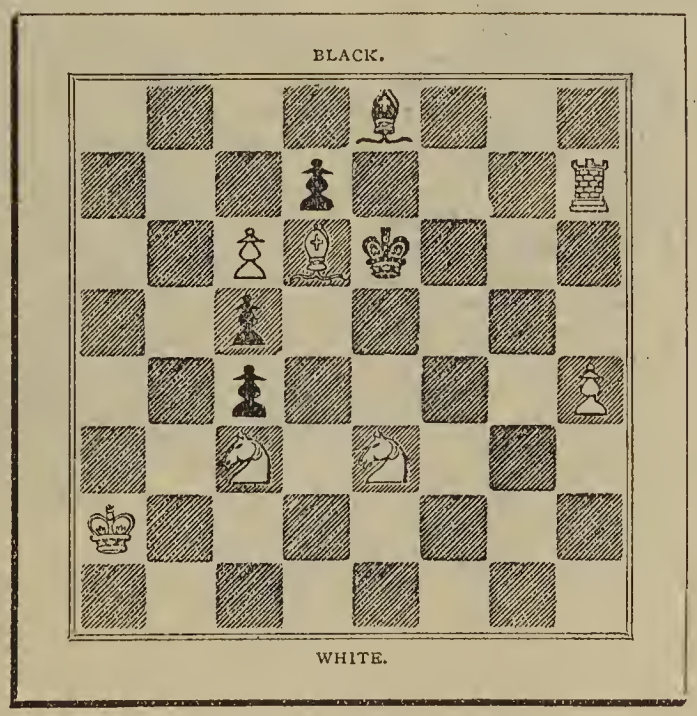
Note the silence of Christ. Here; before Pilate; His *look* to Peter. There is a time to be silent, and we can often do more good by silence than by speech.

Learn from *Christ's words to the woman:* "Behind a frowning providence, He hides a smiling face."

II. From the action of the disciples we learn that *kindness is often done from selfishness.* They wanted Jesus to grant her request, not because they felt for her, so much as because "she crieth after us." Never miss an opportunity to be kind, but always seek grace to be kind for the right reason.

III. See in this woman,—

A model mother. Her daughter was sick, and she prayed: "Lord, help *me.*" She made her daughter's misery her own. Love is a self-forgetting thing. What a mother! Children should seek to be worthy of their parents.



A model seeker of blessing. She went to the right One; she asked in the right way; she acted on her faith. Note in her prayer—how earnest, humble, persevering, bold, and it was intercessory. Note her faith—particular, patient, persevering. Note what she learned—(1) the power of Jesus; (2) the power of prayer; and (3) that the word of Jesus is as powerful as His bodily presence. "And her daughter was made whole from that very hour." We cannot see Him now, but He is none the less able to help us, to heal us, and to hear us.

CHESS.

By F. F. ROWLAND.

PART VII.

ILLUSTRATED POSITION, NO. VII.

White to play and mate in three moves.

THE above ingenious problem, by Rev. H. W. Sherrard, fully illustrates the power of a pawn, and cases where it is necessary to promote it to a particular piece. The key move is 1P takes P. In reply, Black may play K, take B, or K to B3, or else move his B, then, in order to effect mate in the required number of moves, White must, as the following solution will show, play the Pawn to the eighth rank, and promote it to a Q, R, B, or Kt, according as Black moves.

WHITE.	BLACK.
1P × P.	1K × B.
2P × B becoming R, etc.	1K to B3.
2P × B becoming B, etc.	1B to B2.
2P to Q8 becoming Q, etc.	1B to Kt3.
2P to Q8 becoming Kt ch.	1B × P.
2Kt to K4, etc.	

A good player embraces in his mind the full power of all the pieces and pawns, and notes every point of advantage and danger left open by his opponent. He who plays at random plays on chance, and chance is not an element in chess. No move should be made without a special object, and every move of your opponent should be carefully studied, in order to find out the object he has in view. It is by thus studying, the novice becomes the adept, and is thereby able to enjoy all the pleasures chess affords.

Before turning our attention to the opening moves of a game, we will give the following sound advice, which was laid down by one of our greatest chess masters, Stamma, and by which we hope our young friends will be guided.

Your first view should be to open the game so as to make way for your pieces to come out, that you may post them advantageously, and have them in readiness to attack and defend.

This is best done by advancing proper Pawns; these are the King's, the Queen's, and the Queen's Bishops' Pawns. The three Pawns on the King's side should remain unmoved, in order to guard him, and secure a retreat for him when he castles.

Castle as soon as you can conveniently. This is sometimes so necessary to be done without delay, that it may be worth while to abandon a Pawn, rather than lose the opportunity.

If you bring out your pieces too soon, before you have opened their road, they will confine your Pawns and crowd your game; if you play them near the adversary, so that he may drive them back by pushing his Pawns, the same bad consequence must follow. In this case you lose a move, and that alone may probably be the loss of the game. Your adversary perhaps gains a move on his side, that helps his game forwards, or it may be in his power to hunt your piece till he catches it, or drives it where it may be useless to you by the difficulty of bringing it again into play. Thus you may lose several moves.

One exception to this rule is, when you play a piece thus, in order to get into a safe and advantageous post at the next move. But in general, it is best to bring out your pieces under the protection of your Pawns, which, likewise, by being advanced, leave places of safety for them to retire to, in case they are driven, though you must avoid exposing them to it.

Never let your King lie in danger of receiving a check by discovery; that is to say, in such a position that your adversary, by removing one piece, opens check by another behind.

A double check may still be worse.

If a Pawn stands before your King in a direct line, and it is in your power to take it with a piece, look first whether your adversary cannot pin that piece down, by bringing a Rook behind it, and take it at the next move, either with Rook, or by pushing a Pawn upon it.

If your adversary plays or leaves a piece, where it lies in your power to take it, as you may at first sight think, for nothing, do not immediately conclude it to be through inadvertancy, especially if he is a good player; but consider whether by taking it you do not expose yourself to a mate, or at least to pay too dear for what you get.

Sometimes a bait of this kind may lead even your Queen into a place, where she may be so entangled, or detained out of the way, as not to be set free in several moves, if at all, to come to your assistance.

He that has a piece or Pawn advantage, is commonly in the right to make an exchange as often as he can conveniently; it increases the odds on his side, for two to one is greater odds than three to two. Yet let him consider before he does it, whether he may not lose a move, instead of getting one, or mend his adversary's situation, and perhaps spoil his own.

SOLUTION TO POSITION ILLUSTRATING LAW X.

Assuming this to be the end of a game in which White gave the odds of KR,—1 castles on K side, 1 K to Kt6, 2 Kt to K2—ch, 2 K to R6, 3 B to Kt2 mate. Two other variations.

(*To be continued.*)

GLASS-MAKING AS A BRITISH INDUSTRY.

By Henry H. Bourn, Author of "Earth's Diamonds; or, Coal, its Formation and Value."

IN the general acceptation of the term, glass includes any substance or mixture, earthy, saline, or metallic, which is reduced by heat and fusion into a hard, brittle, uniform mass, having a high degree of lustre.

The invention of glass can be traced backward for many ages. The manufacture of glass was well understood before the beginning of the Christian era. In the time of Strabo, A.D. 27, glass had become an article of considerable importance; and, as early as the year A.D. 65, its immense magnifying power was well known, when formed into a convex shape. From Pliny, it appears that the discovery of glass was made from sand found in a small river of Galilee. Articles were made from it, he states, to the shape required, by blowing with the breath, or by pouring into a mould, or grinding in a lathe. Nero is reported to have given a sum equal to £50,000 sterling for two glass cups, each having two handles, but by no means of an extraordinary size. Glass has been discovered amongst the ruins of Herculaneum, which was destroyed in the year A.D. 80.

The art of making ornaments, beads, and amulets of glass was known amongst the Ancient Britons.

The Venerable Bede tells us, that artificers skilled in making glass were brought to England from France, in the year A.D. 674, to glaze the church and monastery of Weremouth. According to other historians, they were brought over by Wilfrid, Bishop of Winchester, about the same time. This appears to have been the earliest date at which glass was used for glazing windows in Great Britain. Venice excelled all Europe, for many years, in the fineness and clearness of its glasses; and, up to the thirteenth century, alone had the secret of making crystal looking-glasses. It was during the year A.D. 1557, that glass of the finer sort began to be manufactured in England, in Crutched Friars, London. The fine flint glass, little inferior to that of Venice, was first made at the Savoy House, Strand, London, and the first glass plates for looking-glasses were made in Lambeth, in A.D. 1673. Since then, improvements have been introduced from time to time, by which English manufacturers are enabled to produce specimens which favourably compare with continental productions.

The manufactured glass now in use, may, for our present purpose, be divided into four main branches:—plate, crown and sheet, flint, and bottle glass,—all of which have their varieties and sub-divisions. The plate glass is made for such purposes as mirrors and windows, of a superior class. Crown and sheet glass are used for ordinary windows. Flint glass is made for ornamental work, where diversity of form is required, as in lamps, table glass, medical and perfumery glasses; while bottle glass is used for all commoner purposes.

The materials used in manufacturing glass are sand, lead, arsenic, nitre, and manganese. The most perfect kind of flint glass was formerly made by fusing 120 lbs. of white sand, 50 lbs. of red lead, 40 lbs. of best pearl ashes, 20 lbs. of nitre, and 5 ounces of manganese. Crown glass, or the best window glass, differs from flint glass in having no lead, or other metallic oxide in it, excepting manganese. Sheet glass at present contains in round numbers, 72 per cent. of silica or white sand, 13 per cent. of soda, 13 per cent. of lime, and 2 per cent. of alumnia and oxide of iron.

The sand, used for making glass of the commonest kind, is obtained in large quantities in Wales, Bedfordshire, and Lancashire. For better class goods, the sand comes from Croydon, Reigate, Alum Bay, Isle of Wight, Terre à Bleu, and Fontainebleau, in France. Before admixture with the other ingredients, the sand is washed and burned. The burning is in ovens, specially constructed for that purpose; the object being to remove all moisture and organic matter. After undergoing this process, the sand is carefully sifted, and placed in bins ready for use.

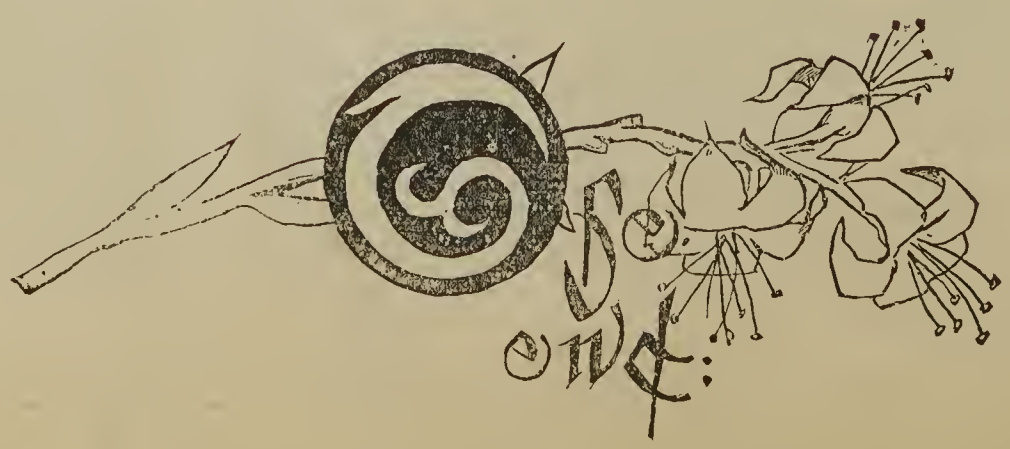
The pearl ash and red oxide of lead are thoroughly mixed with sand in a bin, dried and passed through sieves. The mixture is stored in barrels, ready for use, in the glass-house, and the mixer's duty is to prepare a sufficient quantity, during the week, to charge the pots or crucibles with on the day when it will be needed by the workmen. The furnaces are heated to a white heat before being charged, and the mixture is converted into molten glass by about forty-eight hours' constant firing.

The glass would of course be white, if nothing more was done with it. To obtain the various brilliant colours, now so much in demand, other materials have to be added—mostly metallic oxides. Oxides of copper give different shades of green; oxide of iron is also used. The addition of manganese gives a fine puce colour, while cobalt is used to produce blue. Oxide of uranium gives the appearance of gold to the finished glass, while a solution of gold and tin produces the well-known and beautiful ruby tint. A peculiarity of this tint, however, is that the glass, when cold, shows no trace of the colouring, but remains white, the ruby tint only being brought out in the process of annealing. A crucible, or pot in which the ingredients are fused, holds from 10 to 12 hundredweight, and is commonly filled by four successive charges, one being allowed to become partly melted before the next is added.

After leaving the furnace, glass is made to assume its desired shape, either by blowing, pressing, or grinding.

At present there are about 25,000 persons employed in glass-works in Great Britain, nearly 10,000 of whom are to be met with in the counties of Warwick, Worcester, and Stafford. In the flint-glass houses, the men and boys work in sets of four, the "head man," "the servitor," "the foot-maker," and "the taker-in." A few boys only are employed in crown-glass houses, as "pushers," to slide back the iron door of the furnace, after the glass is drawn out. Glass-houses are in the shape of a large beehive, and, as a rule, are not such very hot places to work in. Most of the modern buildings are both cool and light. The amount of heat differs according to the kind of glass being made, some kinds requiring larger openings in the furnace than others. The greatest heat is felt by the men who have charge of the metal and furnace during founding, before the actual glass-making begins. At the mouth of the furnace, the heat will, in all probability, be from 172 to 220 degrees; where the blower stands, from 95 to 118 degrees; where the boys "take in," from 80 to 190 degrees.

In making crown-glass, the ingredients being quite ready, the operative dips the end of his pipe, or hollow rod of iron, into the crucible, and, twirling it round, collects a pear-shaped lump of molten glass. Resting his pipe upon a stand, he turns it gently round, and allows the surface of the lump to cool sufficiently for a second gathering. By simple, but ingenious processes, the lump of glass is converted successively into the shape of a cone, a Florence flask, a large globe, an enormous short-necked decanter, a "bull's-eye," and finally, by the action of heat and centrifugal force, into a thin, circular sheet of glass.



After the complete fusion of the ingredients, there are seven processes through which plate glass passes: (1) the pouring of the molten metal upon a flat iron table, highly polished, 20 feet long by 8 or 10 feet wide; (2) the passage of a roller over the molten glass; (3) the annealing; (4) the trimming; (5) the grinding; (6) the smoothing; (7) the polishing.

All articles which are either oval or square are blown in moulds. Only those which are round can be blown in the hands of the operative.

In the annealing kiln, the glass is allowed to cool somewhat gradually. Without this, glass would be unfit, through its brittleness, for use.

In the cutting or grinding shop, a large number of men will be employed over ground glass, the rough grinding being done on a steel disc. The desired pattern is brought out by a smooth stone wheel, and the polishing is completed, either on a wheel made of bismuth and lead, or by a revolving brush, and a good supply of rotten stone.

Glass-cutting is an unhealthy occupation, not only from its being sedentary, but from the irritating dust arising during the polishing stage, which plays great havoc amongst the operatives.

JAN. 28, 1888. ONE PENNY.

"A.1."

WEEKLY — Edited by MRS. STEPHEN MENZIES.

Borrowed Clothes

THE SEA-OTTER.

AN adult sea-otter is an animal not much larger, and very much in *embonpoint* like a full-grown and well-conditioned beaver (*Castor Canadensis*). The skin, however, lies upon it in a very different manner from that peculiar to the giant rodent just cited, since the folds of the otter's hide, when seized by the hand, seem to have an enormous power of elastic stretching, and rise from the adult body just as the skin does on the scruff of a puppy's neck; in other words, the cutaneous covering of the kalan appears to have been fashioned for twice the anatomical bulk which it rests upon. There is no sexual dissimilarity in colour or size among the adults, and both sexes manifest the same intense shyness and aversion to man, coupled with the greatest solicitude for their young, which they bring into existence at all seasons of the year, literally "rocked in the cradle of the deep."

The otter is only about fifteen inches long when born, and provided with a rough coat of coarse brownish grey hair, until it is two or three months old. From this poor condition of the pelt at birth, the pellage of the sea-otter steadily improves as it grows older and larger, so that by the age of three and four years, the animal wears its prime coat of adolescence; then the kalan sports one of rare beauty. Its rich black gloss, and characteristic velvety sheen and shimmer are well known to us, furnishing, as it does, many garments which add greatly to the comfort of both sexes during the inclement weather of this clime. This fur, when blown open by the inspector, shows much lighter toward the root than upon the surface, and extending over all, are scattered glistening hairs, whitish to pure white, which add greatly, or rather curiously, to the beauty of the coat.

The feet are so small, that really nothing of the whole expansion of the sea-otter's skin is lost when they are cut off. I should say that the hinder limbs are the sole propulsive organs; they are, when compared with the impotent tiny fore-feet, large and strong, and webbed between the toes, like those of a duck. The natives told me that the creature swims with surprising rapidity, and is a famous diver, and that often, in its desperation and determination not to be captured alive, it will deliberately jam itself into rocky interstices and crevices below the surface of the water, from which it never rises in life.

The sea-otter is not gregarious; it seems to lead a solitary existence, though the younger of its kind do undoubtedly herd in small bodies of forty or fifty, with a sprinkling of a few adults throughout the party, and so far forget themselves as to crawl out *en masse* upon some lonely rocky islet's beach or surfy reef, when howling gales of wind are blowing, and high seas running.

The devotion of the parent otter is remarkable, when it is tested while the young are nursing. The maternal progenitor is said to lie upon her back in the water, or on the kelp rafts, as the case may be; when she is surprised with her tender offspring, she clasps

the pup to her breast in her fore-paws, and turning quickly, exposes her back to the Aleutian spear-thrust, or the instantaneous death-wound of the bullet; but desert her young—never!

There have been numerous attempts made by the natives to raise young otters, which they have captured as they speared or shot the mothers, but all these trials have failed; the kalan will not be comforted, and deliberately starves itself to death. The diet is one of shell-fish almost exclusively—clams, mussels, sea-urchins, etc. They are said to be very playful when all alone by themselves, and I am assured by several old sea-otter hunters that they have watched the kalan for more than half an hour at a time, as it lay upon its back at the surface of the water, where it sported by tossing a piece of seaweed up into the air from paw to paw, taking all this time the greatest delight apparently in catching the algoid ball before it could fall into the sea. It is also tireless in its playful attention to its young, and will humour the juvenile gambols of its offspring for hours at a time.

The quick hearing and acute smell possessed by the sea-otter are not surpassed, and rarely equalled by any other animal. They will take alarm and leave from the most trivial causes, such as a small fire ten miles to the windward of them, and the footsteps of man must be washed by the ebb and flow of many tides ere the traces upon the beach will cease to alarm and prevent its landing thereon, should it chance to approach for that purpose.

The physiognomy of the sea-otter is ugly; its small, snaky, glittering black eyes enhance the *mal-contour* of its globose face. The capture of the sea-otter is confined to-day, as it has been chiefly in times past, to the efforts of the natives of those lonely regions where it is found. These people employ four methods of securing this valuable quarry; *i.e.*, the spearing-surround, that of surf-shooting, of clubbing, and by netting.

The oldest fashion, and the one generally used until the introduction of fire-arms, is that of the spearing-surround. Its method was and is as follows: A party of fifteen or twenty men get into their skin kyacks or bidarkies, two souls to each boat, and move out to sea, under the control of a self-chosen leader. They spread themselves out in a long line, slowly and silently paddling over the waters where sea-otters are most usually found, or where they confidently expect to surprise them. When any one of these hunters discovers an otter, asleep most likely in the water, he makes a quiet signal by lifting his paddle, or throwing up his arms. Not a word is spoken or a paddle splashed while the men are thus scouring the sea. The signal given, he who gives it darts toward the animal, which instantly takes alarm, and generally dives before the Aleut can get near enough to throw his spear. The hunter, however, keeps right on, and stops his canoe directly over the spot where the kalan disappeared, leaving only the circling rings of water in displacement with the floating bubbles from its quick-caught breath. The other men, taking quick note of the location of the discoverer over the wake of the startled animal, instantly deploy and scatter, forming a circle round the spot, half a mile, perhaps, in circumference, where they pause and patiently wait for the reappearance of the otter at the surface. It must rise in ten or fifteen minutes to breathe; when it does, then the man who is in turn nearest to the point of re-appearance again darts forward in his canoe to the spot, just as his predecessor did, while all hands in the circle shout and throw their spears, so as to make the creature dive again ere it shall have half caught its necessary modicum of fresh air, and thus not have even an instant in which to expel the poisoned gases that burden its lungs. This method is rapidly repeated, as often as the kalan can rise and dive, the canoe circle being rapidly drawn anew with each change of base, so that the surprises come so quickly and so surely, that the unhappy and distressed brute finally becomes so filled with gases that it cannot longer dive, and then becomes an easy victim to its captors.

The "clubbing" of the sea-otter is the most exciting and gamy undertaking of the Aleutian hunters, and it only transpires in the winter months, and then, during those infrequent opportunities which occur when gales of wind, snow, and sleet sweeping down from the northward have about blown themselves out; thereupon, the very boldest of the hunters set out in their light bidarkies from Sanaak and Belcorskie to scud down to the southward forty or sixty miles, on the tail of this storm, to those far-outlying rocks just protruding above surf-wash, where they creep up to the leeward and land upon them, often finding, as they do so, sea-otters hauled out there, lying with their heads pushed under and into the beds of kelp, to avoid the fierce pelting of the spray hurled by the fury of the storm. The noise of the tempest is so great, that the stealthy approach of the hunter then is not noticed, and he being armed with a short stout club of wood, despatches the animals one after another, without giving alarm to the whole body of unconscious victims. There is probably no chase of terrestrial or marine animals so exhaustive and exposing to the hunter as is that of the sea-otter in Alaska to-day, for the only periods in which men can expect to surprise it with reasonable certainty is immediately after or on the eve of tempests, when the pounding of the surf, with a force which whirls fine spray like bird-shot in the wind, literally drives the storm-weary otter to the land; but the moment the howling of the gale subsides, then the kalan hies himself to sea again.

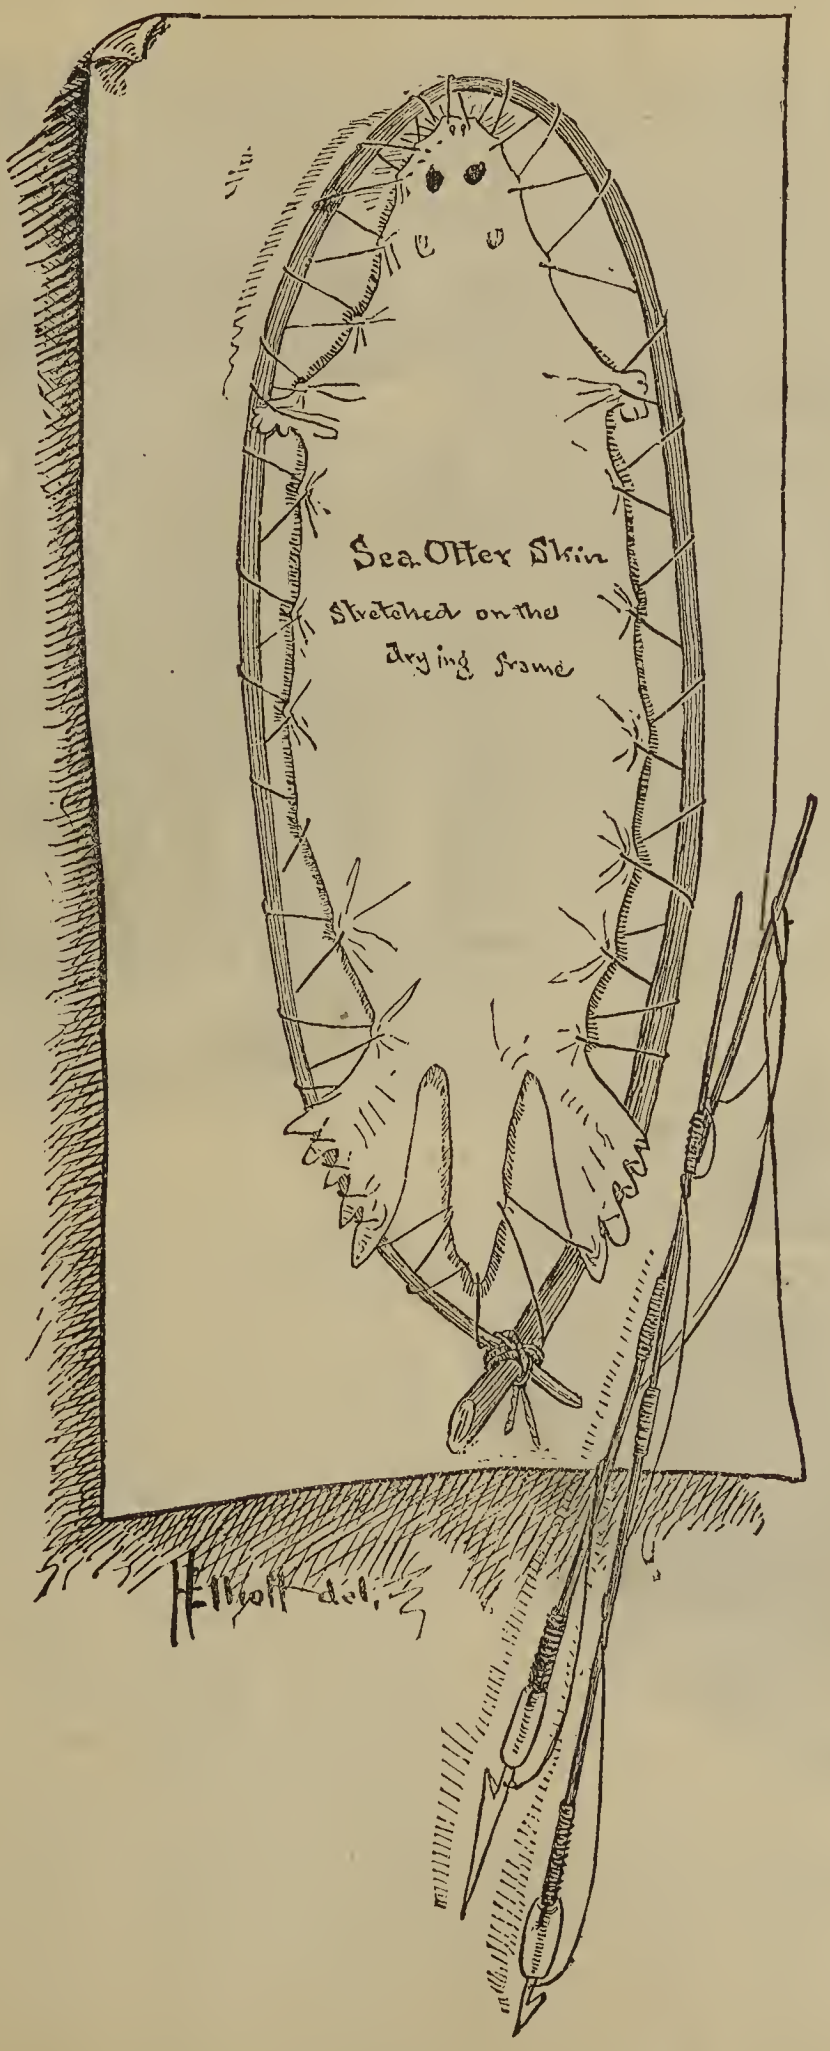
The well-known naturalist, the Rev. J. G. Wood, speaking of these animals, says:—

Although so fierce and savage an animal when attacked, the otter is singularly susceptible of human influence, and can be taught to catch fish for the service of its masters, rather than for the gratification of its own palate. The Chinese or Indian otter affords an excellent instance of this capability; for, in every part of India, the trained otters are almost as common as trained dogs in England. It seems odd that the proprietors of streams should not press the otter into their service, instead of destroying it, and should not convert into a faithful friend the animal which at present is considered but as a ruthless enemy. Even in England, the otter has frequently been tamed and trained for the purposes of sport. A well-known gentleman, an inhabitant of Carstairs, was possessed of one of these animals, which had been trained with singular success. When called, the otter immediately answered to the appropriate name of Neptune. The animal, it appeared, was caught two years ago, being then only a few weeks old. It was actually suckled by a pointer, and, showing early signs of docility, was made over to the gamekeeper. In process of time, the animal increased in aptitude and sagacity, and was soon enabled to undertake the duty of an economical fisherman, frequently procuring a dish of excellent burn trout at such seasons when the angler's art, from adverse winds or foul streams, was in vain. In the morning, after these fishing exploits, which sometimes occupied the greater part of the night, Neptune was always found at his post, and the stranger might be astonished to see him among several brace of pointers and greyhounds. No one understood better how to keep at his own side of the house. In fact, according to the gamekeeper, he was "the best cur that ever ran."

Neptune was an amiable creature. He would allow himself to be gently lifted by his tail, but invariably objected to any interference with his snout. As an angler, his reputation is advancing rapidly, and one or two of Mr. M.'s neighbours intend to borrow him for a day or two in the Spring, for the purpose of ascertaining the quality and size of the larger trout in the pools of their estates.

Another of these animals was accustomed to go to work in a very systematic manner. It always plunged into the water very quietly, and, keeping close by the bank, took its course up the stream, disturbing the fish by smart blows with its tail. If a fish remained by the bank, the otter passed by, and did not seem to notice it, but if the fish should dart in front of its pursuer, it was instantly seized, and brought near the surface of the water—probably in order to lessen the force of its struggles. When the otter had brought its prey to shore, it always discovered some reluctance in parting with the fish which it had caught, and signified its disapprobation by a plaintive whine.

Mr. Richardson gives a very interesting account of an otter which he tamed, and which was accustomed to follow him in his walks like a dog, sporting by his side with graceful playfulness, and swimming at perfect liberty in the stream. This animal, however, could never be induced to yield her prey to her master; but when she saw him approaching, would quickly swim to the opposite side of the river, lay down her fish, and eat it in peace. The animal was accustomed to wander at her own will in the house and garden, and would eat all kinds of garden pests, such as snails, worms, and grubs, detaching the snails from their shells with great dexterity. She would also leap upon the chairs, as they stood by the windows, and catch and eat flies as they fluttered on the window-panes. She struck up a warm friendship with an Angora cat, and on one occasion, when her friend was attacked by a dog, she flew at the assailant, seized him by the jaw, and was so excited, that her master was obliged to separate the combatants, and to send the dog out of the room.



The mode of instruction followed in educating the otter is sufficiently simple. The creature is by degrees weaned from its usual fish diet, and taught to live almost wholly on bread and milk; the only fish-like article which it is permitted to see being a leathern caricature of the finny race, with which the young otter is habituated to play, as a kitten plays with a crumpled paper or a cork, which does temporary duty for a mouse. When the animal has accustomed itself to chase and catch the artificial fish, and to give it into the hand of its master, the teacher extends his instructions by drawing the leathern image smartly into the water, by means of a string, and encouraging his pupil to plunge into the stream after the lure, and

bring it ashore. As soon as the young otter yields the leathern prey, it is rewarded by some dainty morsel, which its teacher is careful to keep at hand, and soon learns to connect the two circumstances together.

Having become proficient in the preliminary instructions, the pupil is further tested by the substitution of a veritable, but a dead fish, in lieu of the manufactured article, and is taught to chase, capture, and yield the fish at the command of its master. A living fish is then affixed to a line, in order to be brought by the otter from the water, in which it is permitted to swim; and lastly, the pupil is taught to pursue and capture living fish, which are thrown into the water before its eyes. The remaining point of instruction is to take the so-far trained animal to the water-side, and induce it to chase and bring to shore the inhabitants of the stream, as they rove free and unconstrained in their native element.

In many parts of the world the otter is admirably trained for this purpose, and is taught to aid its master, not only by capturing single fish, but by drawing whole shoals of fishes into the ready nets of the sportsmen.

When in pursuit of its finny prey, the otter displays a grace and power which cannot be appreciated without ocular investigation. The animal glides through the watery element with such consummate ease and swiftness, and bends its pliant body with such flexible undulations, that the quick and wary fish are worsted in their own art, and fall easy victims to the otter's superior aquatic powers. So easily does it glide into the water, that no sound is heard, and scarcely a ripple seen to mark the time or place of its entrance; and when it emerges upon the shore, it withdraws its body from the stream with the same noiseless ease that characterizes its entrance. The otter is a playful creature, and is very fond of engaging in mock aquatic combats, which display the extraordinary powers of the creature to the very best advantage. When on shore, the otter can proceed at a considerable pace, and when in haste, employs a curious "loping" gallop as its means of progression.

COMPETITIONS.

Acrostic Competition. We would remind our readers that this closes on the 31st (see "A. 1.," Dec. 17th).

Spelling Chase. If our readers are as entertained presently over the results of the Spelling Chase Papers as we are just now with their examination, they will pass a vote of thanks to us for providing them with so much profitable recreation. Such absurdly ingenious mistakes!

Our £100 Competition, announced Jan. 7th, will close Feb. 4th; and our "Definition Competition" (Husband and Wife) on Feb. 11th.

"NOTHING TO HOLD ON TO."

IN a darkened chamber, a young man lay dying. Round him were gathered four or five of his companions, very little solemnised by the nearness of death, more intent upon keeping up their own and their companions' spirits, than upon anything else.

Perhaps an onlooker might have thought the laughter rather forced, and the jokes a little feeble. There was something very sad in the sight of the dying lad, propped up by pillows, with his brilliant, uneasy eyes glancing hither and thither, as though in search of some help and comfort; whilst his pallid cheeks, grey-hued, told that the forces of life were fast ebbing away.

"Keep your spirits up, old boy," cried one of his friends, with a laugh, as the hollow cough racked his poor feeble frame, and the dying lad lay back, painfully gasping, upon the pillow.

"I wish one of you'd read me something," he whispered feebly.

"Not that," as one of them took up "Bell's Life," and prepared to read a paragraph; "I should like—the Bible."

"The Bible!" burst forth from one and another in mocking chorus. "You're not such a fool as to want *that!* Not a bit of it, lad; we've learned you better than that, all these years. The Bible is only for old women and children, and just suits their puling ways. Don't get downhearted, Davie. Hold on, man, hold on!"

The dying boy looked round from face to face, with a strange fear and yearning in his great eyes.

"I'll hold on, mates. I'd be *glad* to hold on, but *I've got nothing to hold on to!*"

Oh, the awful truth of those pathetic words! He was dying—slowly dying. The faith of his mother's God had been long since thrown aside, under the evil influence of companions who had surrounded him in his new city life. Infidel lectures and books had gradually undermined even his moral character; and though young,—and David Fay would have been ashamed to confess it,—he had no clear idea left of what was right or wrong.

Now life was suddenly closing, and the great unsearched eternity lay before his trembling feet. True, he had learned to deny the existence of a God, the revelation of a judgment to come, and the possession of a soul. But with death close at hand came strange fears and questionings of his own unbelief. He was willing to hold on, but *what had he to hold on to?* His teacher had cut the Rock from under his feet, and now he found they only rested on shifting sand.

Do these lines meet the eye of one who has doubts of his Bible? You admit it. You point to the powerful intellects that have endeavoured to destroy that Book; you affirm that ten thousand men are now warring against the truth of God's Word; that lives have been spent in assaulting its truth. But, tell me, have they given anything better, anything more comforting, more solid, more soul-helping? Have you any BETTER light than the lamp of God's Word? If so, boldly produce it, and then you may have our Bible, for we shall not need it again.

But no! The men who would fain clutch the Word of God from our grasp, offer us "*nothing to hold on to!*"

"OONALASKA:" A TALE OF A FAR NORTH LAND.

CHAPTER XIX.

KATIE AND CHIPS.

"EVERYTHING comes to him who can wait," said Captain Boyd that evening at table; "so we shall hang on a bit, Mr. Graves, to see if the fog clears."

"From all accounts," replied Nat, senior, "the mist has no business to come so soon. But this may be an exceptional year. Anyhow, the glass is going up."

"Yes, and I hope we won't have a gale from the north-east, which looks more than probable just now."

"What did you see on shore, Mr. O'Neil?" asked Miss Graves.

"What did I *feel* for, you should say, mother. The fog was so very thick; and when we did make the shore, we found only a black, beetling wall of rocks, with its summit buried in the mist. It was actually alive, Miss Graves, with sea-birds. When I fired my gun, they flew in thousands, I was going to say millions."

"We heard the row, Dess," said Jack Silk.

"Yes, it was a row; but the fledglings fell off the rocks in scores, and I feel now I committed a cruel act in firing. Well, we pulled right away round to the north side, and here we got a landing, and found the island inhabited."

"By Indians?"

"No, by foxes."

"It is Bo'roffia without a doubt," said Captain Boyd. "However, I hope we'll soon make sure."

The fog made no attempt to clear off that day, at all events, but next forenoon it lifted as if by magic, or more strictly speaking, it went rolling away south, and our adventurers hoped they had seen the last of it for some time to come.

And just as Captain Boyd had suspected, the island they had made was one of the smallest of the Pribylov group, the chief being St. Paul's and St. George's, islands of very considerable size.

The latter large island had been passed in the fog, lying farther to the east of the direct route in which the *Oonalaska* was steering.

A Russian or Greek cross surmounted, in those days, the eastern hill of the little island, in front of which the ship now lay at anchor, and on the west was the crater of a burned-out volcano. Both the cross and the crater had a strange story to tell, could they only have spoken.

And now here is a curious circumstance. No sooner had Dr. M'Phee left his patient, than old Chips scrambled out of his bunk, feeling "as lively as a nine-years-old."

Old Chips walked quietly on deck, and Katie, with a kindly smile, went up to him saying that she hoped he felt better.

"I'm as right's a trivet, thank ye. Now look, Miss Katie, look, you've been kind to me, and if you wants a skin or two, old Chips knows where to find them."

"You mean foxes' skins?"

"Nay, Miss Katie, nay, but walrus, miss—sea-lions; them's the skins!"

"And should you go hunting them?"

"No. Wrong season. They are nursing now, Miss Katie, that is, if so be any is left near the island. But I mind the time when they were here in thousands, only it's long agone. I've killed 'em here, but their real home is far down south, among the islands of the Aleuts. We passed 'em in the fog, and more's the pity, for wild and beautiful they looks; some wi' hills towerin' high o'er other hills, till they lose themselves in the clouds like. Aye, and more than one o' them shows up dreadful in the dark of a winter's night, with the light and smoke, and what not. I've seen some terrible sights in my time, miss, but most of all in my younger days. The very fires of these volcanic hills seem to have gone out since I grew up in years."

"The Russians own all these islands, and all the vast continent to the east, do they not, Chips?"

"Hush, miss," said the old man, glancing round, as if afraid of listeners, while a fierce gleam for a moment lit up his eyes, then died out again. "They owns them, and it

will be a happy day for Alaska when it passes under the flag of the United States. Yes, they at present owns 'Laska and all the 'Leutian islands; and old mates o' mine have told me, that the seas around these same islands o' 'Leutia has been red wi' the blood of the murdered natives."

"Hush, Chips, you frighten poor little me. But about the skins?"

"I was a-going to remark, miss, that I've often and often laid in my boat, and watched the otters playing in the waves just like kittens, only that kittens don't take the water. It's on their backs they like to lie, with their young, maybe, fast asleep, on their breasts, and maybe the mother takin' forty winks as well."

"'Rocked in the cradle of the deep,' Chips?"

"That's it, Miss Katie, and, maybe, the father liein' not far off on a floatin' wisp o' sea-weed, a-watchin' the pair of them. Now, wouldn't a man be worse nor a hay-thin' to shoot in a case o' this kind?"

"He would, indeed."

"Wouldn't you stand by yourself, miss, and see him keel-hauled, if he was mean eno' to shoot?"

"I daresay I should, Chips, but——"

Jack Silk now came upon the scene.

"Please, Miss Katie, there's a couple of boats going on shore, and would you——"

"Would I? Yes."

"Beg pardon, sir," said Chips, touching his eyebrows by way of a bow, "be ye yourself a-goin'?"

"Yes, I'm going, Chips."

"May I?"

"Yes, I'll give you leave," cried Katie. "Mr. Silk, we'll both go in your boat."

Jack had a load, for Katie's brother was of the crew, and Cousin Nat himself, and there was a whole lot of gear forward, that neither Katie nor her brother knew the use of.

"She's nicely trimmed," said Jack, taking his seat on the gun'als as usual. "Give way, lads."

It was a beautiful day now, bright and clear. The hills on the island they were bound for were arranged in greens, and greys, and browns, but the cliffs were dark and frowning.

Astern, if they looked, there was the rugged isle of St. Paul itself, sleeping in the sunshine, and though it was six good miles away, there fell on the ears of those in the boat, a strange humming sound, faint at times, and at others swelling into a roar like that of a waterfall, or breakers beating in fury against a rock-bound beach. On board, this had been hardly perceptible, but, when well away from the ship, Jack cried,—

"Lie on your oars a minute, men. Listen, Miss Kate," he added.

"What is that strange sound?"

"The seals, miss," said Chips. "They are in millions over on St. Paul's."

But as they neared the island, this sound became lost, or rather it became merged into the medley made by countless thousands of birds. The birds came out to meet them, and, at times, the air around the boats was almost darkened with them, while the noise of their wings alone, was like the whistling of a storm through a forest of pine-trees.

The nearer to the beach, the more numerous they became.

No wonder Katie's eyes were wide with astonishment. They had indeed reached a haunted isle at last,—a bird-haunted isle.

CHAPTER XX.

CHIPS MEETS OLD FRIENDS.

"WHAT are they all?" Katie had found tongue, but no one heard her.

"What were they?"

"Why, they are gone!"

"Yes," said Jack; "and a good job too. But wonders will never cease."

"But why did they come so quickly, and disappear all of a sudden? It looks as though the sky had swallowed them up."

"Look overboard, Miss Katie," said Jack.

Katie did so. She was thinking of the beautiful green island in the tropics, in which Jack had shown himself so splendid an actor, and when he told her to look overboard, she half expected to see one of those enchanting submarine gardens, which lie on the coral reefs of the sunken ocean. But here the water was very deep, rough, darkish-blue, beautifully transparent—translucent would be a better word—for the sun's rays seemed to go deep, deep down, and it revealed thousands upon thousands of huge jelly-fish. This seemed the home of these gorgeous flowers of the ocean. Many were as large as a lady's sunshade, but no sunshade was ever half so lovely. It is generally supposed that these charming medusæ are contented to float lazily about through the water, like animated umbrellas, with the tops uppermost. But here, they were almost as active as eels, swimming in all directions, or simply floating at ease.

"Oh! how lovely!" cried Katie, enthusiastically; "why, they seem to have rubies, sapphires, and emeralds set in every limb!"

"Why," cried Jack, looking seawards, "yonder come some native boats. Chips, old man, you've been here before; are the St. Paulites civil chaps? They come in a questionable shape. Come they in peace, or come they in war?"

"They are angels," answered old Chips, enthusiastically. The "angels" numbered, in all, about a dozen, and rowed swiftly onwards in their "bidarkies," those skin-covered canoes in which they manifest such marvellous agility, that it is a pity a crew could not be requisitioned to attend at Henley Regatta.

Some bidarkies had but one rower, but most had two, and the men appeared to be tied in with lashings round their waists. The bidarkies, indeed, is partly boat and partly bag, for though its frame is of wood, this is wholly covered with tightened sea-lion skin.

The natives secured their paddles under their lashings, and jumped out before their boats had time to reach the beach.

Then, without more ado, they made a wild rush towards Jack's party, so that, for the time being, it appeared doubtful what the intention of Chip's angels really were.

Uglier angels, surely, were never seen on earth; high in the cheek-bone, broad in face, thick lipped, and brown or yellow complexions, with eyes set wide apart, as if for handiness to look over their shoulders, or see round corners. The dress of these "hay-thins," as Jack had the rudeness to call them, might have been useful, but it was certainly far from ornamental. Caps of skin, from beneath which straight locks of their dark, ugly hair straggled, coats of various kinds—many of them must have done duty on the backs of hardy sailors—and long boots of skin or throttle of sea-lion. For in these regions, the natives and travellers also, are absolutely dependent on these animals for the necessaries of life.

These were the angels that made a rush for Chips; all friends, evidently, for they hauled him *nolens-volens* on to the beach, and not content with shaking him by the hand, and pawing him all over, formed a circle and danced wildly around him, till some of them had to sit down on the boulders and pant.

Then Chips informed his officer that the new-comers would assist him in any way, and that though the season was early, they knew where to find tons of eggs.

These half-bred Aleuts also politely informed Jack, in a language full of round-mouthed vowels and consonants, all in bunches, which Chips put into English, that the whole of the island of St. Paul's was at his command, to do as he liked with, and that the inhabitants thereof were waiting to throw themselves into his arms.

Jack thanked them, and made a most polite and conciliatory speech. And the Aleuts cheered the speech, even before Chips translated it, and trebly cheered it after he had done so. But one word stood so boldly forth among all the others when they conversed with each other, that Katie was fain to ask Chips the meaning of it. The word was "Kopek," and means a cent, or something smaller. On the whole, it was evident from their shouting and capering, that these natives were glad the ship had come.

Nat, senior, and Katie went away for a walk over the island, while Jack and his merry men, with Chips and his strange crew, started off egg-hunting.

The cousins bent their steps in the first place towards a cross surmounting a hill-top.

"Perhaps, Cousin Nat," said Katie, "it is some one's grave."

Perhaps it was, but they never got near it, being stopped by the ugly appearance of what was evidently a seal slaughtering-ground. Nor was the odour therefrom at all encouraging, so they retreated with all haste towards a higher hill on the other side of the island.

Old Chips came to meet them as soon as they started. They saw the old man waving them back, and it was well, perhaps, they stopped till he came to guide them shorewards on comparatively dry ground, otherwise they might possibly have slipped over a cliff, or been treated to a sousing in some mud-covered pond.

Jack complimented Chips on his wonderful agility, adding that one who knew the country so thoroughly, and was so well up to the ropes, was worth his weight in gold.

One of the oldest, and smallest, and ugliest of the Aleuts had squeezed himself into a small cave, not much bigger than a badger's den. His grey-yellow face and dirty hands alone were visible, and he did not look unlike a toad in a hole.

Katie was gazing at the creature with a look of such comical alarm on her face that Jack fairly burst out laughing; but feeling that he had given offence, hastened to explain that the toad in the hole was going to test the eggs. "You see, Miss Katie, he's in the dark there. But here they come."

And round the cave now crowded the Aleuts, leaving only a little space for the sun to fall on the "toad's" face. The toad caught the eggs one by one neatly with his left hand, passed them over one eye, and handed them back with his right.

The good eggs were packed in salt at once, and carried off to the big boat. There was nothing more to be seen or done now, and as every one was getting hungry, Jack gave the order to embark.

(*To be continued.*)

ANATOMY SPIRITUALISED.

By the Rev. J. Hiles Hitchens, D.D., F.S.Sc.,
Author of "*Ecce Veritas*," "The Young Men of Scripture," etc.

No. 2. The EYE;

or, Discretion in Seeing.

THERE is not a more delicate organ of sense belonging to the human body than the eye. Beautifully and ingeniously constructed, it discloses the infinite and unerring wisdom of the Divine Creator. It is a perfect optical contrivance for the purpose of collecting the rays of light proceeding from surrounding objects, concentrating those rays, and conveying a distinct impression to the mind. Acting both as a camera-obscura and as a telescope, the eye accommodates itself to the degree of light and range of distance without any conscious or conspicuous effort. We customarily speak of the eye as *seeing;* but it no more sees than the microscope, telescope, or spectacles we use to assist our vision.

The eye is an instrument of the soul, the medium by which external objects are mirrored on our wakeful spirits. It is one of the gates to the "city of Man-soul"—an inlet to the heart, a window at the top of this "earthly house," a handmaid of the immortal principle within—whose duty and delight it is to carry a true picture of visible nature to the gallery of the heart. Very precious is the gift of vision. To be in constant darkness, cut off from all the pleasure that springs from observing the beautiful handiworks of Infinite wisdom; to see no more the variegated flowers of the garden, the waving foliage of the forest, the foaming waters of the cataract, the lapping waves of the ocean, the heather-clad sides of the mountain, the fleecy clouds of the summer's sky, the golden glories of a setting sun, the silver light of the full-orbed moon, the myriad spheres that sparkle at midnight in the immeasurable expanse above us, and, best of all, the expressive and familiar faces of those we love right fondly—this must be a severe privation. Science has, of late years, done very much to preserve and restore sight. But with the utmost endeavours of medical skill, it is calculated that one person in every thousand is blind. In London alone, there are 3,000 persons devoid of vision; in the United Kingdom, 30,000; and throughout the world, 800,000.

The eye expresses what passes on within the man. The thoughts and affections stream forth from these little orbs. Anger, avarice, love, sympathy, jealousy, and pride quickly disclose themselves at these windows of the mind. And what power over others the eye can exercise! Addison says: "A beautiful eye makes silence eloquent; a kind eye makes contradiction an assent; an enraged eye makes beauty deformed." Thackeray wrote: "A pair of bright eyes, with a dozen glances, suffices to subdue a man, to enslave him, to inflame him, and make him forget; they dazzle him so, that the past becomes straightway dim to him; and he so prizes them, that he would give all his life to possess them." But perhaps Spenser is the most enthusiastic, when, referring to the inspiring influence of the eye, he writes:—

"Long while I sought to what I might compare
Those powerful eyes, which lighten my dark spright,
Yet found I nought on earth to which I dare
Resemble th' image of their godly light.
Not to the sun, for they do shine by night:
Nor to the moon, for they are changéd never;
Nor to the stars, for they have purer sight;
Nor to the fire, for they consume not ever;
Nor to the lightning, for they still persevere;
Nor to the diamond, for they are more tender;
Nor unto crystal, for nought may them sever;
Nor unto glass; such baseness might offend her.
Then, to the Maker's self, they likest be,
Whose light doth lighten all that here we see."

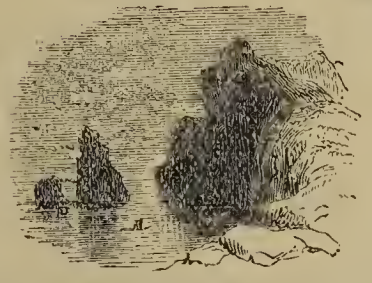
But whilst they are thus a powerful and persuasive index of our feelings, the eyes very largely supply that which awakens feeling. The eyes are inlets to the mind, as well as outlets from the mind: avenues to the heart, as well as channels from it. Whilst they give expression to what *is*, they gather impressions for what *shall be*. By the eyes we can lift our minds to heavenly thoughts and meditations. We can look through the outspread wonders of the natural world and see God; we can look into the inspired page, and, as in a glass, see ourselves. Thus David used his eyes when he wrote: "The heavens declare the glory of God, and the firmament showeth His handiwork." Thus the Saviour points to the lilies of the field, and, expatiating upon the beauty of those modest flowers, teaches that taste may be combined with true piety, and the heart aided in its serious contemplations, by observing the loveliness of nature. We may glean food for the heart and life in every field of observation. As Charnock quaintly says: "He whose eyes are open cannot want an instructor, unless he wants a heart."

Alas! with many the eye is the channel by which all manner of evil enters the mind, and gains the mastery of the heart—the door at which Satan has crept into the soul. We read in Holy Writ of an "eye that is not satisfied with riches." It cautions us not to "look upon the wine when it is red." The Apostle, in classifying sins, says: "For all that is in the world, the lust of the flesh, the lust of the eyes, and the pride of life, is not of the Father, but is of the world." Moreover, we shall discover that the most fatal errors of our race have resulted from the exercise of sight. Our first parents forfeited all their pristine joy and honour, and involved themselves and their posterity in woe, through looking; for it is written: "And when the woman saw that the tree was good for food, and that it was pleasant to the eyes, and a tree to be desired to make one wise, she took of the fruit thereof." When Achan was plundering a house in Jericho, he found a Babylonish garment, the magnificent colours and richly embroidered pictures of which, attracted his notice and aroused his admiration. Close by he discovered two hundred shekels of silver, amounting to about £30 in value of our money, and, with these, an ingot of gold weighing fifty shekels, worth £113 sterling. On these treasures he allowed himself to gaze with covetous eyes, then he took them, and hid them in his tent, and at last came discovery, disgrace, and death. Samson's downfall may be traced to his eyes.

In like manner David's great crime, which caused him such severe and bitter remorse all his life after, was attributable to the misuse of his eyes. Ahab's cruel and iniquitous conduct toward Naboth, arose from his eye frequently lighting upon the fruitful vineyard in the proximity of his palace. He coveted the Jezreelite's property, and resolved, at all costs, to obtain it. Thus might we go on with the historical accounts of men's failings, as presented in the Bible, and show how Satan, in overcoming men, has first wounded them in the eyes. He knew how successful he had proved with the first Adam and all his progeny, and hence he tried the same method with the "second Adam, the Lord from heaven." It is written: "He taketh Him up into an exceeding high mountain, and showeth Him all the kingdoms of the world, and the glory of them." By spreading out all the earthly grandeur before the eyes of the Redeemer, the arch-fiend vainly hoped to entrap the spotless Son of God. But Jesus resisted the temptation, and thus proved it possible for man, by the aid of Divine grace, to prevent the entrance of sin by the gates of the vision.

But, alas! how repeated are the falls daily occurring through the misuse of the eyes! Men of business, holding offices of trust and responsibility, have looked on the wealth of their employers, and, from the look, have been led to falsify accounts, embezzle property, bring discredit upon their friends, and ruin on themselves. Young men have gazed on the glittering tinsel of the enchantress, and, like the foolish moth which flutters around the brilliant flame, have fallen a miserable prey to beauty's blaze. Men and women, of all ages and of all grades in life—and some from lofty niches in the Church and State—have looked incautiously on the sparkling wine-cup, and have looked and looked, till, despite all warnings, they have quaffed, and revelled, and reeled into the drunkard's premature grave.

Thus the eye will prove either a help or a hindrance, a servant or a snare, a blessing or a bane. It will let in sparks of temptation, which set the whole man on fire from hell, or it will kindle the flame of pure devotion upon the altar of the heart. Hence the need of discretion in seeing.



Like Job, we should make a covenant with our eyes. Like David, we should earnestly and daily pray, "Turn Thou away mine eyes from beholding vanity." There is quite as much vanity in the world now as in the Royal Bard's time. Sin is not less dangerous or destructive, temptations are not less insidious, and our frail nature is not more fortified against evil than it was then. It is not prudent to counsel young persons to see life in all its aspects, and judge for themselves. Nay, it is a most injudicious and suicidal course. The mariner, with chart in hand, does his best to steer far away from hidden rocks. He knows that, upon yonder perilous shoals and rock-bound shores, there are the remnants of wrecked vessels, and he keeps wide away, using the sounding-line, lest the wind or current should bear him too near. The ignorance and foolhardiness that would induce the master of a ship to steer straight for the point marked in his chart "dan

gerous," in order to see the roaring reef for himself, would be deserving of lasting condemnation.

Nevertheless, there are some who, "sailing o'er life's solemn main," heedlessly hasten where thousands have made shipwreck, under the plea of seeing life. You do not tell your boy to put his tender hand through the bars of the lion's cage in the Zoological Gardens, in order to see for himself that the lion is ferocious, and can bite and devour. You do not take your daughter into the fever ward of a hospital, or to the bedside of a small-pox patient, where she runs imminent risk of being smitten by disease, in order to teach her what a terrible change such diseases will work. You deem it enough to speak of these things, and beg the young people to accept what you say as verity, and keep far from danger. Then, to be consistent, we should counsel those about us not to look upon what can in itself be of no mortal service, but of untold injury. Be it remembered that the precious jewel of purity, if lost, cannot again be found, though you seek it carefully with tears. The imagination, once soiled, cannot again be restored to its primitive chastity. There are some lights that can be rekindled if once extinguished, some articles that can be repaired if once broken, some constituents that can be re-combined if separated; but who can reconstruct a flower when a rude foot has trampled upon it? Who can replace the bloom upon fruit when a hard hand has grasped it? Who can re-collect and re-confine the sweet aroma when once it has escaped from the vase? Let us take heed, or our hearts will soon be put out of tune, and our whole life drop into the minor, unless we call off our eyes from beholding vanity. The Arabian proverb deserves remembrance: "Shut up the windows, that the house may be full of light."

There are some singular creatures without the organs of vision. There is, for example, the eyeless fish, which lives in a subterraneous lake, and which, after heavy rains, is forced through crevices of the rock into the lake of Madalena at Adelsburg. Most living creatures are, however, endowed by the Creator with the power of sight. But man only has the capability of lifting his eyes upward, without moving other parts of his body. Does not this suggest to us that the Divine Proprietor intended man to look up for his life, strength, happiness, and hope? "I will lift up mine eyes unto the hills, whence cometh my help." Is there not an untold depth of meaning in God's words: "I will guide thee with Mine eye"? Our eyes must be fixed on His eye, if we are to be guided by Him. Our work should be—"looking unto Jesus."

"Oh, hearts that are weary, and eyes that are sore,
Look off unto Jesus, and sorrow no more.
The light of His countenance shineth so bright,
That on earth, as in heaven, there need be no night."

WIND WAVES.

(Cant. 4. 16.)

BLOW! blow! North wind, blow:
Come with thy vigour, come with thy snow.
Over my garden of spices rare,
Myrrh and cassia growing there.
Blow! blow! O north wind, blow,
And send forth the perfume from flowerets fair.

Blow! blow! zephyrs light,
Over the woodbine and lily white;
So that my Lord, my Beloved, may see
All ye are doing for Him, and for me.
Blow! blow! till all shall rejoice,
In blessings ye bring from my garden so free.

Blow! blow! all winds blow;
Blow with your freshness, your warmth, and your glow.
Scatter the seeds, from my garden, outside,
Everywhere, anywhere, that they may abide.
Blow! blow! to deserts around,
That flowers may blossom on every side.

Blow! blow! blow with thy might,
Send forth its odours from morn until night,
Carrying its virtues, where pestilence reigns,
Into the streets of our city, and lanes.
Blow! blow! O north wind, blow;
Blow from the mountains, and blow from the plains.

Blow! blow! harmoniously blow,
South wind with north wind ever must go;
For the Ruler of winds—what seemeth so ill—
He tempereth for blessing, *the warmth with the chill.*
Blow! blow! that others may know
Your sweetness, which flowing, shall perfect His will.

William H. Ross.

AT WHAT A COST! OR, DUKE ARDEN'S LAST STAKE.

By Max Gerard.

"'Hullo! Duke, what a mope you are, . . . always dozing or smoking now. What's up?'"

CHAPTER I.

"HULLO, Duke, what a mope you are!" cried Percy Arden, as he bounded into his cousin's presence. "Here you sit, smoke! smoke! all day long. You used to be a bit jolly, but you're always dozing, or smoking, now. What's up?"

"Be civil, young shaver, or stay in the proper place for you—the nursery," answered the person addressed.

He was a handsome enough young fellow, and looked the very picture of refined ease, as he lounged in the long, low library that summer morning, occupying, all too easily for one so little advanced in life, and at such an early hour in the day, the chair that belonged to his elders. The boy, a nice, bright, open-faced little fellow of about ten or eleven years, looked solicitously into his cousin's eyes, and then eyed him all over.

"Poor old chappie!" he said, tenderly. "You aren't well; see how your hand shakes! I'm awf— *very* sorry for you."

"Now, Perce, I'll put up with a good deal from you, but I'm not going to stand *every*-thing. Just take yourself off, if you're going to act Miss Pry. Of *course* my hand shakes —it was that stupid mare yesterday; I could *not* hold her in, she's so *awfully* fresh."

As he uttered the last two words, he looked slyly at Perce, and touched him jocularly. The boy immediately understood.

"Well, I'm not going to say it again. Miss Knox proved to me how useless it was, and—and, Duke, I'm going to try to please her, for—for *somebody's* sake, besides my own."

"Hang it! I'm not going to stand this. Get out, you are getting much too good for me, you young pious!"

The boy saw the young man was serious; so, fearing to irritate him, he went quietly out of the room at once.

And the young man? He was in a miserable frame of mind, and the more so because he knew what the boy had said was perfectly true. He held up his right hand—it shook ominously. A frown contracted his brow, and he muttered: "Yes, it shakes; but it is not the *mare's* fault. I'm getting below par, moping about here, as Perce said. He's a jolly little chap, for all his pious ways, and I'm a brute to show my temper to him as I did. Can't think how it is, but I'm not so easy tempered as I used to be. I'll go out; a bit of a stroll will do me good, perhaps."

He rose, shook himself, yawned, went to a wine-cupboard in the room, poured out a tumbler full of something, swallowed it eagerly, and, taking down his gun from the rack outside, passed out from the house, and into the copse that led to the fields, through which ran the high-road to Farley. In the copse he met Perce. The boy rather shrank from him.

"Don't go off like that, youngster," called his cousin. "I was only joking just now. Shake hands, and be friends again."

There were tears in the boy's eyes as he felt the strong fingers tremble, and knew the cause. He looked steadily into the flushed face, for the thick tones of the voice sent a chill to his heart.

"You're such a dear old Duke," he said, "and I'm such a tiny chap beside you; but don't you think I might be useful to you sometimes? Other fellows can do lots of things."

"Yes; you shall carry a letter down to Miss Treherne for me before lunch; only don't think too much about me, nor look so solemn, Perce, old boy. I'm not going to my funeral."

The boy looked after him as he strode out towards the road, and said to himself: "No, Duke, but you're going to *The Crow's Nest*, and that means your grave, old Mr. Peters says. Poor Duke! I wish Miss Knox could help you as she does me."

Meanwhile Duke, or Marmaduke Arden, walked on. He, too, was thinking and soliloquising; but he thought as a dreamer. The fumes of the brandy were clouding his brain, and making his steps unsteady, so that he did not notice the figure of a young and attractive-looking lady, who was gazing sadly at him from over the hedge on Mr. Treherne's side of the road. As she turned into her father's fields, she said to the friend who was with her,—

"I'm so sorry for Duke Arden. His uncle is so good to him, his aunt almost worships him, and he has the making of a fine fellow in him; but, look at him *now*—only ten o'clock in the day, and he cannot walk straight! I'm *so* sorry."

"I thought you rather liked his society," replied her friend; "you are always very chatty with him when he comes."

"Yes; so few that know him will speak to him as I have done. I have pleaded with

him to let the better nature in him have its way—to give up all kinds of strong drink, and once or twice he has *almost* promised to do so; but look at him *now!*"

Yes, look at him *now*, indeed! And what are his thoughts? Confused jumblings of Mabel Treherne, of Percy, of that letter which ought to have come this morning, settling that business for him which a friend of his uncle is managing so successfully. "I'm glad," he muses aloud, "I didn't settle last year to read up for the law; an outdoor life suits me best. And if I can get this berth on the estate of that old Scotch earl, I can ask Mabel to be my wife at once. In fact, as there's no possibility of a refusal from the earl, and I fear none from dear little Mabel, I'll ask her to-night. But, as she says, I must *reform*. I shall be all right when I'm a full-blown factor, with any amount of responsibility, and Mabel to look after me."

A young man of five and twenty, with "any amount of (unfelt) responsibility" under his hands on his uncle's acres; with education, manhood, position, and influence all on his side, talking of a frail girl as somebody "to look after him"! Surely *something* is amiss. Yes, Duke Arden knows it, too. In his better moments he has resolved to free himself from the chains which he knows are dragging him down to ruin. He has promised his uncle, on his knees, to renounce strong drink; and felt that when that uncle sent him for a sea trip to Australia, he should come back liberated from its fascination. But no. He made friends with the chief steward on board, and all the way out, after the first three days, drank harder than when at home. On the voyage home it was the same thing; and when he got back, the hunting parties, the county dinners and balls, the various "meets," the wedding-breakfasts, and the bar-parlour of the cosy-looking, old-fashioned hostelry, *The Crow's Nest*, were too many temptations for him. Strong, fine, handsome man though he was, he yielded to their deadening influence, until, at last, his one, all-potent, overmastering craving was for strong drink! Yet even *he* was noticing the change that was gradually marring his good looks.

"I *must* have it!" he would say to himself. "Only this glass; it will make a man of me, and then I won't touch another drop. It's too bad, really, after all uncle has done for me; and yet, what am I to do? Well, I will make a stand after this glass—I will *not* be dragged down, body and soul!"

And he kept his good resolution? Not he. "Only this once" has been the Nemesis of thousands since the world began to sin. That one glass; that one vicious indulgence of self; that one false step; that once again yielding to sin, *after the voice of warning* has spoken in the conscience, is just the one step which clinches the bargain of the soul with the tempter, and, as in the case of Duke Arden, drags it down to ruin.

CHAPTER II.

LEAVING Duke to find his way to *The Crow's Nest*, let us go back to the house where his uncle, Squire Arden, is pacing up and down the long old-fashioned dining-room, his head bent, and an expression of pain and perplexity upon his handsome, sun-browned face. A lady is sitting in the recess of one of the windows—his wife; she is silent, but sorrowful. She knows that it is no use to speak *now;* she will not irritate her husband with propositions, or pity; he will turn to her when he needs her help. And he does.

"Avice," he says, pausing in his walk before her, "I cannot tell what to do about Duke. I have been hearing worse things than ever this morning from one or two friends. He is in debt again all round; his drink bill is frightful, and there are some claims that I can say nothing about to you, but they are disgraceful. I wish he may get that place with the Earl of B ——, for it may set him straight."

"I don't know that it will," answered Mrs. Arden; "nobody seems to have any influence with him, now." Then the tears started to her eyes—her heart was full of them. "And yesterday I was told that it was all our fault,—and perhaps it is."

"What!" thundered her husband, pausing in the act of pouring himself out a glass of wine. He did not know what it was ever to feel "muddled," and scorned the habitual drunkard with an unmitigated scorn and contempt; but when anything went wrong, he would take a glass of wine in addition to his usual regulated supply, and thought it only right. He set down the glass.

"*Who* says that Duke Arden is to blame us for his ruin?"

His wife cowered a little before his stern gaze, but she replied,—

"Mrs. Bourne was here yesterday, as you know, and she said that she and her husband were so grieved about Duke; he was to be seen at all hours of the day, under the influence, more or less, of alcohol. And last week, when Mr. Bourne said to him, 'I say, Duke, *why* don't you look the thing fairly in the face, and give it up?' his answer was, 'Ah, Mr. Bourne, so I might if there was not so much of the stuff in my uncle's house, and on his table. As it is, what am I to do?'"

"The ungrateful scamp!" cried the squire, using words that he never allowed himself to utter in the presence of his wife. "Have I taken my dead brother's son into my home—nursed him in my very heart, done for him as I had done for no other, and put up with that from him that I had brooked from no other, giving him a son's place in my affections, only to meet with this return?" Then, bitterly adding, "Well, it is time he was gone!" he took up the glass and drained it. Then he looked at the bottle. "This was full last night—yes, I *must* be to blame to let such a scrapegrace have free access to this sort of thing."

Mrs. Arden ventured to speak, though her voice trembled,—

"George, dear," she began, "*because* you have taken so much from him unchecked, is perhaps the reason of his downfall."

"That's right, isn't it, Avice?" responded her husband, cynically; "always hit a man when he is down! *You* to think that I have ruined my own nephew — you, who ——." The speech was interrupted by the entrance of a servant with the post-bag. Mrs. Arden left the room, and the squire

"'Ruined!' he groaned, leaning upon his uncle to steady himself. The squire gravely read the letter."

at once began to sort the letters busily at his desk.

On her way up to her room, Mrs. Arden met Miss Knox, the governess, of whom she was very fond, and Percy. The latter said, "Oh, mother, tears in your eyes! No bad news, is there?"

"Yes, Perce, there is,—don't ask what, darling, now." She kissed the boy, and he went slowly down, saying to himself,—

"It is poor Duke, I'm sure; I heard father say his name as I passed under the window. But I'm only a *boy*, can't do *anything*."

Meanwhile, Laura Knox was following Mrs. Arden—her privilege.

"Can I do anything? I know you are in trouble," she said.

"No, dear, there is nothing for any one to do, at present; it is a case of patience," said Mrs. Arden, remembering her husband's last words to her. "Only, you must have noticed how changed Duke is of late, and it is that that is troubling us, dear."

Laura Knox knew too well. Then, venturing upon very delicate ground,—

"Dear Mrs. Arden, I *have* noticed, so has Percy. He so loves his cousin that he would do anything for him, he says; and last night, before I went to my room, I looked in at Perce as usual, and found the dear boy on his knees, asking that his cousin might be kept from the power of the dreadful temptation. Percy seems to understand how it is with his cousin, and he is so manly about it."

A shadow of displeasure crossed Mrs. Arden's face.

"His father would be very sorry to have Percy made a milksop, or to get any of those dreadfully extreme ideas (whose outcome is cant), to spoil all his boyish ways, and honest, simple faith."

"Faith in what? or whom? dear Mrs. Arden," asked Laura.

"Well, my dear," said the lady, avoiding the point at issue, "I only know that yesterday at luncheon, Percy refused his customary glass of ale, saying he did not need it, and his father was very angry, for he justly said, 'Who is to judge for a child—his parents or himself?' I admire you, dear, but I fear you are putting notions into the boy's head, and he will get to be like the children in the stories, who, directly they become what is called 'pious,' fall ill and die."

"Have you noticed that Perce is any less robust than usual? Or that he is not the same racketty, noisy, romping—I was going to say *jolly*—boy, that he has ever been?" asked Laura.

"No, no; he is perfectly alive with fun; but what is the good of his troubling his head about Duke?" asked the Squire's wife, in a half-relenting tone. "Don't you think he may grow morbid about it?"

"Not while he feels as he *does* about it," answered the other; "it is splendid to see his devotion. That boy is a Christian soldier, and a regular brick into the bargain!" was the admiring conclusion.

She left the room, and, in the privacy of her own apartment, did what so many of our sisters do—prayed for the tempted brother.

To return to Squire Arden. When he had read through his letters, he looked at the postmarks of those which were for Duke. Seeing one from Scotland, and thinking it to be the conclusion of the business between the Earl and his factor-elect, he put on his hat, and walked down the copse, as Duke had done. Seeing a labourer, he asked,—

"Seen Mr. Duke out to-day, John?"

"Yes, sir, I seen him,—he was on the road pretty nigh *The Crow's Nest*, sir. I don't mean as he was goin' there, sir." He corrected himself hastily, seeing a frown of displeasure on his master's usually unruffled countenance.

The squire muttered something about its being "All right," and walked on. Halfway down the road he saw Duke coming towards him; he had a reckless air about him, for, mid-day though it was, he had made a foolish bet with the landlord of the *Nest*, over a friendly glass, and had lost. The bet was on a trial of skill with powder and shot, but in the uncertain state of his brain and hand, Duke missed, and the landlord won.

Of course the squire knew nothing of this, but he noted with fresh pain the aimless, don't-care, slouching gait of his nephew.

"Here's your letter, Duke," he said, half averting his gaze, as if *he* were to blame for his nephew's condition, though, of course he was not.

Duke opened the letter with feverish haste. As he read, his jaw fell, and his cheeks blanched; a spasm of mortified pride and pain crossed his features, as with shaking hand he held out the letter to the squire.

"I am ruined!" he groaned, half staggering towards his uncle, and leaning upon him to steady himself. The squire gravely read the letter, which stated that it having come to the knowledge of the Earl of B—— that Mr. Marmaduke Arden was much given to habits of an unbusiness-like nature, he felt it to be his duty to decline his services as his factor. Squire Arden handed back the letter, and, seeing how really ill Duke seemed, postponed his talk, and quietly led him home. Nothing was said during lunch of anything that had transpired during the morning—every one seemed under a cloud. Duke dragged himself to his room, but hearing Percy's voice shouting that he was going to cricket, he called the boy in.

"Just wait while I write that note I spoke about; you can leave it for me. And, old chap, you believe in prayer, and all that sort of thing, don't you? well, I *can't*;—but you can just put in a word for me next time, and ask the gods to blow a good wind my way, for I'm down on my luck; the whole world's against me, and I'm ruined."

"That isn't true, Duke. You've made ever such a man of me, and *I'll* stick to you through thick and thin, see if I don't. Don't laugh, Duke, but I'd die for you, if it would make you happy again."

"I believe you would, old boy," said Duke, chokingly. "There, be off!"

As the boy ran off, leaping on his bat, whistling and shouting by turns, Duke looked after him from his window.

"There's no humbug *there*," he muttered. "I'd stake his pure young life that he'll pray for me."

Duke was wretched: he sat down to think. What could he or should he do? "Well, I mean to put my luck to the test, and if Mabel Treherne will only take me in hand, I know what I'll do—I'll never touch another drop of spirits. But there is not a fellow I know who does *not* drink something of the sort. I'm in the thick of it; all our 'set' indulge as far as they're able; but there's that conf——, well, *something* about me, that, when once I've tasted the stuff, I'm off for the day, and I can't take a little without that awful craving. Come in," he called, in reply to a tap at his door.

It was Mrs. Arden; she was pale, and Duke rose and placed an easy-chair for her. He felt something was coming; not that he dreaded or avoided his aunt, for he was deeply attached to her, but he hated tears, and anything like a "scene."

"Duke, dear," said she, in gentle tones, "I'm afraid we've all been very unkind to you, and I feel that *we* are to blame for so much that has grieved us for so long, and to-day, especially."

She paused, looked at him keenly—tried again to say something, but failing, rose from her seat, and tenderly kissed his heated forehead.

"Don't worry about me, Aunt Avice," said the young man. "I am going to the dogs, and the sooner the better. I ought never to have been born, to be a curse to myself and a disgrace to others."

"Oh, don't say that!" Something in the tone—such a contrast to all Mrs. Bourne or Miss Knox had said—smote upon her. Had she been verily guilty in letting this young man go on all through the years of childhood and youth, in the belief that manhood would correct all the evils of earlier life, and be itself a means of strength against temptation to him? The thought came like a revelation, and the words, only half remembered though they were, floated dimly across her memory, "*Wherewithal* shall a young man cleanse his way?" and before she half realised what they meant, came other words for answer: "By taking heed thereto, *according to Thy Word*." Oh, then she was *indeed* to blame! "Don't say that," she repeated. "We will do anything to spare you in the future; we have been so inconsiderate, Duke. And you will brace yourself up, and meet things like a man, dear, and forget that you can do anything in your own strength. I blame myself for not better caring for you; but I'm only a woman, Duke, and what do women know of all that you young men have to meet and to resist?"

Duke lifted his head from between his hands; there was something noble and strong in the expression of his face now, as he answered,—

"No, you *don't* know. But though I've met temptation, I'm obliged to confess the coward when I say, I've never resisted it. But by the words you've spoken, and, as a last throw—my only remaining stake—I swear, by that boy's love, I'll never touch strong drink again."

His aunt rose; her eyes were full of tears, and her heart of thankfulness.

"Oh, Duke!" she said, "what a happy woman you have made me to-day!"

But, alas! how frail are our strongest promises! How fleeting our brightest hopes, unless there is behind them a Higher than man's will!

(*To be continued.*)

Care not for the Babel towers in Shinar, that cannot even touch the clouds, when, at your own lowly thresholds are waiting chariots of fire, to bear you beyond the firmament.

Whenever time prepares a fresh field of conflict, and the hour has come for the battle to join between the old and the new, the stately form of the true hero and leader never fails to stride to the front.

No one can trustfully read his Bible without becoming sure, that one of the gladdest surprises in the new life will be found in the return to us of those fond and patient purposes, now in full accomplishment, which we once mourned over, as having died without a sign.

HOMELY HOBBIES: RECREATIONS IN GEOLOGY.

By W. H. Harris, B.A., B.Sc.

No. 7.—The Coal of our Fires.

WHEN Poetry and Science are spoken of as being in opposition to each other, it is from a very mistaken idea as to their mutual relations. There are thousands of problems in nature, for the solution of which the scientific imagination proves the finest instrument. That there is, indeed, a whole "Fairyland of Science," Miss Arabella Buckley has shown to the world in her charming books, and that "fact is stranger than fiction," any department of natural history will testify. It is true we want prosaic observation, and cold, calm reasoning in all science; but the breath of fancy is needed to give life, warmth, and energy to these intellectual processes. Under its influence they become effective for the highest and deepest knowledge, and for the best purposes of mental culture. Hence it is that some of our most truly scientific writers and lecturers are also the most popular; for they touch our faculties at many points, and give us pictures for eye and mind, full of beauty, and of the charm begotten of the beautiful and the true.

We have been led into making these observations by thinking how best to describe to our readers "the Coal of our Fires." It would be a rather amusing experiment to ask the first half-dozen people one met the simple question, "What is coal?" We know from actual occurrence the kind of answers which would be given. We have, indeed, had such specimens as the following: "Why, coal is coal, to be sure"; or again, "It is dug out of mines deep down in the earth"; or, "It is a black substance, which we burn"; or, "It is a sort of stone which can be set alight, and will consume, giving out heat." Then, if further questions were put as to the origin of coal, we should be told: "It was made when the world was created"; or, "It was formed in some way or other, just like the rest of the rocks"; or, "It came from forests or trees, which, somehow, got buried." This last is probably the nearest approach to a correct explanation that we should be likely to receive. But what should we think of the scientist who gave as his answer to our first question, "Coal is gas and stored-up sunbeams, with a small quantity of earthy matter, which we need hardly take into account"? Yet this is literally true, and not a mere poetical fancy.

Now, let us examine the subject in an easy, common-sense sort of way, and see what we can learn for ourselves of this most useful mineral and its production. The first thing we have to do is to ask ourselves, What substances burn away as coal does? We think at once of paper and wood, oil, tallow and wax, as most familiar combustibles. If, then, we imagine such a very unpleasant circumstance as our house being on fire, and try to think what would disappear in the conflagration, and what would be unconsumed, we notice that, speaking with considerable accuracy, all which had had an animal or vegetable origin would perish, while what was purely mineral in its nature would remain unburnt. The appearance of articles, in the latter class, might be sadly changed—metals twisted, fused, and put out of shape, plaster and bricks blackened and thrown down, glass melted, china broken, earthenware cracked, and a general havoc wrought; but if we weighed these things before and after the fire, little actual loss of material would be discovered. A natural conclusion, then, from these facts would be that coal was of *organic* origin—rather surprising, no doubt, when we consider the depth below the surface of the earth at which it is found, and the various kinds of rocks lying upon the "seams."

But next, let us try to get corroboration of our inference from other quarters. We have chemical analysts, who can so split up the vast majority of substances as to be able to tell exactly of what elements and in what proportions these have been compounded. In answer to our inquiries as to those easily-burning materials we mentioned above—paper, wood, oil, tallow, and wax—we should learn that they all have been built up by animals or plants, and from very little beside oxygen, hydrogen, nitrogen, and carbon. By combination in various relative quantities, and by subtle re-arrangements of their ultimate particles, their differences have been brought about; but, practically, they are the children of a quadruple parentage. If we go on to ask if coal is their sable brother, the chemist tells us he has no doubt of the fact, from the identities of feature and of nature.

This further information makes us feel tolerably certain we are in a fair way to solve the mystery we undertook to investigate. We will, however, try to get more proofs from other directions. Can the microscope tell us anything? Most assuredly it can; for, if very thin slices of coal be prepared, we can discern, even with a moderate "power," the clearest evidences of vegetable structure. We can see striking resemblances to tissues of plants well known to us; nay, more, we can make out the spores or seeds of certain trees, which, in their countless millions, have largely contributed to form our beds of coal. What more can we want to convince us that our "black diamonds"—a name concerning which we shall have more to tell—once lived in glorious greenness, and drank in air, and light, and heat? Well, perhaps some incredulous reader may still be tempted to say, "Your story is so strange, that, though I confess you seem to have truth on your side, I can hardly yet believe it is correct."

Let us take one more step, then, in our investigations. Hitherto we have been confining our attention to what any coal-box in our rooms may contain. Now let us take a journey, longer or shorter as is required, to the nearest coal-mine, and let us search among the heaps near the pit-mouth for any evidences of plant-remains visible to the unaided eye. We shall not have a long trial of our patience. In the great piles of shale, or argillaceous matters, which have formed the "under-clays" and the roofs of the coal seams, there is found a profusion of impressions of ferns and other kinds of vegetation, which must banish all doubt as to the fact that these now deeply-sunken strata were once at the surface of the earth, clothed in verdure and beauty. At length, then, we may unhesitatingly conclude that coal has had its origin in the plant-world.

But, now, let us go back to our poetic scientist's definition of coal, as "gas, stored-up sunbeams, and a little earthy matter," and let us see what is really meant by it. In order to verify its correctness, we must make some inquiries as to the growth of trees in the present day. Of what materials are their tissues built up? How and whence do they obtain these substances? And what are the conditions under which our modern vegetation thrives? We have already said that chemists tell us wood consists chiefly of oxygen, hydrogen, nitrogen, and carbon, not, however, in their free condition, but combined, so as to form nutriment of various kinds. For instance, water, which is essential for all life on earth, is a compound of oxygen and hydrogen—both gases. Ammonia, another kind of plant-food, is a product of nitrogen and hydrogen—the former, as well as the latter, being a gas. Carbon dioxide, better known, perhaps, under its old name of carbonic acid—a third important source of vegetable tissue—is also a gas, consisting, as we should suppose, of carbon and oxygen.

Besides these components, trees contain a few earthy materials, in some of which oxygen finds also a place. How the water of the globe was originally formed, we do not fully know, but it is certain that both ammonia and carbon-dioxide result from the decomposition of organic substances into gaseous conditions. Let us next see how the sunbeams come in. First:—The water needed by plants is, for the most part, supplied by rain; but rain would be impossible, were it not that sun-energy lifts vast masses of water, as vapour, into the higher parts of the atmosphere, where cold currents or a rarefied condition once more condense it, first into clouds and then into drops, which fall by their own weight to the earth. Again, the decomposition of organic matter, and the consequent production of ammonia, go on only under the influence of a tolerably high temperature, and this, as a general condition, can arise solely from the heat given out by the sun. Once more—and this is a wonderful fact—a very large portion of plant-tissue is derived from the extremely minute quantity of carbon dioxide existing in the atmosphere. The air we breathe consists of a *mixture*—not a *combination*—of nearly 21 per cent. of oxygen, about 79 of nitrogen, and four parts in 10,000 of carbon dioxide. We may well feel astonished, then, to be told, that the solidity and bulk of our forests depend on this small fractional and last-named substance. A natural question is—How can plants get their hard material from this invisible gas?

Botanists and chemists most satisfactorily explain the process. The former tell us, and with their microscopes show us, that the green parts of vegetables abound with tiny openings, to which the name of *stomata* ("mouths") has been given. One purpose served by these apertures is to drink in carbon dioxide from the air. But it is found that they also, under certain circumstances, exhale this same gas. Thus we are confronted with two more problems. First, how is the carbon dioxide split up into its two elements—the solid carbon being retained, and the oxygen given off? Secondly, what makes the difference between the absorbent and exhalant action of the stomata? Here the chemist comes to our aid, and points out to us that the green parts of plants owe their colour to a peculiar substance, called chlorophyll, and

that this is the agent in the decomposition of the carbon dioxide. Again,—and this is our special point now—it is certain that this decomposing process goes on only under the action of light—in other words, it is dependent on sun-energy.

Once more, we know from modern scientific researches that force or energy is never annihilated, though it may undergo various transmutations. It may become known to us in the apparently dissimilar forms of motion, heat, light, electricity, chemical action, or vital phenomena, but it is never lost. It may, from its active manifestations, pass into a sort of *latent* state, when it is no longer cognizable by our senses ; but it only needs suitable conditions to make itself once more manifest. This doctrine of "the conservation of energy" is one of the triumphs of our modern science, and opens up magnificent fields of speculation. In its light, we see now what is meant by "stored-up sunbeams" as a constituent of coal. Plants absolutely require solar energy, in the forms of both light and heat, for their vital processes. Through these processes they build up their tissues, as we have seen,—these tissues being able, under the application of a small quantity of heat, to yield up their elements to the strong appetite of oxygen for them. In the re-construction of gases, produced in combustion, a large amount of energy, in the shape of heat, is evolved. This heat we often employ to put into violent action the particles of water, till they take the form of steam, and this, again, is made to impart its energy to the iron of our locomotives ; so that we may not only say that our coal is due to the storage of sunbeams in vegetable tissues, but that we travel on our railways by sunbeams, set free from their prison-house, in the fuel of our engines.

Have we not here a veritable scientific romance ?

In a subsequent Paper we shall try to show just how our beds of coal have been formed, and will give a few particulars of their chief constituent plants.

LOVE, COURTSHIP, AND MARRIAGE.

By PHYLLIS BROWNE.

No. 4.

Choice of a Partner for Life.

AN American writer once said that it was much easier to suggest whom not to marry, than whom to marry. This is exactly the truth, and, if every one were determined to be satisfied with nothing short of perfection, marriages would be events of rare occurrence.

There are no perfect men, and there are no perfect women ; and the man or woman who expects to find either will be disappointed. More than this ; those who, having resolved to marry, calmly proceed to take stock of individuals of the opposite sex, to find out who is good enough, seldom make a successful marriage. They are so prudent, that they over-reach themselves. They want to receive everything, and give nothing, and this does not answer. There is never a perfect union of two hearts and two lives, where feeling, or, in other words, love, does not constitute the principal motive. Prudence about essentials is to be commended, and feeling ought to be kept well in hand until this is ascertained. Once satisfied on this point, feeling should reign supreme, and all minor considerations be put aside.

What, then, are the essentials of such vast importance, that an earnest young man or young woman ought to guard himself or herself from falling in love with one who does not possess them ?

First, an earnest, Christ-loving spirit.

Second, a body, free from incurable hereditary disease.

Third, an honest, sober, steady, capable character.

Fourth, a congenial disposition and similarity of taste.

Perhaps it will be said that these conditions are too strict, and that young men and young women could not be reasonably expected to abide by them. If so, it is a sad thing for the world. There is no chance of happiness where they are not fulfilled. How can a man and wife live together, unless they are of the same spirit ? Supposing the husband has an earnest desire, above all else, to do what is right, and to walk in the light of God's love, and his wife thinks only of gaiety and show ; it is as impossible that a perfect union can exist between them, as it would be if they lived in different planets. For a time, while the novelty lasts, they may get on fairly well, but discord is inevitable, and the giddy wife will be, before long, a hindrance and a drag to her husband, while the husband will be a torment and a source of irritation to the wife.

As to the second condition. Those who marry, knowing that they have in their constitutions the seeds of incurable hereditary disease, commit a sin against society, because they help to perpetuate pain and weakness. This very serious subject can only be hinted at. We believe, however, that if those who have inherited disease would consider that they are called upon to deny themselves for the sake of their fellow-creatures, they would be benefactors to their race. We believe, also, that as the world grows wiser, this self-denial will be regarded as one of the most solemn duties resting upon frail mortals.

The importance of the third essential, that a partner for life should be honest, sober, steady, capable, and industrious, is so obvious, that few would question its truth.

Some women, blinded by love, have a notion that marriage will alter character, that it will make the drunken man sober, the dishonest man straightforward and honourable, the idle man industrious. Marriage makes many changes, it is true, but not changes of this kind. The woman who marries a rake, thinking to reform him, generally makes a sad mistake.

The will and power to reform must be proved before, not after, marriage. Certain disappointment awaits, also, those who marry where brains are lacking. The great philosopher was right when he said : "Have nothing to do with fools ; they are the fatal species."

The fourth essential, that partners for life should have congenial dispositions and similar tastes is, compared with the others, like small change to sovereigns and bank-notes. Rich men can enter on large undertakings ; to buy estates, they sign a cheque, or produce bank-notes. But, for the small wants of every-day life, they need sixpences, shillings, and half-pence. So in marriage. It is of the greatest importance that a partner for life should have an earnest spirit and a good constitution, and should be sober, honest, capable, industrious ; but if, whilst all this exists, one dislikes reading and the other enjoys it,—one has no taste for music and the other is soothed and charmed by it,—there is very little prospect of comfort.

A cynical old bachelor once said, that matrimony is like a pair of shears, so joined that they cannot be separated, often moving in opposite directions, but punishing every one who comes between them. This dolorous description is only true where the wedded pair are not congenial. "Choose a wife as you choose a knife ; look to her temper," said a wise man ; and the advice is equally valuable, whether husbands or wives are under consideration.

When satisfied concerning these essentials, particularly the first three, feeling may be permitted to take its course, and develop into love. Without this satisfaction, feeling ought to be crushed, no matter at what cost of pain and disappointment. An unwise fancy can be conquered by those who have strength of will ; and young men and young women who persist in attaching themselves to individuals unsuitable in essentials, are simply preparing untold misery, not only for themselves, but for those who will come after them.

But, it may be asked, are these then the only essentials in marriage ? Are we not to think of beauty, position, wealth, talent ? Ought not a young man to think whether his intended wife will be a good housekeeper ? And ought not a young woman to think whether her proposed husband can provide a well-furnished house ? Undoubtedly, if conditions of this kind are favourable, all the better. But if love is absent, these details are not worth a thought. Alone, they cannot bring happiness ; there is nothing in them that abides. And it is because men and women pursue these things that mistakes are made in marriage.

Where true love is, such trifles can be disregarded ; or, if necessary to comfort, love can obtain them. By the help of love, a clever girl can become a good housekeeper ; an honest, industrious young man can work to furnish a home. Love imparts beauty, it

exalts and enriches the beloved. Without it, the most richly ornamented house, the best ordered household, will be a barren desert. With it, the plainest cottage becomes a home.

In that wonderful book, "Bunyan's Pilgrim's Progress," there is an account of a man who gave the whole of his attention to that which was on the ground at his feet, and did not notice the golden crown which an angel was holding over his head. In marriage, as well as in many other ways, men and women are like this foolish man. They look out for what is of little account, and disregard that which is of chief value. There can be no greater mistake than to think only, or chiefly of wealth or beauty. When two people have lived together for six months, it usually signifies very little to either, whether the other has a straight nose or curly hair. If by that time each has pleased the other as companion and friend, the face, though plain before, will have become most pleasing; whilst, if there have been contradictions and disagreements on either side, the most beautiful face will have lost its charm. When we truly love a person, our eyes find satisfaction in resting on their face, no matter how homely that face may be.

There are individuals who speak as if lack of beauty were a crime, and its possession a virtue. They praise those who are pretty, and blame those who are not; they are very critical upon looks, and think beauty the great essential in marriage. Their affection generally lasts as long as the beauty, and no longer. An attack of small-pox, or an accident might entirely destroy it. That love is worth nothing that does not last through illness and change. The love that is true grows with time.

Mrs. Hutchinson writes, in the life of her husband, Colonel Hutchinson: "So constant was he in his love, that when his wife ceased to be young and lovely, he began to show her most fondness." Even when there is no disfiguring illness or accident, youthful beauty lasts only a short time. The loveliness vanishes, but the partner remains. It is a sad look-out when nothing worth having is left.

Wealth is quite as unstable as beauty. "Riches take to themselves wings, and fly away." Ask any one who has lived to middle life, how many of the people reputed to be wealthy twenty years ago are wealthy now? how many poor men have become rich? how men rich men are poor? Even if mere worldly success were the chief consideration, it would be safer to be united to a partner with energy, ability, and courage, than to trust to wealthy friends, or to a bank account. Banks break, fires burn, ships laden with merchandise go down, rust corrupts, and moths destroy; but industry, perseverance, and capacity conquer difficulties. Better to marry one who is poor, and who yet possesses the qualities which lead to success, than to trust to success already won.

If, therefore, without love marriage be a mockery, it may perhaps be asked: "How are we to know when love exists?" Here there really is no difficulty. Sooner or later love makes itself known. "Love and a cough can never be hid," says an old proverb. Still, where people are doubtful about their own feelings, it is as well to apply one or two tests.

Here are four suggestions.

It is fairly safe to marry the person with whom we could pleasantly spend a week, if shut up together, far away from any one else—in the Eddystone Lighthouse, for instance.

It is fairly safe to marry one whom we should be proud and thankful to claim as our own, under all circumstances.

It is a good sign when we are anxious to please, above every one, the person whom we are to marry.

It is a good sign when the person we are to marry is the one whom we are most glad to see when in trouble or difficulty.

Marriage is often said to be like a lottery, in which one here and one there draws prizes, and the rest draw blanks. An individual, however, who answered all these four tests, would, at least, give promise of being a prize. But as it is scarcely likely that any human being could fulfil every condition, love is required to smooth over difficulties.

APPLICATION *versus* GENIUS.

By JOSIAH FORRESTER.

A DISCRIMINATING public has hitherto saved me—and is likely ever to save—from the necessity of pleading not guilty to the soft impeachment of being a genius. I will not say that, if I were to ask memory to consult the diary of my adolescence, a time would not be found when I diligently searched my pedigree, my mirror, and my ink-pot, for a hint of a consummation so devoutly to be wished, but these oracles were dumb. When I tried to stir up the gift that was in me, it came out, sometimes in perspiration, but mostly by a systematic neglect of the larder, coupled with a sedulous use of the razor. Pass my hungry fingers as I might through my flowing locks, I never could find any genius attaching, when the operation was over. An attempt to cultivate it on less hair, and a little oatmeal, *à la* Carlyle, having also signally failed, I, at last, came to see that if there really were such a thing as genius, which was seriously to be doubted, seeing I could discover none of it in myself, it would only come out as I was faithful to my own individuality.

O. W. Holmes was not specially addressing me, but he might have been, when he said: "You may have genius. The contrary is, of course, probable, but it is not demonstrated. If you have, the world wants you more than you want it."

So far, the great American carries my judgment with him, but I cannot quite subscribe to the next sentence: "It has not only a desire, but a passion for every spark of genius that shows itself among us." The passion comes, it is true, but mostly too late. Forster puts it in a nutshell in the dedication of his life of Oliver Goldsmith:—

> "Genius and its rewards are briefly told:
> A liberal nature and a niggard doom,
> A difficult journey to a splendid tomb."

What I have said to my soul, I say to you: "If you have genius, thank God that it is not your fault; and if you have not got it, thank God all the same that you can, like the majority of your fellow-creatures, get on very well without it." I trust I am a very humble Christian; but when I look round upon the men and women who are universally acknowledged to be geniuses, when I remember that the heart of almost every one was eaten out with some jealousy, weakness, evil passion, or bitter disappointment, I must plead guilty to borrowing the Pharisee's prayer: "Lord, I thank Thee that I am not as other men are, or even as these geniuses." Honestly, I think that about the grandest sight either God or man can see, is a man who confronts his little world, and says: "There is nothing unusual about me, but ere I give up the ghost, I am going to try the loftiest possibilities of my nature."

That the steady application of an enthusiastic soul is, in the long run, quite equal to—if not better than—genius, has had many illustrations in life.

In recent biography, I have come across no more striking example of this fact than that given in the absorbingly interesting Autobiography of Mr. W. P. Frith, R.A. Here is a man, who states with the most engaging frankness and sincerity, that he knows he is not a great artist, and by no possibility could have been; and yet few graduates of the palette have been so successful as he. What is the secret? We shall see later on. As many of you are not likely to see Mr. Frith's volumes, and as, no doubt, you need a little stimulus to bring out the best that is in you, I propose to retail a few of the facts disclosed in the autobiography. Here, however, let me interject that I am only using Mr. Frith as an illustration of the great fact that success does not necessitate genius, and not at all as my ideal of a painter.

Mr. Frith does not seem to have been born with the legendary silver spoon in his mouth, nor, for the matter of that, with a palette stuck on his left thumb. If, however, he owed nothing to wealth or ancestry, it is equally true that "chill penury" did not "repress his noble rage." His father, comfortably off as the landlord of "The Dragon Inn," Harrogate, had not only a taste for art, but a desire to do all he could to make his son an artist. At the age of eleven, young Frith made a drawing of a dog, and the drawing made such an impression upon his male parent, that that gentleman metaphorically—perhaps actually—took the boy to his heart, and emphatically pronounced him "the genius of the family." Strange, however, to say, that though subsequently, at school, he neglected his other studies to copy drawings with chalk or pencil, when the "genius of the family" was confronted with the question of a profession, he said he would much prefer being an auctioneer; but, though he was sure he never could paint, *he would try if his father wished it.* Not a very hopeful way of beginning a life-work, certainly. His drawings were submitted to two artist brothers, and they advised Mr. Frith to go on with the artistic training of his son. The value, however, of their advice will be best seen in the following story, told by Mr. Frith himself. When he had attained to some fame as a painter, he met one of the brothers Chalm, and said to him: "If it had not been for you, I should not have been an artist at all." The gentleman thus addressed was much surprised, for he had no recollection of the circumstance. Thinking that a sight of the drawings submitted to him would help his memory, he asked to see them. After looking at them for some time, he said: "Do you mean to tell me that I ever saw those things before?"

"Indeed you did."

"And that I advised that you should be trained as an artist on such evidence as that?"

"Indeed you did."

"*Then I ought to be ashamed of myself.*"

At first the work was little short of drudgery and vexation of spirit to the young man, who sighed regretfully after the auctioneer's box and hammer. His teacher more than once said he would never make a painter of him, and was especially "mad against him," when he struck against any

more copying. The lad, however, had some gift in him, and he stuck to his colours. A compromise was effected, and he was allowed to try his hand at a subject in monochrome, viz., a brown jar, a wicker Florence oil-bottle, and an old inkstand. *This was the turning-point in Frith's life.* He says: "I no longer regretted the easy life, or what I thought such, of the auctioneer. I felt real enjoyment in my work, a feeling which has possessed me, from that day to this, in ever-increasing strength."

Though he had found the turning-point, it was not to a royal road to success. No! like everybody else, the work was emphatically "up-hill," and many were the discouragments in the way. You have heard of that ingenious boy who said of his wooden boat, that "he had made it entirely out of his own head, and that he had enough wood left to make another." The time came when young Frith could look at a picture which he had made out of his own head, but he was not so complacent over it as the boy was over his boat. His theme was taken from Scott's "Lay of the last Minstrel," and tried to body forth the lines :—

"Full slyly smiled the observant page,
And gave the withered hand of age
A goblet, crowned with rosy wine."

"I knew far too little of perspective," he says, "and, consequently, the relative sizes of the old man and the page puzzled me frightfully; sometimes their figures were tumbling over each other, and sometimes they were slipping out of the picture. Do what I would, I could not make their feet stand on the floor. The boy had a stupid giggle on his face, and stood upon his toes. The old man's beard insisted on looking as if he had tied it on, and its annoying owner nearly drove me wild with his remarks; and the girl who sat for the page, said, 'She never see such a face; it wasn't like *her*, *she* knew.' Indeed it was not, nor like any earthly thing. How well I remember throwing down palette and brushes, and rushing out of the house in despair, and wandering about Chalk Farm, where pigeon-shooting was going on, watching the pigeons as they were knocked over, almost envying their fate! After rubbings out and alterations innumerable, the picture was finished. O'Neil and poor Cowper came, smiled, and said nothing. My old master told me flatly I should never do anything as long as I lived, and that all his hard work to make an artist of me had been thrown away. This was inspiriting! However, I sent the 'Last Minstrel' to the Suffolk Street Gallery, and it was hung among other specimens of imbecility."

After such an experience as this, many would have given up in despair, but Frith was made of sterner stuff, and there grew in his heart a strong determination to succeed. He made up his mind that, in artist phrase, he would "hang on the line." Not, O ye uninitiated, on the clothes-line,—a despairing suicide,—but to have a picture of his, not only accepted for the great annual exhibition, but hung in the very best position. It is inspiring to read that, by dint of unflagging perseverance, he succeeded; a picture of his occupied the coveted position. The next year he was not so successful, but after a short interval *some work of his appeared on the line every year for close on half a century.* Some of his pictures, such as "The Derby Day," "The Railway Station," etc., not only drew such admiring crowds that they had to be protected by rails and policemen, but have fetched fabulous sums of money. The one secret of Frith's success seems to have been an infinite capacity for taking pains. That he produced pictures, which, both in theme and treatment were poor, he was the first to see and acknowledge; but his sense of failure or mortification only stirred him to do his work more thoroughly. He might have taken for his motto,—let me give it to every reader of—"A.1."—Russel Lowell's very trenchant words in the "Biglow Papers" :—

"Folks that worked thorough, was the ones that thrive,
But bad work follers ye ez long's ye live.
You can't git rid o't; jist ez sure ez sin,
It's ollers askin' to be done agin."

His own deliverance on the subject is worth your serious consideration.

Reynolds says: "You must have no dependence upon your own genius; if you have great talents, industry will improve them; if you have but moderate abilities, industry will supply the deficiency." Another writer says: "Genius means the power of taking great pains." I don't think either of those great men could have been quite serious, or could have intended their advice to be taken literally, but rather to enforce the absolute necessity of hard work. Would the severest application have produced a Raphael or a Hogarth? No. But neither Raphael nor Hogarth could have produced their immortal works without the exercise of painful industry. And when is the time for that exercise? In healthy youth—a time, alas! when temptation to idle pleasure is most difficult to resist. No artist, who has arrived at mature age, can look back at his early opportunities without a remorseful sense of his neglect of many of them. I can even accuse myself,—fool that I was,—of feeling contempt for the scrupulous attention insisted on by my master to details that seemed, to my youthful wisdom, to be absurdly unimportant. I know better now, and suffer justly for my folly."

The sum of the whole matter then, is, that to get on in any business or profession, genius is not needed; only enthusiasm, painstaking thoroughness, hard work, and determination not to be beaten. If your calling in life is honest, and you are married to it by the force of circumstances, do not spend your hours in idling, dreaming of some more congenial pursuit; do not waste your strength in fuming and fretting against it; you will only do yourselves irreparable injury. I read the other day of "a fine (?) young man," who hanged himself in his master's house near Paris. What was the matter with him? Nothing more nor less than utter dissatisfaction with his calling. On a memorandum he left behind, he bewailed his lot to his parents, and besought them to inscribe over his tombstone the words :—

"Born to be a man;
Died a grocer."

My young friends, make no mistake. A man can be as much a man in a grocer's shop as in a studio, in a pulpit, in a cabinet, or on a throne. With right aspirations, right principles, good, sound, common sense, that, and dogged perseverance, a young man can make the lowliest position the stepping-stone to a lofty pinnacle of worldly success, and commanding influence for good. Try, and while you are trying, remember that—

"The heights by great men reached and kept,
Were not attained by sudden flight;
But they, while their companions slept,
Were toiling upward in the night."

NOTES ON THE INTERNATIONAL SUNDAY SCHOOL LESSONS.

By Rev. J. H. Thorpe, M.A.

January 29th.

Peter confessing Christ.—*Matt.* 16. 13-28.
Golden Text: *Matt.* 10. 32.

Cæsarea Philippi—a town at the foot of Mount Libanus, called in the O.T. Laish or Dan—was built by Herod the Tetrarch, and was so called to distinguish it from Cæsarea on the Mediterranean. Notice valuable marginal notes in the R.V. on the 18th verse. It would be useless to enumerate the different interpretations given of ver. 18, of which there are at least five; we shall only say that the one which commends itself to us is that which regards the *true confession* of the God-man Christ Jesus as the rock on which Christ builds His Church.

The general lesson is about confessing Christ. But as confession should be always a thing of deliberation and solemnity, we begin by—

(1) *A Caution.*—It is quite possible for men to have good opinions of Christ which are not the right ones, high opinions which are not high enough. See ver. 14. There were many opinions abroad about Christ, they were all such as connected Him with revered and honourable names, but they were all wrong, and very much below the mark. So in our days, some think Christ a good man, but forget He is "God our Saviour;" some think He is a great Saviour, but that they are sinners too great for Him to save. Some regard Him as able to save all and any, but they have not trusted Him for themselves. All these are wrong. See here the object of a true ministry, to bring men to right views of Christ, which lead to a right confession of Him. See, further, that you must not take your opinions or thoughts of Christ from the world. Here you cannot set your watch by the town clock, but by the sun.

Note that the real test question for your religion is not what you think about Church government, Church Services, Church ministers, or Church going,—it is "what think you of Christ?" See, further, the interest Christ takes in the progress of His truth in the world. He inquired from His disciples how it fared with His truth; no doubt, in the first instance, to give them an opportunity to express their own thoughts, but we feel also to teach them this last lesson. Do you take a like interest?—pray that all in your town may have right thoughts of Jesus, and that He may be so preached that they will have no excuse if they have wrong ones.

(2) *A Confession.*—Its subject was "Jesus Christ Himself." "Thou art the Christ, the Son of the Living God." Christians are men who confess, not a bundle of doctrines or lines of thought, or peculiar practices, but a personal Saviour. A faith which lacks the personal Christ is like an organism without a heart. St. Paul preached, not "Christ Jesus and the Crucifixion," but "Christ Jesus and *Him* crucified." Remember, truth isolated from the person of Christ grows hard and cold. Religion is the bond between a personal sinner and a personal Saviour. See that yours is of this sort.

We now turn to another point. Briefly,—the Church of Rome claims authority over all churches on earth. It is plain from the N.T. that no permanent superiority was given to St. Peter by our Lord, for the same words were afterwards spoken to *all* (Matt. 18. 18). On a certain occasion James and John sought pre-eminence, and they not only aroused the indignation of their brethren, but were rebuked by our Lord (Matt. 20. 25). We read in Acts xv. the account of the first Council at Jerusalem. St. Peter did not preside. St. James did, and the judgment of the Council was pronounced by James, not by Peter. All this is very strange, if St. Peter was what the Church of Rome states. Stronger than all, is St. Peter's own description of himself in 1 Peter 5. 1-4, "Who am also an elder, etc."

DIVISIONS OF LESSON.

I. CONFESSING CHRIST. Vers. 13–19. What different people think about Christ. What do *we* think about Him? Duty of confessing Him. Sin and danger of secret discipleship. How to confess. Illustrate.

II. CHRIST'S CHURCH. Vers. 18, 19. Its Builder. Foundation. Chief stones. Laws. Privileges. Purposes.

III. CHRIST'S CRUCIFIXION. Ver. 21. A glimpse into the future. Christ's principal work. The glorious *finale*.

IV. CHRIST'S CONDEMNATION. Ver. 23. Sometimes Christians, when off guard, do Satan's work. Hasty words. Satan's temptations.

V. CROSS-CARRYING. Ver. 24. The laws of discipleship. Servant not greater than Master. Cross-discipline.

VI. COUNTING THE COST. Vers. 25–28. Cost of selfishness. Cost of gaining the world. The cost of a soul. The cost of God's reward.

Thoughts for

CAREFUL CONSIDERATION—

1st. If we confess Christ, He will confess us. Christ's actions regulated by ours. See Golden Text.

2nd. Are we safe on the Rock?

3rd. "No cross, no crown."

4th. What is our chief concern?

PETER CONFESSING CHRIST.

CÆSAREA PHILIPPI. "This ancient city occupies one of the most picturesque spots in Syria. A broad terrace on the mountain side looks out over the plain. Behind it rises in rugged peaks the southern ridge of Hermon, wooded to the summit."

Ver. 18. "Thou art Peter, and upon this rock I will build My Church." Some think this to mean Peter is the foundation to Christ's Church. Correct reading, "Thou art petros (a piece of rock), and upon this petra (a rock), I will build My Church." A play upon Peter's name. "Petra," the word for rock as applied to God. It was as though Christ said, "Thou art not only a noble piece of rock, thou art a noble piece of the true Rock. Thou hast been hewn from the Rock of Ages, and art hence meet to form a fundamental part of the living Temple, which I am about to rear on *Myself*. There was a grand mystical sense in which Peter was, as it were, a bit of Christ." (Morrison.)

The neighbourhood may have caused Christ thus to speak. Surrounded by the boldest, most picturesque, rocky scenery. A ruined castle near with immense foundations; here and there "cyclopean pieces of rock cut out and chiselled in immense symmetrical masses." "We meet with heathen temples all over these mountains" (Thomson.)

"Gates of hell." "Gate," the place of power and judgment; hence "powers of evil shall not prevail against the Church of Christ."

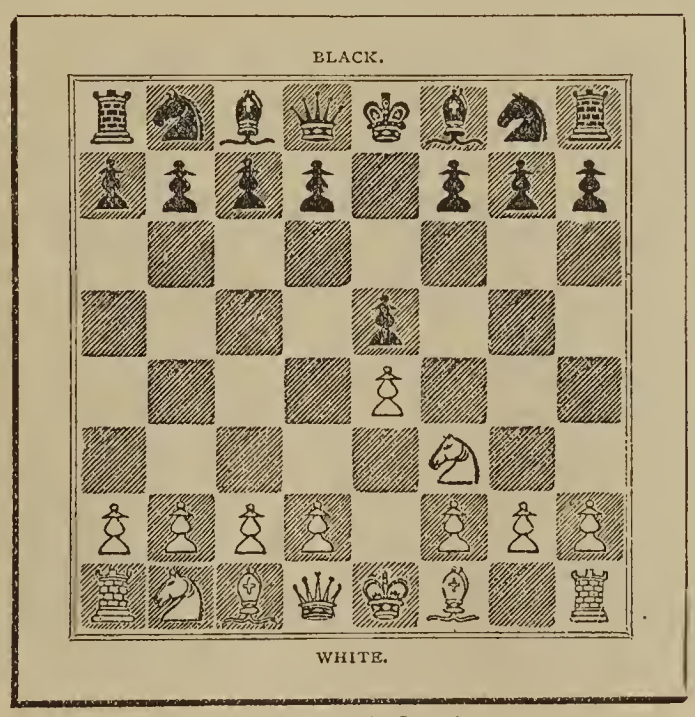
Ver. 19. "Keys of the kingdom." Peter was consequently a "steward of the house of God." At Pentecost he opened kingdom to the Jews, afterwards to Gentiles (Acts 10.). "This is not a personal and independent authority given to Peter and his supposed successors. It is simply this, that to His disciples Jesus commits the keys of the kingdom, which is the word of God."

Ver. 19. "Whatsoever thou shalt bind on earth, shall be bound in heaven." "Bind" and "loose," common phrases, meaning to *forbid* and *allow*. This power not confined to Peter. See Matt. 18. 18. No reference to absolution of sin; simply as steward, to regulate affairs of kingdom, and would be sanctioned by heaven, because first originated there. So intimate should all Christian workers be with the King, they will reflect His will.

THE Planet Venus and the Star of the Magi. Next week we shall give an interesting article by an able scientist on this subject, now attracting so much attention.

CHESS. (PART VIII.)

ILLUSTRATED POSITION, NO. VIII.



THE OPENINGS.—A good opening means a good game, consequently, the opening is one of the most important features to be studied. Play, in middle games, will come with practice, and a knowledge of end games may be acquired by examining some of the many problems that are published. The various ways of beginning a game are known by their several names. There is the King's Knight's Opening, King's Bishop's Opening, Queen's Knight's or Vienna Opening, Centre Gambit, King's Gambit, Queen's Gambit, Irregular Openings, etc.

These are again sub-divided. In the King's Knight's Opening we have Philidor's Defence, Petroff's Defence, the Two Knights' Defence, the Giuoco Piano, the Evan's Gambit (accepted and declined), Ruy Lopez Opening, Four Knights' Opening (which may also result from the Queen's Knight's Opening), Three Knights' Opening, Greco's Counter Gambit, Scotch Gambit, Damino Gambit, the Queen's Bishop's Pawn's Opening, and several less practised Openings.

In the King's Gambit, we have the King's Knight's and the King's Bishop's Gambit (regular and irregular); while under the former we have, besides the ordinary King's Knight's Gambit, the Allgaier Gambit, with its various sub-divisions, bearing the names Kieserisky, Thorold, Ourossoff, and Hampe; the Muzio, the Salvio, the Cunningham, and the Cochrane Gambits. In all these, the Gambit is accepted; there is, likewise, more than one form of the Gambit Declined.

The word Gambit is derived from an Italian term used in wrestling, where one player gives his opponent a temporary advantage, in order, the more successfully, to trip him up. The sacrifice of a man on the second, third, or fourth move, constitutes the Gambit; if the opposite player refuses to take the offered man, it is the Gambit Declined.

The varieties of Openings are mostly named after those players who first adopted them. The best, and usual, move for each player to make first is P to K4; it at once liberates Q and KB; then the first player (always White) may bring out a Kt. Our diagram, No. VIII., represents the position after the following moves:—

King's Knight's Opening.

KING'S KNIGHT'S OPENING.

WHITE.	BLACK.
1P to K4.	1P to K4.
2 Kt to KB3.	

The replies which Black has choice of making are: 2Kt to QB3, which admits of a number of other Openings to be treated of in our next; 2Kt to KB3, Petroff's Counter Attack, or Russian Defence; 2P to Q3, Philidor's Defence; 2P to Q4, Queen's Pawn Counter Gambit; and 2P to KB4, Greco's Counter Gambit.

(*To be continued.*)

CRISP CORRESPONDENCE.

[WE set apart this column as a medium of communication between our readers. Those who ask questions must not expect always to find the information in the next Number; but it will be supplied as soon as possible. We would specially ask those who have had reliable knowledge on any topic discussed in these columns, to communicate it promptly and generously for the help of others.—ED.]

INQUIRIES.

"Artist" would be glad to know if modelling or china clay can be hardened in any ordinary oven? If not, what is the cheapest way of getting it done?

"Sister Dora" asks if there are any Hospitals in London, or elsewhere (especially Children's Hospitals), where a probationer can be trained as sister-nurse without payment? We do not expect this could be done without probationer first going through the training and experience of an ordinary nurse. A variety of statistics as to Hospitals, age, and terms for admission, etc., etc., will be found in the September Number of OUR OWN GAZETTE for 1886.—ED.

"Musical."—I should be glad to get full information about "Musical Glasses," where they can be obtained, their cost, the best kind, etc., etc.

John F. C. asks: "How could I manage to gild the edges of books?" We thank you for your hearty words about our Paper. The Volume will (D.V.) be issued *yearly*, at the end of October.

Needlework.—Hesperides asks for title of best book of directions for *plain* Needlework; also one giving hints on Ambulance Work. We shall hope to reply in our next to your other most important questions. We appreciate sincerely your hearty efforts to gain subscribers to our Paper.

ANSWERS.

E.A.—The frontispiece for each monthly part and the index for the yearly volume of "A.1." will be issued at the end of the year, for the convenience of those who wish to bind their own numbers of "A.1." Your letter was most welcome, but we should have liked your name and address. Persevere in prayer, and surely the answer will be given.

"Amicus."—Ferns planted in a wardian case, should be very slightly watered once a week.

"Hearty."—The best plan for gold fish is to have a little weed growing in the globe in which they are kept, and also a few water snails, when the fish will help themselves to what they require. If food is given them, it should not be more than once a week, at the oftenest, and the quantity should be exceedingly small.

E.M.—To conquer stammering, observe the following suggestions:—

Practise speaking very slowly, very deliberately, very evenly—and as often as practicable. 2nd, Stammering is frequently occasioned by nervousness; therefore give up smoking and the use of intoxicants, both of which are prejudicial in this direction; even tea and coffee should be taken with extreme moderation; cocoa and chocolate are better. Exercise, fresh air, tepid sponge bath every morning will hasten cure, which, on the other hand, is retarded by rich, indigestible diet. Our correspondent ("Hygiene") offers to give any further advice in his power, if E.M. will send his address to our Office.

Skeleton Leaves.—Dissolve four ounces of common washing soda in a quart of boiling water, then add two ounces of slacked quicklime, and boil for fifteen minutes. Allow this to cool; then pour off all the clear liquor into a clean sauce-pan. When the solution is at boiling point, place the leaves carefully in the pan, and boil the whole together for an hour. Add boiling water, to replace that lost by evaporation. The epidermis and parenchyma of some leaves will more readily separate than others. A good test is to try the leaves, after they have been gently boiling for an hour, and if the cellular matter does not easily rub off betwixt the finger and thumb beneath cold water, boil them a little longer. When all the matter has been rubbed off very gently, they will be a dirty white. To bleach them, make a solution of a large teaspoonful of chloride of lime to a quart of water, add a few drops of vinegar. Fifteen minutes is time enough for the leaves to remain in the bleaching liquor; if left longer, they become brittle. Dry between blotting paper after they have been bleached. We thank E. L. R., who sends the above, for his hearty co-operation in the circulation of our Paper.

Young Men's Bible Class.—The Teacher of a Class asks us to insert a request that many fellow-workers will plead for such a blessing on his work, that every Member of the Class may be led to Christ.

Railway Bookstalls.—So many friends are anxious to promote the circulation of our Paper. Will they kindly remember that one of the *most* effectual ways of doing so is to make a point of systematically inquiring for—"A.1."—at the Railway Bookstall, when starting on a journey, and to give away the copy thus purchased to some fellow-traveller. Such an effort will cost *one penny*, but it will tell most certainly upon our circulation.

Monthly Parts.—We should be very glad to be able to place these on the Tables of Waiting-Rooms all over the kingdom. We will send one of our Monthly Parts, post free, through the year, to any Station desired, on receipt of Postal Order for 5s.

Hesperides.—We would gladly go fully into your question, but that it was taken up earnestly in the Feb. number of OUR OWN GAZETTE, 1886, to which we refer you. Also to a little book of great value, entitled, "Conformity to the World," by Canon Hoare, Tunbridge Wells. We think there is great force in your argument, and would certainly say: Do not try how far from Jesus you may walk to catch some gleams of His presence, but how *near* you may walk with God, and thus realize your Father's smile and blessing. Thanks for your enthusiasm about our Paper.

CLOUDS AND MOSSES.

LESSONS LEARNED OVERHEAD AND UNDERFOOT AMONGST THE WELSH HILLS.

I THINK that you may like to have some of the lessons which were taught me during a week in North Wales, lessons by teachers of which we think too little—clouds and mosses.

No skies in England are ever alike for two days together. Did you ever think of the blessing we enjoy in that endless picture-gallery of God? Perhaps no one would, thoroughly, who has not lived under the hard blue monotony of a southern sky, without clouds; and certainly I never appreciated them as I did when living among them in the hills. "Can any understand the spreadings of the clouds?" asked Elihu. "With clouds He covereth the light; and commandeth it not to shine by the cloud that cometh betwixt" (Job 36. 29, 32). That was my first cloud-lesson. My husband and I were riding up the steep, stony slopes of Snowdon. We left radiant sunshine in the valley; we watched the light fleeces softly moving over the peaks above us. Slopes of coloured mosses and shadows of noble mountains made our way wondrously beautiful; and all at once God's snowy messenger fell round us like a silvery haze, and we rode into a dense, icy-cold mist—not a step to be seen ten yards off, not a ray of light through. We knew what the disciples felt when "they feared as they entered into the cloud." That is the time to trust the guide, or the mountain-top would never be reached; that is the time to keep to the narrow path, for deadly precipices slant on either hand. Just like that, sometimes, in life, unexpectedly, not by our own fault, God's clouds come down. We were climbing patiently; we had not stopped to rest on the hill Difficulty; but the icy breath of pain, or disappointment, or indefinite heartache, suddenly blotted out all the prospect and the sunshine. Never mind, the Guide is near; you can always see the next step, and each one leads you higher.

Another day we saw the clouds at play among the Festiniog hills. How radiantly white! how lightly dancing! How they rolled their snowy skirts backwards and forwards! To us who watched them from the valley, how exquisitely fair, as they floated to and fro! And so, without clouds, life itself would be a monotonous level. There cannot be bright light without shadow, and the hills are beautified by their clouds. A life without clouds would be a *selfish* life, and there is no beauty in that.

Let us take delight in remembering that clouds only seem solid *from below*. Walls they seem sometimes—thick walls that we could not possibly get through; but if we climb patiently, we find that they are only fogs, after all. Only fogs! How often we make clouds for ourselves by making fogs! By puzzling ourselves with doubts and fears, and a million tiny drops of discouragement and grumbling, not one of them worth looking at—and there is a cloud! Let us be brave, and dash the fogs from our hearts, when we are tempted to wrap them round us, by opening those grumbling, doubting hearts to the rays of the Sun of Righteousness, shining all the time.

After all, what *is* a real cloud?

> "The little flocks of cloud are wandering
> In the blue, vacant prairies of the noon.
> We call them anything but what they are,—
> White fleeces, mantles of the angels dropped,
> Mountains of mist, or ships, or pyramids,—
> And, weaving Fancy's opal texture thus,
> Pass over their eternal dignity
> In being God's former and latter Rain."

Ah, yes! without clouds, no vegetation. Our green earth would die into barrenness; we, and all that live on it, would soon depart, if it were not for these clouds. Would our souls fare any better without *their* clouds? Surely not.

Did you ever see a glorious sunrise or sunset without clouds? How could the firmament become a fairy palace of rosy splendour, if the radiance of God's fingers had no draperies to touch into colour, fairer than any painter ever knew? And without clouds there could be no rainbow—God's covenant pledge. Yes, thank the Lord, there *are* two places where there are rainbows without clouds. One I have seen; the other, I pray that we may yet see. The earthly throne of the cloudless rainbow is on the spray of the waterfall—flickering, dancing, dying as the cascade leaps and sinks. The other is round about the great white throne, "in sight like unto an emerald," where the tears of earth are illuminated by the Sun that never sets, and transfigured into a perfect covenant-pledge—a covenant *fulfilled* for ever and ever. But you will be tired of this long cloud-lesson; we will take a short one now from the Welsh mosses.

I shall never forget one Sunday afternoon walk, when we climbed up a tortuous path in the Bettws woods to the moorland, and after a mile of desolate barrenness, came suddenly on the utter calm and silver beauty of the lonely Elsi Lake. Not a sound echoed, not a bird flew there, but all around stretched the chains of mountains, and the air was sweet with the "gale" on which we trod. We saw three kinds of blossom only—one bush of the brilliant North country rose, and below, in the marsh by the lake, beds of golden asphodel and ruby sundews. It was among the latter that we found our teachers, the mosses. There they hid, grey, and olive, and silvery green, club, and feather, and tree-like fans,—nothing very remarkable at first sight, but in themselves exquisitely fashioned, and ministers of an infinite good.

And first, the mosses and lichens hide the bare places on the mountain side; it is they who make the grey rocks beautiful. I have seen a granite stone so painted by them as to look jewelled. Dear friends, do our little unnoticed words and deeds of hourly life act in this way on its bare, unlovely places? Are not the "soft answer," the ready smile, the tiny service, like the mosses painting the dull day? Can we not often hide the unloveliness of others by our own sweet acceptance of their little worries and roughnesses? And do we care to do it, when we know that we can?

Let us follow the greater ministry of the mosses. It was a burning day as I stood by the Elsi Lake, but cool and fresh when I plunged my hand among the mosses, for they had made the growth of higher plants possible. A drop of rain falls upon a bare rock, and it dries up,—nothing is visibly the better for it; but if it finds a fringe of moss there, ever so delicate, it is caught by the tiny fingers, and another drop joins it, till there are enough to roll down the stone and soak into the earth below, which is covered with the moss cushions. There the precious "rain of God's strength" is hidden; there, in their turn, the mosses die, and by their death is formed the soil which at last is fit for the coming of the scarlet sundews and the golden asphodels, and the rose-pink bog pimpernels, and the azure, ivy-leaved campanula, as I have seen them growing together, where all would have been desolation without the nourishing mosses.

Are there any flowers making life sweeter and gladder for others, that are due to our patient little services, the daily losses and deaths of *self?* But the rain returns, the bog becomes overcharged, and among the moss stems a tiny rill finds its way, saved by them from being licked up by the sunbeams; and there are many more that join it, and presently they grow into a stream, and the stream into a river, like the Conway, that rushes near Bettws, coming from the Elsi Lake. I know that there is no river without springs, but I know also that the waters are fed by the mountain torrents, which have their birthplace among the mosses. There is no saying what the little deeds that we never think of may do towards swelling the "river of God, which is full of water," the river of life, "the streams whereof shall make glad the city of God." Think of it, you who are discouraged sometimes, and fancy that little things for Him are really not worth while. Do you say, "No one notices what I give up; no one cares for my trying to be cheerful, when I am tired?" Yet by that you may have sweetened the day; the little kind deed may have died, like the hidden moss, but it has furnished the soil for a better cheer. Remember the cup of cold water, and the delicate fringes of the mountain stone. I saw acres of the bare shoulders of Snowdon beautified with every tinge of gold, brown, olive, sienna, till they shone in the sunshine like embroidered robes. I have beside me now a bunch of radiant green, that was plucked from among them thirteen weeks ago, living in water still, and as I look at it, I remember who it was that said, "Inasmuch as ye have done (good) unto the least of these My brethren, ye have done it unto Me."

Wolf Hunting on the Russian Steppes.

CHAPTER XXI.

A SHIPWRECK AT ST. PAUL'S.

THE village of St. Paul's, near which the *Oonalaska* cast anchor next day, was, at the date of our tale, not yet taken possession of by civilised Americans. It was still the abode of misery, filth, and squalor, to say nothing of the curse of intemperance. The Russian traders were far from particular,—they found it, indeed, rather an advantage to deal and barter with poor drunken men,—so they had taught the Aleuts to brew a terribly intoxicating kind of beer, called quess, and even supplied them with strange liquor. All this is greatly changed now, and the St. Paulites have log or frame houses, good stores, a church and town hall, or pleasure house, and even better clothes than they used to wear.

The arrival of the *Oonalaska* was a sign for general rejoicing amongst the natives. A big, green-painted Russian barque lay in a bay, but she was evidently considered nothing new, and hardly had the *Oona's* anchor gone rattling into the sea, ere crowds of skin-covered bidarkies came round, and of course Captain Boyd good-naturedly permitted the most of their owners to come on board. They knew the boat from the quarter-deck, that was evident. By-and-by they would be ready enough to effect barters and sales with the men, but they would deal with the officers first and foremost. They had skins of fur-seals and sea-otters, and they could fetch the flesh of young sea-lions before many days, and blubber for oil in abundance.

They were full of business. What would the white men buy or barter? and what would they give away?

Had the white men any butter, had they sugar, had they sweet biscuits, had they tea, had they tobacco? They named the various articles, it seems, as they valued them. Lastly, what had they in the shape of shawls?

The *Oonalaska's* people had a little of everything, and they had plenty of money as well. English or American money it was, certainly, but yonder lay the Russian barque, her men could sell anything for English silver.

Chips was a useful member of society now. He was interpreter, and faithfully performed his duties; moreover, the old man was dearly beloved by the islanders, nearly all of whom knew him. Right proud was old Chips when he was presented with several skins of the sea-otter. Half-cured they were, too. He and Turlough O'Brady spent a forenoon rubbing and scraping the insides, and softening them. Then they were taken aft by Chips, and presented to Katie. Valuable they were indeed, but he would hardly listen to thanks. They were of no use to him, he told Katie, adding gallantly that to see her admire them and smooth them did him more good than meat or drink.

If Katie Graves did not very quickly learn enough about Arctic seas, Arctic life and manners, it was not for want of asking questions of her mentor, Chips. These Arctic seas, with their numerous islands, were all eloquent witnesses to him of bygone adventures. Often, as his eye roamed round the horizon, he would point out to Katie something especially interesting. Strange, wild stories had he to tell her of his adventures, not only in these regions, but in Greenland itself. So, whenever the wilful young lady found her way to the half-deck to read to the men, she was sure to ask Chips—childlike—to tell her a story, as soon as she had finished.

"I was shipwrecked on this very island one year," he began once, then stopped.

"Oh! tell us, Chips. Do light your pipes, men. How, Chips?"

"Oh, it bean't much, missie."

"Did it blow hard?"

"Blow! Aye, Miss Katie, and a wild night it was in August. Dark? Except for the wash of the waves when we struck beach, and the foam of the breaking water, you couldn't have told stem from stern. No, we hadn't run ashore ten minutes, before we began to break up in good earnest.

"The masts, you see, had gone first, the decks swept, and bulwarks gone. We were broadside on too, for a current was running athwart the shore like the race of a mill.

"No, missie, we never did expect to see the sunrise. And few of us did. You hear talk of life-boats doing great things at home; but where in all the world, except here, would you find men venture to sea in such a night as that was, in skiffs of skin, to save lives from a shipwrecked barque?

"But that is what they did, and rescued every poor soul they found clinging to bolt or stump, or broken timbers."

"And yet," said Katie, "they call these poor creatures savages."

"I've been amongst real savages, Miss Katie, down south, but they don't dwell here. Rough they look. Roughly they do dress, to be sure, but la! bless you, missie, my own mother couldn't have been kinder to me that night than these honest souls. No wonder I like them. No wonder I've called them angels."

"Was it a long, dreary winter?"

"Well, missie, it were, and it weren't. There were no balls or parties, and no theayters, and no fine lighted shops to look in at. But though I was young, I didn't miss them much. 'Sides, missie, the wind blew steadily on all the dark winter. 'Twould have blown the strongest man in the world right clean off the island, if he hadn't 'a done as we did when we went out for a moonlight walk."

"What was that, Chips?"

"Walked on all fours, missie."

"Did you go hunting?"

"Hunting! Why, my dear young lady, there wasn't a living thing left on the island to hunt. The seals had all gone off. Bears there were none. The foxes had all gone to sleep, and the very cats had got tame and come indoors."

"Was it very cold, Chips?"

"Cold isn't a name for it, out o' doors, I means; but inside our hut we had a fire o' driftwood and walrus oil; we were just as cosy as a teapot with its nightcap on. We'd made the hut so snug, too, you would have laughed. The walls was all a-hung wi' fur skins, even the ceilin' and the sofas and floors heaped up wi' them. No bird ever lined its nest better than we lined our hut."

"And what had you got to eat?"

"Oh, we'd saved a lot o' stuff, biscuits and pork, and beef and beans. Then we had dried salmon and sea-lion flesh."

"'Sea-lion flesh'!"

"Ah! and a dainty morsel it is, missie."

"And had you books to read?"

"We had a few. And we talked, and spun yarns, and smoked. Aye, we did smoke a bit!"

"I can't blame you, Chips."

"Well, then we had tea,—tons of it."

"'Tons of it'?"

"Aye, for the good folks here drink it all the winter, maybe a gallon or two a day, and so did we. So, you see, the house was the best place, when the wind was a-howlin' round."

"I can well believe you were pretty well off," said Katie.

"Couldn't have been shipwrecked in a better place, I assure ye, missie; and mind you, we could do a deal o' sleep."

"Like the bears in winter?"

"Like everything in these regions. Why, missie, if you ask some o' these Aleuts where the seals go all the winter, they'll tell you they bore themselves holes in the ice with their warm breath and their bits o' flippers, and crawl in, just as me or my mates crawl into our bunks, and sleep till Spring-time comes. And mind you, missie, I more'n half believe them."

CHAPTER XXII.

ON WALRUS ISLE.

"MR. SILK." The voice was Katie's. Jack's face lit up, as scenery in summer does, when, after a thunder-storm, the sun peeps out from a rift of blue.

"Yes, Miss Katie."

"Is it not nearly time we were getting up another picnic?"

"And," added Miss Graves, "my sailor boy is an excellent caterer."

Jack looked up at the skylight. Not a ray of sunshine came in through there. The crimson-coloured glass looked more like the reflection of a London fire than anything else.

"D'ye think, sir, the fog will clear?"

"I haven't a notion," replied Captain Boyd; "better ask Chips."

"All right. Are the boats at our command, sir?"

"Yes, my boy, and the ship too. But remember—in fact, we must all remember—it is getting on in June; we must not dawdle too long round these islands, but see all we can—and then, hurrah! for the North."

"Hurrah!" cried Jack, jumping up, and preparing to go on deck. "I'll go and see Chips at once." And next minute he stood in earnest confab with Chips beside the winch.

The roar of the seals still went on, and it was evidently going to be a busy season with the natives. Some of these, however, found time to come on board, and even as Jack and Chips were talking, one came looming out of the fog, and called Chips his "very good friend"—about all the English he was master of.

"This is the very man we want for our picnic, sir," said Chips.

"Well, then, I'll leave you and him together; you know what I said, and I suppose you can manage it. The hut you build will suit your friend, perhaps, when we are done with it."

"Now, Captain Boyd," said Jack, "I've made my arrangements, and Mr. Godfrey here says he would like to go on shore with Chips, and superintend the erection of our picnic hut."

"All right. You won't mind being left alone on this isle of St. Paul's for a day or two, Mr. Godfrey?"

"I wouldn't mind," said Godfrey, "if you left me here for good and all."

There was more truth in Godfrey's words than the captain and Jack believed.

"Well, take a few hands with you, and if we are long gone, let them employ their time getting skins. The skipper of the Russian barque says he has no objection."

Godfrey did not take long to choose his men—five men of the working crew, with Turlough O'Brady and the Boy Bates to carry the camera, and Chips as second in command.

One whaler held all, including their tools and provisions.

Away they went with a parting cheer, and in half a minute more had disappeared.

Captain Boyd had retained the services of a couple of Aleuts as pilots, and steam was now got up. In less than an hour the *Oonalaska* was moving steadily away eastwards, with a point or two of north in it. They steamed slowly, so it was two hours before they reached their destination, and heard the surf beating on the strange rock called Walrus Isle, mingling with the incessant cries of the myriad birds, and the occasional short, grunting cry of the bull walruses.

Just then, much to every one's satisfaction, the fog began to lift, or, at all events, it got thinner, and the sun now and then shimmered through the clouds.

There was sufficient light, at all events, to see the island and the birds, and to land with safety.

Two boats shot silently away from the vessel's side, one under the command of the redoubtable Jack, and having, as passengers, the ladies, inclusive of Sally the maid. Sally had expressed a desire to see this wonderful island, that she had heard so much talk about, so as to be able to tell her "darter in Ameriky," when she found her, about some of the strange sights she had witnessed.

The island was very small, simply a long flat reef, in fact, composed of volcanic rocks, and one which has ere now proved a sadly "uncanny" one to many a fog-enshrouded mariner.

The other whaler contained the men folks, while, at the bows of each, stood an Aleut with uplifted hand, to signal to the coxswain the direction, and, if need be, to check the speed. The ship did not anchor, but lay out in the deep, dark water, gently rising and falling with the roll of the seas. The landing was far from easy, Jack handing the ladies up, not as if he stood on the pier of some seaside watering-place, but rather as if helping them up the sides of an Egyptian pyramid.

Of course Sally was no sooner on shore, than she must lift up her eyes in fear and astonishment, with many a gasp and many a sigh, and many a startled "Oh!"

"If my darter could only see this!" was her almost constant ejaculation.

Nat, senior, escorted his sister, Jack took Katie, and young Nat was told off to see to the safety of old Sally, a duty which he most gladly and gallantly performed.

But ere long there was matter of astonishment for all and everybody. As soon as they stood in groups on the plateau, which is mostly of bare rocks sparsely covered in some parts with hardy grasses, the sight around, to say nothing of the sound, was startling,—indescribable. Certainly no such visitors had been expected, and the birds were not prepared to receive them. They were in myriads,—if there be any exact meaning attached to the word,—in thousands, in tens of thousands; they almost darkened the air, and hid the sea, in their screaming, wheeling, whirling flight, while the rustling of their wings alone would have been deafening, had the birds themselves been silent. It was for a time almost impossible to stand erect among them. The birds had very evidently intended to try to hurl the intruders over the cliffs into the sea, for the sharks to eat, but they could not make up their minds as to the exact way of commencing. They not only filled the air, but occupied every available spot of the surface of the island, building their nests, scraping holes for nests, and hatching or guarding their eggs. In some places they were in rows or regiments, in others, scattered thickly over the ground, or even piled up in heaps. And they were of all sorts and sizes, from the guillemots, tall and stately, or the old-fashioned-faced puffins, or the erect white gulls and cormorants, to the pretty kittywakes and other tiny gulls, and the tiny snow-sparrow, or smaller auk. It was a puzzle that few could have solved, to tell how they knew their own nests, or whether they did not often squat or straddle by mistake over those of their neighbours.

At a signal from the Aleuts, our party remained perfectly still, and, after a time, some sort of order was restored; then many little amusing scenes were noticed.

Want of room appeared to be the chief drawback to the comfort and happiness of these birds. Even the smallest of them did not for a moment hesitate to viciously peck the heels or legs of an encroaching Harry, or guillemot. "Can't you see where you're going?" the little one would seem to say. "Stand off, awkward. You're crowding me, and squashing my eggs."

Usually the big ones took this in good part, but not always, for sometimes fierce fights ensued, during which the eggs of the Harries got pitched about anyhow, and the marvel was, so few were broken.

But there were more wonders yet to see; for, as they were gazing amusedly at the little domestic disturbances among the birds, a great walrus blew his fog-horn. Instantly the Aleuts set out towards the sea on the other side, and all followed. The snorting and bellowing got louder as they approached the cliffs, and lo! just down there, beneath them, where the low waves went swilling over the black, flat rocks, leaving them bare as they receded, they beheld a school of gigantic walruses taking the shore to rest and sleep. They seemed to be under the charge of a chief, bigger than any of the rest—bigger and uglier. And all admitted, after they got safe on board, that more unwieldy and unshapely brutes could hardly be imagined. The chief grunted loudest, but the rest put in a good bass. It was not a pretty chorus, and somewhat melancholy withal, though I daresay it was very satisfactory to themselves.

The chief took the easiest and flattest position, so that he could neither slide forward nor aft. The others scrambled down anywhere and anyhow, lying on their stomachs, their sides, and as often as not pillowing their heads on their neighbours' bodies. They looked good-natured, however, but hairless and unsightly.

Katie thought they did not exhibit much grace of movement, and as for the line of beauty, I believe an artist would have found it wanting. The shoulders are fearfully massive, the head more flat than round, the bristly upper lip protrusive, and the eyes goggle, and liquid, and round.

There were at least a hundred of these great beasts. When the chief raised his enormous front, Sally screamed louder than the cormorants.

One of the Aleuts whispered to Jack, and he raised his gun in the air and fired.

The scene was changed, and such a change! Those mighty monsters had rolled in, as it were, with the waves, and settled down to sleep, hardly noticing our adventurers, who, by the way, were to leeward of them; but now every head was thrown up, the eyes rolled for a moment, glared, in fact,—it was something to see and dream about, and an ugly dream it would be—there was one long, confused, blowing, snorting roar, and in a minute more, hustling, tumbling, rolling, falling, standing not on the order of their going, the whole herd of unsightly brutes had left the cliffs, and gone dashing out to sea.

Our party embarked with all speed, and pulled off towards the ship, the birds still shrieking around their heads as midges in a summer evening, at home in old England.

"Well," said Nat, senior, laughing, as soon as they all got below to the saloon, "that was a new sensation, anyhow!"

From Walrus Island to the Isle of St. George is by no means a very long voyage, but the summer's day had closed in, dark and stormy, before they reached it.

The glass had gone down rapidly, and there was every appearance of a wild night. The sky was comparatively clear. Indeed, the sun had gone down among clouds so transcendently glowing and beautiful, that the genius of a Turner could not have done justice to them. It was a horizon of fiery reds and flaming golds and purples, and the sea, all between the starboard quarter and this glorious west, had borrowed its splendour of colour and tints, and moved and heaved and revelled in it. The island itself was bathed in a lovely dreamy light, which, however, faded away soon after sunset, till it stood out bold, black, and by no means inviting.

But the wind blew dead ahead, increasing every minute in force, though as yet there were no rolling waves, only little jerky, spitting seas, that gave the vessel anything but a certain or easy motion, and which, small though they were, hit or split on her bows with tremendous force. The spray rose up at each side of the bowsprit like fountains, and was carried right abaft the funnel.

Long before the ship reached her anchorage, the birds came out to meet her, in their thousands, tacking and wheeling around her, dipping and plunging into the seas, and screaming in all the exuberance of their wild delight.

The Aleuts on board proved good pilots. Guided, perhaps, by the formation of the rugged hills, dim and dismal-looking as they were, and by an occasional light that flitted about on shore, they brought the vessel to her anchorage, in the open roadstead.

(*To be continued.*)

OUR MONTHLY TALK.

BY THE EDITOR.

"SPEAK."

"KNOW ye that a great man and a prince has fallen" asleep "in Israel?" The familiar face, so full of calm and power, of the Earl of Cavan is no longer seen amongst us. For a full half-century, his life had been yielded to the service of Christ; for the last thirty years, powerfully impelled by Jer. 23. 28, he was untiring in his efforts to draw others under the power of the same Divine Master. "Speak—speak," was the command he delighted to obey. But this voice is now hushed. May the Spirit of the Living God stir many a heart by the same sympathetic word.

Young men, "*speak!*" These are no days in which to be silent. When our Master's name is dishonoured in our presence, remember, "silence gives consent," therefore "*speak;*" speak right out, although, maybe, you stand and speak alone.

When the irreverent jest passes round, or a contemptuous slight on God's Word, "speak," keep not silence. Know you not there may be present timid souls, whose quickened conscience wants but the courage of strong example, and they will speak also? Thus there shall rally to the defence and upholding of God's truth, a noble band, that but for your uplifted voice, should yet have remained "His *hidden* ones."

When the path of duty takes you into the society of the worldly and careless, remember that aching hearts are there,—thirsting souls, whose aching void the world can never, never fill,—immortal souls, pressing with terrific speed down to an unsearched Eternity. Therefore "speak," "speak My Word faithfully."

And when so-called "advanced views" are propounded, which, under the specious guise of "progress," are sapping the very foundations of God's truth, by openly denying, or quietly ignoring the substitutionary and atoning work of the Lord Jesus Christ, let men and women, redeemed with the precious Blood of Christ, lift up their voice and cry aloud. "Progress" forsooth! but progress on the Down Grade.

Yes! These are no days for silence. "Let every man be fully persuaded in his own mind" first, and then, with the heroic courage of conviction, let him "speak."

Amid the deepening darkness of these last days, when men who should be standard-bearers of the Cross are departing from the simplicity of the truth as it is in Jesus, when the faith and love of many are drifting from their moorings, God indeed needs His witnesses,—men of faith, courage, and undaunted zeal, in whose breasts burns the martyr-spirit of apostolic days, whose trumpet shall give no uncertain sound. We may be branded as narrow and dogmatic. So be it; we do not covet to be broader than the Truth of God, nor to water down the terms of God's salvation, and of judgment to come, until they have lost all power either to allure or alarm.

Friends, let us study God's Word closely, prayerfully, intelligently; and then, be prepared steadfastly to contend for the faith. So many are drifting, drifting, imperceptibly it may be, but surely drifting. Let us see that *our* anchorage is "sure and steadfast."

What a grand theme is the story of the Cross! one before which the loftiest intellects have bowed with profoundest reverence; and withal so simple, that it meets the capacity of the most unlearned.

But, beloved friends, we can never take our stand openly and avowedly on the side of Christ, until there have been heart dealings with, and a heart surrender to Christ. In most men's lives, there is that memorable moment of decision, when "thine are we, David, and on thy side, thou son of Jesse," symbolically expresses our life-resolve. For long years, maybe, He had called, but we had wavered; a season of dark and dismal doubt had followed, when every foothold seemed well-nigh swept away, and when the world had gathered with increasing force around our heart and life. We were as a barque at the mercy of the storm,—no master, no helm. Thus we drifted, drifted (perhaps some of you are drifting still) on towards the rockbound shore of inevitable doom.

We *talked* of happiness, but we knew it not. The sun of prosperous circumstances beamed upon our path; but no light irradiated the dark, cold chamber of our heart. We turned to intellectual society and literary pursuits; but they could not hush the inward voice of conscience, that, in our still and lonely hours, told of guilt uncovered, and eternity unprepared for. Oh, what days, months, years of careless indifference, or of mental anguish!

We pause not here to tell of the mystery of His love, its patient, long-enduring pursuit, until we could resist no longer.

A Saviour's atoning work was our refuge; we fled to the shelter of His cleansing blood; we accepted the Divine assurance of pardon; and peace and joy were ours. Into the bitter waters of our own natural condition, there had been cast the tree of healing, and it was Marah no longer; for instead, there came welling up the living water. And, since then, what has been the record? Not always prosperous circumstances; not exemption from trial; not the absence of severe disappointment; no, not always happiness, but something apart from and independent of all these—deep, unalloyed, unspeakable joy.

I passed into a crowded thoroughfare in the City a few days since, and on my ear fell the liquid, rippling notes of an exquisite little songster. It was so unnatural in such surroundings; it seemed as if the song belonged to another scene. I looked up, and around, and there, in a tiny cage, on the wall of a public-house, and amid the grimy atmosphere of our smoky London, chirped my feathered friend—lovely image of the Christian's joy, bubbling up and overflowing, in spite of the most adverse surroundings.

Do you covet this new life, with its unfailing joy?

"Wilt thou be made whole?" Is your will surrendered, so that you are ready to come down to that one platform, where alone Christ can meet and save you? the platform of acknowledged guilt and need. Thus, trusting alone in the infinite value of His precious blood, you shall hear, in your inmost soul, His own Divine assurance, "Thy sins *are* forgiven, go in peace." Then your feet will have entered the path to the kingdom; and as to the supplies for that new life, let all thy wants lie upon Him; His infinite resources are all at the command of your faith, and the "just shall live by faith."

Again acknowledging the appreciative words which reach me from all quarters, and which are heartily welcomed,

Believe me,

Yours most truly,

M. J. MENZIES.

February, 1888.

TOLD IN A LINE.

THE examination of our Literary Competition is going forward with great vigour, but it *has* been a task! Our Examiners have had their hands more than full.

Our "Acrostic Competition" remains open until February 29th, and is evidently stimulating keen thought.

The "£100 Competition" closes to-day. We would almost give £100 not to have to undertake the examination of the paragraphs!

If our readers are as entertained presently over the results of the Spelling Chase Papers, as we are just now with their examination, they will pass a vote of thanks to us for providing them with so much profitable recreation. Such absurdly ingenious mistakes!

Our Crisp Correspondence Column is evidently appreciated, and its interest to our readers grows in proportion. We welcome both questions and suggestions.

—"A. 1."— We heartily acknowledge the valuable co-operation which so many of our Y.M.C.A. Secretaries have been giving, by introducing the Weekly to their Members. Young as it is, it has already secured a large circulation. Weekly reading is what is wanted. Specimen parcels free! Good for advertising meetings.

Scriptural Charade, Dec. 24th, page 127.
Answer—"ONION."

Y.M.C.A. ITEMS.

Camden Town.—We congratulate the Camden Town Association on its fine new building, costing £3,200, and containing a handsome Lecture Hall, and Reading Room, and Secretary's Office on the ground floor, and Parlour and smaller Hall, Caretaker's apartment, etc., above. From its fine situation, it is likely to be a grand centre of work amongst the hundreds of young men who daily pass from Holloway and Regent's Park.

Darlington has also taken a good step ahead in the opening of its new Rooms in Bondgate. We wish the Workers an increase of blessing this New Year.

HALF-AND-HALF.

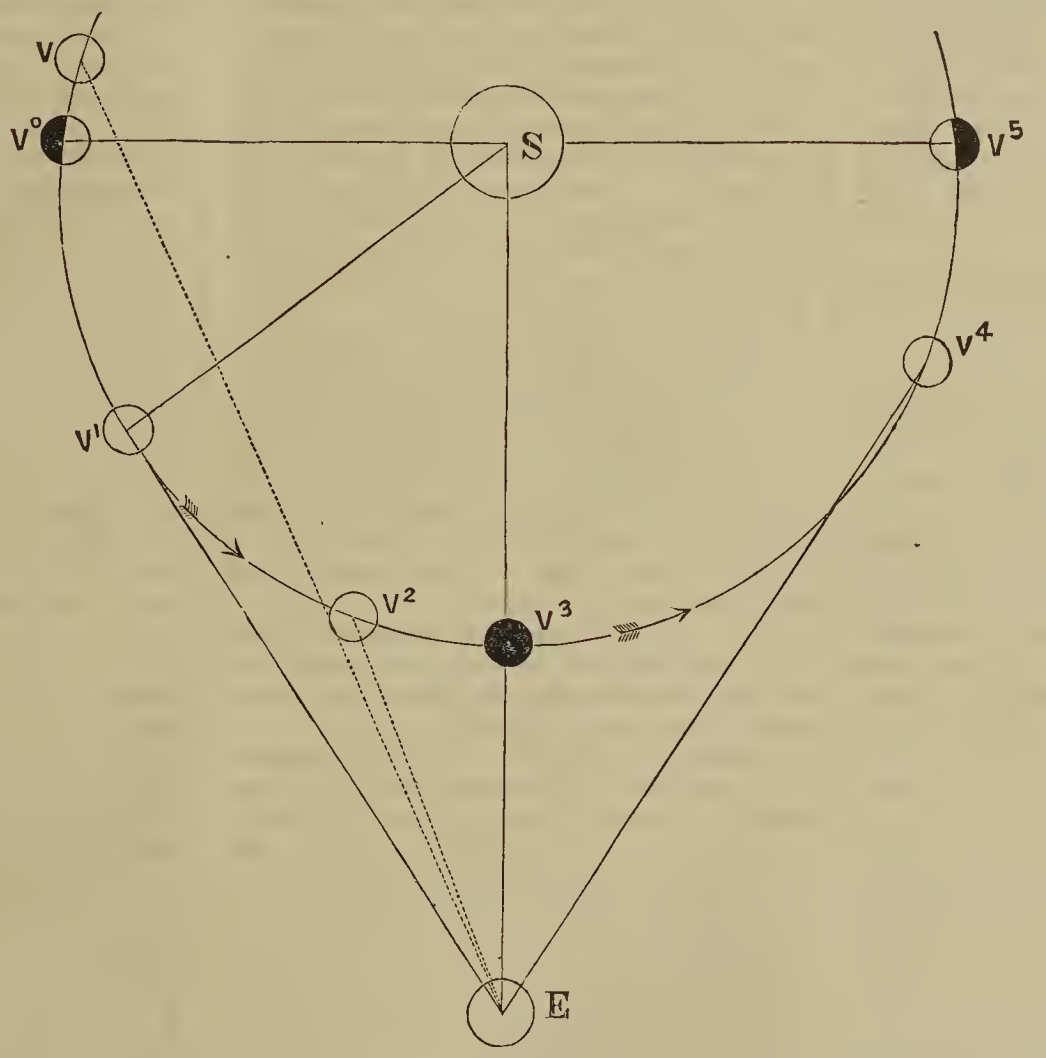
WHEN you hear of a shipwreck, you generally hear of so many being saved, and of so many lost; but you never hear of any being *half-saved* or *half-lost*. Those who were on board are either alive or dead. There is no half-work about it.

But there are hundreds of professing Christian people in the voyage of life, who, if you go to them and ask, "Are you saved?" will reply, "I do not know;" or, they will seek to evade the question by indirect replies. If you say, "Are you lost?" they will at once say, "I hope I am not so bad as that." If asked again, "Are you saved or lost?" they try to take refuge in the supposition that they are a kind of half-and-half, hoping, and perhaps wishing, but thinking it presumption to reckon themselves amongst the saved.

But the word of God recognises no such position; with God it is either saved or lost, life or death, heaven or hell.

God does not deal in half-and-half measures. His is a whole and complete salvation, for Christ's is a "finished" work.

THE PLANET VENUS AND THE STAR OF THE MAGI.



By R. N.

MOST readers of "A.1." probably know by this time that the planet Venus has been receiving more than a usual amount of attention during the last few weeks. How it comes to pass, I do not know, but it seems that an idea has recently obtained amongst some people, that the star of the Magi has again made its appearance, and been seen in the eastern morning sky; and further, it seems that the planet Venus has been taken to be this star. Briefly let me explain, that there is no *connection whatever* between the two, nor, may I say, between the star of the Magi and any heavenly body known to astronomers.

Any good almanac (Whitaker's, for example,) furnishes us with the information that in the month of December, Venus was a morning star, that she was at her greatest elongation east on July 13th, at *inferior* conjunction with the sun of September 21st, and her greatest elongation west, on December 2nd.

I will try and justify the statement I have made by reference to a few astronomical facts. And first let me explain the terms I have used, with which some readers are possibly not familiar.

In the accompanying diagram, which makes no pretention to be according to scale, let the circle S represent the sun, E the earth, and the large curve V, V^3, V^4, be the path of Venus in her tour, or properly, orbit round the sun. By elongation, is meant the distance a planet appears to the people on the earth to be from the sun. This distance is therefore to be measured by the opening or angle between the line S.E., and a line from the earth to Venus, wherever she may be in her orbit. I think it is evident, that the greatest elongation is reached when she is at V^1 and V^4. In the year 1887 she was in the position of V^1 on July 13th, and V^4 on December 2nd. A planet is said to be in conjunction with another heavenly body, when the two are seen together in the heavens, and a straight line joining them reaches the earth when produced. Such would be the case when Venus is in the position V^3, and also when she is in the diametrically opposite part of her orbit. In the latter case the conjunction is called *superior*, in the former, *inferior*, and this was the phase Venus passed on September 21st. Now with regard to her brilliancy. When she is in the positions V^0, V^5, we see half her surface illumined, just as we see the moon at her first and third quarters ; but as Venus approaches the position V^1, we *see less* of her illumined surface, and might therefore expect her to appear less brilliant. This is not the case, however, because she is also approaching us, and therefore what light she reflects we see more of.

Her brilliancy *decreases*, owing to the fact that the visible illumined area gets less and less as she approaches the position V^3, and *increases* because she is all the while approaching the earth, the result of which being that she shines most brilliantly about the middle of August. When she comes to the position V^3, or between us and the sun, we lose sight of her, because she is entirely overwhelmed by the light of that luminary. Occasionally Venus passes *exactly* between us and the sun, or makes a transit of the sun's disc, when she is seen as a black spot passing across the sun's face. On leaving the position V^3, we soon see her as a very thin crescent in the early morning, getting brighter as she approaches the position V^4, or greatest elongation west. By the time she reaches the position of *superior* conjunction, the whole side turned to us is illumined, or she is, as it were, full Venus. As, however, she is so very much farther from us in this position, she appears as a quite insignificant object. The curve V^1, V^3, V^5, or orbit of Venus, is not circular, but what is called elliptic. Her distance therefore from the sun is not uniform. It averages about 66 millions of miles.

Now these few remarks apply, not only to the movements of Venus for the year 1887, but also for many thousands of years previous. (The days of her conjunctions, etc., alter from year to year.) If this is the case, it is actually impossible that Venus can have been the star of the Magi, for in St. Matthew's Gospel we read that the star *went before them.* I take this to mean that the star had an especial movement for them, and if so, it is manifest that it must have been only a comparatively few *yards* above the surface of the earth. The star of the Magi, moreover, has never been identified by astronomers. Efforts have been made by some to show that it was a comet, by others, that two planets in conjunction blended into one great light ; but all these efforts have failed. Speaking generally, I may say that astronomers have entirely failed to find a place in any map of the heavens for the star of the Magi. It may not be out of place to remark here, that the word *αστηρ*, used in the Greek Gospel, means a luminous body, and not necessarily a star.

There are many people who think that what are called the laws of nature are competent to account for and explain all the unusual phenomena described in the Bible. They think that all God's works must be performed through the operation of what they call natural laws. Possibly this may be the case, but until we *know all the laws of nature*—which are simply God's laws for the physical universe—we are not in a position to speak of the results of these laws. Many of God's works may be the uncalculated results of laws, some of which we know, and some we do not know. With our very limited knowledge of anything, we can only confess that the Creator of all things can alter, interrupt, or revoke any of His own laws. Now we know in part ; but a time will come when we shall understand all things perfectly.

The star of the Magi cannot be referred to any known phenomenon in nature, and therefore, I say it was a miracle. Some people have supposed that the star which appeared in the constellation of Cassiopœia in A.D. 1572, was the Bible star ; others give the same honour to a star that appeared in Serpentarius, in A.D. 1604, but these people can have no notion of the stupendous distances of the stars. No star in either of these constellations is nearer to the earth than three hundred thousand times 91 millions of miles. The sun is nearly 92 millions of miles from the earth, and I think it must be quite evident to any thinking person, that it is impossible to fix any particular spot as being under the sun, in the sense conveyed in St. Matthew 2. 9. Still more evident is it that it would be impossible for a house or a village to be under a star 300,000 times the distance of the sun. I think it is right to infer from the Gospel narrative, that only the faithful wise men saw the star ; but whether or no such was the case, it is certain that the star which guided the Magi to the Saviour of the world was one which no man in our day has ever seen.

P.S.—In the month of December, nearly eighty letters were received at the Greenwich Observatory, requesting information on the subject in question.

A NIGHT ON THE MER DE GLACE.

By Mrs. L. MONTAGUE.

DURING the summer of 1882, an artist and his wife were making a sketching tour in Savoy, and especially in that part of it which lies at the feet of the stupendous peaks, known as the chain of Mont Blanc.

Mr. and Mrs. Pole were staying at the *Montanvert*, a summer hotel, which overlooks the glacier which is called the *Mer de Glace*. A veritable "sea of ice," it is, indeed; nearly five miles long, and, in some places, over a mile in breadth, presenting the appearance of an unbroken series of frozen waves, as if a mighty sea, rushing down upon the peaceful valley beneath, had been suddenly transformed into ice, and its destructive career stopped for ever.

It is almost impossible to realise, when looking at this mass of ice—six hundred feet thick in many parts—that it actually moves. Nevertheless, it does move,—imperceptibly to the casual observer, it is true, yet every year the glacier advances some yards. Huge granite boulders are brought down, together with great quantities of rock and soil, which help to form the *moraine* on either side of the glacier.

It was in the midst of the wild and magnificent scenery of this range, that Mr. Pole determined to spend some days.

Though not an artist herself, Mrs. Pole was quite as enthusiastic on the subject as her husband, and invariably accompanied him on all his sketching expeditions.

Having once been guided over the *Mer de Glace*, they were accustomed to cross it by themselves whenever they wished to reach the beautiful green slopes, pine woods, and waterfalls on the other side. There is one part of the glacier, which can be travelled without the smallest danger, and it was here that Mr. and Mrs. Pole constantly crossed. One afternoon, the former wished to finish a sketch begun on the previous day, and accordingly set out, accompanied, as usual, by his wife.

Having crossed the *Mer de Glace*, they stepped briskly forward, and soon reached their destination, when Mr. Pole seated himself on his camp-stool, and shortly became deeply absorbed in his work. Two hours passed away, and then he said to his wife,—

"I think you had better go back now, Edith, for you must be tired; besides, I am afraid of your catching cold. I have not quite finished, but I will follow you very soon."

Mrs. Pole declared that she was not in the least tired or chilly; but her husband insisted on her returning, and at length she rather unwillingly complied.

"Take care of yourself," she said, as she left him; "the Aiguille du Dru looks very cloudy. Do not be long, or you might get caught in the rain."

Mr. Pole painted on, taking no heed of time or weather, though, had he looked around, he would have seen that the clouds had come down upon the mountains, and were thickening every moment.

At last, the falling of a few drops of rain upon his picture aroused him. He looked up, and then took out his watch.

"Hullo! half-past seven; no dinner for me to-night. I must be off, though; what a fog there is coming up! I hope I shall be able to find my way home."

He hastened to gather his things together, and started in the midst of the thick fog. Having walked some distance, he took what he imagined to be the turning which led down to that part of the glacier which they usually crossed, but, ere long, he became aware that he had made a mistake. The ground was soft and crumbling under his feet, and, all at once, a stone near him detached itself, and went thundering down with a noise that caused his heart to stand still.

"I must be on the lateral moraine," he said to himself, "but on what part, and in which direction am I going?"

He stopped, and strained his eyes to pierce through the gathering gloom. The clouds swept by him with marvellous swiftness, the air was damp and intensely still. Not a sound was to be heard, except the noise occasionally made by a falling stone, which seemed to wake a thousand echoes, as it rolled down upon the glacier.

Very cautiously Mr. Pole began to descend, and, after a space of time that seemed to him almost endless, he reached the foot of the lateral moraine.

At that moment the clouds lifted slightly. "Ah!" he cried joyfully, "now I am all right. I remember this projecting piece of rock quite well." And he stepped on to the glacier. He picked his way along for some distance, and then stopped short. On his left hand rose a wall of ice, and beneath it was a deep crevasse.

"I do not recollect this," he murmured doubtfully, turning a little to the right.

The way now became more difficult. Every minute he had to skirt pools, which he knew to be almost fathomless; huge peaks of clear blue ice towered on each side of him, and beyond, as the fog lifted and lowered continually, he could see ridge after ridge of fantastic forms, some of them inexpressibly weird and strange.

Before long, it became very evident to Mr. Pole that he had lost his way altogether; the darkness was fast increasing, and now it commenced to rain heavily.

Suddenly, a bit of one of the ice-peaks just above him broke off, and fell with a most appalling sound—down, down, he thought it would never stop falling. At the same instant the clouds lifted, as if by magic, and, to his horror, Mr. Pole found that he was standing on a narrow ridge between two frightful crevasses. To go on was an impossibility; to go back, in the fast-increasing darkness, he dared not. He could scarcely conceive how he had reached this point in safety. The only thing to be done was to gain the shelter of an overhanging mass of ice just behind him, and there wait for the dawn. At all events, he must get off this narrow ridge. He turned, and stepped very carefully back. Just then, another piece of ice fell, startling him so much that he dropped his camp-stool and stick; the latter was a serious loss, for it had a spike at the end, which helped him considerably in keeping his footing upon the slippery surface of the glacier. The remainder of his things were strapped upon his shoulders, together with an old waterproof cloak, which he used for the protection of his sketches from the rain.

Having with much difficulty gained the shelter of the projecting piece of ice, he wrapped himself in the somewhat threadbare cloak, and lay down to wait for the morning. It was a horrible situation. Drip, drip, all round, the edges of the huge mass above him were dripping; little streams of icy water ran down the sides and along the surface of the ledge on which he was lying. It was so strangely still, too, except for the crashing of the ice-peaks which toppled over every fifteen minutes or so—or the dull rumble of falling stones on the moraine.

How awful it would be if the roof of ice above him were to give way! he thought, shuddering; and how dreadfully anxious his wife must be getting! "It is no use thinking about it, though," he said to himself; "I will try and sleep for half an hour." Accordingly, he closed his eyes; but, after a few minutes, opened them again with a start. Surely the glacier was moving, and rapidly bearing him down with it into some grey torrent, or deep-blue crevasse! No, it could not be; he was half dreaming, that was all.

How bitterly cold it was getting! He stamped his feet, and tried to rub some warmth into his fingers. Then he felt for his pipe, and, having filled it, struck a match, and soon succeeded in lighting it. The faint gleam seemed almost cheerful in comparison with the surrounding darkness, and he smoked three or four pipes, one after another.

Then he crawled to the end of his shelter, and looked out. The clouds had all disappeared, and the moon was shining, while, in the distance, he could see the lights of the *Montanvert*. He stood up and gazed around him, and now perceived that he was on the most dangerous part of the glacier.

"How could I have got here?" he said aloud. How, indeed? Alone, and unaided by human agency, he had traversed that which the most skilful guide would scarcely have dared to attempt.

How to retrace his steps, was the question he now asked himself. He could not do it again, alone; assistance must be procured somehow. Making a trumpet of his hands, he shouted as loud as he could. Hark! Was that an answering cry? He held his breath to listen. Were those lanterns flickering in the distance? He shouted again and again, and, this time, an unmistakable answer was returned. Could it be only the echoes? he wondered. No, there it was again; and now he could see the lights distinctly. He struck a match, and pulled out his watch. It was half-past twelve. The moon, which was not at the full, was setting, and Mr. Pole did not dare to stir in the darkness which was again thickening. He must wait at least two hours and a half before any hope of a rescue could be entertained. Accordingly, he sat down, lighted another pipe, and tried to cultivate a philosophical frame of mind.

In the meantime, what was Mrs. Pole doing? She had felt a vague anxiety about her husband from the time she had left him, and when he did not return for dinner, she began to feel somewhat more uneasy. The clouds came down and obscured everything, the rain began to fall heavily; but she fancied then that he might have taken refuge in some hay *châlet*. However, at nine o'clock she became seriously alarmed, and, at length, went to the proprietor of the hotel, and confessed her fears. He looked grave, and summoned one of the guides. A whispered consultation took place, and finally it was arranged that a search-party should go out at once. Upon this, Mrs. Pole declared her intention of going too, and, in spite of all their attempts to dissuade her, actually started with them. They went first to the spot where Mr. Pole had been sketching, and then proceeded for about a mile further on; but finding no trace of him, they resolved to return, and continue the search at daybreak, a few hours hence.

Just as they were crossing the *Mer de Glace* on their way back, Mrs. Pole stopped.

"Hark!" she said breathlessly; "did you not hear a shout?"

They all waited and listened.

"It is nothing," remarked one of the guides; but, at the same moment, the shout was repeated.

One of the men then answered, and they all paused, and listened again.

"There is no doubt he is there," remarked the guides at last; "but it is useless to attempt to rescue him until dawn. We must wait till then."

"Oh, but, is he in danger?" cried Mrs. Pole.

"So long as he keeps perfectly still, he is not," was the answer.

"Let me try and go to him."

"No, madam; that is impossible," returned the guide gently. "You must return with us, and wait for a few hours, when we will bring him back to you safe and sound."

How Mrs. Pole spent the next two hours she never knew; but, at last, the dawn broke, and the search-party once more started. It took them a considerable time to reach the spot where Mr. Pole was, and they were still longer in returning, for he was now thoroughly exhausted, and half-frozen as well. However, they got safely back to the hotel, and Mr. Pole found himself the hero of the hour. Everybody crowded round to hear his adventures, and, as his wife laughingly declared, he became for the time quite a celebrity.

Nevertheless, it will be long before he runs the risk of spending another night on the *Mer de Glace*.

LOVE, COURTSHIP, AND MARRIAGE.

By PHYLLIS BROWNE.

No. 5.—Being Engaged.

A CYNICAL old bachelor once said, that he always looked upon a friend who was engaged as he looked upon a man in a fit; he felt that he could not help the sufferer, so he wanted to turn away his head, that he might not see his contortions. Young folks, when engaged, have no right to behave so as to make their friends and acquaintances feel uncomfortable. To be continually making a display of affection, seizing every opportunity of squeezing hands, or whispering tender nothings into the ear of the beloved object, is not only unbecoming but indelicate, and not so much a proof of ardent affection as of ill-breeding. No young man who respects his betrothed, would ever make her the subject of remark; and no young woman with self-respect would ever permit herself to be so humiliated. True love is too sacred to be made the occasion of jokes and jeers.

During their engagement, lovers have the opportunity of getting to know one another thoroughly, and of finding out mutual tastes and opinions. This opportunity is valuable, because it prevents unpleasant surprises by-and-by. In order to make the most of it, it is necessary that they should put aside all pretence, and dare to appear what they are.

A girl I knew, was expecting a visit from her lover, just after she had become engaged. A friend inquired, "Why have you not put on your best dress and made yourself look smart? I thought Willie was coming." "So he is," was the answer, "and that is why I wear my old gown. I want him to see me and know me as I am every day." This honest purpose gave a beauty to the face, which fine dress could not bestow.

Experienced persons tell us, that the more hot the love fever is at first, the sooner it is over. The love that endures begins quietly, burns slowly, becomes stronger and warmer as time goes on, gives time for fresh fuel to be added to it, and can be watched and guarded. so that there is hope that its steady flame will warm and make cheerful the domestic hearth. The love that flares fiercely all in a moment, makes a crackle and blaze which causes us to turn and start; but it does not last, and it leaves only a handful of dead ashes behind.

Courtship is not always, by any means, the very happy time it ought to be. With too many, it is a time of unrest, of excitement, and of constant visiting. Engaged couples seem to think they ought to be continually going either to entertainments, or from one house to another, receiving congratulations, and making acquaintance. A poor preparation this for a perfect home life.

During the time she is engaged, a girl ought to be queen. If her lover is of the right sort, he will feel it a privilege to meet her wishes whenever it is possible. He will try to shield her from everything that is disagreeable and unpleasant, he will guard her from danger and try to crown her life with love. But he will never be exacting in his demands upon her devotion; he will not selfishly try to keep her away from her friends. It will be sufficient for him if she be happy, and if he may be the cause of her happiness. In offering her his love, he has acknowledged that for him, at least, she possesses "the sweetest of woman's rights, the right to be loved and flattered."

To do them justice, masculine lovers are, for the most part, very ready to make much of the girl of their choice. The pity of it is, that they do not always show the same amiability after they become husbands. Their conduct reminds one of the story of the woman, who said to her husband, "You and I ought to agree, sitting by our own fireside. Why, even the dog and the cat get on well there, they do not snarl and fight, but are very good friends." "Ah!" grumbled the man, "tie them together, and then see how they will behave."

It must not be supposed, however, that when two people are engaged, the man has all the work to do. A wise girl will make the most of this golden opportunity to win the *friendship* of her future husband, as well as his love. She will seek to gain his entire confidence, so that there shall be nothing in which he is interested, hidden from her. When she receives his confidence, she will prove, by never betraying it, that it is merited. A man soon finds out whether a woman is worthy of trust. If, after telling her some story, unknown to any one but himself, he hears it repeated by strangers, he will conclude at once that it has been made the subject of tittle-tattle, and he will feel that he has been betrayed. Such an experience gives the death-blow to friendship. When a lover has trusted his *fiancée* with a confidence which he would not give to another, she ought to guard with most jealous care the doors of her lips, lest that secret should escape.

Besides winning her future husband's friendship and confidence, an engaged girl should be a purifying and elevating influence in his life, leading him on to higher things. In their daily tasks, she should try to induce him to take a kindly view of surroundings, to judge others charitably, and to avoid giving cause of offence. More than this, she should make it her practice to converse with him about *things*, not *persons*. This is, I believe, a most valuable rule for those who want to live an earnest life. Sometimes, listening to young people chattering, we cannot help marvelling that they do not get very weary.

A French philosopher once said:—"Small interests are the death of the higher life." This is true. When we occupy ourselves with trivialities, we neglect what is important. Foolish, empty-headed young men are uncomfortable if they hear their sweethearts talk sensibly, and show that they have a liking for good books and higher things, and that they weary of idle chatter. They are afraid lest their acquaintance should say, that in the marriage which is to be, "the grey mare will be the better horse." Young men who have brains of their own, however, never have any fears of this sort. On the contrary, they are proud and delighted to find that their *fiancées* are so superior to other women; and can we wonder if occasionally they feel inclined to say to themselves:—"What a clever fellow I must be, when a splendid girl like this consents to take me for better, for worse"?

When young men dislike women to be thoughtful, the fault usually lies on the shoulders of the women-folk of their own circle. In this matter, as in many others, we have to confess that men are what women make them. If a girl is silly, frivolous, and doll-like, the man who is united to her will have the opinion that it is woman's business to look after the house, to make herself attractive and to chronicle small beer; and that it is man's duty to protect woman and do the thinking for her. They like to think that man is the head of the woman; forgetting that, "if man is the head, woman is the neck, and the head turns which way the neck moves." But if, on the contrary, a girl has character, strength of mind, and a good share of mother-wit, her lover will be positively elated, and will feel head and shoulders higher than his companions on the strength of his future wife's capacity.

As a rule, men are most ready and even eager to admire what is admirable in the girl of their choice, evidently feeling that any praise bestowed on her, belongs also to them. They are right. Nothing brings out the best that is in a woman, so much as being believed in by a good man.

Still one word remains to be said to those who are engaged, and that one word may seem to some a little void. Nevertheless it is true, as experience will prove. It is this. Young people make a mistake when they are too lavish in their expression of affection for each other, and so make their love too cheap. This is especially a point which girls should remember. It is in the nature of men to value highly what they obtain with difficulty, and to esteem lightly what they get with ease. A sensible girl, therefore, will always be affectionate, of course, but still dignified in her conduct to her lover. By so doing she will be taking the surest means, not only to win his respect, but also to keep his affection. In doing this, there is no need for her to be coy or coquettish in any way. Let her simply maintain her maidenly reserve, and draw the veil of modesty over her love, to preserve the delicacy of its bloom. If she do this, not only will she be more likely to keep her lover, but the probability is, that his affection will grow and become more ardent, as time goes on. If she quite early wearies him with her demonstrations, the chances are that she will lose him. As old Herrick says,—

"Let moderation on thy passion wait,
Who loves too much, too much the love will hate."

AT WHAT A COST! OR, DUKE ARDEN'S LAST STAKE.

By Max Gerard.

" 'I am terribly shaky—and—well—this is my last declension.'"

CHAPTER III.

LEFT to himself, and with something like the glow of a new and noble enthusiasm filling his breast, Duke's thoughts ag .in turned to Mabel Treherne. He resolved, that very evening, to get her to promise that, at some future date, to be determined by his prosperity and success, she would become his wife. Her sisterly solicitude, her genuine sorrow, her heartfelt words when he had sometimes told her of his difficulties, encouraged him to think that he had but to offer himself, and he would be accepted.

It is a fact that most men, especially the least worthy, feel themselves to be doing a right and noble action when, after a life spent in dissipation, riot, and all kinds of unnameable sin, they offer themselves to the purest and best girl they know. After the sowing of wild oats (*wild oats*, forsooth !) they hope in this way to reap a harvest of full grain. They regard the sacrifice, if there be any, as on *their* side ; it surely is a meritorious act to give up that which, from the abuse of it, palls and satiates ; to leave old habits and haunts, because indulgence therein is no longer possible to them ! How many men feel that in offering themselves to a girl, just to be "kept straight" by her, they are doing her the greatest wrong that one person *can* do to another ? *Not one in fifty*. And is it not quite an accepted theory with some women, that, after all, womanhood is at its noblest when it condones the offences of man, by standing with open arms, and receiving the moral outcast, beggared of all shame and honour, and sheltering him gladly in the bosom of purity ? This is, in reality, to put a premium upon dishonour, and until woman —the first in the condemnation, therefore the first in the reparation—will learn that her womanhood is to be the safeguard against,—not the harbour for,—sin-wrecked morality, man will still play the fool and the coward, and the world must continue to suffer in consequence.

The fool and the coward ! Yes, Duke Arden felt that he was both. Not that this thought in any way helped or strengthened him. No, it depressed him greatly ; he felt as if, gradually, the pluck which had the last few hours animated him was all ebbing away. "Not that she will refuse me," he told himself over and over again. "I will let her know how matters stand —that through a bit of ill-luck I've lost that berth, but that *she*, and she only, can spur me on to something better, and I'll stick to it for her sake. She will not have the heart to send me to the bad by refusing me." Cowardly, indeed ! What a poor, miserable bit of manliness must be left in him who can thus deliberately lay a trap for a young and innocent woman's heart ! When he has come to the verge of his resources, to make her the unconscious balance of his life—the pivot upon which he shall turn for good or ill, for life or death !

He looked at his watch, and seeing that it was time for him to be getting ready, he proceeded to his dressing-room. Here, hung over the mantel-piece, was a brace of holster-pistols he had bought in Australia. He took them down, examined them, cocked one, and fired it out of the window. Percy came to the door.

"I say, Duke, is that you ? Mind my pigeons, just below your window. Going out, eh ?"

"Yes ; wish me good luck, and propitiate the deities for me !"

He was polishing the lock of the pistol ; then he re-cocked it, and set it carefully up in its sling over the fireplace.

"Ah, as some one said, a sure and certain cure for all ills," he said, proceeding to "decorate" before the dressing-glass. "How wretchedly white I am !" he exclaimed, eyeing himself. "What on earth will Mabel say ? Well, my promise does not hold good until after I have seen her. I am terribly shaky—and, well, this is my last declension." So saying, he pulled a sportsman's flask from the table-drawer, and drawing long and deeply from it, exclaimed, "Now I'm a man again !"

He had not seen his uncle since the morning ; he felt he did not want to do so. When the matter had been settled with Mabel, he could talk to him at his ease ; he would have a definite prospect in view ; his uncle would not object to anything, when he found he had acted so prudently ; he would, as usual, pull him through his financial difficulties, and all others would disappear, when it was publicly known that Mabel Treherne had promised to be his wife.

Thus do we cozen ourselves ! The *mirage* created by a disordered imagination leads us on, and we go the more surely to ruin. Duke was ready now ; his cheeks were flushed, his eye bright, his hopes rampant ; everything was *couleur de rose*. He did not pause to think of failure. The coward has but one resource when his own foolish plans fail, and Duke had "prepared for the worst," he said.

On his way down, he passed Percy's room. He looked in, and saw the boy hastily rising from his knees.

"Not going to roost yet, Perce, are you ?" he asked, carelessly.

"Not *just* yet, Duke ; I was keeping my promise—*you* know, what you asked me. And old Di has got pups, and I'm to have one ; father has promised." The boyish delight could not be restrained ; he caught his elegant-looking cousin behind at the waist, and pushed him all down the lobby, following him out to the porch, and vociferating his good-byes at the top of his voice. Duke went out in a good humour ; he really did love Percy—the boy was so genuine and so thorough ; there was not a bit of the "sneak" about him, though he was a great tease.

"I know the little chap will be glad when he hears what I have done. He looks after me like an old hen looks after a troublesome brood, and, by his love, I vow I'll not disappoint him."

* * * *

Mabel received Duke in her usual sisterly manner. She was not one to bridle and blush, and make affected speeches ; she simply said, "I saw you this morning, Duke ; I have generally wished you could see yourself when I have seen you lately. I *am* so sorry !"

"Hush ! Mabel ; all that is past. Come out here," stepping towards the verandah, and holding open the casement for Mabel to pass, "for I have something to tell you, at which, I know, your kind and tender heart will rejoice."

Mabel stood leaning against the rustic balustrade. Duke faced her, in an easy attitude. The girl was pitying him, thinking what he was making of his life, and what a different record he *might* have to give at the great Reckoning, if only——

Her thoughts were interrupted by the subject of them.

"I know you are thinking the best you can of me," he said—he always "talked good," as he called it, to Mabel, whenever he felt he had a point to gain with her,—"and I'm a lucky fellow to have your and Perce's prayers."

Mabel looked searchingly at him.

"Don't look like that," pleaded he. "I'm in dead earnest this time, Mabel ; and your prayers will be answered, for I am going to reform. I've never looked at it before as I do to-night."

"I'm so glad to hear you speak so, Duke ; but how is it going to be done ? You remember our last talk ? You cannot do anything in your own strength, for that is as weak as your resolves. How, then, do you know you will change ? Who will help you ?"

"*You* will, Mabel !" he cried, stepping forward to catch at her hand. "*You*, my good angel, as I have called you all day. Yes, *you* will help me. For you I will renounce all that has made my life hitherto

a failure; for you I resolve to give up that which stands as a barrier between me and prosperity; for your sake to-day, and for Percy's sake, too, dear little chap! I promised my Aunt Avice that I would never again touch strong drink."

"What time to-day did you promise her that?" asked Mabel.

"Oh, this afternoon, when she came up to my room to speak about a piece of business that I was coming to," said Duke.

"Then you have not kept that promise. Duke, how *can* you go on hoping in your*self?* When will you believe that *you* are bound, hand and foot, by invisible chains, and that your bondage will only end when you walk in the fear of God and His commandments?"

How he inwardly cursed his folly in allowing that last craving to master him, so that he was betrayed by his very breath to the girl he was hoping to win. Yes, by the breath that was assuring her of his resolve, for her sake, "to vanquish and overcome all his enemiies."

"Mabel!" he pleaded, "you are rather hard upon me; I felt shaky, and knew you would notice that something had upset me, and that was why. Do not condemn me utterly. Oh, Mabel, it is in your power to make me what you would have me to be! Promise to be my wife at any distance of time you may like to name, and see what I can become."

"No, Duke, I will not be so unjust to you, or to myself, as to promise that. I would not degrade you by making myself—a poor, weak woman—the price of your redemption. And I have no faith in such a bargain. If you had striven to overcome, that you might win me, instead of seeking to win me that you may overcome, it would have been quite different. I am sure you will see the injustice, as well as the cowardice, of what you ask, and will go where strength is to be found, if you really desire it."

"I had something to tell you," he began, in tones hoarse with emotion. "This morning that letter came, saying that the Earl of B—— had thought better of it, and would not need my services. You see I am ruined, and it is now or never that I must see a turning-point in my history. You have settled that for me, Mabel; I know I am not worth a thought at your hands, and so it is all settled. Two blows in one day. There is only that little boy now, and I can't face *him*. Good-bye."

He held out his hand; it was trembling now with an overmastering disappointment, that drew the veil of blackness over all his thoughts.

"No, I will not say good-bye to you thus, Duke. You have reached a crisis in your life, and now you must act for yourself. But you are wrong in supposing I shall not think of you,—indeed I *shall*, and pray for you too, my brother. God has made men to be strong; flee to Him, Duke, who has promised to succour the tempted, to strengthen the weak, and to raise the fallen. You have *never* done this, or you would not have asked what you did just now. Good-bye—read this," she said, putting into his hand a tiny note, "when you reach your room, and remember, I have written it for you."

He hurried away from her presence, and, while taking his hat from the rack, saw through the open door of the dining-room, a decanter on the *buffet*.

"What does it matter *now?*" he muttered, seizing it. Then he looked at the little note lying in his hand. Should he? O God! this awful craving. He put the tempter from him. *She* had said something about raising the fallen; but she was a woman—she could never know the *depth* of his fall. Oh, how low had he sunk, even in his own eyes! And she had refused him—well, there was no hope; he would end it all. Again seizing the decanter, he began to pour the contents into a glass, but with a stifled groan left the room, and rushed out into the night. "She shall never have it to say that I died with a lie on my lips, or that her father's wine was the last I tasted!"

He hastened along the Farley Road, and though he staggered sometimes as a drunken man, and those who passed him knew and pitied him, yet he was not drunk. But his brain was in a whirl; he saw no light; the madness of despair was urging him on with fiendish intent of purpose. On reaching the Manor House, he did not notice that there was an unusual air about it—that there was in it the hush of a sudden ill, with the excitement that ill always produces. He stumbled to his room as one blind, and, feeling over the mantel-piece for his pistol, reeled back, falling against the wall, for the case was empty, and the pistol was gone!

CHAPTER IV.

How long he lay there, he never knew. A loud knocking at his door roused him, and, on opening it, he saw Miss Knox, her eyes swollen with weeping, her voice broken by sobs.

"Oh, Mr. Duke, you must come now if you wish to see Percy again alive. He is quite unconscious, and we do not know how long it may last; but you had better come."

Percy dying! His last stake lost! But what could it mean? Was it all part of the dreadful dream through which he seemed to be passing? Silently he followed the governess to the boy's room, and there, grouped round his bed, were uncle, aunt, doctor—and lying still, pale, and death-like in the midst, was the boy who, a few hours ago, he had seen on his knees in that very room, praying for him! No one looked at him as he entered, but he noticed that his uncle shuddered, and seemed to turn from him, burying his head more deeply in his hands, as if to avoid him. Mrs. Arden was weeping. Duke looked for a word of explanation from some one, and the doctor beckoned him from the room.

"*Why* is he lying there, dying?" he asked breathlessly.

"Ah, why? He is shot through at the waist; and the bullet is lodged in the spine. We are waiting for Sir Barclay Thorpe, from London, but if the bleeding continues, he will soon be too late." The doctor went back into the room, but Duke was stunned. Shot! How? He went downstairs; the butler was sitting in the hall, looking wretched.

"*Who* has shot my cousin?" he asked.

"He's shot himself, Mr. Duke, with one of your pistols. You must have left it loaded somewhere in your room, for after the report, Master Percy was found lying in a pool of blood in his room, and the pistol was on his dressing-table, having just been fired"

"He could never shoot himself, and put the weapon back on the table. He has never touched my pistols or gun before. I cannot believe he has done it,—but, O God, that it were undone!"

"Ah, it's too late to wish that now, Mr. Duke! That poor child is about the only Arden that knows anything of God. Better *he* should die, than some o' them as are not so well prepared."

Duke could not answer; he felt the bitter home-thrust, but he was not thinking of him-

"'Only there is something I must say: you have saved my life, but at what a cost!'"

self. Going into the library, he saw his uncle's glass, and the wine standing beside it on the table. In that moment all desire seemed to leave him; he loathed, or thought he loathed, the evil thing, and hid the bottle away in the cupboard. Then he paced up and down the verandah; the surgeon seemed to be hours in coming. Meantime the boy upstairs was more surely nearing the end—the end he himself had prepared and longed for!

"There *is* no good in the world," he muttered. "Life is a failure, and death a mystery, and hope and religion a miserable mistake."

Putting his hand into his pocket, he felt the note Mabel Treherne had given him at parting. He opened it mechanically, and read:

"*O Lord, I know that the way of man is not in himself; it is not in man to direct his steps.*" "*Order my steps in Thy Word.*"

He heard the dog-cart drive up, and presently the hurried and whispered consultation of the doctors, then the sobs of his aunt, as she and the squire left the room, and doctors and patient were left alone to decide in those awful moments the probability of life or death.

And when the doctors came out, none could read their faces, and they would say but little; the bullet could not be touched, but the bleeding was staunched. One doctor remained, and, with Mr. Arden, sat during the first weary watch in that silent room. Still the boy was unconscious. Night wore into day, and day again into night, and by this time the poor little patient was in the delirium of fever. No need to recount the weary days and nights that passed in that lonely house—the hopes and fears that raised or depressed the hearts of the watchers! And Duke? Miserable, worn, he kept his room, lest his presence should add to the squire's grief, and only left it to inquire, as often as he could, about his poor little cousin.

One day his aunt came to his room. She started when she saw how changed he was by grief and remorse, and asked him: "Do you think you can come and sit by the bed for a little? Percy is ceaselessly calling for you; and perhaps you will understand what he means. But you must be calm, Duke. Come!"

He followed as one in a dream, and on entering the room, was shocked at what he saw, so wasted was the boy. He was saying:

"Oh, Duke, I knew you wanted to kill yourself with that pistol, so I have put it away, and you will never find it. Duke, I *have* kept my promise. I have prayed for you. It will be all right, Duke. The pistol could not cure you; but cheer up, old coz, God can."

And so on, all the time, without a pause, he rambled; sometimes of his lessons, his dog, his mother, but more often of Duke and the pistol. Duke could not bear it. He was cut to the heart, and sobbed like a child, for he understood it all. The boy had heard his wild words, spoken before he went out on that fateful evening, and had taken the pistol from his room, and, by some terrible accident, had shot himself. He had said he would die, in his boyish way, to make his cousin happy; and, oh, how faithfully he had kept his word!

"And I am his murderer!" felt Duke. "But if he *should* live, I vow I will do anything he asks me, whatever it is."

* * * *

It is six weeks later, and the invalid, who has so far recovered as to be lying, for the first time since his illness, on a couch in his mother's room, has been telling Duke how it all happened.

"I forgot I had put the pistol on the dressing-table, and threw my brush hastily down, and it must have touched the pistol, for I remember nothing but a flash, and then falling—and that was all."

"No, it is not all, Perce; there's a lot more to tell, but I'm not going to tell it now. Only there is something I must say: you have saved my life, but at what a cost!"

The squire and his wife were in tears; they could see the change in Duke, but as yet his uncle had not spoken the pardoning word, for which Duke was longing and hoping.

"Never mind the cost, so that it is saved," said the boy, thankfully. "You know I said I would die for you, Duke, if needs be; and I believe it is all for the best. Now, father, tell Duke."

"Your aunt and I have been talking, Duke, and she has convinced me that we are greatly to blame for your sin, which has ended—really ended, I feel sure—in what has been such a sorrow to us. We have resolved,"—and, as he said this, the squire's voice shook, and he solemnly bowed his head,—"by God's help, never to put temptation in your way again."

"Yes," said Mrs. Arden, "*God* helping us, in the future. Percy has taught us what self-sacrifice is, and we will help you all we can, Duke, to live a new life in 'the fear of the Lord,' as we hope to do."

"And I," said the young man, humbly and reverently, "promise, by that same help of God, never to touch what has proved so bitter a curse in my life. I am going away for a time, and when I return, if I am worthy of your confidence, I hope again to share this as home with you. But until I have proved that I am a man, and not a vile and unbelieving coward, I cannot again sit at your table."

He went away, and having found the Earl of B——, made a clean breast of everything to him, and so won upon his confidence, that he appointed him as sort of sub-factor. Step by step he plodded on, working hard, and meeting with continual and countless temptations—for who is not tempted, O my brothers, who seeks to walk in purity and uprightness of heart?—slaying the dragon, self, and "forgetting those things that are behind," but overcoming them one by one with the new hope that was in him—the hope of his manliness and his manhood, the hope that should quicken and inspire the pulses of every true man to become worthy the name and the strength of his manhood, and to regard it as a gift from the Highest, to be used for His glory.

And did he succeed, think you? Did any man ever *fail*—that is the answer—who, day by day, and hour by hour, stayed himself upon the assurance, "He is able to succour them that are tempted."

At the end of two years he returned; his uncle was getting old, and dear old Perce was longing for him, and there were things that only Duke could see to about the place, especially as Percy would always be a cripple, unable to walk without the use of crutches. "But never mind that!" he would say. "I've got such a lot of happiness that some other fellows know nothing about, and I've got *Duke*."

"And what has Duke got, I wonder?" Mrs. Arden would ask.

"The best aunt in the world," Duke would answer; "and the promise of the best little wife in the county, and Perce, and—best of all—the strength which is made perfect in weakness, to fear God and to keep His commandments. What bosh I used to think all that sort of thing was! Something for women and mystics; but now——!"

And Mabel Treherne never repented that she had become Mabel Arden; and Duke never, NEVER forgot that terrible night, nor how near he was to losing his last stake, which eventually proved his strongest, but—AT WHAT A COST!

THE END.

HOMELY HOBBIES: RECREATIONS IN GEOLOGY.

By W. H. Harris, B.A., B.Sc.

No. 8.

THE COAL OF OUR FIRES (*continued*).

IN continuation of our last week's subject, we will now give a few particulars of the vegetation which produced our coal beds. Before beginning this description, however, we must make some preliminary observations.

In the first place, we have spoken of our supplies of fuel being obtained from deep mines. This is a fact familiar, of course, to every one; but it may not be equally well known that nearly all the coal-seams of our own country, which are best worth working, belong to a special geological period, named, from this fact, the "carboniferous." Moreover, the series of beds thus classed belongs to the group called the "palæozoic," as containing the most ancient representatives of animal and vegetable life. But while the above statement is true with the qualification mentioned, geologists are now agreed that the change of plants into coal has gone on in all three of the great epochs into which the life-history of the globe has been roughly divided. We shall see, in fact, good reason for believing that the earliest stage of the grand process is going on now in various parts of the world.

Another curious circumstance, worthy of note, is that, high up in the Arctic regions, where, at the present day, vegetation is scanty enough, or non-existent, beds of good coal have been found, proving that, in remote times, climatic conditions widely different from the present were prevailing there. To account for such a fact, various most interesting theories have been propounded. We must not discuss these, as to do so would lead us on to difficult ground. We would, however, in passing, commend the subject to our readers who are attracted by geological questions, and especially to those who are inclined to make the carboniferous period their hobby. We can promise workers in this field of knowledge abundant pleasure, and can assure them that, in the collection and arrangement of specimens of the numerous kinds of coal, with their attendant fossils, delightful occupation will be found for many a leisure hour.

In the small space at our disposal, it will be best to confine our attention to the "palæozoic" coal-beds. The largest contributions to these have been genera of plants, called respectively *lepidodendron*, *sigillaria*, *calamites*, *dadoxylon*, and various ferns. These rather lengthy names have been given by scientific men, as being indicative of some distinguishing character of the different plants. Thus, the first of which we shall mention a few particulars—the *lepidodendron* (Gr.: *lepidos*, a scale, and *dendron*, a tree)—is so called from the scale-like workings left on its trunk by fallen leaves; for these grew on the stem as well as on the branches, just as in the case of the well-known *araucaria* or "puzzle-monkey" of our gardens. Botanists trace in the *lepidodendron* affinities, not to our forest-trees or to any of the higher orders of plants, but to lowly club-mosses, the largest specimens of which are only two or three feet in height, while their relative of the coal-period was a tall and branching tree. Some trunks have been found nearly fifty feet in length, while fragments of others indicate still greater dimensions. Each branch, soon after leaving the main stem, divided into two others; these each, again, into other two, and so on, *i.e.*, in what is called a *dichotomous* manner. The seed or spore-vessels, were conical in shape, and terminated certain branches. Their contents occur in extraordinary profusion in our coal-seams, and by their resinous nature, doubtless, help in making the bright flames of our fires.

The *sigillaria* genus was a large one, for no less than thirty-five species of it have been found in the coal-measures. These trees grew to a height of, probably, seventy feet. Their trunks, from one to five feet across, were fluted, and, in these depressions, leaves grew. These, as they died and fell, left *seal*-like scars, whence was the origin of the name given to the genus, from the Lat. *sigilla*, a seal. The roots, called *stigmaria*, were long a puzzle to botanists, but all doubt as to their real nature was set at rest by the discovery, in the Lancashire coal-field, of their connection with *sigillaria* stems. The cylindrical rootlets, once thought to be leaves, seem to have been attached to the main roots by fitting into little cylindrical pits. The trunks must often have become hollow during the life of the tree, as frequently happens now with our elms and beeches.

They were so squeezed together that we may often see remains of their two opposite sides, now converted into smooth, glistening coal, forming two layers, less than an inch apart. This fact will help to give an idea of the enormous pressure to which the vegetable matter of the carboniferous age has since been subjected. Botanists are by no means agreed as to the affinities of *sigillaria* to plants now existing. Some writers connect them with the ferns; others, with the spurge tribe; others, with palms; some, with the cacti; and others, again, with the cycads. It is curious that, though these trees have contributed more largely than any to our fuel-stores, less is known of this genus than of almost any of the coal-plants.

The *calamites* are recognized as being allied to the horse-tails (*equisetaceæ*) of our ditches and damp places. Their main stem was simple, but at regular intervals gave off a number of slender branches at the same level, and these again bore delicate leaves, also arranged in whorls. The fruit was cone-like in shape. The trunk contracted rather rapidly towards the base, and gave off long, round roots, which spread laterally through the ground. Like the genera previously mentioned, this one far exceeded in size its modern representatives.

The *dadoxylon* was like our conifers, probably most resembling the yew. Botanists have recognized a certain kind of structure, called *disc-tissue*, as characteristic of all known coniferæ. Now, under the microscope, a precisely similar sort of tissue has been observed in remains of *dadoxylon*, proving that this tree was much higher in grade than those we have previously described, being certainly a real exogen. The trunk in some instances was nearly fifty feet in height. The pith was much larger than that of most conifers, and, with its surrounding tissue, frequently shrank so much as to allow the interior of the stems, when broken at the top, to be filled with earthy deposit from water flowing over them. Casts of the inside of the trunk are common, and formerly were called *Sternbergia*, on the supposition that they belonged to a distinct genus. The fruit was named *Trigonocarpon*, and was a good deal like that of the modern *Sulisburia*,—a Chinese yew. It is so abundant in the coal-measures, that it is said to be obtained, in certain localities, by the bushel.

The *ferns*, to an ordinary observer, would be scarcely distinguishable from those of the present day. Yet they show to the botanist certain differences. They are divided into genera, known from each other by the way in which the fronds branch and the veins of the leaves are arranged. Altogether, about 250 species have been discovered.

But it is now time that we turned to consider the transformation of vegetable matter into coal. We must, however, first mention the three methods by which, it is thought, such matter could have accumulated in quantities sufficiently vast to make seams of coal. Here, again, we are greatly helped in our speculations by observing what is now going on in various parts of the world. Firstly, then, we find that in the estuaries of certain great rivers, and into some lakes, immense quantities of trees and fragments of vegetation are carried by floods and freshets occurring periodically. During the intervals of the inundations, the deltas are covered with a dense growth, and the annual decay of these materials must make a constantly increasing deposit of an organic nature.

As illustrating accumulations of this kind, we may refer to what goes on at the mouths of the Ganges and the Amazon. Secondly, we have, in the great dismal swamp of the Mississippi, an instance of a large tract of land overspread with a dense forest and jungle-growth, actually raised several feet in height above the surrounding country, though water extends throughout the entire region. Here thousands of generations of trees have perished, and, by their decay, have made, and still make, immense additions to the total mass of material. Similar growths are found in other districts, and when they have taken place in depressions, which once were lakes, but have been filled up in course of ages, we can conceive that stupendous amounts of vegetation have thus been aggregated. Thirdly, extensive areas in our own country, in Holland, Denmark, and the North of Europe generally, are covered by a growth of peat.

Mosses, rushes, heaths, equisetums, and confervæ, are the chief kinds of plants contributing to its formation. It exists, in various degrees of consolidation, from the spongy fibrous turf above, to the much more solid peat below. In some cases, it makes boggy swamps; in others, it has filled shallow lake basins. Occasionally it has grown over dead and prostrated forests, the partially decayed trees of which it still entombs. Then, beside these three distinct kinds of vegetable accumulations, we have combinations of them. Hence it is no longer difficult to imagine how similar masses may have been collected in past periods.

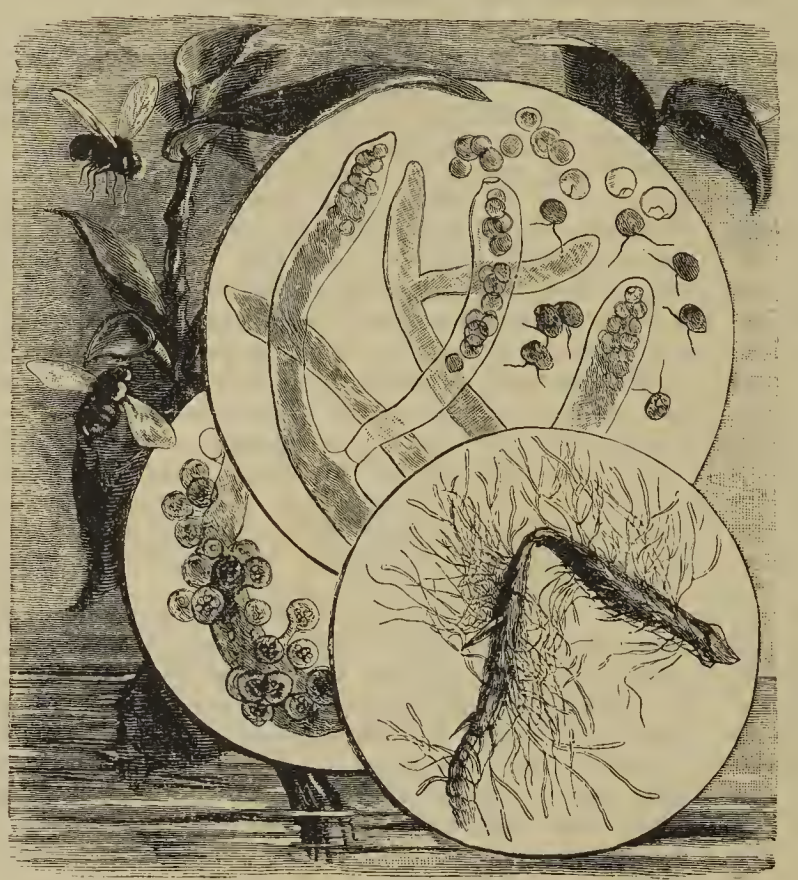
It may surprise us to hear, that it would take forty feet in thickness of such loose materials to account for the production of one foot of solid coal; but, given a sufficiently long time, we can see that there is no impossibility in the aggregation of the quantity required for our coal-beds, especially if, as

must have been the case, areas of such vegetable growth slowly sank, carrying with them their loads, and giving opportunity for new generations to flourish and die above the old.

For the actual change of the crude masses of vegetation into coal, the two chief agents have been pressure and chemical action, aided by water and a moderate temperature. The former of these agents has been supplied,—first, by the accumulation of great thicknesses of other deposits above the carboniferous, and this to the extent of thousands upon thousands of feet; secondly, by the dislocation of the rocks arising from shrinkage of the earth's crust; and thirdly, by volcanic force, acting from below. An elevation of temperature would naturally ensue from depression far below the surface. Chemical action is always ready to develop its energy, wherever organic material is found, particularly where moisture and heat come to its aid.

We shall best understand the actual results which have ensued from these forces, if we consider the constitution of wood, peat, lignite (or brown coal), bituminous coal, and anthracite, so far as their carbon, hydrogen, and oxygen ingredients are concerned. These particulars we give approximately in a tabular form, for facility of comparison :—

	Carbon.	Hydrogen.	Oxygen.
Wood	53	6	41
Peat	60	6	34
Lignite ...	67	5	28
Coal	85	5	10
Anthracite	92	4	4



It would be impossible, in such an elementary paper as this, to go into explanations of the chemical changes thus seen to occur. It is sufficient, for our present purpose, to point out that the main difference traceable is a continuous increase in the percentage of carbon, and an equal diminution in that of oxygen. The practical consequences are, on the one hand, the production of carbon dioxide, and various hydro-carbons, both liquid and gaseous. Hence come the accumulations in our coal-mines of the deadly "choke-damp," and the explosive "fire-damp," as the colliers call them, together with, occasionally, large quantities of bitumen, asphalt, and the rock oil, or petroleum of commerce. These alterations, moreover, are progressive with age, anthracite being the oldest of our varieties of coal, and that which has been most subjected to pressure, heat, and chemical change. The other substances mentioned in the table, occur, as to antiquity, in the order stated.

We have been able to give the barest outline of this grand subject. Before leaving it, we must mention that anthracite is not the last member of the interesting series of altered vegetable matter. In beds still older than those producing our steam coal, are found thin veins of almost pure carbon—the hydrogen and oxygen having been nearly eliminated together. This substance is called by the names of blacklead and graphite, the latter being the more appropriate. It is the material of which our pencils are made.

There remains just one more stage, and this is very rarely attained; but, when the carbon alone is left, and takes a crystalline form, we have the DIAMOND.

A FOREST ON A FLY'S LEG.

I SAW in my laboratory one September day a glass jar filled with water, into which an unlucky fly had fallen. It was still alive, and struggling to escape. An hour later I noticed, as I passed, that it was dead. Two days afterward the floating body was completely enveloped in a white fleecy covering, the individual threads of which were finer than the most delicate product of textile art. This was the winding-sheet of the unfortunate animal; but examination proved it to be a living shroud, nourished at the expense of the tissues it covered; in fact, it was the plant we have figured above on the leg of the fly, and to give it a barbarous name, is the so-called "Achlya" of botanists. Apparently it came from nothing, but this was only because human vision, unassisted, is incapable of detecting the myriads of germs which float in the air. Beyond doubt, one such, the parent of the plant, had either been thus carried into the water, and simply awaited the death of the fly before it could begin its growth, or it may have been entangled among the hairs of the leg before the animal met its fate in the jar of water, but remained dormant until stimulated to growth by the contact of the water. In either case the plant was the product of a previously existing germ, inconceivably small in size, so small indeed that it is quite useless to give its dimensions, though these can be accurately measured by a very simple process.

"Forest on a Fly's Leg."

This germ was transparent, too, and round. Within an hour from the time that it began its work in real earnest, it had thrown out a thread-like prolongation on one side, which was as transparent and pale as the part from which it started. However, small as this germ was, it illustrated a parental duty often lost sight of by beings higher in the scale—that of providing for its offspring; and when the thread started to grow, it was nourished by the food stored away in the parent germ, until it was old enough to appropriate nourishment from the fly leg on which it was growing. This thread elongated, and in a few hours branched, until in a very short time it exceeded the germ in bulk and weight many times over. Then the ends of the threads and branches began to enlarge, and to emerge out of the greyish substance which they contained, a great number, possibly a hundred or more, round bodies, which did not exceed the one two-thousandth part of an inch in diameter. It is interesting to watch their growth from a shapeless mass into perfect little spheres. Then, when they are finished, and a partition is formed behind them, they rupture the end of the enlarged branch, and escape into the surrounding water. Not to remain quiet and germinate at once as plants, but to begin their life career, with motions proportionately as rapid as those of any animal; though the quart jar in which they are confined is a world far too vast for them to sound the heights and depths of in their short motile existence.

The locomotive organs are one or more transparent hairs, which, vibrating, do duty as oars or paddles, and propel the sphere through the water. This animal energy exhausts itself in half an hour, and the little globule comes to rest, throws off its outer coat, and begins its life as a plant germ should. In a few hours it grows into just such a plant as the parent which we have described, and later, in the same day even, may culminate its activity by the production of germs resembling itself in every particular. Just as some of our most conspicuous plants observe regular hours for opening their flowers to the sunlight, so there is almost as marked a periodicity in the hours of maturity and escape of these active globules; most frequently between the hours of ten in the morning and three in the afternoon, does this take place.

This process cannot be repeated indefinitely. How often it may occur is hard to say, but somewhere in the life cycle of this achlya a more complicated method comes in, apparently to help the vigour of the race. It is strange how such an union between beings so humble should produce the most vigorous vitality, and illustrate the formula in which the great Ritter expressed his views, derived from study of nobler form—that is, that "Life is but an exchange of relation." Strip active, sentient being of all its attending circumstances, reduce the principle itself to the lowest terms, and it will yet be found essentially the same everywhere.

Hence then, this achlya, simple as it appears in relation to the oaks or the buttercups, is actually a very great advance on other groups of plants, for the intervention of a new set of organs is requisite to complete its life-history—organs which may be regarded as prophetic of others, in whose advent the vegetable kingdom attains its highest development.

Examine these in the achlya. Terminating some of the many branches of the filamentous mass are enlarged globular extremities, which are filled with a fine granular mass, and when fully developed, the tips of the smaller organs produced lower down on the same branch penetrate. The result of this union of the different bodies is that a new arrangement of the particles contained in the larger one follows. Instead of a single

uniform globular mass, a division into several smaller spheres ensues. These take on a distinct and moderately firm wall; produce some oil globules often in their cavity. A well-defined partition follows, which is to separate the large sphere from the parent twig (see Fig. 2.). The smaller curtained spheres are the perfected fruit resulting from a union of the cells, and are each capable of developing into just such a plant as the parent by pushing out a thread-like growth from the side. Evidently this is the highest life phase of the plant; but, simple as it appears, it invests the species with a new lease of life. Essentially it means that matter, which but for such union and new distribution of its constituent elements, was incapable of self-perpetuation, is now invested with this new capacity, and capable of almost endless reproduction. This may appear strange, that results so important should be accomplished by means so simple; but it is not so strange as the fact disclosed on examination of the microscopical and chemical characters of the uniting elements. They show no essential differences, neither do they differ under the same tests from other like substances. This, however, is but an urgent reason for further investigation into the nature of the substance. We call it protoplasm—it is true. That, however, but gives a name to a difficulty. All that we dare say now is that, from an exchange in the relations of like particles, a new life and force has risen. The most important fact to be drawn from this lesson is, that it illustrates essentially the nature of various changes in much higher organisms; yet it is so simple, that one sees here the very beginnings of life. Though the veil which conceals the most profound mystery of life is not cast aside, it is rent; and through the opening comes a glimmer of hope that some day we may comprehend wholly what we now apprehend in part only. The rapidity with which this plant reproduces itself is astounding. Assume one of the threads to have two hundred of the little motile spheres, and that each of these, under favouring conditions, would produce a crop like themselves in twenty-four hours (and the estimate is by no means a high one), we should have on the fifth day, as the product of one such sphere, 320,000,000,000 such germs.

Or, if we take one of the larger spheres as a criterion, forty-three of which I have actually counted on one thread, and each of these maturing at the average ratio, we should have at the end of the same time 1,143,134,062,768. If any emotion of sympathy was started with the single germ out of which such a crop was produced, because its tender life depended upon chance wafting it to a suitable place for germination, and without which it must have perished, that emotion is speedily checked by a feeling of thankfulness that plants with such enormous reproductive capacities should have some limit placed to their increase.

With so much revealed from so unexpected a quarter as the leg of a fly, one might well be content to believe that there is nothing, living or growing, unworthy of our inspection. But only the half has been told. Place this achlya in a warm room. Give it the favouring condition of light and moisture. It may be found in a few days that it is dead, and even decomposed. As it had been nourished at the expense of the putrescent tissues of the animal, so it in turn serves to feed the still smaller plants which swarm in the drop of water around it, and which have been the immediate cause of its death.

As for the size of these plants which have destroyed the achlya, the mind fairly falters when an attempt is made to realize how minute some of them are. Magnify one of the least four thousand diameters, or, what is the same thing, sixteen million times, and it would fall far short of the dimensions of a pin's head. Yet, small as they are, the interest with which modern science invests them is absorbing, for within very recent times it has been rendered probable that they and their kin, the other bacteria, are the active agents in producing and propagating diseases which decimate mankind. Though these plants increase with a rapidity which infinitely exceeds that of achlya, and which we can no more comprehend than we can their size, yet they have life histories, which, in their different stages, are not the less fixed and definite, from the fact that men have until now only read a few paragraphs, and failed to solve some of the most important problems of their birth and death.

Approach the secrets of the universe from whatever side we will, and it dawns upon us that we draw near to magnitudes and forces that we cannot conceive, either in their smallest or greatest exhibitions.

Fig. 2.

"THAT'S YOUR SORT."

By S. Gillespie Prout.

AND a precious "sort" it was, to be so wonderfully exultant over!

The announcement was, unfortunately, addressed to an entirely unappreciative blue jacket, who, somehow, could not see it at all. As the three friends came swaggering down the street, taking up nearly all the pavement, and not exactly dispensing either melody or perfume, Jack, who had just come ashore on leave, in the steam-pinnace of H.M.S. *Minotaur*, and who, as befitted a fellow with a first-class rating on board an ironclad,—flag-ship to boot—wanted a wideish bit of pavement to himself, with a quiet "Port your helm, mate," elbowed into the scraped-up mud accumulations, to the grievous damage of a "gent's fashionable complete suit, at £1 4s. 11¾d.," and the loss of a "stunning" cheroot, their privileged possessor.

Poor fellow! His brief gutter experience made his recent companions, when he overtook them, most unkindly shy of his society; —they thought him a very bad sort indeed, to walk down the High Street with. It was, in point of fact, their own sort—the sort they had all been rejoicing in, arm-in-arm together, a few minutes before; but "your sort" was now very muddy, and very inodorous, and nobody can see his own sort in a companion just out of a mud-heap. No one, of course, of those whom I am talking to, is expected to recognise "*his* sort" in our discomfited young friend. No fear of the reproachful exclamation, "Oh! but I say, it's too bad of him to go and draw a fellow off like that." There are sorts *and* sorts; this one, you see, is a representative sort. The "suit" and "weed" may be of very different cut and growth—Bond Street and the Haymarket may have supplied them. "All wool," and undoubted Havana, and an opera air unknown in shilling Music Halls, may be hummed in the most gentlemanly key by their possessor—an immensely stupid "sort" all the same; really not the difference between the two varieties, of the farthing's worth of pins that made up the £1 5s. for the suit which came to grief.

The one nice little lot, including our soiled acquaintance, will turn into the flaring "palace" at the street corner, with a big ruby glass barrel over the swing doors. "Well, what's it to be?" "Eh?" wants considering cap, does that.

"Got stunning 'bitter' here. Say we try that for a beginning?"

"Have a weed, old chap, for the one your naval friend knocked from under your beak. There, that's about your sort!"

The other nice little lot will saunter up the steps of "The Royal" on the Esplanade. "Waiter, a bottle of Clos Vougeot—the '63 mind! Have cigar, Reinas? Not such a bad sort, my dear fellow."

Gents and gentlemen, "berry much alike." One of either party may be found, a few hours later, making painfully persevering, self-revolving efforts at progression, or occupied in smiling endeavours ("I can't bear these latch keys—whatever can have come to the lock?") to open the door of his lodgings with pipe stem or gold pencil-case.

Now, I'm not going to say there's no pleasure in any of this; nor in the drive to the race-course on a four-in-hand; nor in the tax-cart,—behind the gaunt, thorough-bred screw, that can do her fourteen miles within the hour,—with a two-gallon jar under the box-seat. I do not say there's no pleasure in the Billiard-room, especially if you have happened to make the big break of the evening. None, in the penny gaff, or Her Majesty's Theatre, at Rosherville Gardens, or Willis's Rooms. There *is* pleasure, of a sort, in it all, and of a very keen sort, too,—no use in denying it; but it's a sort that won't "stay."

Young fellows, indeed it's a long way off "A. 1." Any number of sorts—your sort, and my sort, and his sort, and her sort. There are some such interesting, charming sorts I'd like to talk about, but Maud and Connie would say it was "awfully bad form" to bracket their dainty ulsters and hard hats with ours, though really—but, there, we'll keep to ourselves.

We have had the Beer and the Burgundy sort; then there's the athletic sort, and the æsthetic sort, and the intelligent sort, and the "most excellent young man" sort.

"You're not going to call them all 'bad sorts,' surely?"

No, indeed. Some of them good, so far as they go, but how far is *that?* Will they *go across?* Are you sure that any one of them is the heaven sort, or that the heaven sort *will take it in?* Actually, we may say,

there are but *two* sorts—that and the muddy earth sort—God's sort and Satan's.

Isn't that putting it *rather* too strongly—somewhat sudden and startling?

Perhaps. But I don't see what else we can make of it, though I confess I have not "modulated;" we have Bible for it.

God's sort must be the "*eternal life*" *sort*. We all say "Of course" to that. "God hath given to us eternal life, and this life is in His Son." "He that hath the Son hath life: and he that hath not the Son of God hath not life."

It just comes to this: any and every sort that *has not Christ in it*—no matter what else it has or has not—has not *life*, and it is not *God's*. I'm coming down too hard upon your sort, really! You are not going to say it is God's sort, as I have put it, but—never mind the "but;" if it's not His, it's *the other*, with *no life in it*, and it's not all your own! "Prove all things," says the grand old Apostle. Ay, his *was* a sort, who is a great authority on running, and wrestling, and glorious doing of all kinds.

Shall we have a *Sort-test?* How if, *in the go on of it all*, came the message: "You are wanted"? It's *splendid* to be able to say: "Whatever comes, is right; and whenever it comes, I'm ready." Only the *having* sort say *that*.

"Of course," you say, "it's all quite right to talk of these things, but you do not see why you are going to die so soon."

Neither do I, nor yet *why you are not;* you may, and in the face of its tremendous issues, *the "may" has it*, against all the "very unlikelies" and "most probablies."

The first column of your daily paper may preach to you a short sermon that may come closer home than anything I could say. "Quite suddenly, at ——." "What! poor Fred gone?" Do you care to *think out* your own words? *Just your sort*, was he not?

But, now, I do so want you to see that God's sort—the everlasting life sort—takes in so many more sorts than you would ever have expected. Such a monstrous idea it is, that religion—or, what is an ever-so-much better word, Christianity—is a thing to give anybody "the blues," to make a "duffer" and a "softy" of him; to pull down the corners of his mouth, and turn up the whites of his eyes, and take all the fun out of a fellow; to darken life's path with "muggy" shadows, and check young, eager feet to funeral pacing. Do you now really think that God *does not like* His children to be just as happy, as *safely* they can be, on their way to the Home where He is fitting ready for them His things of undreamed-of joy? That's not *Bible* thinking, for certain. I can only tell you that the bravest, merriest—yes, we'll have the word, the jolliest—fellows I have known; men who could go in for the happiest, heartiest *swing* of life, and at a minute's notice, look grim old Death straight in the face without winking, have been "your blue lights," "your religious fellows"—men who *had* "the Son of God."

"But I can tell you," says somebody (I do so hate that old "Somebody"), "if you're going in for religion, and all *that* sort, you'll have to give up no end of things." What *will* you have to give up? A lot of life-rubbish that *won't keep*—goes so bad that it poisons you. You'll have all the things that go for true, glad living, and for glad dying. They, surely, are the *right sort*.

Suppose we end our bit of talk with two or three *don'ts?* Don't keep by you one hour, a "religion" that is not strengthened and stiffened, all through its fibre, by many a Bible "shall" and "hath." Any other is too limp and ravelled a sort for *use*. You would never take a broken, weakly, scarfed oar, to fight the beat and crash of an angry sea; nor trust the strain of a frayed, spliced hempen rope down well-nigh half a mile of gloom. Wiser, either doing in storm or shaft, than *to trust your soul to yourself!* Don't, when a particularly bad sort poses as a specially good one, say, "*That* man calls himself a Christian! Well, all I can say is, *if I'm to be like that*, I'd rather not be a Christian at all." Who asks you to be "like that"? The very worst sort going! Be *you* the real thing; if there were no real Christians, there could be no make-believes—there would be nothing to sham.

And don't, whatever you do, take up the maudlin, quasi-religious idea that this life is "all a delusion and a snare," or you'll do no good in it to man, woman, or cock-sparrow.

Life is a splendid gift to us, *real all through*, in its this side "moment," as in its for-ever outwidening. Heart-full, all-along work for your Saviour and Master, your sisters, and your brothers; athletics and æsthetics, mind, muscle, and mirth, *all put into it*. The victor-welcome into the sunless light, and song, and love-gladness of "that great city," and to the presence of the King, the eternities of grand, swift, untiring service in "the kingdom, the power, and the glory," —*that's your sort.*

NEW YORK "TURNERS" OR TURN VEREIN

(GYMNASTIC SOCIETY).

THIS society, a German organization, is the parent one of New York, and was started some thirty-six years ago. Within the building on Fourth Street there are chess, billiard, reading, and smoking rooms, ladies' rooms, committee and officers' rooms. Upon the ground floor is the gymnasium. This is a hall fifty feet wide by seventy long and twenty high, containing every species of gymnastic apparatus. Upon the next floor is the dining or supper room, an apartment almost as large as the gymnasium. Besides these rooms there is a large Lecture Hall, capable of seating 1,000 persons, lodge rooms, ladies' parlour and toilet rooms. A great feature of the Turners' social life is the variation of work and play. Formal discussions, concerts, gymnastics, chess tourneys, and other harmless and amusing performances keep all the members, who desire it, busy and interested. There is a benevolent society by which sums of £1, paid weekly, in case of sickness, and funeral expenses at death, are insured to members; the initiation fee is twelve shillings, and the quarterly dues five shillings.

This active Teutonic society publishes a weekly chess newspaper, called *Balm Frei*. About 700 men compose the New York Turn Verein, and 1,200 children of the surrounding neighbourhood are instructed in useful, health-giving exercises by this association.

The Turners' school is an admirable one, and does great good in the neighbourhood. At the schools are taught, in addition to gymnastics, drawing, modelling, and sewing for girls, and many other useful and domestic arts. The children in the school—who are of all nationalities, Irish, German, Italian, and American—are taught gymnastics compatible with their strength and their years, and even the girls are called upon to join classes in calisthenics. The modest charge for all pupils is only about two shillings per month. There is a cadet corps, composed of lads from fourteen to eighteen years of age, who are drilled twice a week in infantry tactics. The badge of the society is four F's—ꟻꟻ—from the first letters of four German words signifying happiness, joy, freedom, and peace; excellent watchwords, and illustrative of the life of this admirable society.

NOTES ON THE INTERNATIONAL SUNDAY SCHOOL LESSONS.

By Rev. J. H. Thorpe, M.A.

February 5th.

The Transfiguration.—*Matt.* 17. 1-13.
Golden Text.—*Luke* 9. 35.

THE Transfiguration in all probability took place at night for these reasons: (1) St. Luke tells us our Lord went up into the mountain to pray; this He usually did at night (Luke 22. 39, etc.). (2) The Apostles were heavy with sleep, but are expressly described as having kept awake. (3) St. Luke says they did not descend till "the next day." See also 2 Pet. 1. 18, 19. As to the light seen by the Apostles, it was not a light that shone upon Christ from above, but *from* Him, from within.

The Transfiguration may be regarded as the turning-point in our Lord's earthly ministry. Up to this, His work had been popular, crowds followed Him, and the Pharisees and others seem not to have been able to carry their hatred into overt opposition. But from this onwards, we can trace a gradual change, culminating in the cry of "Crucify Him!" This brings us to what appears to be one of the lessons of this scene.

(1) The consecration of Christ to His redeeming work. Think of the scene. Two of His most honoured servants come in glory to visit Him. Hitherto success has attended His ministry. *He knows* what lies before. What more ready than the temptation to turn aside, avoid the cross, and now return to heaven? But no! He "steadfastly set His face" to His great work, and came down from that mountain top to give Himself a ransom for us. His love for sinners never once abated, and He denied Himself the glory, and chose the cross for our sakes. (2) We have a lesson suggested by the words in St. Luke's narrative (chap. 9. 29). "As He prayed, the fashion of His countenance was altered," etc. Christ was ever a "Man of Prayer," but prayer time is the time which tells most on the character of a man. Be a man of prayer. (3) There are some to whom Christ reveals His glories more than to others. Some disciples belong to an inner circle. Doubtless those three men entered more fully into sympathy with the Saviour's work than others. They gave Him more of their love than the others. And Christ ever gives Himself to us in the proportion in which we give ourselves to Him. (4) Moses and Elias appeared. Each retained his own personality. Their central theme was Christ and His death. The believer dies, he changes his place, but not his desires or his interest in his Lord. (5) "Hear ye Him." The natural inclination of the disciples would be to gaze on the glory, not to "*hear Him.*" Visions and manifestations have had their work to do, but for us, as for the disciples, the words of Christ are our guiding stars. The importance of the written Word—our only safe anchorage. (6) See Luke 9. 34: "And they feared, as they entered into the cloud." How often it has been so with God's people. Yet they saw in it fuller, clearer, and more glorious manifestations of their Lord than ever before, just like John the Baptist, with his rough garment and plain fare, who prepared the way for Christ. The men who know most of God have often to pass through clouds. (7) Contrast the scene on the top with that at the foot of the mountain. Christ in glory above, His baffled disciples below. Christ is now at the right hand of God, and to Him all power in heaven and earth is committed. One of the secrets of power in work for Him is to believe this, and to bring all our hard cases to Him in prayer.

The object of this event, twofold. 1. As to our Lord: to encourage Him in His work and sufferings. He was capable of being influenced by human motives. "For the joy that was set before Him," etc. 2. As to His disciples: to fit them for future testimony and trials. See 2 Peter 1. 16, 17. Compare Joseph's dreams preceding his trials.

Why did Jesus take *any* disciples? Why only three? And why these three? He took some that they might be *witnesses*. Two or three the lowest competent number. It was not intended for common view. Probably our Lord discerned in them a special fitness for the reception of this revelation.

This was a miniature representation of the glory of Christ. Ch. 16 gives "the sufferings of Christ"; ch. 17, "the glory that should follow." Compare Matthew 13. 43 and Philippians 3. 21.

Moses and Elias: the heads of the legal and prophetic institutions, representing "the law and the prophets." They speak of His decease (exodus). An embodiment of the teaching of the law and the prophets. (See Luke 24. 44.)

The retirement of these, and the voice from heaven—a pictorial representation of the passing away of the legal economy to give place to Christ. "Hear Him."

Peter's utterance. Such ecstasy very delightful, but not to be leaned upon. It is good *to be* here; yes, but not to *remain* here. Christian life is not made up of raptures. The mount of transfiguration is to prepare for contact with the demoniacs in the plain.

Contrast verse 4 with Nehemiah 13. 4, 5, 8, 9.

The command not to tell the vision. Why? Prudence required that our Lord should abstain from an assertion of His full glory. To do this would have been to precipitate His death. Then it was not intended for common, idle, vulgar gaze, to please curiosity (2 Cor. 12. 2). It would have been casting pearls before swine.

After His resurrection they would understand the vision better themselves, and the people would be better prepared to receive it.

Jas. L. Stanley.

INTERNATIONAL LESSON (*continued*).

1. *Place of Transfiguration.* "Mountain."
Much said in Scripture about mountains. Isaac offered up on one; the law given from Sinai; Elijah answered by fire on Carmel; Christ tempted by Satan, etc.

2. *Privileged Disciples.* "Peter, James, and John."
Three times Christ took these disciples with Him.

i. Saviour and Death (Mk. 5. 37). Sympathy.
ii. Saviour and Disciples (Mk. 14. 33). Suffering.
iii. Saviour and Divine glory (Mk. 9. 2). Splendour.

3. *Persons seen with Christ.* "Moses and Elijah"—the Law, and the Prophets.

4. *Painful and yet precious theme of their conversation.* Luke 9. 31. Notice the journey from Mount Tabor to Mount Calvary. Trace from this scene in Luke's Gospel, and mark the word "*Jerusalem.*"

5. *Peter's sleepiness and selfishness* (Luke 9. 32, 33). Good for *us*. "Let *us* make," etc.

6. *This scene, prophetic of the coming kingdom and glory of Christ* (see 2 Pet. 1. 16-19).

Moses represents those who have fallen asleep in Jesus; Elijah the living saints who are taken away at Christ's coming; and Peter, James, and John, the earthly saints; *i.e.*, Israel on the millennial earth.

"*Jesus only.*" As your—

Justifier to clear.	Rom. 3. 26.
Example to follow.	1 Pet 2. 21.
Sanctifier to purify.	Heb. 2. 11.
Understanding to enlighten.	Eph. 1. 17, 18.
Strength to uphold.	Isa. 41. 10.
Overseer to rule.	John 13. 13.
New man to put on.	Rom. 13. 14.
Liberator to release.	John 8. 36.
Yoke-fellow for fellowship.	Matt. 11. 29.

Threefold transfiguration.

*1. Christ transfigured (Matt. 17. 2). Glory.
2. Moral transformation (Rom. 12. 2). Grace.
3. Spiritual transformation (2 Cor. 3. 18). Gazing.

* Same Greek word—metamorphōomai—translated "transfigured," "transformed," and "changed."

Three times the Father acknowledged His Son, and each time when He was in the attitude of prayer. Luke 3. 21, 22; Mark 9. 7; John 12. 28.

F. E. MARSH.

FURTHER NOTES.

A week after the conversation in last lesson. No account of what occurred during those days.

1st. TIME OF TRANSFIGURATION. Summer. Hour of prayer. Luke 9. 28. Night. Disciples sleepy. Luke 9. 32. Note also, "next day," when they came down. 2 Pet. 1. 18, 19.

2nd. PLACE OF TRANSFIGURATION. Reasonable to suppose Mount Hermon, as Christ was in its neighbourhood immediately before and after the event. Refer to other mountain scenes of Bible.

3rd. WITNESSES OF TRANSFIGURATION. *Peter, James, John.* "Three a sufficient number of witnesses to prove the fact to the world." These three most advanced in knowledge of Christ, and best able to receive these higher experiences. Twice afterwards they are His only companions. *Moses, Elijah.* Witnesses from the spirit world. How did disciples recognise them? Perhaps by traditionary descriptions, or by Christ's words. Moses representative of law, Elijah of prophets. Beautiful picture of the accomplishment of the two in Christ. Some think each appeared in resurrection body. (Jude 9.)

4th. SCENE OF TRANSFIGURATION. "A change not of substance, but of quality and appearance." Transformation scenes in nature. Scene should be pictorially described. "His face as sun." "The face of Moses had shone (Exod. 34. 29), but as the moon with a borrowed light; but Christ's shone as the sun, with an inherent light" (M. Henry). Raiment white. See Rev. 1. 14. The enveloping cloud. The glistening snowy mountain peak.

5th. CONVERSATION AT TRANSFIGURATION. Three glorified ones talk together. Subject, "*decease.*" The great event. That to which Law and Prophets pointed. Take it away, and you take away the key to Old Testament. Peter's request. Wanted to make three booths, so that their guests might stay.

Ver. 5. God's voice joins in the conversation. Same words as at baptism. The grand *finale*. The closing chords.

6th. EFFECTS OF TRANSFIGURATION. Ver. 6. Afraid, fell. The touch of Jesus. The voice of Jesus. The sight of "Jesus only."

7th. EXPLANATION OF TRANSFIGURATION. About Elias: John came in spirit of Elias. Were not to tell it, as neither hearers or tellers would fully understand its meaning at present. It was to *encourage* them. *strengthen* their faith in Christ, and *teach* them something about His work and the spirit world.

Lessons from Transfiguration:—
a. Live near to Christ, and you will be privileged to see His glory.
b. In the sweet hour of prayer come sweet visions.
c. We shall know each other in the better land.
d. The white garment here, our endeavour; the white garment yonder, our hope.
e. Christ's touch and voice the inspiration of saints.
f. Toil in the valley must follow the mountain rapture.

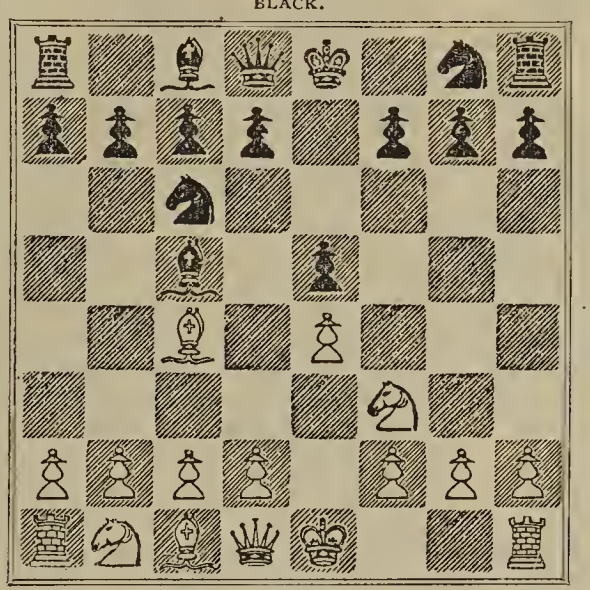
C. SKINNER.

CHESS.

By F. F. ROWLAND.

PART IX.

ILLUSTRATIVE POSITION, NO. IX.



THE OPENINGS.—In the King's Knight's Opening, after each player has moved 1P to K4, the first player (White) brings out his KKt to KB3, and the second player (Black) replies with 2Kt to QB3. White has choice of proceeding with any of the following openings:—3B to B4, leading to the Giuoco Piano, the Evans, and other important games; 3B to Kt5, Ruy Lopez; 3P to Q4, Scotch Gambit; 3P to B3, Queen's Bishop's Pawn Game; and Kt to QB3, leading to the Three Knights' Game, and the Four Knights' Game.

The diagram which we give, represents the position after the following moves:—

THE GIUOCO PIANO.

WHITE.	BLACK.
1P to K4.	1P to K4.
2Kt to KB3.	2Kt to QB3.
3B to B4.	3B to B4.

BLACK.

WHITE.

Here, White can proceed by 4P to B3, or 4P to Q3, or 4Kt to QB3, or Castles. He also has other moves; viz.: 4P to QKt4, Evan's Gambit; and 4B × KBP, the Jerome Attack, which sacrifices the B in order to expose the black king to danger.

In the King's Bishop's Opening, there are two principal sub-divisions, which stand in need of distinct names. In one, the second player plays B to QB4 as his second move, while, in the other, he plays Kt to KB3 at the same stage. These openings, like the others to which we hope to refer hereafter, often run into each other, the same position being reached by a transposition of moves. The student should endeavour to recognize the identity of position reached by different lines of play. Again, either the Evan's Gambit is a sub-division of the Giuoco Piano, or the latter is a general name for several distinct Openings. The Evan's Gambit, itself, has several varieties; the best known (besides that designated the Normal) being the Fraser, or Fraur Mortimer, the Compromise, and the Richardson.

EVAN'S GAMBIT.

WHITE.	BLACK.
1P to K4.	1P to K4.
2Kt to KB3.	2Kt to QB3.
3B to B4.	3B to B4.
4P to QKt4.	

If Black takes the P with either B or Kt, the Gambit is said to be *accepted*, but he may, with safety, *decline* it, playing 4B to QKt3, or 4P to Q4. If White 4 Castles, and 5P to QKt4, we generally obtain an Evan's Gambit, with two moves transposed.

(*To be continued.*)

CRISP CORRESPONDENCE.

W. L.—Thanks for your hearty words about our Paper. Though we receive so many, each one seems to come as fresh as the first, and brings with it new stimulus. Specimen Copies have been sent to all the friends you named. We shall be glad if *every* reader would drop into the nearest Post Office just a post-card, bearing the names and addresses of six young men; we will despatch Specimen Copies at once.

"A Lover of Wordsworth."—Look out next week for a reply to your sensible question.

Veritas.—What is the Banker's clearing House?

C. L. B.—Any MSS. or Puzzles may be submitted to the Editor for approval, but their safe return cannot be ensured unless the full name and address be written on each MS. In so many cases these are omitted, and supplied afterwards on post-cards; causing much inconvenience, and sometimes, we fear, the loss of MSS.

H. H.—We are pleased that you agree with the unanimous vote of favour awarded to our "Spelling Chase." Competitions of this kind are as useful as they are amusing, and we are cogitating over others of the same description, but even more novel and entertaining. At first sight, every one said they could spell that paragraph correctly,—but they couldn't! The vocabularies of many intelligent people are small,—pitifully so; those who, as you say, "seldom have need to write any but the most commonplace words," will thank us for an effort to enlarge their acquaintance with our language.

OF INTEREST TO YOUNG MEN.

THE decision of the Board of Education of New York City, to include manual training in the regular educational course in the public schools, is a move in the right direction. The great need to-day is more industrial education. The ancient Jews required everybody to learn a trade. St. Paul, though one of the most learned men of his nation, was a tent-maker. It was a good rule, because it prepared every man for actual service to society, and placed him, in a measure, beyond the vicissitudes of fortune. Would it not be a still better rule, if adopted in the education of both sexes? We should then no longer hear the oft-repeated parental inquiry, "What shall we do with our boys?"—and we might add, "and girls." A girl can learn shorthand, type-writing, and photography in the time now spent, and often more than wasted, over the piano. A boy with some talent for that sort of work may, without being a great artist, learn the practical art of engraving—an art that is of peculiar value to the advertiser. And, after all, it is better to be a self-supporting mechanic than a briefless lawyer, a hungry doctor, or a penniless clerk.

W. Byrd Page, of Philadelphia, the champion running high jumper of the world, whose remarkable performances, when on a visit to this country last year, will long be remembered, will retire from professional competitions after one more public exhibition at the Inter-collegiate sports in the Spring of this year. Mr. Page is in the post-graduate department of the University of Pennsylvania, and is devoting himself to the study of electricity and mechanical engineering. Though he intends to retire from active competition in athletics, he says he will never wholly abandon the sport as an amusement, and will always be ready to defend his championship against any rival.

A German, named Rothglesser, has devised a modification of the Rover safety pattern bicycle, to be steered by the saddle, thus permitting even a man on "A Safety" to ride hands off.

The Faculty of the University of Pennsylvania have banished cigarettes from the College grounds on the recommendation of Professor J. W. White, who has charge of the physical education of the students.

The first Y.M.C.A. in Denmark was organized in 1878; there are now 62 Associations. Copenhagen has a military Y.M.C.A.

In Paris there is a Y.M.C.A. for Swiss young men who live in the French capital.

A proposal is on foot to raise £40,000 for a splendid new building for the Anglo-American Y.M.C.A. in Paris.

The Italian Y.M.C.A.'s are mainly known by the name of "circoli" (general Italian term for any club) and "union."

There are 44 Y.M.C.A.'s in Italy.

The Sunderland Association has 300 students enrolled in the evening educational classes.

The Brooklyn, N.Y., Y.M.C.A. last year spent £500 for evangelistic work amongst young men.

The last report of the International Committee of the Y.M.C.A. makes the startling assertion that, in the United States, 75 per cent. of the young men of that country are never seen inside of any church; that only 15 per cent. of them can be called regular church-goers, and that but 5 per cent. are communicants. Home statistics show something different on this side.

A CANADIAN SETTLER'S STORY.

TOM was lying on a low camp-bedstead in our log-house. He had not spoken for twenty-four hours ; and now, his breathing was so hurried and feeble, that I prepared myself for the worst. Was there no help? no hope? I turned to the door with a heavy heart.

The night air was soft, the moon rising behind the gloomy pines, and from the swamp where the fire-flies hovered in the still air, there came the plaintive croaking of the frogs —the Canadian nightingales—a weird, but welcome melody, which Tom would have hailed with delight, for it told of the warm days for which we had longed.

Spring had come ; the fragrance of the moist, rich earth mingled with the aromatic odour of the fir-trees ; the forest was carpeted with anemones ; snowdrops, impatient of delay, had, at the first indication of a thaw, forced their slender blossoms through the still hardened ground. Our autumn-sown wheat was freed from its covering of snow ; one could almost see the green shoots growing under the genial influence of the April sun.

Yet how could I rejoice? What was seed-time or harvest to me, now that Tom lay dying? How hard we had worked in the fall! With what eager anticipation we had driven our rude harrow from daybreak to twilight! Was he, poor fellow, never to reap the gladsome fruits of our united labour? Was he to be snatched away, just as the farm was beginning to pay? It was terribly hard.

In my dejection, I was tempted to repine bitterly, as we have all done at times, when circumstances, with cruel perversity, wear a flinty visage, and seem to augur nothing but the ruthless frustration of cherished hopes.

But there came with the peaceful silence of the hour, and the awful calm of the great forest, a sense of God's infinite power and mercy. Could not He whose Hand controls the times and seasons, at whose decree ice and snow, and the bitter winds of winter had fled—could not He, to whom all things are possible, spare my friend's life?

I was not, perhaps, what is called "religious" ; but since our lonely sojourn amidst the wild depths of the Canadian forest, failing earthly counsel, I had sought Divine guidance in the affairs of everyday life, and learnt to give thanks for mercies which I had once accepted without discerning whence they came.

For the hundredth time that day I prayed that Tom might live. I had not been able to determine the precise nature of his malady ; but what little experience I possessed, told me that he had been for some days past in a state of high fever. He could not eat ; his skin was hot and dry, and his mind wandered, until he became unconscious ; and then the only indication of life was a faint and painful respiration. Dreading the effect of a chill during his febrile prostration, I had kept the stove burning night and day. I turned to his bedside ; his breathing was low, the heaving of his broad chest scarcely perceptible. I sat there through the long hours of the night ; and when the grey light of dawn peered through the single window, and the strange music from the marsh died away, he had apparently ceased to breathe.

Our oxen lowed from their shed ; the moonlight was waning before the pink glow in the eastern sky. Night merged into morning, and Tom lay dead! I could not, would not believe it! I took his hand, I called him by name. My eyes burned and ached ; the silence of my surroundings overpowered me. I reeled to the door, to find it was already daylight. The sun was above the trees, whose tall stems and feathery limbs stood out clear and defined, clad in tender green, and divested of the fantastic shapes which darkness had lent them.

Through that long spring day, fatigued with much night watching, I went about as one in a dream. I dug a grave by the big cedar, the tree that we had sat beneath of summer evenings, when we talked of home and boyhood's days. A week since I had ridden to the nearest settlement, twelve miles distant, and sent the news of Tom's illness to the one who had promised to become his wife. How often he had spoken of Mary Sutcliff during the past few weeks! The thought of her grief went to my heart. They had become acquainted and engaged whilst crossing from England ; she, an orphan, coming to friends at Ottawa ; he to a settler's life in the new country, and a desperate fight with toil and difficulty, until he should gain an assured position. We came, expecting an El Dorado, and at the end of three years we were making a bare living. Sleep at length overcame me, and I stretched myself upon the floor.

I may have slept for some hours, I cannot tell ; but on a sudden I awoke, seized with an overwhelming terror. I had heard a sound from within, where the corpse lay so ghastly and motionless! My heart beat loudly. I raised myself upon my elbow, and listened with a painful earnestness, whilst big drops of perspiration broke out upon my forehead, and I experienced the strange tingling at the roots of the hair, which accompanies intense nervous apprehension. Was it a low moan that I had heard? My limbs shook as if with palsy. Urged on by a dreadful curiosity, I looked into the room. By the stove sat the emaciated figure of my friend! Bewildered, utterly appalled at the awful silence and mysterious resurrection of the one I had supposed dead, I hid my face, and fell senseless to the ground.

* * * *

Two days afterwards, in the morning sunshine, came the rumbling of an ox waggon over the corduroy road a mile distant, the jolting of the heavy springless cart, and the driver's holloa. I went to the door, and through the "clearing" saw the cumbrous carriage approach, bumping over the track, now fast for a moment in the swampy soil, whilst the heavy, patient brutes strained their great loins and shoulders.

As it neared, I caught sight of a slight girlish figure, and in a moment Mary Sutcliffe had grasped my hand.

Her eyes told of much weeping, her cheeks were pale ; the bloom which they wore when we parted had left them ; she was travel-worn and looked ill. Her quick sight detected the upturned earth near the cedar tree.

"I feared that I should be too late," she moaned, whilst her eyes filled with tears. "I hastened on receiving your message, and now ——"

"And now," I cried, "you have come, and thank God you find Tom Moreland alive and well!"

I drew her within, and bade her cease her tears. A glad cry of astonishment, a shout of joy which I shall never forget, and Mary was beside her friend Tom, who, alive, breathing God's blessed air, though feeble and shaky, had been snatched from the very jaws of death.

The driver, a sturdy Irishman from the neighbouring settlement, stood with a wholly-bewildered expression upon his face.

Around our farm, there has since sprung up a fair-sized village ; and Tom and Molly Moreland are the proudest parents and the happiest couple in the whole Dominion of Canada.

To the loving-kindness of God in thus answering my earnest prayer, do I attribute Tom's apparent resurrection from the dead.

WEEKLY — Edited by MRS. STEPHEN MENZIES.

"OONALASKA:" A TALE OF A FAR NORTH LAND.

By GORDON STABLES, C.M., M.D., R.N.,
Author of "The Cruise of the 'Snowbird,'" "Thirteen Hundred Miles in My Caravan," etc., etc.

CHAPTER XXIII.

THE FIRE. SALLY'S DREAM.

THERE were no heavy seas; yet the water was now seething with foam all around, a boiling, fuming ocean of white, in which no boat could have lived for half a minute.

"If it doesn't blow any harder," said, or rather *sang* Captain Boyd to Desmond on the quarter-deck, "I should think we were pretty safe." It was about half-past ten; the stars were out, or rather they showed every now and then through the drift, and the wind was howling and howthering down from the hills, and hissing and yelling through the rigging. "I shan't turn in, though," he added, "so let me know if there be the slightest signs of a shift of wind."

"All right, sir."

Captain Boyd was unusually quiet. He sat in an easy chair, with his handkerchief of red silk over the bald spot on his crown. He seemed asleep or listening.

Listening he was to the wind. Without doubt it was increasing, and, at times, seemed to reach hurricane force.

He was sitting thus when Desmond came staggering in, wet and shiny, in oil-skins and sou'-wester.

He smiled to the company, took a look round, as if the light dazzled his eyes, filled with salt water as they were, then quickly advanced to the captain's chair, and whispered something in his ear.

"Don't think they'll bear the strain? Then, my dear sir, tell the engineer to get up steam at once. Let him clap a cake or two of blubber in, to begin with; I know he has some stowed away for just such little emergencies. I'll be up presently."

Captain Boyd then went aft to his snuggery, got on his storm clothes, and went on deck.

The night had grown suddenly pitchy dark; not a star was in sight, nor could the captain have seen anything, had they shone, for the spray was making a clean breach over the ship. He found his way to the binnacle, and gazed anxiously in. No, the wind still kept in the same direction; so far so good, and he fervently thanked Heaven.

Whish! a flash of lightning, more brilliant than he had ever recollected, lit up the ship and sea for a moment, bringing out in bold relief every mast, and stay, and rope. It quivered for a moment, then went out, and for a few seconds, all round looked ghastly blue and red. The thunder followed quickly after,—sharp, rattling, rending thunder,—that seemed to tear its way through the ship from stem to stern. A thunder-storm is rare in these seas.

No more thunder, no more lightning, but hail that cut the men's faces and hands, hail so sharp, that for a time no human being could stand against it; even the captain himself had to retreat down the companion for shelter.

This passed. Then the storm-spirit took charge of the night.

In his time, plain Jack Boyd had weathered many and many a gale in many a sea, but such force of wind he had never yet experienced. For a time it really seemed that the good ship would founder where she was.

One of two things must happen unless relief came soon, or there was some abatement of the violence of the storm. Either she must part cable, or drag and drift.

And what did either accident mean?

It meant broaching to, turning beam on to the wind and seas, and foundering in deep water.

Every one on board was only too cognisant of the peril that hung on the pall of night. Nothing was thought of but the great, the intense danger, and the doom that appeared imminent, that appeared almost on them with every extra shriek of the wind, or wicked strain and jerk of the ship.

To say that the captain was afraid, would have been wrong, but uneasy he was, and impatient. If he had been able to do anything, it would have been different.

Would they never get up steam? Twice he had asked the question, and twice been sorry immediately after he had done so, for well he knew they were doing their best in the engine-room.

Is it not usual to go to prayers at sea in times of greatest danger? Yes, but no need of that to-night, when all were praying, silently it might be, and silently it was; but the same Great Being, who "holdeth the sea in the hollow of His hand," can see the moving lips, and read the throbbing hearts of His creatures in seasons like the present.

"Thank Heaven!" muttered Captain Boyd, as the rattle of the engines was faintly heard at last, and the white steam mingled with the driving spray.

"Are we safe now, Jack?"

It was Katie's frightened, tearful face, that looked up from the sofa. She had never called him "Jack" before. He seemed not to have heeded it, but his heart was suddenly filled with a great joy.

"We've got up steam, Miss Katie," he answered, "and we shall now be able to relieve the strain on the anchors."

A whole hour went past.

Everybody was longing for daybreak, dismal though it might be, for darkness and terror are sisters.

But no one thought of turning in.

The captain had just gone below, ordering Jack to tell him at once if there was any change.

Jack came down almost immediately after.

"Engineer says the padding has caught fire, sir, and he fears the coals are all alit."

On fire! Dreadful words, on shore even. But at sea, and on such a night! On fire!

No bell was rung, no shouting was allowed; even the steward had orders to breathe no word of the new danger in the saloon.

But the word was passed speedily forward, and all hands were *summoned*, not called,* and in less than five minutes, with a regularity that would have been commendable even on a ship of war, every soul was at his quarters. The donkey-engine was started, the hose was laid on and manned, and buckets were all in working order.

Miss Graves was seated beside her cousin Katie on the sofa, both were reading the same book, and had not missed the two Nats, whom the steward had quietly beckoned from the saloon. They looked up now, though, in some alarm; for the sound of dull blows echoed along the decks overhead, and the lamps rattled in their jimbles. The men were scuttling that portion of the deck which lay over the coal bunkers for the admission of the hose.

"Steward!" cried Miss Graves.

"Yes, ma'am."

"Where are my brother and cousin Nat? How pale you look! Tell me what is being done on deck. What is that strange noise?"

"It is nothing, ma'am. They are paying out an anchor, perhaps, astern. They——"

But before he could say another word, smoke came rolling aft, the smoke of scorching wood, and the ladies knew the worst. They were braver far than the steward himself; but both fell on their knees by the cushioned locker, and in this position Captain Boyd found them, when he ran below to see how things were getting on. He helped them up.

"Your prayers are heard," he said, in answer to their mute appeal; "the fire is well under, and the wind is going down. It is clearing over the hills away to windward, and day is breaking."

Then came evidence of a fact well known to psychologists. Those brave souls, who had kept up so well while danger was extreme, now threw themselves into each other's arms and wept.

The captain waited a little. He knew better than to check such emotion at once. Then he got up slowly. "Now then, ship's mother," he said, cheerily, "where is all your courage, eh?"

Miss Graves dried her eyes, stifled a sob or two, and commenced to comfort Katie, who was somewhat hysterical, laughing spasmodically through her tears. Captain Boyd sent Jack down, for he could now be spared. No one knew better than this same honest Jack Silk, that the danger was not quite over, though lessened; but he must needs come rattling downstairs, singing. He pretended to start back in astonishment when he saw the ladies.

"What!" he cried, "do you mean to say you are not in bed? Why, I thought you turned in hours ago."

"Jack, the ship has been on fire!" It was Miss Graves who spoke.

"Steward," roared Jack Silk, "show face here. I'm dying for a cup of coffee. Ha! bring three, and the biscuits; I am sure the ladies will join. I beg your pardon," he added, nonchalantly; "ship on fire, did you say? Bear a hand now, steward. Oh! by the bye, yes, the coals *were* alight. You were not afraid, I do hope."

"How did it happen?"

"Why, easy enough. The engineer put fat under the boilers, and got up more steam than we wanted, fired the padding, and so on. But don't you see, Miss Graves, that if he *hadn't* fed the fire with fat, he *wouldn't* have got up steam, and we should have all been at Davy Jones's locker by now? Steward, you are a capital fellow. Now, ladies, have supper. Why, it is nearly breakfast time! I say, Miss Katie, you won't turn out quite so soon to-morrow, will you? Don't run away, Steward, I shall want more."

Nonchalance is an excellent thing under some circumstances, and I do not deny it was so in this case; but Jack was slightly overdoing it. Miss Graves looked at her sailor boy, as he always called himself to her, and smiled. Then she patted his hand —that was her way—but she did not speak.

By-and-by the captain returned to the saloon; then Jack Silk got up, and really looked relieved. He knew the danger was quite over now, else Captain Boyd would have remained on deck.

"Good-bye, ladies," said Jack Silk; "good-night, I mean, you know. Honolulu! I'm making a mess of it. I meant to say, Good-morning."

"Dear old Jack!" murmured Miss Graves, as soon as he was gone.

"He's a good boy," said Captain Boyd; "right and tight. A sailor every inch of him. And now, children, I am going to show you that I am master in my own ship: go to bed."

* * * *

Those asterisks are meant to represent the fall of the curtain on the events of this never-to-be-forgotten night.

Sally was always dressed most nattily for "an old girl," as Jack would call her. Her cap was a pretty thing in black, with a red ribbon in it, just by way of toning down its piratical colour; her sleeves were narrow and neat, and she wore a sort of apron, with a bit of a bib on top of it. I do not know what ladies call it, but I know it is the style of thing gentlemen like to see in a waitress, and it had a couple of pockets in front. This description must suffice, even for my lady readers: if I go farther, I may put my foot in it. However, Sally's grey hair looked pretty, I can tell you, peeping out from under the black head-dress, with its ribbon of red; and her wrinkled face, at times, would be all puckered with smiles, that kept playing hide-and-seek between her dimpled chin and her bits of beads of eyes, in the cheeriest way imaginable.

* Calling all hands in a merchant vessel is usually a very noisy performance.

Sometimes, in her eagerness, Sally would run foul of the steward, and, though it never was the steward's fault, Sally would draw herself proudly erect to her full height of four feet something, and say, "'Ave a care, Mister Steward, what you be about."

I'm afraid Sally was not quite *au fait* in the etiquette of the ship's saloon ; for example, it is not customary for servants to put questions of any kind to the captain, any more than I,—a servant of Her Majesty —dare address the Queen. But Sally had long settled in her mind, that to ask Captain Boyd how he did was altogether the correct thing, showing she took a lively interest in his welfare.

On the morning after the fire, Sally was looking wondrously fresh and young.

"And 'ow be you, sir?" she inquired, as soon as the captain got seated at the table.

"Very well indeed, Sally, thank you, for an old one. How's yourself?"

"Ah!" sighed Sally, "my poor back, sir. I would feel young, sir, if it wasn't for my poor back."

"Well, Sally, you and I are getting up in years ; we must expect to grow a bit stiff, you know. How did you sleep last night? Anything disturb you?"

In the hundred books of my boyhood, there was a much-esteemed and wildly illustrated volume, called "Jack the Giant-Killer," and one story, in particular, used to seem to me delectable. It was Jack's adventure with the Welsh giant. Jack had gone to see him on a friendly visit, and his giant-ship received him royally, and, after supper, showed him to bed, and bade him a kindly "Good-night." But, from some words that the host inadvertently let fall as he was going downstairs, Jack gathered that he meant to flail him to death before the morning light. So Jack—and it really was very clever of him—instead of going to bed himself, put the roller of the mangle, or something of the sort, under the sheets, and drew his own nightcap over the top of it. Having done so, he hid behind the window-curtains, and waited.

At midnight, or, as Burns calls it,—

"That hour, o' night's black arch the key-stone,"

the giant stalked in with his club. He listened for a moment at the bedside, and, as no sound of snoring came from the mangle-roller, he concluded Jack was very fast asleep, and proceeded to operations. Having satisfied himself he had done the deed in the most satisfactory manner possible, he strode off. He was naturally somewhat surprised when Jack came down to breakfast, and his curiosity prompted him to ask his guest precisely the same question Captain Boyd now asked Sally.

Jack's answer was,—

"I slept first-class ; but about midnight a rat came and whisked me with his tail. That was all."

Sally's answer was,—

"Oh, sir, which I did sleep uncommon sound. You see, the ship was ashore-like, sir, so I wasn't afeard, an' the wind, sir, a roarin' through the sticks, and the twine, and things, made me think they were trees. And, sir, I dreamt my darter, poor dear, were a-baking, sir, and made a bed for me in the oven, and it did feel so comfortable!

Well, seeing that Sally's little cabin was close to the coal-bunkers, and the engineer had forgotten to wake her, it must have been pretty comfortable. But all is well that ends well, so the captain and the ship's mother exchanged glances, and both laughed.

The wind had died down almost as quickly as it had risen, but the waves outside were houses high. It was just the day, however, to see the sea-lions in all their glory. With the exception of the birds,—and they had seen enough of them on Walrus Island,—the lions are the principal sight on St. George. Right away round the east corner of the island, was a place much frequented by these monster seals ; whether or not it be still their habitation, I do not know.

A blacker, wilder, lonelier place, however, it would be difficult indeed to imagine. The cliffs here, that frown over the deep dark ocean, are tall, bold, and almost over-hanging. During some terrible convulsion of nature, a portion seems to have tumbled down. It looks as if it had been sliced off, and dashed into a million boulders or fragments at the cliff-foot, forming a kind of rough beach, with here and there a splintered, needle-like rock, towering upwards into the sky, though close to the beach, showing the place to which the rocks in bygone times extended.

A more dreary-looking, weirder-looking point of land it would be difficult to conceive ; and as the boats rounded the corner, and opened up the bouldered beach, they came upon a scene which defies description. It was the home, during the breeding season, of the sea-lions. They were here in their grim and awful thousands, and greeted the arrival of the boats with a chorus of sound that seemed to shake the very cliffs overhead. At a signal from their guides, the men lay on their oars.

CHAPTER XXIV.

WHAT KATIE SAW AT ST. PAUL'S.

THE waves here had fine play. They were little hills, and whenever the boats sank in the trough of the seas, nothing was visible to those on board, but the sky and the frowning cliff-tops. Anon they were raised cloudwards, and then it could be noticed how the water rose, and surged, and dashed among the boulders where the sea-lions lay ; and how madly the bull-lions played and gambolled on the swell and among the breakers, allowing themselves to be carried in towards the rocks, then disappearing for a moment under the surf, only to come up again away out among the swelling seas. Some rose quite close to the boats, and even stayed to stare and wonder, and Katie had time to notice that they were of different tints, not black, as they looked at a distance, but brownish, and even greyish. Their awful heads and eyes, and the terrible strength of shoulder raised above the wave, made Katie tremble from head to foot, and creep close to her cousin, as if for protection. But when one of the monsters roared threateningly, displaying his cruel fangs and rolling his eyes, even Miss Graves herself was frightened.

I fear I cannot well describe the roar ; it is a deep bass bellow, the last part of it appearing to be sucked in again over the teeth. I can go no nearer in my description than that, but if any of my readers should happen to come across me next summer in my caravan, the *Wanderer*, I may be inclined to get up a vocal display for their benefit.

Our people landed on the beach near a rude village of native huts, and the villagers swarmed round them, both male and female. They were, if possible, uglier and less romantic looking than those Aleuts they had seen on St. Paul's. But they were the quintessence of civility, and in returning their salutations, Jack Silk raised his hat.

Both Katie and Miss Graves had brought them presents of tea and tobacco, and Jack carried a huge bag of lump sugar. This he made them scramble for, throwing it broadcast in all directions, as if feeding fowls, and the antics of the strangely-dressed and uncouth natives were comical in the extreme.

Then Katie proposed a walk. It was, indeed, a brief one, and very tiresome, though, had they been naturalists, there was much that was well worth study, for grasses, mosses, and wild-flowers were sometimes very charming in colour.

But everywhere here, man is met with the evidence of man's cruelty to the poor beasts, who make the island their home in the breeding season. Jack and young Nat went back to this part of the beach that same evening. There was going to be a great sea-lion drive. A bit of a moon shone faintly between drifting clouds, so the night was considered favourable. When the tide was at its lowest, the two friends, with a company of natives, armed with sticks and pieces of cloth to wave, left the dark shelter of the rocks, and proceeded to crawl along the water's edge, till finally they got between a drove of lions and the breakers. Now was the time to spring up with wild shouts and wilder contortions, to rattle clubs, and wave the pieces of cloth. Then commenced the maddest and most awful *mêlée* that our heroes had ever been engaged in. With a roar that shook the hills, the lions came dashing on towards the sea ; nothing could stop them. Jack and Nat were both knocked down, and when they got up, thankful they had escaped the fangs of the startled and enraged monsters, they noticed that the natives were driving at least twenty lions inland. It was a pitiful sight ; the poor unwieldly animals soon became cowed and tired, but were frightened and goaded on, and their roars and rage were changed, so Jack thought, to a mournful wail, wrung from their very hearts. Those Aleuts had no mercy. The lions were wanted, so on they must drag themselves. They were penned at last, being surrounded by stones and driftwood, and from this prison there would be no escape, except by death. Rough sailor though Jack was, his heart bled for those unhappy-eyed creatures, many of which, no doubt, they had seen, only that morning, sporting among the waves and breakers. The killing by clubs, I refuse to describe ; such scenes have shocked and sickened me many a day, and I would not even hint at them, did I not believe with Landseer, that the depiction of the sorrows of the beasts that mourn, tends to soften, rather than harden the heart. Who, for example, could gaze for a moment at the great artist's picture of the hound-hunted deer, without feeling compunction and pity for the animal? or at that of the little Scotch terrier, tied to his kennel beside an empty dish, with no one near to help or set him free, without a pang of sorrow?

The scene changes now, and the *Oonalaska* is back once more in the English bay at St. Paul's. Chips and his merry men have made excellent use of their time ; under the direction of Godfrey, Turlough has been busy photographing, Boy Bates doing a little of everything, and the natives affording able assistance, so that, lo, and behold! a big barrakie is built of rocks and driftwood.

Compared to some of the miserable half-underground huts of the natives, it is quite a palace or town hall. It is roofed and thatched

with seaweed ; and the crevices in the walls are all neatly stuffed with grass and moss.

Inside, there is a level floor and seats ; and at one end, a kind of stage. Yet, marvellous to say, this hall by the sea has arisen from chaos in the short space of four days. This is the headquarters of Katie's picnic, and her idea of giving the principal natives a treat has been carried out to perfection.

But, first of all, a thorough inspection of the island took place. They were favoured by a fine day. Why, the ground actually steamed under the sunshine, and the Aleuts found it hot. Even the fur-seals, that generally lie so snug and close, must to-day scramble and shamble, every now and then, on to the beach to bathe.

Sly Jack Silk never told the ladies of one particular part of this "school-treat," as he called it. But when they got out of the boats, and wandered up through a crowd of wondering seals, who hardly made room for them, Katie and Miss Graves laughed to find eight bold blue-jackets, dressed in their best, carrying a couple of hammocks suspended from poles, quite Madeira fashion.

"Well, you see, Miss Katie," said Jack, by way of explanation, "it is too rough for you to walk, though mother might have done so."

"Thank you, Jack Silk," from Miss Graves, ironically.

"It is the truth, mother."

But Jack Silk had made one mistake, viz., in having sailor-bearers. Sure-footed and all as they were, they were utterly unsuited for the road. They were too rough-shod ; so, after once or twice very nearly "spilling the ladies out," much to the amusement of a crowd of girl and boy natives who followed the strange procession, the jack-tars were politely dismissed, and Aleuts, pure and simple, were hired to replace them. I am, however, not quite correct in saying "pure and simple." Simple they were, without doubt ; but with those oily oil-skins, and those boots composed of sea-lion throttle and flipper, they looked greasy, to say the least. However, they were very willing, and the way they got over the ground, whether sand or boulders, and up the hills and over the cliffs, was quite remarkable. The officers of the *Oonalaska* followed, Godfrey alone keeping alongside of the hammocks. It would take me a week to describe even a twentieth part of all the wondrous sights the ladies witnessed in that hammock-ride. I can but mention a few, on each one of which a long essay could be written.

Well, first and foremost came the seals, principally the fur-seals, that lay on the sands of the breeding grounds, or on the cliffs and banks innumerable—even as sheep on a highland hill-side. Seals in the sea, as well, sporting on every billow ; old seals and young seals, male seals and female seals, all looking so wise and so beautiful, and wee baby seals—that Katie must needs get out of her hammock to lift up in her arms and fondle—just like little babies rolled up in soft dark flannel, and quite as innocent-looking, for they are never cross. Fain, very fain, would the girl have taken one of these bonnie wee ones away as a pet ! But how could she, with the fond, liquid eyes of the anxious mother watching her every movement ?

Seeing her interested in seal-life, the head Aleut, who could speak a little English, told her many strange stories about these animals, —about the mother's affection for the young, how they taught them to swim, and about the strange tricks the seals play.

Concerning everything connected with animal life around these wondrous islands, this old Aleut was an authority. His descriptions, too, although couched in almost childish language, were graphic in the extreme. While he talked, you could follow every incident, however minute, in his story. The seas he described were moving seas—windswept—and the creatures therein, or among the hills and on the beach — anywhere, everywhere—were presented to your imagination in a form so vivid, that the impression made was instantaneous and indelible. The man had been born and cradled among these creatures of the deep, and, all his life, had mingled with them, and listened, one might say, to the stories of their lives. The hammock-men carried the ladies to the top of a high cliff, perilously near the edge, too, and therefore, far, far down beneath, they could see the seals frisking and tumbling in the deep, clear sea ; chasing, racing, darting, driving—leaping out of the water, leaping over each other—standing on their heads, floating tail down, and assuming shapes, at times, so ridiculously comic, that Jack Silk laughed aloud, and everybody else followed his example. On this sunny day, the hills and valleys, covered with waving grass and willows, and wild flowers pink and yellow, with isolated patches of moss of the most vivid green, were a sight to witness.

Well, there were foxes about, and strange wild cats, besides a queer little animal among the rocks, which was neither a rat nor a squirrel, but somewhat like both. Katie asked her guide about it. He told her the creatures came from the clouds, and quickly changed the subject.

As the tourists were returning, they saw two boats pull up on the beach ; one contained the Russian ladies, the other Captain Boyd himself, old Sally, Robin Hood, and Little John.

It would be difficult to say which of the latter three distinguished persons was most frightened at the spectacle the seals presented. Sally was duly escorted up the bank by two stalwart blue-jackets, but the dogs stood still for a time, and refused to move. Their heads and tails were held defiantly high, their hair stood on end from stem to stern, and, though it was impossible to hear them, it was evident they were barking. Seeing, however, that this had not the slightest effect upon the seals, Robin Hood gave just one look round to Little John, as much as to say, "Come on, John, we've got to go, so here's for off."

With a series of movements, which would best be described by the words, "hop, skip, and jump," these monster dogs came bounding over the seals, and arrived at the bank grinning all over their honest faces, as if they deemed it the best joke in the world.

But the ladies are waiting, and the villagers, too, crowd round the new hall door. The entertainment is just about to commence.

(*To be continued.*)

THE SEVEN WONDERS OF THE WORLD.

The Pyramids first, which in Egypt were laid ;
Next Babylon's garden, for Amytis made ;
Then Mausolus's tomb of affection and guilt ;
Fourth, the Temple of Dian, in Ephesus built ;
The Colossus of Rhodes, cast in brass to the sun ;
Sixth, Jupiter's statue, by Phidias done ;
The Pharos of Egypt comes last, we are told,
Or, the Palace of Cyprus, cemented with gold.

TOLD IN A LINE.

NEXT week we hope to give the final awards in several Divisions of our Literary Competition. Don't miss the Number !

The Examination of the remaining Divisions is going forward briskly, and the results will be announced in our Number for Feb. 25th.

We have also in hand the Spelling Chase, the £100 Competition ; and the Definition Competition (closing to-day) will be upon us by the next post ! We need a large Office, and plenty of patience. The Acrostic Competition, happily, is not due until Feb. 29th.

In our next, a striking Article for Young Men, from the gifted pen of Emily S. Holt.

MY FRIEND.

(AN IDEAL.)

HE must live on the hill-top of life,
Very near to the sun and the blue ;
And his soul shall be clear as the light
That the shadows of earth pierces through.
And his heart must be strong for the right,
And his aims must be earnest and true.

2.

He shall love all things lovely and pure,
All his thoughts shall be lofty and sweet ;
But yet lowly his heart, as the flower,
That in silence springs up at your feet ;
All unconscious of praise or of power,
Growing fair, 'mid the dust and the heat

3.

For the good he shall mightily strive,
Ever willing to spend, and be spent ;
For the law of his life shall be love,
That bends low for a noble intent.
He will suffer to draw men above,
And to urge them of sin to repent.

4.

In his heart there is room for the sad,
And the outcast of ev'ry degree ;
For his pity all treasure transcends,
And he asks only love for his fee.
Oh, his kindness, like showers, descends,
And his sympathy's wide as the sea.

5.

For he trusts to a Power not his own,
To uphold him 'mid conflict and strife ;
And he leans on an Arm that is strong
To protect 'gainst the dangers of life.
So, all fearless, he sings his glad song,
Though the shadows of darkness be rife.

6.

Yea, my friend, did I say?—but not yet
Have I found him of whom I have said ;
But what time we shall tenderly greet,
All the pale flowers of life will turn red.
Do you ask me, Where tarry his feet?
Ah, I know not. Perchance he is dead !

JOAN JASPER.

LOVE, COURTSHIP, AND MARRIAGE.

By PHYLLIS BROWNE.

No. 6.—Married Life.

OLD married people very often say that the first twelve months of their married life were by no means the happiest, and that many times before they were over, they wished themselves single again.

We cannot wonder at this. It is a great change for two people, who have both got into certain ways, and acquired settled habits, to leave those with whom they have lived from childhood, who understand their little peculiarities, and know where to look out for awkward corners, to take up their abode with an individual, who is accustomed to quite different ways of thinking and acting. The trial is also the greater when marriage rubs the gilt off the gingerbread of courtship, and changes the romantic into the matter-of-fact.

The happiest marriages are those in which this change never occurs; in which wedded lovers remain lovers to the end of their days, and grow more, instead of less, lover-like. If only people would see that they are as much bound, after marriage, to be attentive, considerate, and polite to their other halves as they were before the nuptial knot was tied, wedded life would be more often a success.

There is a story of a certain man, who, being very miserable on his marriage, asked a friend's advice about getting a divorce.

"How did you treat your wife when you were courting her?" asked his friend.

"As well as ever I could," was the answer, "for I loved her dearly."

"Then if you want my advice, I say, Go home and do that again for a year, and see what happens."

At the end of the time the husband called on his friend. "I took your advice," he said, "and I have come to tell you that my wife and I are as happy as we can be, and that I mean to court her all the days of my life."

The sacred writer tells us that "he who findeth a wife findeth a good thing." It would be just as true to say, that "she who findeth a husband findeth a good thing." When it turns out rightly, the marriage relationship is the best thing we have on earth. When it turns out badly, it makes everything else bad. Those who are truly married—married in heart as well as in hand—need never be lonely, never want for advice, sympathy, and help.

Sometimes, when a man has made a mistake in his dealings with his fellows, friends turn away from him, and acquaintance blame him. He goes home to his wife; she stands by him; she is indignant with those who have misjudged him; she is very, very slow to believe that he can ever be in the wrong. So, too, if the wife gets into difficulties, the first person she goes to is her husband. He comforts and cheers her, he smooths difficulties out of her path, and advises her how to avoid them for the future. If she has been in the wrong, he makes excuses for her, and will not hear her blamed overmuch, even by herself. Sympathy of this kind is most helpful. To be believed in by some one whom we truly love, tends to bring out the best in all of us.

There is little hope of wedded happiness when a husband or wife confides in a third person about the other's little failings. Confidences of this kind are little short of treachery; they certainly, to some extent, account for the faults which are supposed to have called them forth. If ever we hear of a man saying, "I have a good deal to try me at home. My wife has a very bad temper, she is impatient with the children, and she is constantly grumbling and complaining," we have reason to think: "Poor woman! she has enough to make her bad-tempered. She has a husband who is not true to her." If we hear of a woman saying, "My husband is unreasonable, he is never satisfied, he wants me to do more than is possible, etc.," we have reason to say, "Your husband is an unfortunate man. He never will have cause to be satisfied with you, because you are not true to him."

Let husbands and wives learn this lesson, to keep their misery to themselves. If they are unfortunate in their marriage relations, they will only make matters worse by telling of them. If things are really wrong, we might as well raise our household gods in a pile, set fire to them, and try to warm ourselves at the blaze, as think to put what is wrong right by proclaiming the mischief abroad. It never does any good to bring out-

siders between married people. If wedded folks cannot work out their problems together, they will never work them out at all.

If marriage is to be happy, no secrets must come between husband and wife. It is sometimes said that women cannot keep secrets; but the wife, who for years has been the trusted guardian of her husband's innermost thoughts and hopes, has rarely any difficulty in keeping the door of her lips.

A cynical old bachelor once advised a friend: "Never tell a married man anything. He will tell his wife, his wife will tell her mother, and her mother will tell everybody."

This charge is unfair. Married women who are gifted with only a small amount of sense, are so proud to be trusted by sensible men, that they become usually most discreet. If they are liable to make a mistake, it is in being too reticent rather than too talkative; and a family secret would be more easily drawn out of the average man than out of the average woman. In this matter popular opinion has been unjust to women.

We all remember the story of the mother who said to her children, that if they wanted to make home happy, they must keep and cherish two bears—Bear and Forbear. This remark is as true for married people as it is for children. We are none of us so perfect that we do not make constant demands on the patience and good temper of those who live with us. It is a happy thing for us if these kindly dispositions flow from love rather than from pity. Married people are supposed to love each other more than all the world besides. They know one another's faults and small weaknesses; they understand where the shoe pinches, and can put their finger at once on a tender place which feels the twinge. If they will be on the look-out, they may prevent many a stumble and many a small annoyance.

The management of the income has, perhaps, as much to do with making or marring the happiness of married life, as anything that can be named. The old proverb says: "When poverty comes in at the door, love flies out of the window." There is never so little likelihood of a mischance of this kind as when husband and wife join hands together to close the door against poverty. Some men have no notion of letting their wives help to make both ends meet. They look upon their wives only as housekeepers, who are to be persuaded, coerced, or cajoled into providing as many comforts as may be with as little money as possible. Some women also look upon their husbands chiefly as purse-carriers, who are to be bled judiciously until they furnish money for this extravagance or the other. Both husband and wife are undoubtedly to be pitied.

A wise American once said, that if a man would become rich, he must first ask his wife's leave. The husband who stints his wife of money that he is able, and that it is reasonable to give her, is not doing what is best, either for himself or for her. The best way of managing a woman is to trust her, and to treat her liberally. A woman must be very bad who does not respond to trust. The woman who pulls *with* her husband can do far more to help him than one who pulls contrary to her husband's direction.

Last, but of first importance, there can be no real happiness in marriage unless husband and wife are united in being the followers of Jesus, and the possessors of His Spirit.

"Can two walk together except they be agreed?" asks the sacred writer; and for walking together through life, agreement concerning religious faith and hope is most necessary. When two people have resolved to give up their self-will, and reverently accept the will of God; to disregard worldly motives, and to try earnestly to live their daily life and do their daily work as in the great Master's eye; when they take the teaching of the Bible as their guide in conduct, and when they both have the inward consciousness of God's presence, they cannot but be united and happy, with a happiness which no storm can ruffle, and no calamity destroy. Nothing unites like Christianity. The peace and satisfaction arising from outside circumstances may perish; the peace from within remains. For married people, who together possess this peace, home is a temple, every hour is an opportunity for service, every task is converted into work for God, and marriage, which is the sweetest of all human relationships, becomes merged in relationship with God.

The reverse of this presents the saddest spectacle,—though one, alas! not unfrequently seen. The influence upon children, and in other respects, is very disastrous. There are few commands which it is more important to remember than the Divine injunction to Christians: "Only in the Lord."

THE ETHICS OF FOOD.

By the Rev. J. Hiles Hitchens, D.D., F.S.Sc., Author of "*Ecce Veritas*," etc.

HUNGER and thirst are words, which convey far more to the mind than human language can explain.

They are words which conjure up before the mental vision a whole troop of heart-rending results. They represent two tyrants, who are closely attended by agony, theft, ferocity, murder, degradation, disease, and death. Doubtless, the reader has been hungry and thirsty, but has never known the terrible agonies of starvation, or the torture arising from absolute privation of drink. The latter is worse than the former. Men have been wholly deprived of food for weeks, and have survived; but the limit of endurance from thirst is said to be three days.

The primary cause of hunger and thirst is the absence of food and water to supply the waste which is incessantly going on in these physical organisms. Every moment, whether we are conscious of it or no, there is a sacrifice of some minute particles of our living fabrics; every moment there is passing away from us, invisibly, a mass of water in the form of vapour. An estimate has been given, to the effect that there is daily evaporated from the skin from two to three pounds of water. The body of man has been frequently compared to a locomotive engine, and the food which he partakes of has been likened to the fuel. To a certain extent, the analogy holds good, but it is by no means a perfect illustration. When the fuel in a steam-engine is consumed, the motive power ceases, and the engine stops. There is no activity when the heat is gone, and there is no heat when the fuel is gone. But in the animal organism it is very different. The vital heat is produced by, and is not productive of, activity; and the activity is fed by the bodily tissue which the food is designed to repair and replace. So that, unlike the steam-engine, our bodies live upon themselves—consume their own tissues. Food is designed to replenish where there has been expenditure; and where there is a total absence of food, the bodily powers feed upon themselves till death ensues. Hunger and thirst are, therefore, gracious and God-given instincts. They tell us when our physical systems require attention and supply. Though they have been productive of so much sadness and sin, yet they have stimulated to untold excellencies and efforts.

Hunger and thirst must have characterised our first parents when in their pristine state. The Eternal One, when He placed them in the attractive garden, and surrounded them by all that was delightful to the senses, made provision for the calls of appetite. He said: "Of every tree of the garden thou mayest freely eat: but of the tree of knowledge of good and evil, thou shalt not eat of it." Eating and drinking were necessary before the Fall. But eating and drinking were not then attended by the hardships, sins, and discomforts which have so largely accompanied them ever since the Fall. It was not till the fatal declension of Adam and Eve, that man had to toil for his daily subsistence. It is a part of the curse—"In the sweat of thy face shalt thou eat bread."

But, alas! since Eve ate the forbidden fruit, and gave thereof to Adam, the tendency of humanity has been to intemperance in feeding—as though the devil, having accomplished the downfall of man by eating, resolved to make the mouth his vassal. In all ages, by gluttony and drunkenness, he has acquired the mastery over hundreds of our fellow-pilgrims. Noah and Lot were overpowered by drunkenness. The awful doom and subsequent destruction of the cities of the plain are traced in Scripture to gluttony, for Ezekiel ascribes their ruin to "fulness of bread." Nabal, Elah, and Benhadad were all guilty of shameful intoxication. Belshazzar and his godless guests were all feasting to disgraceful excess on the night Babylon was taken, and the king of the Chaldeans slain.

Into the Church at Corinth intemperance crept, when the members turned the Ordinance of the Lord's Supper into an opportunity for inordinate eating and drinking. Satan, we know, in these cases succeeded. Having achieved a victory over the first Adam, he hoped to defeat the second Adam—the Lord from heaven—when, during the forty days' fasting, the arch-fiend said to Jesus: "If Thou be the Son of God, command that these stones be made bread." The devil's first temptation of Christ was an appeal to the sense of hunger. That temptation the Redeemer perfectly resisted, by reminding the tempter that man has nobler capacities than the merely physical, and rarer food than the richest of earth's dainties; and that he whose spirit feeds upon the words which proceed from the mouth of God, shall never long need physical nourishment. Looking to his supreme interests, God will take care of the rest.

And does this not bring before us the true light in which to look at our physical necessities and supplies? Does this not suggest that man should remember that eating and drinking do not form the object of life—that feeding is not the end of existence here, but the means to a nobler end? Yet there have been, and still are, hundreds of men whose life-motto seems to be: "Let us eat and drink, for to-morrow we die!" Regardless of all future consequences—regardless, indeed, of the personal and relative results of indulgence—regardless of the disease they bring upon themselves, of the disrepute they incur in society, and of the bitter sorrow and want they lay up in store for their relatives, there are men whose first thought in life is—"What shall we eat, and what shall we drink?" They are the people of whom the Apostle writes when he says: "Their god is themselves." All they can procure for the mouth is only so many offerings to this impotent and iniquitous idol.

We read of Vitellius serving at a feast, 2,000 fishes and 7,000 birds; that Heliogabalus was at one supper served with 600 ostriches; and that Cleopatra spent £50,000 at one repast, by dissolving in acid a pearl valued at that sum, and then drinking it. Such instances stand out notoriously in history, but they are not solitary cases. Indeed, the luxury of modern times threatens to be one of the greatest evils society has ever known. Civilised and Christianised though this country is, there is yet need that we should keep before us the heathen motto inscribed on the walls of the temple at Delphos—"*Avoid excess.*"

The consideration of health should influence us. One of the grandest boons bestowed upon us by Heaven is that of health, and it is the duty of every man to regard his bodily powers as talents lent by God, for the use of which he must be accountable. Those things should be shunned which we know to be injurious, and those sought which promote health and well-being. Nowhere in Scripture is a man directed to pursue the life of the old Anchorites, who separated themselves from society, and, living in the desert, fed on roots and plants. Nowhere is a system of continuous fasting to the maceration of the body recommended. Nowhere are we called to that penance which the Romish ritual prescribes, and which oftentimes unfits a man for active service.

But we are exhorted to temperance—that is, self-discipline or abstinence from evil; and we shall do well to imitate the Apostle, who aimed to keep his "body under," or in full control. The wise man was right when, in Ecclesiastes, he wrote: "Blessed is the land when princes eat for strength, and not for drunkenness." Romanists tell of a sacred chamber of the Virgin Mary, called Loretto, which they believe was carried in the air from Syria, and placed where it stands in Italy. That is mere fiction, but the Gospel reverses matters into undoubted fact, reminding us that our bodies are houses, that shall be one day incorruptible, and glorified, and translated to heaven. They should *now* be rightly used and duly honoured. Milton well writes:—

"If thou well observe
The rule of *not too much*, by temperance taught,
In what thou eat'st and drink'st, seeking from thence
Due nourishment, not gluttonous delight,
Till many years over thy head return:
So may'st thou live, till, like ripe fruit, thou drop
Into thy mother's lap, or be with ease
Gather'd, not harshly pluck'd, in death mature."

Another safeguard of temperance is the free exercise of reason. Whatever tends to disturb the balance of the mind, and render the voice of reason weak or uncertain, should be most rigidly avoided. Intemperance in feeding is sure thus to harm the mind. Hence the men who have done much in the world—who have lived for future generations—have been temperate men. Socrates was famed for his sobriety; thereby he enjoyed a strong constitution, and when the plague swept off the inhabitants of Athens, it left him unscathed. Galen lived to the ripe age of ninety, by making it a rule ever to rise from the table with an appetite. Luther was very abstemious; his friend Melancthon says that, for many days together, he has known him content himself with a small piece of bread and a herring, declining all invitations to social feasts.

Not without moderation could Calvin have preached every day at one period of his life, whilst, at the same time, he compiled his voluminous commentaries. Milton rose for study at four in the morning during summer, and five o'clock in the winter; Richard Baxter, whilst a preacher, published more books than any man of his age; Doddridge began study at four in the morning, was twenty years writing his "Family Expositor," whilst discharging many pastoral duties; Edmund Calamy studied sixteen hours a day; Samuel Rutherford began his day's work at three in the morning; Jonathan Edwards spent twelve hours each

day in study. Owen was the author of 28 volumes, Goodwin of 20, Lightfoot of 13, Jeremy Taylor of 15, whilst, nearer our own times, there have been remarkable instances of hard, long, and most prolific work in every realm of art and literature. But none of these men would have been what they were—none would have accomplished what they did—had they indulged to excess in the pleasures of the table.

"Temperance and proper diet
Kept the mind and body quiet."

The recognition of our religious obligations should always prove a safeguard. The Apostle says: "Whether ye eat or drink, or whatsoever ye do, do all to the glory of God." If a man kept ever present to his mind the thought that he is created and preserved for the purpose of glorifying the Almighty Father, could he stoop to brutish gratification? Is *that* to the glory of God, when a man eats till he is unfit for labour, or drinks till reason has departed? Can a man seriously ask God's blessing upon his excessive libations? Can the glutton or the drunkard bow the knee before High Heaven, and render thanks for the indulgence of the table? Does he not mock his Maker, when he takes solemn, sacred words upon his fevered and ungoverned tongue? As he reels to his chamber, can the inebriate engage in heartfelt devotions? Must he not feel, in the hours of quietude and consciousness, that he has grossly abused the gifts of Providence? The act of taking food has no moral worth, except the object of the partaker be to obtain strength for the duties of life which devolve upon him. But when the man exceeds the bounds of moderation, he unfits himself for those obligations of life, and so sins before God. Trapp quaintly but truly says: "They serve not the Lord Jesus Christ that serve themselves. How can they when their kitchen is their shrine, their cook their priest, their table their altar, and self their god?"

One other thought, reader, before we close this paper. The means that Satan used to accomplish the ruin of man, God uses in accomplishing man's restoration. As sin and sorrow entered the world by eating, so Deity sanctifies the appetite, and nourishes our souls thereby. Right through the Scriptures, there are plentiful allusions to eating and drinking. Very early was eating associated with religion. When any great event was to be commemorated, a ceremonial, involving eating and drinking, was felt to be the most effectual. The Paschal Lamb and the unleavened bread were suggestive emblems, pointing the thoughts of men onward to the provisions God would make for the necessities of humanity. In the Christian Church, the early followers of our Lord broke bread from house to house, and had their ἀγάπαι, or love-feasts, which were designed and adapted to bring into lively exercise the better feelings of the heart. There was also the institution of the Lord's Supper, designed to be a perpetual commemoration of the dying love of the world's Redeemer. Nor can we overlook the constantly recurring figure of the heart as hungering and thirsting, and of Christ as affording true bread and water for our spiritual cravings. There is Heaven-sent food; there are God-prepared viands; there is the "Bread of life;" there is a fountain opened—a perennial stream of vitality and happiness provided. Why, then, need any man walk this world *unsatisfied*, crying: "My soul thirsteth for God, for the living God. My soul thirsteth for Thee; my flesh longeth for Thee in a dry and thirsty land where no water is"? Jesus says: "Let him that is athirst come, and take of the water of life freely."

ALCOHOL AND TOBACCO:

THEIR ADVANTAGES AND DISADVANTAGES.

(1). *Alcohol.*

ONE of a man's first arguments in defence of drinking is, that if he turns teetotaler, or becomes a rigid temperance man, many of his friends will, more or less, look down upon him, and others will consider him unsociable. Now, as regards the first, it is only too true, that there are a great many men who do despise a mate who is not ready to have a drink with them now and then. But this is only just at first, and on further acquaintance, a man likes or dislikes his mate according to his real worth.

As to the sociability, which is a great argument in favour of alcohol, teetotalers and temperance men are now becoming so general, that men begin to find that it is not absolutely necessary to sit and drink alcohol, in order to have a friendly talk. There is no doubt that a great many men ask a man "to come and have a drink," in order to make friends with him. But it requires, now-a-days, very little moral courage to go to public-house, bar, or refreshment-rooms, and not partake of anything, while your friend does; though, often, your declining will be the cause of preventing him from drinking, when he has really no more wish to drink than you.

Men are getting used to temperance now, and do not look upon it in the same way as they did, when teetotalism or temperance first began to be preached.

Take nine-tenths of the youth of the present day,—when a man says to them: "Come and have a drink," or "What will you take?" they are not thirsty, neither do they want a glass of anything; in fact, they would often give a good deal to avoid it.

What is it makes them go?

(1) They want to be friends with the man who asks them. (2) They are afraid that he will rather look down upon them if they don't keep him company, and are, generally, unable to give an excuse to their satisfaction; for I have always noticed how a boy or youth is prolific in excuses, under such circumstances, to avoid, as he thinks, being thought unmanly.

Now, as to the first motive, I can assure you that hardly any real friends are made in this way; they are mere acquaintances. With regard to the second—If he who declines is a fairly fine, healthy-looking fellow, the man who offers cannot but be struck by that fact, and often wishes he were as well, physically, himself. I have several times remarked that a strong, healthy man does cause such a feeling. It does, I think, require a little more moral courage for a weakly man than for a strong man to decline.

The time of hard drinking—*three bottlemen*, and so on—is quite gone by, and the upper classes now are causing wine merchants a good deal of anxiety by their greater abstemiousness.

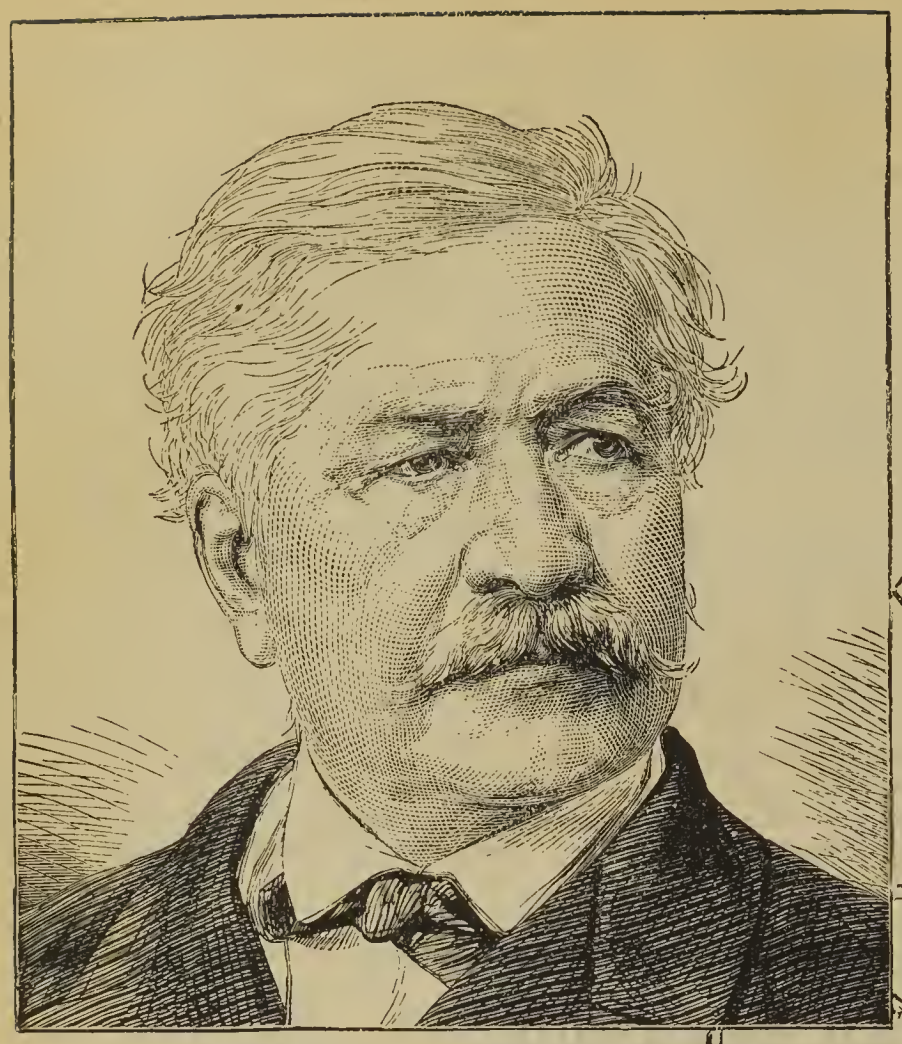
Why should not the brewers and spirit merchants feel the same thing?

Simply because the lower classes are behind the times in the general reformation. I always, for my part, admire a boy or a youth who declines to drink when he does not want to; yet, how few of them ever begin to take a glass at odd times, except to cause admiration, and to make others think them more manly! whereas, they usually think just the very reverse.

(2). *Tobacco.*

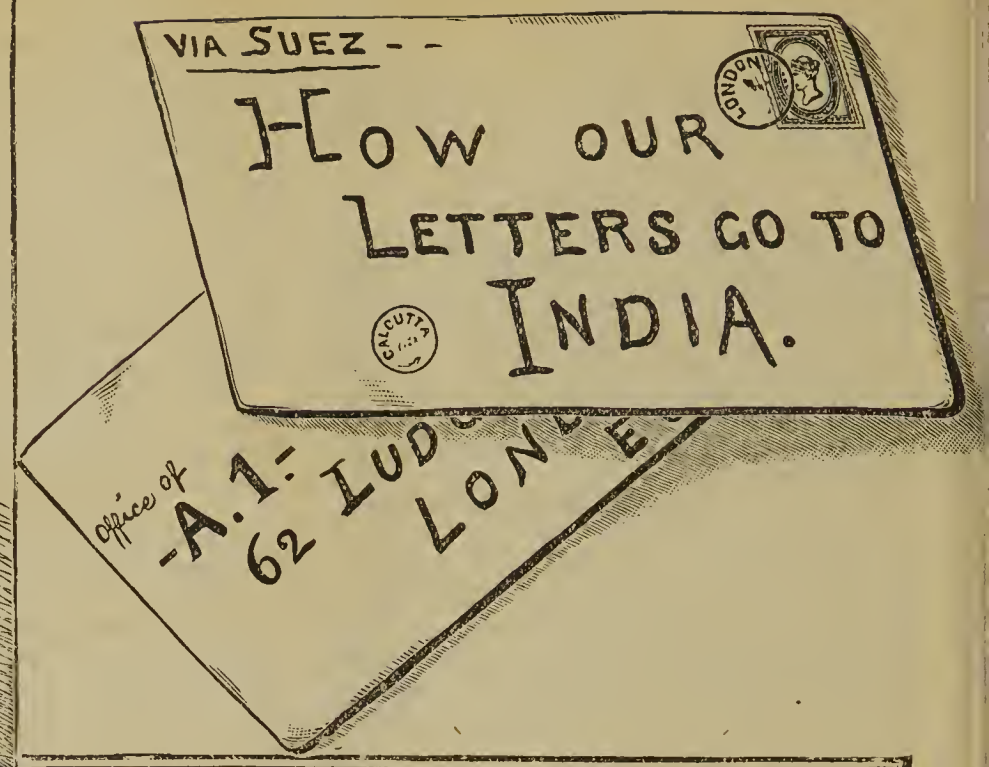
The arguments for and against alcohol apply almost equally here. Hardly anyone really likes smoking when he begins. In youth, it is pure vanity—aping the man—which makes the sight of mere children smoking so common in nearly all our large towns.

For youths, too, the general plea of being sociable and keeping another man company, does not apply. A youth does not actually relish tobacco, as does the older man—the habitual smoker. No one really cares for smoking, until he begins to feel that he would miss it, were he to give it up.



Now, to smoke enough to cause that feeling, is extremely injurious to the physique of any youth. It impoverishes the blood, poisons it, makes a man look unhealthy and out of condition, spoils the wind, weakens the digestion,—and all to what good? Absolutely none!

You may say: "Oh, look at A, B, or C, and others. It does them no harm, why should it me?" That sounds all very well, but there is no argument in it. Look at A or B or C. Are they perfect? Not a bit of it! A may have a very strong constitution; you may have a medium one, only. Then you should not try and take the same liberties with yourself that A does; he will, sooner or later, feel the consequences, and you would feel them, probably, far sooner. Look at B or C—perhaps they may seem perfectly well, but they, probably, can't run or walk quite as well as they used to; their wind is touched, the freshness of youth is just a little gone, and they look a trifle older in face, and less healthy, though, perhaps, hardly perceptibly.

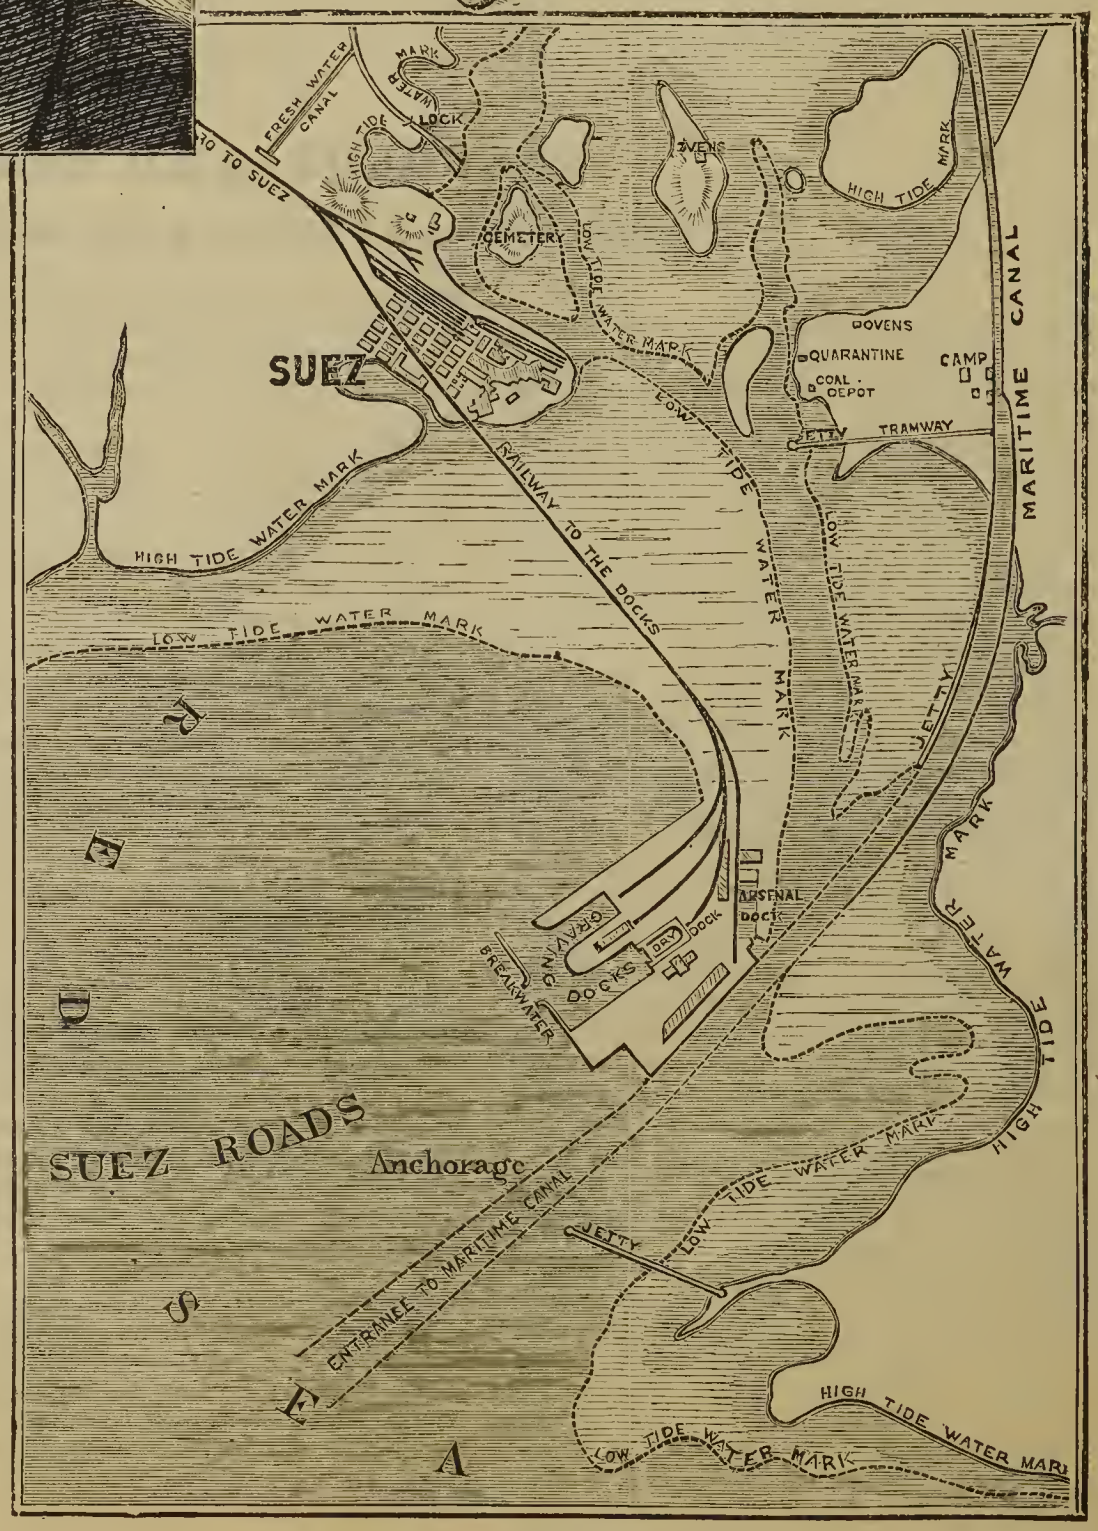


Remember that your bodies are given you to make the best possible use of; and it stands to reason that you are expected to take care of yourselves, so as to be, if called upon, in as good a position as possible to be of use.

Older men, and those who have influence over the young, have no idea how much harm the sight of their drinking and constant smoking is likely to cause, for it makes the young anxious to do the same.

Many, I am sure, especially those who have sons, would be far more abstemious both in drinking and smoking, if they thought it out, were it only for the sake of their children.

The Originator of the Suez Canal.



By T. L. ROBINSON.

PART I.

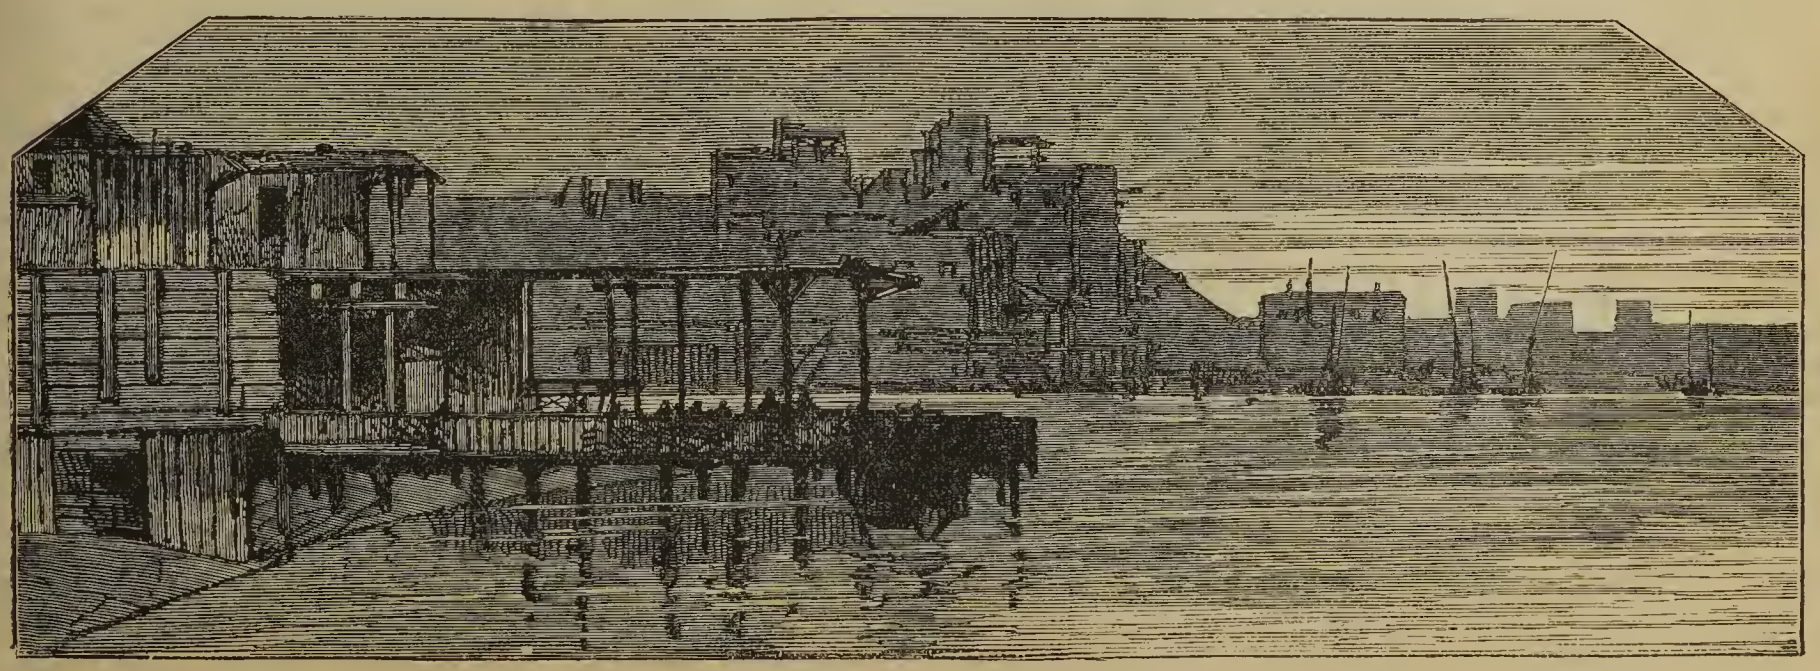
HOW do our letters go to India? What is the route they take? Do they go by the same road as that taken by passengers? Who takes care of them? And many similar questions to these arise with the thought of the six thousand two hundred and seventy-four miles which divide England from Bombay; rather over twice the distance between Liverpool and New York, and yet considerably less than the old route round the Cape of Good Hope, by which, thirty years ago, our ships travelled to India. The wonderful Canal, cut through the Isthmus of Suez at the instigation of the great mechanical genius and engineering skill of Ferdinand de Lesseps, the great French engineer, revolutionised all the previously-maintained ideas concerning the road to India; and (notwithstanding the opposition with which the project had been received in our own land, by most of our greatest engineers, Robert Stephenson, to wit, who was sent out to report by Lord Palmerston, and who laughed at the scheme as ridiculous) when the Canal was opened in 1870, all our best Admiralty authorities acknowledged its value, and did their best to further its employment.

The project of connecting the Mediterranean with the Red Sea is by no means a modern one. An old "Canal of the Kings" was cut by Pharaoh-Necho and the Ptolemies, in the long-past days of Egyptian splendour, which was a hundred miles in length. But this became choked with sand,—the terrible sand of the desert, which has buried so many of the great cities and monuments of ancient Egypt. In the seventh and eighth centuries, this canal was cleared out and restored by the Kalif Omar, and called the "Canal of the Faithful." But though traces of it are still discernible at Suez, the canal itself has long since again succumbed to the encroachments of the dread sand.

But I am not telling you about the way our letters go to India, which is what I set out to do. Well, let me begin by saying, that our postal authorities are fully impressed with the consideration that the epistolary communications which pass

Entrance into the Canal from Mediterranean.

between England and India are, for the most part, documents of importance to their authors and recipients, and, therefore, every endeavour is made to get these letters from one country to the other as rapidly as possible. Every new effort that is made to curtail the route is, consequently, eagerly seized and adopted, so soon as its security is absolutely determined, either by international treaty, or by means of the guardianship of British arms. Rapid transit, of course, costs much more money than a method which is slow and gradual; but then, when the transit is made quickly, more people take advantage of it; and, inasmuch as speed brings long distances to short ones, the number of letters is also increased. The expense of travelling by Mail is, however, too great for the majority of people going to, or coming from India at present, and so most go the entire voyage by sea. Our letters, which are carried by land for a considerable distance, cut off a corner, as it were, and thus save two days in the journey.



Taking coals on board at Brindisi.
"Filling the coal bunkers, ... by no means an uninteresting operation."

For instance, a letter for India, dropped into a letter-box on a Wednesday afternoon, is collected and packed the same evening, and leaves, in the Royal Mail Wagon from Charing Cross, on Thursday morning, at twenty minutes to eight o'clock, arriving at Dover shortly after 9 a.m. In a few minutes, the mail-bags are popped into the steamer for Calais, and say farewell to the white cliffs of Old England. The voyage to Calais does not take long, for it is only twenty-five miles, and is made, in fair weather, in an hour and a half. A very interesting circumstance will be noticed by all travellers on their voyage from England to India; it is one out of which the great French novelist, Jules Verne, made much capital in his celebrated story—"Around the World in Eighty Days"; I refer to the alteration in time, due to the approach made towards the rising sun. As soon as we lands at Calais, it is observed that our watches, which we have carefully set in the morning by Greenwich time, are nine minutes too slow! As we proceed on our trip, I will give the regular alterations as they occur, and I may here observe, that they go on increasing until, at Bombay, we shall find our watches are 4 hours and 51½ minutes behind time.

From Calais, then, we start for the "Gay City" of Paris, passing on our road through Amiens, an old town on the river Somme, principally celebrated for the treaty of 1802, and more recently for being the scene of the descent from a balloon, during the Franco-Prussian war in 1870, of M. Gambetta. But

we must not stop here, or we shall not save much by our cross-country short cut. Neither do we have much time to stop at Paris, for the mail-bags are instantly transferred from the Calais mail train to another train at the other end of the French capital; and we, also, must make the best of way, if we want to follow and accompany them to Bombay. So, as the mails leave the same

Alexandria from the Harbour.

evening, at 8.40 p.m., we shall have to defer any sight-seeing, of which, of course, there is plenty, until our return from India, when perhaps we may feel inclined to take a peep at some of the beautiful and wonderful portions of the city.

Let us now wrap ourselves up in our travelling cloaks and rugs, and seek a comfortable corner in the railway carriage, for we are to travel all night and the greater part of next day. During this part of the journey we pass through that marvel of engineering skill, second only to the Suez Canal itself, the Mont Cenis tunnel. It is at St. Michel de Maurienne, where the new tunnel route diverges from the old route, the break of 50 miles to Susa. The journey along the road, over Mont Cenis, used to be performed by *diligence* in ten hours; but this road was in 1867 filled up by Fell's climbing railroad, working by steep gradients to the Pass, 6,700 feet above the sea-level, and reaching Susa in four hours. But the Great Tunnel, begun in 1857, and formally opened on September 17th, 1871, shortens the route still more by two hours, and is the last link in the most direct chain of railway communication between Calais and Brindisi. It is eight miles in length, and is traversed in from twenty to thirty minutes, and runs under that part of the mountain named the Col de Frejus, sixteen miles to the south-west of the old Pass. Mont Cenis is itself 7,860 feet above the sea-level.

After leaving St. Michel, the route winds along through the Savoy to Fourneaux and Modane; passes through the tunnel of Mont Cenis, and emerges on the Italian side of the mountain, near Bardonnechia, and thence, in a winding route, through a chain of twenty-five short tunnels, in the midst of splendid scenery, all the way to Susa, from whence to Turin it is thirty-three miles. Turin we reach about 7 p.m., but it will be too late to visit any places of interest at this time of the night; and, moreover, we are anxious to indulge in a bath, to stretch our cramped limbs a little, to partake of some dinner, and perhaps obtain a few hours of sleep, before leaving Turin for Bologna in the morning, at ten minutes to five.

Our direct route proceeds on to Alessandria—a quaint old fortified town on the river Po, built in 1168, which is the junction from whence branch lines go to Genoa and through the Apennine range of mountains. A little farther on, our train passes close to the bloody field of Marengo, memorable for the decisive victory gained over the Austrians in 1800, by which, for a time, the French became masters over Italy. From here we pass through the fertile plain of Lombardy, one of the most productive portions of Italy, and so on to Parma and Modena, until we reach Bologna, where we are allowed to stay forty minutes for stretching and refreshment. This is the second time I have mentioned stretching, and I am sure that any traveller will forgive my reiteration; for all who have sat for six or eight consecutive hours in a railway carriage know how to appreciate the luxury of walking out on the platform.

Bologna is the city of a hundred churches, and is one of the chief places in papal Italy, and the birthplace of many celebrated men. It is the last place of note at which we stop before arriving at Brindisi. After leaving, we must keep our eyes open, for at the end of about fifty miles, we come to the Rubicon, the famous little river which separated Ancient Italy and Cisalpine Gaul, the province allotted to Julius Cæsar. When Cæsar crossed this stream, he passed beyond the limits of his own province, and became an invader of Italy. Hence the saying, "to pass the Rubicon," which has now grown into a proverb, signifying to adopt a measure from which it is not possible to recede. Then we come to Rimini, the ancient *Ariminum*, in Umbria. Here Cæsar harangued his troops after having crossed the Rubicon, and here the Tribunes of the Commons, who were in his interest, met him, and at the end of sixty days subdued all Italy.

We are now in the midst of classical country, hardly a space of five miles of which is not full of reminiscences of the ancient glory of the Roman Empire. Alas! corruption, impiety, tyranny, cruelty, fanaticism, and bigotry have chased each other in continually lessening circles, and in continually increasing speed, until that which was once the glory of the world—that which might have been the means of extending to all generations the glory of God to the world—has gradually been sucked into the whirlpool of its own construction; until all that now remains are a few ruins, many reminiscences, and a small city, which is still the centre of the maelstrom, and is still whirling on to its ultimate complete destruction.

From Rimini we proceed to Ancona, which is by far the finest Italian harbour in the Adriatic, but which, by sea, is nearly two days farther from Alexandria than Brindisi, which is only eleven hours from here by train. So we prefer, as do the letter-bags, to go on by rail to Brindisi, which place we reach at a quarter past three in the morning, and proceed at once to the outer harbour, where the Peninsular and Oriental Company's mail steamer is waiting for us and the bags, with steam up, ready to depart at 4 a.m. for Alexandria.

Brindisi was always a starting-point for the East, even in the earliest times. It was the ancient *Brundusium*, at the Eastern terminus of the Appian Way, and from here the Romans always embarked for Greece. It was a celebrated harbour during the period of the Trojan war, but it was probably founded by the Illyrian sailors, who were the earliest navigators in the Adriatic. Brundusium is celebrated for being the birthplace of the poet Pacuvius, one of the first Roman poets who combined with poetry the art of painting; and also as being the scene of the death of Virgil, on his return from Greece. Here, also, Cæsar blockaded Pompey, before the latter made his escape over to Dyrachium, under the hills of Epirus, which are visible in clear weather.

Brindisi is the great coaling station of the Adriatic, and the process of filling the coal bunkers of the steamer with the black diamonds, which are to convert water into steam to carry us to Alexandria, is, though a dirty, by no means an uninteresting, operation. Up a long plank from the wharf to the ship's side, a constant stream of burly fellows, natives of every country under the sun (for Brindisi is a cosmopolitan city, like all the great seaports in the Eastern Mediterranean), come toiling with huge baskets or kreels of coal on their shoulders, filled from a great heap on the shore. As each man reaches the plank, he hands the clerk, who stands at a table close by, a paper certifying to the weight of the contents of the basket perched upon his shoulder, and marked with a number, which designates the person who carries it, so that, when pay-time comes, each man is paid according to the number of certificates he has handed in. But we do not have much time to watch this operation; we are liable to become covered with the black coal-dust, so we betake ourselves to our cabins, and prepare for the three days' sea voyage, which we are about to undergo. Let us hope we are all good sailors, for the Adriatic Sea is not always the calmest; and we are, at any period of the year, especially when we reach the Levant, liable to meet one of those dreadful Mediterranean storms, called, from the portion of this sea in which it usually takes place, a Levanter, which is produced from the confluence of winds around so many jutting points of land and islands.

We are now about to quit the shores of Europe, and, in three days, we shall land at Alexandria, the burial-place of Alexander the Great, who founded it, and after whom it was named. It was originally built in a sort of triangular form, like that of a Macedonian mantle, with its largest side to the sea. It lies on very low sandy land, where only palm trees and windmills are to be seen. The entrance to the harbour is very difficult, owing to the sunk rocks; however, we have a good pilot, and we arrive safely. As soon as the port is made, the passengers' luggage is all got up on deck, ready to be discharged into boats, and we shall see no more of it until we get to Suez. At Alexandria we shall find that our watches are one hour and fifty-six minutes behind time. From our own steamer we are taken in another to the shore, and thence to the train by which we are to start at once for Suez, to arrive there in twelve hours. During these twelve hours, we must avoid water drinking, unless we are provided with a filter, and, even then, the water is most unwholesome. Ripe oranges, however, are plentiful, and this always deliciously-refreshing fruit may be eaten with safety and advantage.

On landing at Alexandria, we find we are no longer in Europe, for everything—with the exception only of the well-appointed omnibus which meets us—is Oriental, from the people to the buildings. The dusky skins of the Arabs and Turks, the gaudy robes of the men, the turbans, the Fez caps, the veiled women—all bespeak the fact that we are now in the East, even if the intensely broiling sun were not sufficient to tell us how near we are to the tropics.

The European quarter proper, however, is handsome, possessing wide, open streets, and a fine square. Peculiarly interesting are the people we see, and very picturesque are the varieties in dress. The wealthy, in their bright, clean, flowing garments; the children emaciated, women selling bread at the street corners, tradesmen sitting, smoking contentedly in their shop windows, which resemble cupboards hewn in walls, and consist of a raised seat of stone or brick about three feet high,—all these form an intensely interesting *coup d'œil*, as we pass through Alexandria on our way to Suez, where I shall take you in my next chapter.

"THAT HOUSE IN LONDON."

By L. T. MEADE,

Author of "Scamp and I," "Great St. Benedict's," "A Knight of To-day," etc., etc.

A NEW and striking Serial Story, in this favourite Author's best style, will be begun in our Number for Feb. 25th. The plot is ingenious and unflagging in interest, and the characters are drawn with a sure and practised touch. We anticipate a great success for "That House in London."

FACTS ABOUT WASHING.

THE washing bills of the metropolis, estimated at the low average of 1s. per head per week, amount to upwards of £5,000,000 per annum.

A working man's calico shirt, costing 2s., and washing forty times, at 3d., has five times its original value expended on it, in soap and laundry labour, before it is worn out. A like proportion holds in the costlier washing of more expensive articles. So far, therefore, as the home market is concerned, the *washerwoman's interest* actually exceeds, in pecuniary magnitude, the gigantic cotton interest itself.

Of this washing expenditure, nearly one-tenth, or half a million sterling, is laid out in soap and soda—9,600 tons and upwards of the former, with 3,000 tons of the latter, at £45 and £10 per ton respectively, being used annually in London.

From the experiences of Glasgow and Bolton, where soft-water supplies have been introduced, it appears that our London outlay on soap and soda might be reduced at least one-half (*i.e.*, £250,000 per annum), by substituting a softer water for our present hard supplies. A still greater saving would result from the diminished wear and tear of the linen itself during ablution, and the proportionately abated toil of the laundress.

It is indeed alleged, in opposition to these views, that half an hour's boiling before use would soften the washerwoman's water, by precipitating a large proportion of the chalk; and that a halfpenny-worth of carbonate of soda, judiciously applied, would neutralise the hardness of 100 gallons of Thames or New River water. But these propositions, though true, leave the practical objection to hard water supplies untouched. For, in point of fact, the washerwomen do not soften their water by boiling it beforehand, nor do they nicely adjust the soda they throw in to the quantity of lime requiring neutralization. On the contrary, the boiling, as they conduct it, throws down the hardening chalk of the water, as a gritty precipitate upon the linen washed; while the soda, used by them in excess to diminish their toil, still further deteriorates the fabric by its caustic alkaline property.

AN INGENIOUS COMPOSITOR.

THE following paragraph, from the first issue of the *Rocky Mountain Cyclone*, is an amusing instance of orthographic ingenuity. It almost rivals "X-ing the Paragrab," by E. A. Poe.

"We begin the publication of *The Rocky Mountain Cyclone* with some phew diphiculties in the way. The type phounder phrom whom we bought our outphit phor this printing ophice phailed to supply us with any ephs or cays, and it will be phour or phive weex bephore we can get any. The mistaque was not phound out till a day or two ago. We have ordered the missing letters, but will have to get on without them till they come. We don't lique the loox ov this variety ov spelling any better than our readers, but mistaix will happen in the best regulated phamillies, and iph the ph's and c's and x's and q's hold out, we shall ceep (sound the c hard) *The Cyclone* whirling aphter a phashion till the sorts arrive. It is no joque to us—it is a serious aphair."

ORIENTAL ARCHERY.

By ANDREW T. SIBBALD.

MY readers would perhaps like to hear something about archery as practised in the East. Within the rose gardens of Teheran, the dark-eyed houris of Persia launch their varnished shafts at the distant butt, equipped in all the magnificent apparatus of their native sport. The place of exercise of the fair Persian dames, is within the shady recesses of the pleasure-grounds attached to the royal residence. The butts consist of moistened sand, enclosed in a wooden frame, and beaten into a hard, compact mass. These are set up in a slanting direction at the boundary of some verdant alley, where the overarching branches of vine and orange tree exclude the fierceness of an Eastern sun. Consistent with that gorgeous taste, so prevalent throughout the East, the whole exterior of the butt is covered with elegant scroll-work and patterns of flowers. Gold and silver, intermingled with various pigments of the most brilliant hues, are lavishly employed to produce this effect.

A female Abyssinian slave stands beside the mark, provided with a large round pebble, to form and preserve an unbroken hollow in the centre, and at this cavity, every arrow is directed. She repeats the operation several times whilst her mistresses are shooting; for the triumph of Persian archery consists not merely in a central shot, but also in making the arrow penetrate deeply into the sand at every discharge.

At the termination of their sport, these fair butt-shooters scrupulously conform to a remarkable custom, which, from remote antiquity, has prevailed amongst Persian bowmen.

The followers of the prophet divide themselves into two great sects, who hate each other with a cordiality worthy of the most polished nation of Europe. The Persians are devout followers of the Caliph Ali, and regard the Turks and other disciples of his antagonist, Omar, as a sort of Mahomedan heretic. To assist in perpetuating the memory of this religious feud, the Persian archer, on discharging his arrow at the mark for the last time, fails not to pronounce the charitable aspiration of "*Ter a kir dirdil Omar!*"—Would that this arrow might bury itself in the heart of Omar!

It must be highly amusing to witness the affected change, which comes o'er the spirit of these orthodox beauties, whilst thus denouncing the heretical caliph. Gay, innocent and thoughtless, it were absurd to suppose they have the least real feeling on such a subject. Still, like prattling parrots, their lesson is repeated, with many a pretty indication of displeasure; but, no sooner does the glancing shaft quiver within its destined mark, than Ali, as well as Omar, is consigned to oblivion; and songs and laughter, merry and musical as the chime of silver bells, again re-echo through the perfumed walks of this magnificent pleasure-garden. Bows, arrows, and the costly *sefin* (thumb-rings for drawing the bow-string) are speedily abandoned to the attendant slaves; and, with a zest, which their recent occupation is so well calculated to supply, the fair revellers hurry off to "taste the good the gods provide them," in the splendid luxury of an Oriental banquet.

Leaving our beauties in quiet enjoyment of its festivities, we will endeavour, like true archers, to get a peep at their accoutrements, since we dare not peep at them. These form so complete a contrast to what has been, at any time, common to Europe, that they merit a particular description.

Persia still boasts within most of her large towns, a race of hereditary bowyers. The royal armoury at Teheran exhibits a number of bows of the richest description, many upwards of a century old, still retaining an elasticity worthy of their external elegance. But their power is enormous; and, although the Shah and his nobles manage them with ease and adroitness, the same could not be expected from the delicate strength of a female arm. When, therefore, the monarch signified his wish that the harem be exercised in archery, the most celebrated bowyers of Teheran were employed to equip them suitably. But, as the material of which these Oriental bows have been made for centuries could not be improved, the workmen merely aimed at fabricating a lighter instrument, still more ornamented.

Buffalo or wild goat's horn, jet black, and of a fine polish, forms the belly of a Persian bow; glued to this is a thin slip of some hard wood, little inferior in toughness, which serves for the back. The extreme points are fashioned to resemble a snake's head, the loops of the cord having the appearance of being held within its extended jaws. As the horn, with its dark, rich lustre, needs not the aid of ornament, it is left entirely plain, the richness of Oriental taste being lavished on the splendid arabesque, which decorates the wooden back. Birds, flowers, fruit, and all the graceful devices one sees in the most elaborate scroll-work of the ancients, are represented on its surface in vivid colours, intermingled with gilding. The centre of the bow, serving for the grip of the archer's hand, is marked by several broad bands of the same metal, separated from each other by figures of flowers and fruit.

These beautiful weapons were formerly considered as the most acceptable offerings which one Oriental monarch could make to another. Thus, when the Ambassador, sent by the Shah to compliment Sultan Amurath II., had deposited before the Ottoman divan the munificent presents of his master, among them appeared nine splendid Persian bows, and a proportionate number of arrows of the same workmanship. The Shah, likewise, presented our countryman, Sir John Shirley, with a similar one. Again, in 1656, the Dutch East India Company sent to the Emperor of Ceylon, among other presents, "two Persian bows, with their arrows and quiver richly adorned."

The Oriental bowstring, from its peculiar construction and twofold use, is not less interesting than the weapon of which it forms a part. Many strong silken threads are laid together, until the whole equals the thickness of an ordinary goose-quill. Whipping, composed of the same material, is then bound firmly for about three or four inches at the centre, and also for a less width, equidistant from either end. Large loops of scarlet, or other colours producing an equally brilliant contrast, are attached to this middle piece by a very curious knot, complicated and elegant, as that by which King Gordianus perplexed his royal brother of Macedon. It is to be solved, also, only by similar decisive means.

I have hinted at the twofold purpose to which it was occasionally applied. To the Turkish Basha, sleeping or waking, whom His Highness suspected of growing rich in his pachalick, it was an object of continual dread. Under these circumstances, rarely did he escape a summons to Constantinople, where, within the Seraglio walls, the bow-

string freed him from *l'embarras de richesses*, and the life he esteemed worthless without them. Like our wolf in the fable, the sanguinary despot quickly found or invented causes for accusation. Brief, therefore, was the colloquy, ere, at a sign, imperceptible to the predestined wretch, the mutes advanced. Placing him upon his knees, they passed their bowstrings once round his neck, and, with their right hands in the loops, drew tightly, until appearance indicated their victim had ceased to breathe. At one time, this practice prevailed extensively throughout the East. It was used as a means of executing revenge as well as punishment, and we may attribute its adoption to the readiness with which the instrument of death could be procured, when every man carried at his back the weapon to which it belongs.

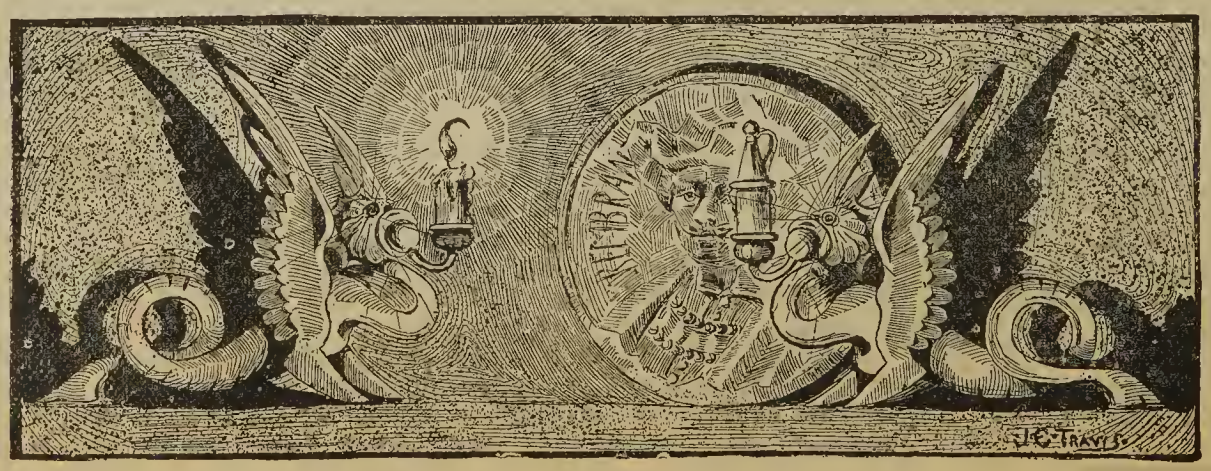
In nothing is the contrast between English and Oriental archery more manifest, than in the manner of bracing the bow. The trousered beauties of the East do this with as much grace and facility as the men, because the lower part of the dress is nearly similar in both sexes.

The Persian arrow is altogether worthy of its bow, being a small jointed reed, called in Latin, *Arundo Bambos*, which is used almost universally throughout the East. Of this there are two species, one being much stronger, and of a texture very superior to the other. War arrows, and those designed for occasions where the chances of recovering them are small, are made of the latter kind ; the former, which, besides its hardness, has a fine, nut-brown, glossy surface, is reserved to replenish the quivers of princes and grandees. The heads take many forms, according to the purposes for which they are designed. In butt-shooting, a solid pyramid of steel seems to be preferred, and for about three inches below this point, the natural colour of the reed is entirely concealed by rich Japan painting, intermixed with gold and silver flowers. Ornaments of a similar style of richness are repeated at the butt end, above and beneath the feathering. Indeed, the Persian arrows are altogether so delicate and costly, that we consider them as objects of curiosity rather than use. When shot into damp ground, the friction gradually impairs their beauty. Substitute a light English pile (the iron point of an arrow), however, for the solid Persian steel head, and you have a really superior flight and target arrow, which, from the extraordinary lightness of its hollow reed, may occasionally be observed to outstrip the wind.

The *sefin*, or thumb-ring, is one of the distinctions of an Oriental archer. Sandys observes, that an early Turkish Sultan occupied his leisure in manufacturing these rings. The produce of his industry, distributed among favourite pashas and officers, received, of course, an additional value, from the distinguished work of the donor. Englishmen, it is well known, draw the bowstring with their three first fingers—the Flemings, with the first and second only ; but neither use the thumb at all.

The Asiatic method is the reverse of this. There the bowman draws altogether with his thumb ; the fore-finger, bent in its first and second joint, being merely pressed on one side of the arrow nock, to secure it from falling. In order to prevent the flesh from being torn by the bowstring, he wears a broad ring of agate, cornelian, green marble, ivory, horn, or iron, according to his rank and means. Upon the inside of this, which projects half an inch, the string rests when the bow is drawn ; on the outside it is only half that breadth, and in loosing the arrow, he straightens his thumb, which sets the string free.

Consistent with the splendour of their other appointments, the *sefin* worn by those dark-eyed houris, whose feats we have so recently been contemplating, are adorned with all the cunning of the jeweller's art. A stone called jadde, crystal, jasper, and even gold, inlaid with stones of varied hue, glitters in the sunbeams, as each snowy hand strains up the silken bowstring. A quilted half-sleeve of crimson velvet, or fine cloth, thickly embroidered with gold flowers, protects the arm from being bruised by the cord in its return.



One other curious contrivance connected with the Oriental bow remains to be described. When flight-shooting,—to which they are particularly attached,—a grooved horn, about six inches long, is fastened upon the back of the bow hand by straps of crimson morocco, buckled round the wrist. The bow is then, and then only, held across the body, and by drawing several inches within this horn, they can use very short arrows. By thus diminishing their length, superior lightness,—the chief quality of a flight shaft,—is proportionably attained.

On the 9th of July, 1792, Mahmoud Effendi, the secretary of the Turkish Embassy, exhibited his *great* strength, by shooting an arrow in this way 415 yards, partly against the wind, and 482 yards with the wind, in a field behind Bedford House, London. He used a Turkish bow, drawing 160 pounds ; and this exploit was performed in the presence of three gentlemen, members of the Toxophilite Society. The arrow measured $25\frac{1}{2}$ inches, which he pulled three inches within the bow, so as to make the draught 28 inches. He said, upon the ground, that Selim, the then Grand Signior, often shot 500 yards, —the greatest performance of the modern Turks. However, the Sultan afterwards, in 1798, drove an arrow into the ground 972 yards from the spot where he stood, the distance being measured by Sir Robert Anstie, Ambassador to the Porte. All these singular contrivances are, of course, common in the East to archers of both sexes ; and their dissimilarity to everything we apply to the same use in England, has induced me to detain the reader by a minuteness of description otherwise unnecessary.

The French traveller, Gentil, who visited India at the commencement of the seventeenth century, dwells with enthusiasm on the appearance of a body-guard, consisting of a hundred ladies, whom he saw in attendance on one of its native princes. Their weapon was a crossbow, in the use of which they exhibited remarkable dexterity. He asserts that he saw each of them plant an arrow, at a considerable distance, into a circle no larger than a French *sol* (halfpenny). On other occasions, they would discharge three arrows at once with such prodigious rapidity and violence, that, on piercing a tree, the steel points entered so deeply, that no force of pulling could draw them out.

When the monarch left his capital, for war or the chase, this band of Amazons invariably accompanied him. They were styled Menaytas, were lodged within the palace, and annually drew a magnificent stipend from the royal treasury. Masters attended to instruct them in every kind of warlike accomplishment, which they studied with the utmost enthusiasm. One of them, whose age Gentil guessed to be about twenty-four, was, unquestionably, the most beautiful woman in India. Her complexion displayed a perfect fairness ; and her hair, black as jet, flowed in a profusion of natural ringlets upon a neck of ivory. In a mock combat performed by a detachment of these ladies, she acquitted herself so valiantly, that the enraptured monarch, unable to control his emotion, caused her to raise her casque, while he saluted her in the presence of his whole court. Then he placed a chain of massive gold around her neck. She was called Langir.

Her mother, Acosira, a woman of extraordinary charms, had been so valorous, that in wrestling, she never met her equal. On one occasion, being challenged by certain strangers, she quickly laid them prostrate on their mother earth ; and, on their attempting to rise and resent this indignity, forthwith strangled them outright. Her own fate was as extraordinary ; she was torn in pieces by a lion, which, during one of the royal hunting matches, she had the rashness to attack, dismounted and single-handed. The king, her lover, being excessively grieved, gave her a royal funeral, abstaining for many days from the consumption of areca, betel, and shaving his beard, with many other symptoms of mourning and regret.

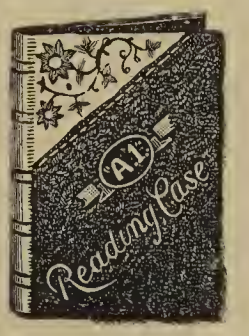
FANCY NEEDLEWORK.

By Blanche C. Saward.

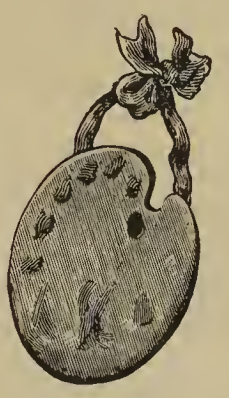
THE articles we describe and illustrate are all of home manufacture, and are made without much expense, and will not be difficult to the nimble fingers that generally accompany a willing heart.

The work-basket in our sketch is made with satin ribbon of two colours, an Indian basket and some narrow lute ribbon. Cost of the materials: — basket, 1s.; 2 yards of ribbon, 1s.; and two yards of lute ribbon, 3d. *To make the work-bag:* Cut three strips of each colour, 8 inches in length, and overcast them together. Turn over a wide, two-inch hem, and make the runnings for a draw-string beneath it. Take the lute ribbon, and run it in and out of the straw basket, with the help of a bodkin, and run in as many rows as the quantity will allow, after taking off enough ribbon for the draw-strings. Sew in the bag to the edge of the basket, make an ornamental bow with the remainder of the broad ribbon, and fasten it on. Put in the draw-strings, and the work-basket is ready for the coloured ribbons. Either use two shades of terra cotta together, or a rich gold with a chestnut brown, or sky blue with a royal purple, or two shades of heliotrope.

Several kinds of Indian baskets that are sold can be converted into work-baskets; those higher and straighter at the sides than the one illustrated, are ornamented with bands of wide satin ribbon, arranged in diagonal or straight lines over the straw, instead of ribbon run through the foundation.



The hand-bag, in our next illustration, is made of navy blue cashmere, trimmed with narrow bands of Leek embroidery, and lined with Persian silk. The foundation for Leek embroidery is Tussore silk, with a pattern woven in it. Its price, for narrow bands, sixpence a yard. The embroidery is done with Leek silks (1d. the skein), in crewel stitch, and consists of covering over the woven pattern lines, and leaving the background plain. A line of gold thread is sewn round the embroidery, and marks it out. A quarter of a yard of serge, one yard of Leek ribbon, and half a yard of Persian silk will make the bag, and the cost will be four shillings.



The hanging-basket is a new shape for twisting Zulu hats into, and is used for holding small pots of ivy-leaved geranium or ferns. The trimming consists of a yard of strong, and very white rope, and a bow of satin ribbon. Cost of materials, one shilling. *To make the basket:* Soak the Zulu hat for an hour in water, take it out and dry it, but, while still a little damp, turn it inside out, and bend the brim over the headpiece, as shown. With a large needle and strong thread, sew the brim down to the front part of the basket, then, thread the needle with scarlet wool, and secure the rope round the edge of the brim with a row of cross stitches across it, tie the rope as a bow in the front of the basket, and unravel the ends. Comb the ends out to make the strands soft-looking. Make up the satin bow, and sew it to the side of the basket.

Covers for books,—magazines, Bradshaws, Whitaker, or other books that are often required,—are among the most useful of household presents. All these covers are made removable, and can be slipped over fresh magazines or books. We give an illustration of the size suitable for covering "A.1." and Our Own Gazette. The foundation is either of ruby plush, cloth, or cashmere; the trimming is a cross piece of pale blue silk, embroidered with gold thread or filoselles. The lining of the cover can be of chintz, sateen, or Persian silk. Half a yard of silk and plush, or cashmere and sateen, will make the cover; the three-cornered piece is nine by eleven inches. The cost of the cover is from 2s. 6d. to 5s., according to the richness of the material. *To make the cover:* Measure the Gazette carefully, and cut lining and outside material a little larger than the paper; take the wedge-shaped piece of silk, sketch a small flower spray upon it, and work this in satin stitch with yellow - pink filoselle. Stitch it carefully to the foundation, and hide the edges with a very narrow silk cord. Mark out the name with white chalk, and secure the drawing by running white thread over the lines. Make the letters by sewing a double line of gold thread along the outlines. Turn the cover inside out, and cut the lining in half, and sew it down to the three outer edges, leaving the two inside edges unsecured and plainly hemmed. Slip the Gazette cover into the two pockets so formed. Little bands of ribbon are sometimes sewn across the back of the cover, but these are not necessary.

The pallet-shaped wall-pincushion makes a very pretty drawing-room ornament. It is easily made, and costs about 1s. to 2s., according to material. The size varies, but 8½ inches in length by 5½ in width is about the best. The materials used are a piece of pale yellow silk or satin, a piece of brown velvet for the back (each half an inch larger than the above measure), one yard of brown satin ribbon, and two pieces of strong mill or cardboard. *To make:* Cut out the two pieces of cardboard in the shape of a pallet, make the thumb hole in both, and see that they are exactly alike. Cover one piece of cardboard with velvet, and secure the raw edges of the latter. Before covering the second piece with the yellow silk, either paint with oil colours on it an easy design, or work a spray of flowers in filoselles, and mark in the spots that represent unused colour on a pallet. Make up the ribbon bow, and attach the ends to the velvet side. Cover the second piece of cardboard, and carefully overstitch the two pieces to each other. The pins are placed along this line of overstitching. The small toilette tidy and pincushion (see figure below) are intended for children's work. Their foundation is made with braids of plaited straw (obtainable from old hats) sewn together to the shape. The trimming of the toilette tidy is a small wedge-shaped piece of plush, fastened on with a narrow braid; while for the pincushion, a linen bag filled with bran is covered over at the top with a piece of plush, and then sunk into the straw basket. The handle of the toilette tidy is of straw, finished with bows of ribbon, and a piece of ribbon is fastened, as a puffing, round the top of the straw pincushion.

Many of the articles described above can be made much more cheaply than priced, as most people have odds and ends they can use, and thus save buying every item required. At any shop where dress materials, or furniture stuffs are sold, small pieces, suitable for fancy work, will be generally given to customers.

It is a pity that more trouble is not taken to interest children in Fancy Needlework. So often, the long seam which has to be sewn, or the fine handkerchief which has to be hemmed, seem dull and irksome work to the little ones, whereas the added charms of colour and form would make the use of their needles a pleasure. Of course a knowledge of Plain Needlework is of vital importance, but children should be won to love it, rather than compelled to do it reluctantly. An added zest will be given, if two very simple allurements are made use of. First, teach the children not to be selfish in their work, but to think of others, less well off than themselves. Disabuse their minds of the prevalent idea, that beauty of form or colour is not suited for the "poor." Then, connect their Needlework with their play, making full use of their strong *doll instinct.* It is a foreshadowing of mother love which makes the children cling to the waxen babies; this love, if not laughed at, but wisely made use of, will aid materially in the development of womanly and housewifely qualities. The cutting out and making of dolls' garments is no small test of skill; if the little fingers find it too intricate work, they will be able, at least to take part in the manufacture of pretty curtains and bedding for "Dolly's" cradle.

OF INTEREST TO YOUNG MEN.

THE president of a New York Bank, one Saturday afternoon, requested an esteemed clerk to come to the Bank next day and help bring up some back work to date. To yield to the request would be to violate the Sabbath, and the young man refused. In vain the president stormed, insisted, and threatened. The young man stood firm, and refused to do that which his conscience could not approve. He was accordingly discharged, with no prospect of further employment. Shortly after, a new Bank was organised, and a trustworthy man was wanted for the position of cashier. The Bank president referred to above, offered to name a man who, sooner than sin, gave up his place; and then he told the story of the clerk he had himself discharged. The nomination was at once accepted; and the upright clerk was rewarded with a higher position and an increased salary.

About 50 per cent. of the members of the Fiftieth Congress of the United States, now in session at Washington, are college graduates.

A determined effort to induce the students at the University of Michigan to adopt the cap and gown, used at Oxford and Cambridge, was defeated by an overwhelming vote.

A visitor at a State prison was looking over the list of names in the prison register, and noticed that, under the head of "Occupation," the words "No trade" were written against nine-tenths of the names. Evidently Dr. Watts knew what he was writing when he penned the lines:

> "Satan finds some mischief still
> For idle hands to do."

The Secretary of a Y.M.C.A., in company with a police-officer, visited some of the gambling houses of a city in Iowa, to see who the young men were that frequented these places. In one of these dens, they saw one hundred and sixty-four young men, nearly every one engaged in some of the games being carried on. In five places visited, three hundred and three persons were counted, of whom all but five could be called young men; and yet the police-officer said that, owing to the many attractions at other places, it was not much of a night for gambling.

Young Men's Christian Associations have been organised at Ligoniel, Culleybackey, and Ballybogie, in Ireland.

The Glasgow United Y.M.C.A. has a total membership of over 9,500 young men.

Exeter Hall Y.M.C.A. now possesses one of the finest gymnasiums in London.

The Y.M.C.A. at Marash, Armenia, Turkey, is in a flourishing condition. It has a membership of 130.

The educational classes at the Chicago Y.M.C.A. are attended by over 1,000 young men.

The American Y.M.C.A.'s are very enterprising and wide awake in their methods of working to reach young men. The Association at York, Pa., recently used an entire page of one of the daily newspapers of that town with an advertisement of their work. This is as it should be; business methods applied to Christian work.

SCOTCH Y.M.C.A. AND FELLOWSHIP UNIONS.

IF our Scotch friends are sometimes accredited with being very steady-going, they certainly make way steadily, and probably gain the top of the hill as quickly as others. Their Y.M.C. Associations and Fellowship Unions are pushing well ahead, with an increase of nearly 500 members last year, and the organising of fresh schemes. The most recent is the appointment of an Evangelist, to strengthen existing Branches, and to open up new ground. We heartily wish God-speed to our Scotch fellow-workers.

NOTES ON THE INTERNATIONAL SUNDAY SCHOOL LESSONS.

By Rev. J. H. Thorpe, M.A.

February 12th.

Jesus and the Little Ones.—*Matt.* 18. 1-14.

Golden Text.—*Matt.* 19. 14.

See what use Jesus can make of a little child:—

A little girl was visiting a prison, and met, at the foot of a high stone staircase, a prisoner, so incorrigible that none of the prison officials could tame him. Running to him, the child said, "Please, sir, carry me to the top, and I'll give you a kiss." The prisoner said nothing, but carried her up to the top, and then the little one kissed his weather-beaten cheek. He fairly broke down, and said, "Little miss, you're the first who has had a kind word for me." From that day the warders found him one of the best men in the prison.

The use of small means brings God the more glory. In a large English factory, where everything is done by machinery, you say, "What wonderful machines and tools!" When you see an Indian workman carving ivory balls with only a few clumsy tools, you say, "What a clever *workman!*"

See in the whole passage before us four points for the Christian:—

1. *His character.* "*Except ye be converted.*" Conversion is the beginning, and you can never end till after you have begun. Note the "except," which points it out as so essential that without it you are not a Christian. Conversion is like the keel of a ship; without it the ship cannot be built. This "except" is like a sentinel who challenges you at the barrack gate, and you cannot pass till you give the answer. "*And become as little children.*" The point here is *humility*. Pride and conceit in a servant of Jesus of Nazareth are as much out of place as a grain of sand in your eye.

2. *His consecration.* Ver. 8, "If thy hand or thy foot offend thee, cut them off." Jesus must be King over you, and King over the *whole* of you! Imagine an English man-of-war, over which the Queen had full command, except a square yard on the quarter-deck, which was held by the Emperor of Russia!

3. *His caution.* Ver. 10, "Take heed that ye despise not one of these little ones,"—*i.e.*, "children," or "babes in grace." How attentive we often are to the learned and the rich, because we look at them through the spectacles of fashion,—it is the way of the world. Watch against this, and strive to see as God sees. When the astronomer looks at the sky on a starry night, his trained eye sees many a star which others cannot discern. Let us be like him, and we shall see many an one, who will hereafter "shine as the stars."

4. *His comfort.* "The Son of man is come to save that which was lost." How precious, when he knows that he once was one of those "lost!" What courage it gives him to go and tell others!

There are seven references to children in the lesson—"Little child" (ver. 2), "Little children" (ver. 3), "Little child" (ver. 4), "Little child" (ver. 5), "Little ones" (ver. 6), "Little ones" (ver. 10), "Little ones" (ver. 14).

Christ's action towards children.

1. He *calls* them to Himself (ver. 2).
2. He *converts* them and refers to them as examples (ver. 3).
3. He *counsels* all about them (ver. 4).
4. He *comforts* those who receive them (ver. 5).
5. He *charges* all not to offend them (ver. 6).
6. He refers to their *custodians* (ver. 10).
7. They are *cared* for by the Father (ver. 14).

Children should be—

C onfident in God as	C aleb (Num. 13. 30).
H oly as the three	H ebrew young men (Dan. 3.
I nstant in obeying as	I saac (Gen. 22. 9). [12).
L earning as	L emuel (Prov. 31. 1).
D etermined to do right as	D aniel (Dan. 6. 10).
R esolute as	R ebekah (Gen. 24. 58).
E xamples of godliness as	E noch (Heb. 11. 5).
N oble as	N ehemiah (Neh. 6. 3).

Enquiry of disciples (ver. 1).
Example of humility (ver. 2).
Except of conversion (ver. 3).
Excelling in heaven (ver. 4).
Expression of Christ about the little ones (vers. 5, 6).
Excommunicate all that offends (vers. 8, 9).
Example of Christ (vers. 11, 12, 13).

Humility.

Humility is the H ighest step in holiness.
Humility is U nselfish in its aim.
Humility is M eek in its character.
Humility is the I mage of Christ.
Humility is L ove's companion.
Humility is I nstant in seeing good in others.
Humility is the T est of fitness for Christ's kingdom.
Humility is the Y oke-fellow of Christ.

Sunderland. F. E. Marsh.

February 12th.

Jesus and the Little Ones.

The treatment of this lesson, more than in most lessons, depends upon character of class. We therefore this week give two brief outlines—one for juniors, the other for seniors.

FOR LITTLE ONES.

Jesus teaching His disciples—grown-up men. Lesson about "a little child." Thoughts to be worked out during the lesson:—

1st. *Jesus* wants *the little ones.* Refer to Golden Text.

2nd. *Jesus* calls *the little ones.* See verse 2.

3rd. *Jesus* searches *for the little ones.* Does not simply *call,* but puts Himself to great pain, like the shepherd for the lost lamb. Why?

4th. *Jesus* loves *the little ones.* That is why.

5th. *Jesus* honours *the little ones.* He never despises little things. Honoured by being made examples. Honoured by having attendant angels.

6th. *Jesus* defends *the little ones.* See verses 6 and 14; also Zech. 13. 7.

If, at the close of the lesson, in going through the outline, the word "*me*" is used in place of "the little ones," it will add considerable force to the lesson. Example, "*Jesus wants* me," etc.

FOR A SENIOR CLASS.

How to enter the kingdom. Verse 3.

How we become great in the kingdom. Verse 4.

How we are hindered from entering the kingdom. Verses 8, 9.

How we are helped towards the kingdom. Verse 10; Heb. 1. 14; Ps. 34. 7.

How we are sought for to enter the kingdom. Verses 12, 13.

"How think ye" of the kingdom? Verse 12.

C. Skinner.

"*Who is the greatest?*" The question of pride and carnal ambition. The fruitful cause of much of the strife among Christians. How few contend for the *lowest* place! Mark the contrast in Paul, who calls himself "less than the least of all saints."

"*Jesus called a little child,*" etc. Christ's object lesson. A little child is useful to Christ. Christ employs a little child to teach older people. He can use little children now.

"*Except ye be converted,*" etc. The spirit they showed was a disqualification for *any* place in the Kingdom, to say nothing of the *highest.* If we have to become as little children before we can enter the Kingdom, then it is obviously better that we should come *when we are* children. There is not so much painful stooping.

"*Whosoever therefore shall humble,*" etc. A great principle often expressed in Scripture. The lower we sink in our own estimation, the higher we rise in God's estimation. See Isaiah 66. 1, 2.

Verses 5, 6. See what *true renown,* what *true greatness,* union with Christ bestows. Observe, too, the seriousness of the sin here described.

Verses 7-9. Christ does not here teach us to mutilate our bodies in order to prevent sin. The meaning is that evil must be checked and destroyed, even though to do so be as painful as cutting off, etc.

Ver. 10. See Heb. 1. 14. Ps. 91. 11, 12. Scripture contains many testimonies to the interest of angels in human affairs, especially in the children of God, and their care over them. The reference here is intended to teach the *dignity* of those who belong to Christ. They are members of the Royal Family, and their attendants have access on their behalf to the presence of God Himself.

Verses 11-14. Intended to set forth the preciousness of *one* little one to God; consequently the seriousness of giving offence to such.

The whole passage 1-14 teaches that the *little ones* are the *greatest.* The proofs Christ gives are—

1. God esteems them so. Ver. 4.
2. Christ identifies them with Himself. Vers. 5, 6.
3. Offences against them are counted serious. Vers. 7-9.
4. The very angels are their servants. Ver. 10.
5. God has a great regard for their safety. Vers. 11-14.

Jas. L. Stanley.

Appetite.—He that only follows his sensual appetites, and makes himself a slave to his own will, lives not the life of a man, but of an animal.

Self-Knowledge.—There is no knowledge so useful as Self-Knowledge. To know oneself is the highest degree of learning; there is no royal road to its attainment; it comes only through trial, discipline, and bitter experience.

To-Morrow.—Every to-morrow has two handles; we can take hold of it by the handle of anxiety, or by the handle of faith. Careless indifference is not faith, but trust in God to do the right is.

Criticism is, if rightly used, "the standard of judging well." It is more difficult, but more important, to apply the standard to our own actions and speech than to those of others.

Reward.—The Christian must not complain if he does not receive his reward at once; the labourers in the vineyard were not paid till the twelfth hour. The middle and heat of the day is not the time to pay wages, unless the man is suddenly discharged.

ADVANCE NOTES ON S. S. LESSONS

IN accordance with many requests from Sunday School Teachers who warmly appreciate this column of Bible Notes, we this week give some Jottings on the International Lesson for Sunday, Feb. 19th, as well as those for Feb. 12th. In future, we shall always give the Notes a week before date, in order that Teachers may have the previous Sunday and week for prayerful thought and preparation. We are always glad to receive such suggestions.

FEBRUARY 19TH.

OUR DEBTS AND OUR DEBTORS.

(*Matt.* 18. 21-35.)

GOLDEN TEXT—*Matt.* 6. 10.

THIS lesson could fitly be called Our Debts and Our Debtors. Why did Peter ask such a question as in verse 21? Perhaps somebody just then had offended him. Everybody at times something to forgive. Some people *always* something to forgive, because quick to take offence. "Seven times." Twice the number set down by Rabbis. "Seventy-times seven." How many would that be? By the time we reached that number, to forgive would be easy. Christ tells a story to teach *why* to forgive. Could be divided into four scenes, or as follows :—

IN DEBT. King. Servants. Reckoning day. One a debtor.

IN DOUBT. How to pay his debt. What his lord would do to him.

IN JOY. Forgiven! Burden gone. Life all different.

IN WRATH. Meets fellow-servant, who owes him small amount. Rough words, unkind and unmerciful treatment.

IN DISGRACE. Fellow-servants see and hear. Feel contempt for him. Report to their Lord.

IN COURT. Again before the king. No excuse.

IN PRISON. Hopeless future.

Lessons Christ intended His parable to teach :—

1st. *We are in debt to God.* Enumerate some of His mercies. What are they worth? Count up the sum.

2nd. *We have nothing to pay with.* Quite bankrupt.

3rd. *Only Christ can pay the debt* (1 Tim. 2. 6). He *redeems* us. Be sure and let Christ get you out of debt.

4th. *We must expect often to have debtors.* We cannot expect our fellow-creatures to treat us better than we treat God.

5th. *We must forgive as we hope to be forgiven.*

6th. *A day of reckoning comes to all.*

For illustration use Luke 23. 34, Acts 7. 60. Hymn, "When this passing world is done."

PLAN FOR BLACKBOARD.

FORGIVE
- DIRECTLY. "Let not the sun go down upon your wrath."
- ENTIRELY. Do not keep back a part.
- BOLDLY. Do not hide your forgiveness. Let people know it.
- TRULY. Not to try and forget is not to forgive.
- SWEETLY. Much depends on *how* we forgive.

FORGIVE because it is NOBLE, CHRISTLIKE, JUST.

C. SKINNER.

IT is only a legal spirit which asks, "How oft?' Love does not seek to place a limit.

Mark how great is the *measure* of forgiveness we are exhorted to, and remember, God teaches us to pray, "forgive us as we forgive." If He expects so much from us, what must His forgiveness be?

The 10,000 talents and the 100 pence are intended to set forth the greatness of our obligation to God, compared with the smallness of our obligation to our fellow-men.

The 10,000 talents are also intended to represent the fact that our debt to God is one we can never discharge. Spiritually, as sinners, we are hopelessly insolvent.

The *first* command of the king illustratcs the severity of the law; the subsequent forgiveness, the mercy of God.

The wife and children to be sold. When we sin, we involve others.

"So likewise," etc. (ver. 35). Does this teach that God will revoke a pardon once given? This would be a contradiction to other plain teachings of Scripture. It means, that the cherishing of an unforgiving spirit is a proof that we ourselves have not experienced forgiveness, or we could never act so.

Further, as long as that is cherished, there can be no forgiveness; it is itself a sin, and while sin is persisted in, it cannot be forgiven. J. L. STANLEY.

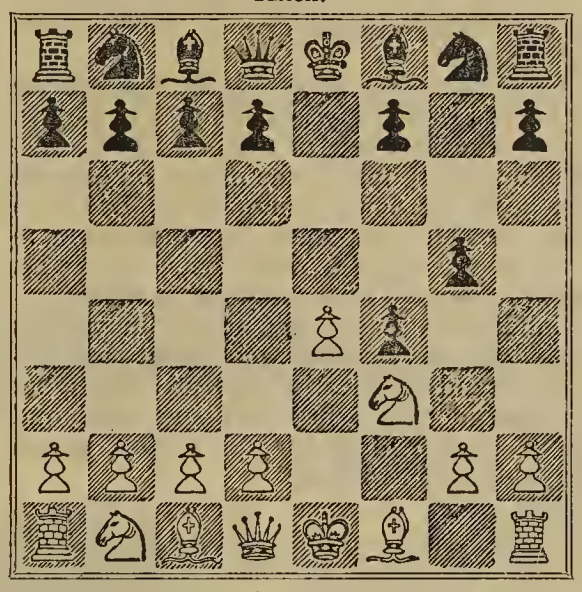
The Answer will be given in our Number for March 10th.

CHESS.



By F. F. ROWLAND.

PART X.

THE KING'S KNIGHT'S GAMBIT.

WHITE.	BLACK.
1P to K4.	1P to K4.
2P to KB4.	2P × P.
3Kt to KB3.	3P to KKt4.

BLACK.

WHITE.

White 4B to B4 gives us the King's Knight's Gambit (Proper); the same move leads to several named forms of the Gambit—Salvio, Cochrane, Muzio, etc. White 4P to KR4 leads to the Allgaier and the Kieseritzky. If, instead of 3P to KKt4, Black plays 3B to K2, we have the Cunningham Gambit.

THE SALVIO GAMBIT.

WHITE.	BLACK.
1P to K4.	1P to K4.
2P to KB4.	2P × P.
3Kt to KB3.	3P to KKt4.
4B to B4.	4P to Kt5.
5Kt to K5 (*a*).	5Q to R5ch.
6K to Bsq.	6Kt to KR3.

Black's 6th move forms the Salvio Gambit. The Cochrane Gambit is formed by Black playing 6P to KB6.

(*a*) 5 Castles, The Muzio Gambit.
5Kt to B3, McDonnell's Attack.
5P to Q4, Koch's or Ghulam Kassim's.

Entering into the MUZIO GAMBIT, we will make the moves as follows :—

5 Castles	5P × Kt (*a*).
6Q × P.	6Qto KB3 (*b*).
7P to K5.	7Q × KP (*c*).
8P to Q3.	8B to KR3.
9B to Q2.	9KKt to K2.
10Kt to QB3	10QKt to QB3.
11QR to Ksq.	11Q to KB4 (*d*).
12R to K4.	12 Castles (*e*).

(*a*) If Q to K2, we have the Kling and Horwitz Counter Attack.

(*b*) If Kt to QB3, we have the Holloway's Defence.

(*c*) If Q to KB4, we have Fraser's Counter Attack.

(*d*) Known as Herr Paulsen's Defence.

(*e*) If Kt to K4, we have Dr. Zukertort's Defence.

KIESERITZKY GAMBIT.

WHITE.	BLACK.
1P to K4.	1P to K4.
2P to KB4.	2P × P.
3Kt to KB3	3P to KKt4.
4P to KR4.	4P to KKt5.
5Kt to K5 attacking the advanced KKtP. Black has eight defences; viz. :—	
Herr Neümann's	5Kt to QB3
The Old Classical	5P to KR4.
Kolisch's	5P to Q3.
Polerio's	5B to K2.
P. Morphy's	5P to Q4.
Rosenthal's	5Q to K2.
Paulsen's	5B to Kt2.
Philidor's	5Kt to KB3.

If Black replies with 5P to KR3, we have the ALLGAIER GAMBIT. White replies with 6Kt × KBP, to which Black answers with 6K × Kt. Here Allgaier played 7Q × P, but this is now considered bad. The favourite moves are 7P to Q4 (Thorold's), or 7B to QB4 ch. (Ourossoff's).

THE ALLGAIER-HAMPE results from both players playing 2Kt to QB3, and then continuing as above (or the same position may be reached by both playing Kt to QB3 later on).

CRISP CORRESPONDENCE.

INQUIRY.

A Student would like to know of a good, but cheap, Commentary on the Book of Job.

ANSWERS.

J. R. M.—Those "term times" in Scotland are indeed evils to be deplored. We do not think your plan of helping the "lads and lasses" who then migrate from place to place is feasible; the Railway Companies would not co-operate. The only way to work amongst the careless ones is by earnest, personal words, and the distribution of Gospel literature. If you can find, in some of our Scotch towns, earnest men or women who will meet the principal trains at such times, and try to steady and influence those who are changing places, we will gladly send such workers a parcel of suitable literature to start with.

A. S.—It is well you realise that you *are* only "a lukewarm Christian." "Whatsoever doth make manifest is light,"—you would not know your need, unless the light of God's Spirit were shining in your heart. When water is only "lukewarm," we do not bid it heat itself,—we set it on the fire; so, when our hearts are chilled with the frost of worldliness, or bound by the ice-chain of unforsaken sin, it is useless for *us* to try to set them right. The Sun of Righteousness is waiting, with love and power enough to kindle your heart to fever heat. Take your "lukewarmness" to Him.

Congregational Colleges (W. P. R.)—The following is a list of these :—

New College, St. John's Wood.	Bradford (Airedale).
Cheshunt.	Brecon.
Manchester (Lancashire Independent College).	Bristol.
Hackney.	Plymouth.
Bangor.	Rotherham.
	Nottingham.
	Edinburgh.
	Birmingham (Springhill).

Français.—One of the best translations, if not *the* best, of the Bible into French is Dr. Segoud's, published in England by H. Frowde, Amen Corner, E.C. Price, cloth, red edges, 3s. 6d.: thin paper, 4s. 6d. There are also more expensive editions.

"Fidelity."—The word holy, as applied in Scripture to *things*, is the same in the original as that applied to *persons*. "Set apart" expresses one of its characteristic features, but does not define its real meaning. The root idea of the word is reverence, or awe, due primarily to God, as the Holy One, and then derivatively to persons and things connected with Him, as "partakers of His holiness."

"Herbalist" and "Medical Botanist."—These are merely fancy expressions, used by those wishing to impose upon the ignorant in those matters. There is no examination to pass in order to assume them; they are only adopted by quacks. To become a qualified practitioner in Pharmacy, an examination has to be passed at the Royal Pharmaceutical Society.

Lena.—We think you will find the following books useful: *French History*, "Histoire de France," par M. Durny, 8s., "Siècle de Louis XIV.," in 3 parts, 2s. each. Both these are published by Hachette, 18, King William Street, Strand. *Botany:* "Lessons in Elementary Botany," Oliver, 4s. 6d.; "A Year's Botany," Kitchener. Both, Macmillan. *Zoology:* "Ray Lankester's Zoology"; also "Nicholson's Zoology"; very good, but rather advanced.

A Perplexed One.—You are looking *back* to a certain night; you are looking *within*, into your cold, dark, unsatisfactory heart; in short, you are looking everywhere but where you should. How do you expect rest and peace? You will never see the sun looking down a coal-mine. "Look unto ME, and be ye saved." The moment you look at Christ, and are satisfied with His precious blood as able to cover and cleanse you from *all sin*, and to justify you from all possible condemnation,—there *must* be joy and gladness. Look, then, right away to Jesus, and remember that faith honours Christ, whilst *unbelief* grievously wounds Him.

[We regret having to hold over till our next, other interesting communications, in consequence of having a double set of S. S. Notes.—ED.]

A RAMBLE AMONGST THE BEAUTIES OF BRITTANY AND THE BATHERS OF ST. MALO.

By Miss Spottiswoode.

Part I.

TWELVE hours suffice to transport one from the shores of England to quaint, old-fashioned Brittany. Of all the provinces of France, perhaps there is none less influenced by the rapid current of modern life than this. St. Malo, girt with its massive walls, pierced here and there with gates, now always resting open on their rusty hinges, must have looked two hundred years ago much as it does now.

The streets within the gates are narrow and steep; the houses are high, and substantially built of stone. It is market day, and the women in their snowy caps are hard at work, buying or selling garden and dairy produce. It seems as if each woman had invented a cap for herself, so great is the variety of form. Priests in long, black cassocks mingle with the throng. Without the gates you may procure a charioteer, in a straw hat and big blue blouse, bearing a long whip, who will conduct you where you please in a dusty carriage, perhaps boasting a cotton awning like a big parasol. The lean, dispirited-looking horse is probably harnessed to the vehicle with a bit of rope. The shops display a quantity of their goods on trays outside the windows. Rosaries, crucifixes, and statuettes abound; also specimens of Breton pottery, bearing designs in gorgeous blue, green, and yellow tints; and costly Breton needlework, consisting of elaborate patterns worked in brilliant silks on fine, dark cloth.

If you pass out of the busy streets into one of the large, cool churches, you will find groups of peasants kneeling before the decorated altars.

Go on to the bathing-place, however, and all is modern, but completely French, from the dainty little maidens, in their light stockings and gay Parisian costumes, to the amphibious-looking "plongeurs," who undertake to teach you to swim.

St. Malo is connected with the neighbouring town of St. Servan by perhaps the most curious bridge ever invented. It is appropriately known as the "pont roulant," or "rolling bridge." It consists of a sort of platform, erected on four long iron rods, which move on wheels over rails laid in the bottom of the harbour. It is worked by means of a sort of pulley. Part of St. Servan is built on ground rescued from the sea.

The coast of Brittany is deeply indented and very rugged. Great rocks display their jagged edges all along the shore, and the restless waves shape them into fantastic pinnacles as they splash wearily round the bleak headlands. Sheltered by these majestic walls lies many a secluded bay, where the blue water splashes in the sunlight over the smooth sands. These are gradually attracting the attention of pleasure-seekers, and large hotels and pretty villas are beginning to overshadow the little village dwellings which cluster round the churches.

The sea-beach, deserted throughout the boisterous winter days, or sunny spring-time, save by the fishermen or solitary coastguardsman, becomes, during the month of August, a scene of overflowing animation. Ladies in smart seaside costumes, and gentlemen in straw hats and white waistcoats, make this their promenade from forenoon to sunset.

Children, attended by nurses in various stages of exasperation, construct unsatisfactory sand fortifications, as at home; but they shoulder their little wooden spades, and march about in mimic drill in a serious fashion not so common with us.

Bathing is, of course, the great event of the day, and the whole company might be divided into those who have bathed, those who impatiently await an empty "cabine" that they may bathe, and those who are bathing. The last are the centres of much observation, especially as it is the French custom to have but one bathing-place for everybody.

Bathing costumes are more various than in England. One tall and portly bald-headed gentleman might be observed gravely entering the sea in a rose-coloured suit. Another wore, as an extra protection, a thick white cloak, which, on leaving dry land, he deposited on a camp-stool, borne by one of his three daughters to the water's edge. Many of the bathers wore large straw hats and had chains round their necks, to which charms were attached.

Almost all could swim, and the object of their ambition was a raft or a boat at a little distance from the shore. The raft sometimes presented a strange spectacle, occupied by six or eight dark figures with long white legs and arms in constant gesticulation.

French people do not seem to "take a dip" by throwing themselves backwards, as we do, but crouch down with their faces towards the wave, which splashes over them.

Sometimes a panting individual may be observed endeavouring to master the art of swimming, clinging to each end of a cord, of which the instructor holds the centre.

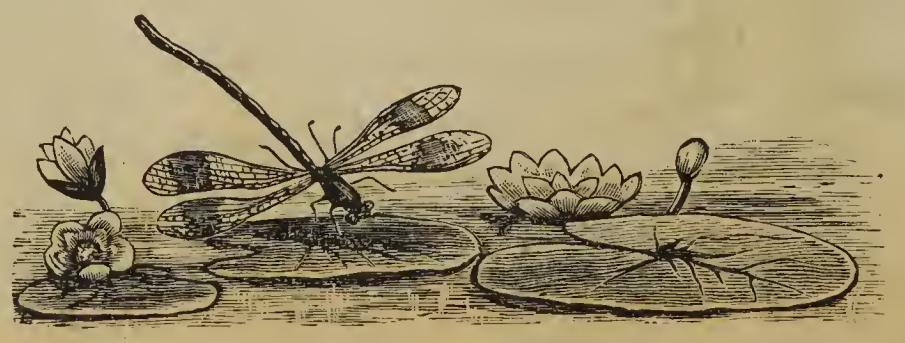
A middle-aged lady appeared one morning among the gay throng at the St. Malo bathing-place, clad in a costume of peacock blue. She wore shoes, and had a straw hat, fastened under her chin, which rather resembled an inverted market basket. Having secured the services of a "plongeur," she had herself plentifully splashed with the contents of a wooden bucket, then dragged by the shoulders through the water, splashing vigorously, and apparently quite indifferent to the peals of laughter on the shore.

Most of the bathing cabins are of grey and white canvas, stretched on a wooden frame, but in some places they have red and white or blue and white stripes. In some less fashionable, but not less crowded spots, the bathers are content with tiny bell-shaped tents.

The peasant people retire early, however. It is said that they do not care to be out of doors alone after dark, for fear of encountering ghosts.

A ramble by the shore when the pale moonlight is gleaming over the dark water, or among the fields and orchards when the glowworms begin to glitter in the hedges, is very pleasant.

Agricultural machines do not appear to be much in use in Brittany, and the gentle, kindly women and girls seem to help a good deal in the fields.



More than once we passed girls at work, whose bright red hair, showing beyond their close-fitting caps, caused us almost as much surprise as the tourist expresses on discovering that there are people in Scotland whose hair is not red.

The Bretons have a strange fashion of reaping the ears of corn first, and cutting the straw afterwards, for which we failed to discover any satisfactory reason.

The people are very fond of fêtes, which often take place on Sundays. We spent the Feast of the Assumption at St. Lunaire, a little watering-place which was not long since merely a secluded village. It fell on a Monday, and the place had almost the aspect of an English Sunday, so many people passed to and from the big stone church with Prayer-books in their hands.

In the afternoon a procession took place. First came some very old men with banners, then girls in white dresses and veils, also carrying banners, on which crosses of various colours were embroidered. After these came little boys, many of them wearing white suits and blue sashes. One of them had a drum, which he beat monotonously at intervals. Priests and acolytes followed, bearing a small figure of the Virgin, and a crowd of peasant women brought up the rear, in their neat black dresses and white muslin caps.

ONE PENNY.

WEEKLY — Edited by MRS. STEPHEN MENZIES.

A NEGLECTED PROFESSION(AL?)

WORK AND WAGES OF A TRAVELLING TINKER.

"SOCIAL SIDELIGHTS."

CAN any one explain why no writer has ever given to the world any account of the "true inwardness" of Tinkerdom? Every kind of mysterious being, such as the Freemason, the Gypsy, and the Mormon, has been exposed time and again, in revelations more or less reliable, or liable to be impugned, but the Tinker, no one has as yet so much as libelled. Yet, as I shall show, he is in all lands the most peculiar of beings, having everywhere a secret language, and keeping himself unto himself with a success which renders the rival efforts of the Rosicrucians to remain unknown, simply ridiculous.

No authors have told us so much about tinkers as George Borrow in his stories, and Walter Smith in his "History of the Gypsies." Both assert, the latter most positively, that the majority of, if not all, the tinkers of Great Britain are Gypsies or Romanies more or less mixed in blood. Indeed, Tinkler, or Tinker, and Hawker, are in Scotland synonymous with Gipsy. And the fact that every tinker in Great Britain can speak some Romany, and that thousands of them have gypsy blood in their veins, would seem to establish all that these writers have declared or intimated. And yet, as a class, the tinkers are not Gypsies, and the characteristic and secret language which they employ amongst themselves is not Romany, but a very singular Celtic dialect, which they call Minkhias or Pickhias Thari, "the tinker's language," but which is also more briefly termed Shelta.

I have not, after obtaining a rather copious vocabulary of the tongue, been able to decide what it really is. That it is Celtic admits of no doubt, but it is not to be reduced to Irish, Welsh, or Gaelic. The tinkers themselves think it is "ould Pictish," an assertion which it would be very difficult to prove. Many of its words are, it is true, Gaelic, and a few, Irish; but the greater part are quite by themselves. In it *thédi* is fire; *strawn*, tin; *blyhunka*, a horse; *chimmel*, a stick; *gullernnocks*, shoes; and *oura*, a town. It has a very different pronunciation in the mouth of an English tinker from the same

words as given by an Irish or Scotch *Minkhia*. There are very few now living who can talk Shelta without employing English as a basis. Thus a tinker of the present day would say, "*The* nidias *of the* kiena *don't* granni *what we're* a-tharyin" (The people of the house don't know what we're a-saying). Very often Romany is mingled with it, even to the extent of entire phrases, *e.g.*, *Me tu sosti mo-diele*, "Thou wilt be satisfied with me"—*Me tu sosti* being purely gypsy.

The truth is, that the tinkers of Great Britain have not only a secret life and language as *half*-gypsies or *Churidis*, but inside this again they have a still more secret fraternity, and a far-less-known language of the Celtic family. No writer has ever known this, unless it was indeed the omniscient Shakspeare, who makes Prince Hal say that he can drink with a tinker in his own language. I have heard from an English tramp, who understood all the mysteries of the roads, that the tinkers believe themselves to be a very ancient organization, and that they have been breaking up, and their old families falling away into the world, ever since railways came in. It was the American war at first, and then the railways, which indicate the two great periods of the decline of gypsyism in Great Britain, and its transference to the United States.

Those who speak the British-tinker language, declare that it was quite a perfect language as used by their parents or grandparents, and that it would be almost impossible to recover it at the present in all its purity. That they should so carefully have kept this language a secret is not so wonderful. The tinker is the most reticent of beings, the most reserved, and the most suspicious.

The tinker is, as a rule, the greatest rogue and the toughest rough at heart on the roads, while, *per contra*, when it serves his purpose, he can be more polite and persuasive than the gypsiest of gypsies. The Romany has never lost a certain Oriental politeness ; the tinker has acquired this from him, and improved it by practice. Going from door to door soliciting jobs, roaming all over the world, seeing cities and men like Ulysses of old, he becomes, Ulysses-like, a very plausible, persuasive individual. He is of all travellers the most imperturbable. He is distinguished by an air of gravity which would become a judge.

I have known many tinkers of many races, but I only knew one who was ever astonished, and he was taken aback by an act of disinterested kindness to his gypsy wife. The English tinker often speaks French. I once got four tinkers together in an out-of-the-way house in London. They left their barrows outside, and being addressed in Romany, and questioned as to several mutual acquaintances, became confidential.

"I don't know much Romany," remarked one, "but I can talk French. *Oui, je parle Français moi.* How did I learn it? Well, I dessay we all know a little of it."

"I know that *couteau* is a knife," said another, "and *bone* means good ; but I don't know what *better* is."

"A bone with meat on it is better," answered the first, gravely. "How do we learn French? By goin' over to France. The French have a prejudice that we English griddlers can sharpen a knife better than their own people, which we can, bein' better cutlers, an' havin' better kits. So I take a spell on the drum (a turn on the road) every summer for the health of my pocket, francs bein' even more inwigoratin' than sixpences. *Vive les francs!* Them's my sentiments."

The tinker is not only a most imperturbable being, but he has a wonderful memory. Possibly, in the depths of his taciturnity, he revolves everything in his mind, while his wheel is turning. Once, in Brighton, I saw a tinker slowly wending his way along the Marine Parade. As he walked on the road, and I along the side-walk, I spoke to him in an undertone in Romany. He never looked at me, but answered in the same guarded manner, supposing that I did not wish to be known. I bade him come to my house to sharpen some tools. As we went, I said,—

"*Tuté don't dik sims a Romany*" (You don't look like a gypsy).

"No more do you," he replied ; "but you know you are one, your language shows it."

Two years after, I met a tinker by Bo-peep, near Hastings. I did not know him, but he remarked quietly, after some conversation, that he had known me before. I was the Baro Romany Rye--the tall gypsy gentleman who had lived at No. —, Marine Parade, Brighton, and that he had sharpened a carving gouge for me of a certain peculiar shape, and that I had paid him double for so doing.

In 1869 and 1870 there were almost no itinerant knife and scissors-grinders or umbrella menders in Philadelphia, and very few in any American cities. Forty years ago there had been many, then they disappeared ; but during the last decade they have become very numerous. Strangely enough, they are mostly Austrians, though with them are many Italians, Slavonians, and Germans. The Italians have a curious *linqua furbeschi*, or thief's language ; the Germans are mostly familiar with *Rothwälsch*, which is quite one-half of it composed of *Schmuss*, or corrupt Hebrew. In this dialect a *ganef* or *gonef* is a thief ; *isch* is a man ; *gani soref schaskenen* means to drink spirits. I have met with an itinerant basket-maker who could speak fluently, not only German, French, Roumanesch, Italian, and Rothwälsch—he being very proud of the large proportion of Hebrew in it which he had acquired—but also the *linqua furbeschi* and French *argôt*. Most British tinkers, be it remembered, speak not only Shelta, more or less, and Romany, but also Canting or English Slang, which is given in full in Hotten's Dictionary, and sometimes the Back and Rhyming Slangs. I have heard that the boot-blacks in London are gradually acquiring rhyming slang among themselves. This consists of using for every word, or in its place, a rhyme, as if one should say for "St. Ann's," "pots and pans." This grotesque language is also given by Hotten in his Dictionary. But neither Hotten nor any other writer appears to have been aware of the existence of the true tinker's language —the Minkhias, Pickias Thari, or Shelta.

It is natural that the tinker, as a cosmopolite, should also be a linguist. Wherever he goes, it is his business to ingratiate himself with housewives and maids, to be in the good graces of cooks, and to impress all who have pots, pans, and umbrellas to mend, or food to give away, with a sense of his excellence. The smile of an Italian tinker soliciting a job is something to be remembered, and his joy at being addressed in his native "slanguage" is indeed charming.

Most tinkers, especially the British, have several callings. They can mend tin and iron ware, sharpen and repair cutlery, and are all *mush-fakirs*, or umbrella restorers, and able to seat chairs with split rattan. So the tinker can, if industrious, make *goshtia garheid*—in Shelta, plenty of money. True, his business is precarious, but if he has a good beat, he can generally find something to do in the worst times ; at any rate, he generally knows of some hospitable kitchen where he can safely count on a lunch. I knew a tinker once in London who was a half-blood gypsy, and who had a full-blood gypsy wife—one of the Boswells. He had, before taking to the wheel or barrow, been a rat-catcher, and boasted of having studied the art under old Lee, the most celebrated rat-catcher in England. From one old tinker, I learned that *modangarengro* was the ancient gipsy word for a tinker, and from him I also heard *angara* for coals, which is not only Romany, but also pure Sanskrit.

Two days ago, whilst I was conversing with an experienced tinker, I remarked that there were two words in Shelta for a place of worship, *champel*, probably a corruption of chapel, and *blarnio*, which means simply a Protestant church. My tinker is partly gypsy, and speaks Romany. I asked him if he had ever heard of the gypsies' church and what became of it.

"Well, I didn't," he replied.

"*Shoonta!* Listen. Once upon a time, the gypsies resolved to have a church, and as it must be a very fine one, they said, 'Let us make it of what we like best.' So they came to the conclusion that they would build it all of sides of bacon. And they went all round the country, and some of it they begged, and more they stole."

"I'll be bound they got the most of it by stealin'," remarked the tinker, dryly.

"Well, you know them better than I do. And when it was built, a fine church it was. But it was the beginning of summer, and of course the gipsies had to *jâ pré o drom* (go on the road and travel), and when they returned, the church was gone, for the dogs had eaten it ; and that was the last of the Romany *kangri*—the gypsy church."

"An' the tinkers' church," said my listener, who had keenly enjoyed the story, "was made, I expect, of bits of tin and scraps of old iron, and it fell apart. But, to tell the truth, I never heard that we tinkers ever had any church at all."

The tinker is *l'homme le plus incompris du monde*—the least appreciated man in existence. He is humble, he is looked down on ; even a tinker's curse is a proverb for the curse of all curses the least to be cared for. And he takes his revenge by not "caring a button" for anybody. But when, to his utter amazement, anybody does care for him, and manifests an interest in him and his ways, he generally shows very grateful feelings. One of the best fellows I ever knew in my life, and who showed himself extremely honest, thankful, and generous, was an English tinker who had been kindly treated—not in a patronising way, but as a man.

In conclusion, I must observe that the Weary Knife-grinder of the anti-Jacobin lyric was a humbug. He declares that :

"Story? Bless you, I have none to tell you, sir."

And his modest denial is accepted.

But there was never yet a tinker without many stories, if he chose to tell them. He who wanders wide has ever much to tell, if you can draw him out. It has been said that a pilgrim who performs the grand tour afoot, and one who is whirled over it in railway carriages, come to widely different conclusions regarding men and things. From my own experience, I should say that a tinker would be about the last man living to be devoid of a story, or of language wherein to tell it, if proficiency as a linguist be any proof of his ability as a narrator.

"OONALASKA:" A TALE OF A FAR NORTH LAND.

By GORDON STABLES, C.M., M.D., R.N.,

Author of "The Cruise of the 'Snowbird,'" "Thirteen Hundred Miles in My Caravan," "From Pole to Pole," etc., etc.

CHAPTER XXV.

"YOU NEED A FRIEND, LAD."

WHEN one thinks of it, the diffidence shown by most people, especially landsmen, in so simple and natural a thing as saying grace before meat, is very ridiculous. What! not breathe a word of thanks for, and ask a blessing on, the good things Providence has placed before you? You in particular, remember; you whose lot has been cast in an oasis of the desert of life, with all around you a wilderness of sorrow—a weary land—in which there is scarcely the shadow of a great rock.

But plain Jack Boyd—honest, blunt old Captain Boyd—was not one of the over-diffident in this respect. And when he looked down from the stage in the new hall-by-the-sea, and saw not only his own men, but the chief citizens of the Aleut village preparing to discuss a hearty meal, it seemed to him the most natural thing in the world to bare his gray head and give thanks, and ask a gracious blessing. He was hardly prepared, however, to see those Aleuts fall on their knees; but a word afterwards from the Russian captain explained to Captain Boyd that, even in this Ultima Thule, the glad tidings had already been sounded, and by the Russians, too. Knowing this, one is loth to believe the terrible tales of murder and rapine by Russians that are said to have taken place in these islands, and on the shores of Behring Sea.

As soon as Captain Boyd had finished, Jack stood up and said, "Men, fall to."

No one there required a second bidding. Our sailor-lads showed the Aleuts a good example. At any rate, they made a good beginning. But, dear me! in half an hour the sailors had done, and the Aleuts were apparently only getting serious. The soup, the pork, the beef and fowls that had gone before were but trifles; the Aleuts had been but skirmishing, and now they prepared to bring up the main army of their appetites.

Only the principal men-folks of the village had been invited to the "school treat," as Jack Silk would persist in calling it; and seeing the way the viands disappeared before these forty all told, the caterer had strong reason to believe that the plates and dishes would soon be empty, and the Aleuts, like David Copperfield, asking for more. Jack registered a mental vow that the next time it was his luck to cater for a corps of Aleuts, he would have a sea-lion roasted whole, and throw in a few sacks of dog-biscuit, and a barrel or two of herrings to make up the weight.

The white folks on the stage had tea served by the stewards and Sally, and then music and singing were commenced, the harmonium having been brought on shore for the purpose. There had been a considerable deal of laughing, giggling, and joking, audible outside, before Miss Graves sat down to the instrument, but all was hushed as soon as she began; and, even after she had finished, the Aleuts were mute, and the only thing to be heard was the surging roar of the fur-seals on the beach.

After a few songs from the *Oonalaska's* people, including Jack's *two*—yes, he had learned another—the ladies from the barque sang.

Then, and not till then, was the ship's fiddler called upon. And this was the signal for general jollity, for, to the intense delight of the simple Aleuts, sailor after sailor appeared on the stage in ranting jigs or rattling hornpipes.

The Russian seamen tried their art also, but, compared to our merry, nimble-footed lads, their performance seemed sadly lacking in grace and gaiety. An old cow, or a genuine brown bear, would have done equally well; but, nevertheless, it was amusing from its very awkwardness, and was *encored* accordingly.

> "But pleasures are like poppies shed,
> You seize the flower, the bloom is fled;
> Or like the snow-flake in the river,
> One moment white, then gone for ever,
> No man can tether time nor tide,
> The hour approaches, Tam maun ride."

Which, being reduced to plain and simple prose, means that at ten by the clock the Russian and English anthems were duly sung—*not* both at once—and boats were called.

Early in the evening Godfrey had left the company. Strange as it may appear—and it was passing strange—the younger Russian lady, who had a very beautiful though sad face, as if she had known a good deal of sorrow, sang a song, the words of which were in her own language, but the melody—ah, that melody! Where had Godfrey heard it? It was "The Wearing of the Green." He listened almost wildly. The lady gave it with all the expression that the music never fails to give birth to in every kindly heart. She felt what she sang—the tender modulations of her voice expressed that feeling. Her eyes were not free from tears, and those of her audience, in more than one instance, brimmed over.

Godfrey had been sitting by the side of Miss Graves. When the song was ended, he was gone. Let me explain. As soon as the music began, the young Yorkshireman, who was as free from any mawkish sentiment as true Yorkshiremen invariably are, felt strangely moved. It was well he got out in time; the melody kept ringing in his ears as he wandered on, careless where he went. Oh! now he remembered, and such a sudden rush of sorrow came over his heart, that, with a pained and anguished cry, he threw himself on a hillock of grass, and burst into a flood of tears.

Need I say this song was Rosa's favourite? It was no ordinary fit of weeping, this. The strong man's heart was rent in twain. Again and again he tried to control his sobs, but no, Nature would have her way.

He wept for his lost friend, his lost love, his lost life. All the grief his pride had pent up so long had found vent at last, and for a time it seemed as though the struggle would end him. And yet it was well he wept, else reason itself might have left its throne.

As he lay face downwards on the grass, sobbing less violently now, a big cold muzzle was thrust under his neck, almost lifting his head up, and next a warm tongue was passed rapidly across his ear. It was great Robin Hood. How well do dogs know when one is in grief! Godfrey raised himself on his elbow, and, patting the big head, spoke a few kindly words, and the dog lay down beside him, as much as to say, "Whatever your sorrow may be, I will share it."

The cool night air blew athwart the young man's face; above, in the dark sky, was a full moon and radiant stars, that carried his thoughts far, far away, to that source from which alone comfort could come to his poor wounded heart.

Well, sorrow brings sleep, and Godfrey's wet eyes closed at last, just as he lay there, with his face turned skywards.

Miss Graves had felt very uneasy when a whole hour and more passed by and Godfrey had not returned. She left the barracoon at last, whispering to Katie that she would soon return, and went out into the night.

Little John ran bounding to meet her, and seemed overjoyed she had come. Godfrey had always been a favourite with the animals—so much so, that they knew him as master.

"Where is your master, John?"

John barked aloud, and went careering off hillwards, Miss Graves following as well as she could. Just as the two of them rounded the corner of a rock, Robin Hood sprang up, and uttered a low and ominous growl.

"Down, Robin, down."

Robin was at her side in a moment. Godfrey raised himself bewilderedly, as she knelt by him and touched his arm.

"Why, is it—is it *you*, Miss Graves? is it you, mother?"

"It is I, boy. I have been uneasy—*so* uneasy about you."

"And I, stupid-like, had gone to sleep."

"What brought you here?"

"You'd laugh at me if I told you."

"No. *You* have been weeping. Why should I laugh? It was that song that brought back your grief."

"The song, mother?"

"Yes, Godfrey. Can't I really be your mother for a time? You need a friend, lad."

There was a gentleness in this lady's looks, and an unobtrusive sympathy in her voice, that went straight to Godfrey's heart, and won his confidence.

"You need a friend, lad!"

Yes, and he had found one. He had found something else—comfort and hope; two feelings that, till now, he had never permitted to find place for even a minute in his heart.

CHAPTER XXVI.

STRANGE ADVENTURES UNDER THE MIDNIGHT SUN.

IT was early in the morning of a dull, grey day, towards the latter end of June, when the *Oonalaska* got up anchor and proceeded on her voyage. After some days they reached St. Lawrence. The southern shores of this island were skirted for some time in an easterly direction; then the ship was kept away north, past a rugged, rocky cape, which loomed darkling through the haze. Yet so near to it was the ship, that those on the quarter-deck could hear the boom of the

waves as they broke in clouds of spray over the boulders. But this sound grew fainter and fainter, and the headland itself disappeared, only the screaming sea-birds remaining, as if loth to leave the ship, or praying our hardy mariners not to brave the dangers of the Arctic Ocean.

On and on sailed the ship on a gentle south-west wind. On and on, all that day, the wheeling gulls still going with her, and far into the night their voices could be heard, as they went tacking and half-tacking round bows or stern. To the ears of Desmond O'Neil, who was keeping the middle watch, the cries of these Arctic gulls seemed to have now a more plaintive wail in them, startling at times as they flew close along the quarter, then dying away in distance and darkness. If he had asked old Chips what the birds were, or why they did not go away and be at rest, Chips would have told him many a strange legend and story of these dark and lonesome seas—of the bold and fearless sailors, who, hundreds of years ago, braved their dangers, and whose bones are deep buried in ocean caves; but their tameless spirits are still heard shrieking at night in dimly-seen shapes like sea-birds.

He would have told him, with many superstitious embellishments, the wondrous adventures of Behring and Cook; or the even stranger story of the Russian Viking, who sailed from Siberia in a light decked boat, with a bold crew of ten, to seek for the ivory islands. How they sailed on and away to the east and the north, for weeks and for months, through fog, and mist, and darkness; seeing monsters by day with eyes so awful, and visages so strange, that, brave though they were, their hair sometimes stood on end, and hearing voices by night that made their flesh creep. How they were exposed to cold, and wet, and hunger, to dangers from tempests, to dangers from the ice, often for days, or even weeks. How, when the fogs left them, the frosts came, and they were beset all through the long dark night of winter. How, when summer came again, they resumed their voyage in a blue and open sea. How they reached, at last, the shores of a lovely island, where strangely beautiful beings lived in palaces among hills and glens, and in green flowery glades among shady woods, where bright-winged birds sang from every bough, mingling their melodies with the murmuring of rippling waters and song of cascades. How that, in this island of the blessed, by night the very leaves and flowers gave forth light and radiant colours. How the wave-worn mariners were invited on shore, and how regally they lived; till a strange inexplicable longing for their wild, rude homes in the far West seized them, and, braving every danger, they sought, and once more found it, bringing with them, not only ivory, but gold galore and precious stones.

Yes, Chips would have told him all that, and more; and told him, too, that his stories must be true, because there were people living still on the storm-washed shores of Kamschatka who believed them.

Perhaps it was as well that Chips was not on deck. The wailing voices of those birds sounded sad enough, but with an ancient mariner by his side, with glittering eye and skinny fingers pointing at the dark, whispering seas, it would have been doubly drear.

But Desmond was Irish, and his mind did, at times, take short flights into the realms of superstition; so now, to make things more cheerful, he launched forth into song, interspersing his verses with orders, shouted to the men by way of chorus, thus :—

"'Oh! had we some bright little isle of our own,
In a blue summer ocean, far off and alone,
Where the leaves never die in the still blooming bowers,
And the bee banquets on through a whole year of flowers.'—
Are you keeping a good look out there forward?

"'There with souls ever ardent and pure as the clime,
We should love as they loved in the old golden time;
The glow of the sunshine, the soft balmy air,
Would steal to our hearts, and make all summer there.'
Take a pull o' the weather main braces."

But the birds were all gone by morning. If I must tell the truth, I must dispel the romance; but here it goes: they were only bachelor sea-gulls, after all, that had followed the ship. They had neither nests nor wives and families to protect and provide for; they could, therefore, take a trip to sea, when so minded, and had convoyed the *Oonalaska* not to scream the voyagers a shrill good-bye, and wish them safely back again, but for the sake of the bacon-rind and morsels of bread the cook threw overboard.

The morning of the third day was dark and misty, though towards noon, indeed, there were many sure evidences that they were near land of some kind, for birds were once more whirling near. A school of whales had been seen, going silently northward, intent on business, and never pausing to look about them, or wonder at anything—for such is the way of whales. A herd of narwhals had followed, with several horns among them, and very much they seemed to be enjoying themselves. Walruses had raised ugly, flat heads to gaze at the ship, and lo! while the sailors were looking at these, a boat appeared.

"Near land of some kind."

She came straight from the east; out of the fog-bank she loomed bigger far than she was. A cobble-like boat, with one mast and sail, the latter probably made of deer-skin. Sitting in the stern-sheets was a single figure, steering with a paddle. As he rapidly approached the ship, the foreyard was hauled aback, and Chips was summoned to hail him, which he did, in a ringing voice, both in Russian and Innuit. But though the boat passed right under the ship's stern, the boatman never once looked up, nor moved in the slightest. What a strange, woe-begone creature he looked! The face was like that of a bat, but yellow, weird, and attenuated, the skin cap making the resemblance more perfect. His open boat rose and fell, and was tossed hither and thither; the waves whistled and hissed around him, but he sat as still as if his little boat were a thing of another world, and he himself a spirit.

"Very strange the mummy should evince no curiosity," said Captain Boyd.

"Ah! sir," said Chips; "beggin' your pardon like, but they be a queer lot along over there."

"Where is over there, Chips?"

"If the fog were to lift, sir, you'd see a strange sight. And lifting it is, sir."

Lifting it was, undoubtedly, or rather, it was rolling away, leaving the sea sparkling in the sunshine, and the sky bright blue and almost cloudless. And away down to leeward, at a distance of some five odd miles, there rose straight out of the dark ocean, on which a few small snow-clad icebergs floated, one of the wildest and boldest headlands ever seen by eyes of seafarer.

It was, to describe it in few words, a mighty mountain pass, or cone, rising skywards from a base of black and beetling cliffs. Here and there were patches of green, with seams of white, but the upper portion was buried in eternal snows. And away beyond, and at the foot of this mountain, lived a tribe of Yacks, or Innuits, far more wretched and degraded than the worst savages of African or Patagonian interiors. Clothed in skins, living in burrows, feeding on walrus flesh and blubber, or fish in summer, huddled together like wild beasts throughout the long and dreary winter, one cannot think of their painful and miserable existence without a shudder. So Chips described them.

"Like to land, sir?" asked Chips; "I know, though, when you gets there what you see won't go far to raise your spirits."

"My dear Chips, no," replied Captain Boyd. "We have seen one specimen of these pretty people; we don't want to see another."

Towards the dog-watches, the wind, which had been going down and down all day, almost died away, and the *Oonalaska* was all but becalmed to the north of the Diomedes. Twin islands these are, lying in the Behring Straits, midway between the shores of Siberia and Alaska. They go by the strange sounding names of Ignalook and Noornabook. Not much more than two or three miles, either of them, they rise, like walls of adamant in the sea's midst, bold, bleak, and barren, and seem to guard the entrance to the Arctic Ocean.

To-night, however, they looked by no means forbidding. There was a soft purple haze, thrown like a curtain of gauze over them; the sea between was a deep, dark blue, with here and there floating hummocks of snow-covered ice.

(*To be continued.*)

"*A week filled with selfishness*, and the Sabbath stuffed full of religious exercises, will make a good Pharisee, but a poor Christian. There are many persons who think Sunday is a sponge with which to wipe out the sins of the week. Now God's altar stands from Sunday to Sunday; the seventh day is no more for religion than any other. It is for rest. The whole seven are for religion, and one of them for rest."—*Beecher.*

"*The writers against religion*, whilst they oppose every system, are wisely careful never to set up any of their own."—*Edmund Burke.*

HOMELY HOBBIES: RECREATIONS IN GEOLOGY.

By W. H. HARRIS, B.A., B.Sc.

No. 9. The Iron of a Thousand Articles.

IF any of our readers were asked to choose between the gifts of a ton of iron and a ton of gold, there is no doubt as to their decision. If, however, we could imagine the possibility of a transformation of all the iron in the world into gold, and that option were given to man as to the working of the change, it is quite sure the general vote would be in favour of things remaining as they are. And the preference would be most wise ; for, while gold has many qualities to recommend it, iron possesses far more. It would, indeed, be no exaggeration to speak of this metal as the backbone of civilization. In no part of the globe has man been able to make any great progress in the simplest arts, in domestic comfort, or in intellectual life, until he has learnt at least the rudiments of iron manufacture. The earliest implements of different human tribes seem everywhere to have been made of stone. The first grand advance was, as a rule, to the use of bronze, or alloys of copper. These possessed considerable hardness, and were fused and worked with tolerable ease. The final stage has been the acquaintance with, and manufacture of, the various ores of iron ; and we may, at all events roughly, estimate the wealth, the power, and the culture of any nation, as bearing a very distinct relation to the quantity and quality of the ferruginous beds readily accessible amongst the strata of the country.

We have no means of ascertaining the origin of the iron in the globe. Spectrum-analysis has proved its existence, actually in the form of vapour, in the solar atmosphere or photosphere. Meteorites, which fall from space on to the earth, always contain this metal. Its existence is inferred with tolerable certainty in others of the heavenly bodies. It seems safe, therefore, to conclude that it was among the original constituents of our planet. What were the conditions under which it first occurred terrestrially must be entirely a matter of speculation. Supposing the nebular theory of this world's formation to be true, we may imagine, with much probability, that the metals were, from their density and their rapid radiation of heat, among the first substances to condense from a vapourous condition into first a liquid, and then a solid form. This would imply their being subsequently covered by vast masses, which were of less specific gravity, and which cooled more slowly. Later on, through an immense accession of heat from the central incandescent and molten parts of the globe, there would be a great mingling of the first solidified substances of the earth's crust. The metals would be re-distributed among other minerals, and would form new combinations with these. Upheavals through subterranean agencies—especially those of shrinkage and of volcanic energy—would bring some of these metamorphosed beds to the surface ; and there, subjected to the action of atmospheric phenomena, a vast round of changes would commence. Rains of tremendous violence, and possibly at first of high temperature : oxygen, with its insatiable greed for iron : carbon dioxide, with a similar affinity for this metal : beside the tearing and wearing influences of sea-waves, river-force, and ice-action, would account for the distribution of ferruginous material, in course of ages, among the rocks in which it is so widely found.

As might be expected, its occurrence is not limited to any particular geologic formation, nor to any special epoch in the earth's history. It is, indeed, found in rocks of all ages, and seems always to have been circulating more or less in the veins of Mother Earth. In most countries it is met with in mineral springs. It appears in the tissues of some plants, and many animals. It exists to such a degree in human blood, that a story is told of an eccentric Frenchman, who had the dead body of a friend cremated, the metal extracted from the ashes, and a ring made of this iron. He thus possessed, and carried about with him, a very lasting portion and memento of the deceased person.

Though in itself an element—that is, consisting of matter which cannot be further analysed—iron has ever had a strong liking for certain other substances. Moreover, being somewhat fickle in its attachments, it has frequently changed its alliances, and continues still to do so. Within the limits of this Paper, we cannot fully discuss the question how far this fickleness has resulted in an important and remarkable fact. We must now content ourselves with mentioning what we may distinctly consider a providential arrangement. It is, that enormous and extremely valuable ores of this metal occur, for the most part, in close contiguity to the coal required for smelting them, and to the limestone which, mixed with them, renders them much more fusible and more easily separable from their earthy concomitants.

The affinity of iron for certain other substances is especially shown towards carbon, silicon, sulphur, phosphorus, and, above all, oxygen. Most of the metal used in commerce contains more or less of these ingredients, all of which, except the first, deteriorate its quality. Carbon, combined in *small* quantity with it, converts iron into steel—a truly valuable modification, as we all know. The other impurities greatly interfere with its value ; hence the scientific manufacturer directs his efforts to getting rid of them as far as possible.

The metal rarely occurs *native*, *i.e.*, in a pure state. Practically, all the iron we use is obtained, either from ores—carbonates, oxides, etc.—or from *ironstones*, in which it is mingled with various earthy materials. The ores occur chiefly in veins and masses of varying size, among the older rocks, and the ironstones among the carboniferous, liassic and oolitic strata. What is known as bog-iron is found in still more recent and quite modern formations.

Another subdivision of these metal-yielding compounds is into—1st, the *sparry* iron ores, including the clay-ironstones and "black bands" of the carboniferous and other series of rocks; and 2nd, the ozidized iron ores. We will give a few particulars of the chief varieties of this supply of our national wealth. *Spathose*-iron (from Greek, *spathe*, a broad blade), or *carbonate of iron*, is one of the most important sources of the metal. It has often a foliated, or leaf-like appearance. At other times it puts on granular, crystalline, concretionary, and earthy forms. The "black bands" in the coal-bearing strata contain so much bituminous or combustible matter, as to require no other fuel for their calcination. Hence these seams have a double value. As to their origin, we may perhaps receive some hints from the present production of bog-iron ore, going on in our own day in peaty districts, and to which reference will be made later on. Our country possesses inexhaustible stores of the carbonate of iron, and these are found under such previously mentioned favourable circumstances as to give every facility for rapid and profitable production. The coal-fields of Ayrshire, Lanarkshire, Shropshire, and South Wales, contain this most valuable adjunct to their mineral riches.

Belonging to the second class of iron-ores, we have the *magnetic*, or *black oxide* variety. It occurs chiefly in rocks that have undergone great change through vast heat and pressure—the so-called *igneous* and *metamorphic* classes. This is not one of *our* chief sources of the metal ; but in Elba and Spain this kind of ore has been worked from remote antiquity, and at the present day it supplies the basis of some of the finest steel in Sweden, Norway, Germany, and Russia. It has the disadvantage of being very difficult of fusion. Its magnetic properties, so immensely important for the navigation of the world, and for the inter-communication of the nations, can have here only this passing allusion.

Hæmatite (Greek, *haima*, blood), or *red oxide of iron*, is a more abundant, and to us more important variety than the preceding. It is worked largely in Cumberland, North Lancashire, Staffordshire, Devon, Cornwall, and South Wales. It is met with in kidney-shaped masses, which show a radiating crystalline structure when broken. Sometimes the texture is compact, or destitute of crystallization. Again, we have the substance known as *red-ochre*, which is an argillaceous or clayey modification of this same ore. When showing crystals of a dark steel-grey colour, it is called *specular iron*, and if foliated, and having a smooth feel, *micaceous-iron*. It yields, when smelted, excellent metal, possessing in a high degree the qualities of toughness and durability. The crystalline varieties seem, from their mode of occurrence, to point to deposition in cavities, from water holding the metal in solution. The ochreous kind is, probably, the result of the breaking down into fine mud of some rock, largely consisting of iron with alumina silicates.

Limonite (Greek, *leimon*, a moist meadow), or *brown oxide of iron*, is known by other names, as *pea-iron*, *bog-iron*, and *yellow-ochre*. As its etymology implies, it is frequently found in peats and marshes, and is then associated with a remarkable but very lowly organism, known to naturalists as the *Gaillonella*. According to Ehrenberg, these minute creatures are not more than $\frac{1}{12000}$ inch in diameter. It would, therefore, take 12,000 millions of them to occupy one cubic inch. The accumulation of the cases of these infusoria, no doubt, is one source of the beds of yellow ochre ; but indirectly, also, they contribute to these masses, first by the decomposition of their animal matter acting on peroxide of iron ; and secondly, by supplying nuclei, around which further deposits

of the metal have taken place, from water carrying it in solution or suspension. Bischoff, the great authority on chemical geology, considers that in marshes and morasses, there are various acids which dissolve the oxides of iron. These latter are converted into the carbonate by carbon dioxide, from decaying vegetable matter and animal remains.

This substance is again oxidized by contact with air, and then floats on the surface of the water as an iridescent film—a familiar object on marshy pools. After a time this sinks to the bottom, where it is again deoxidized by the decomposing organic matters. When all of the organic substance has been destroyed by decay, or ceases to supply carbon dioxide, the reduction of the peroxide can no longer go on, and then beds of bog-iron are formed. This close connection of peat and limonite seems to afford an explanation of, or plain hints concerning, the occurrence of iron-bands among the carboniferous strata ; for, as we said in our article on coal, many seams of this latter substance were once, in all probability, peat-beds, or morass and jungle growths.

There is one more compound of iron which we must not omit to mention, though it is not directly worked for the metal. This is *pyrites*, or sulphuret of iron. It is frequently employed in the manufactures of alum and sulphuric acid. The yellow gold-like patches, so often observable on coal, consist of this substance ; and it is owing to its occurrence that certain sorts of both coke and coal give off, in burning, most disagreeable sulphurous fumes. Its presence in our fuel is, probably, due to the decomposition of animal remains, embedded originally in the forests and vegetable growths from which the carboniferous seams were formed. We have said that this compound is not *directly* used for the production of iron. Very large quantities, however, of cupreous iron pyrites are annually imported into this country from Spain and Portugal, and are burnt for the making of sulphuric acid. From the residue the copper is next extracted ; and lastly, what remains yields an exceedingly large percentage of excellent iron, and to the extent of several hundred thousand tons yearly.

The importance of iron in our national industry may be realized from the fact that some twenty millions of tons of the various ores are annually consumed in the production of the metal, the worth of which, in its raw state, approaches ten millions sterling. There is probably not one of the arts or industries of the country which could be carried on without the aid of this material. It is essential for the simplest purposes of domestic life. Our houses, our clothes, our food, our home comforts, in a hundred ways, are dependent upon iron.

Each new scientific invention, every advance in the conveniences of existence, all progress in knowledge and culture, depend more or less directly upon this staple product. It is, therefore, well worth knowing about, and we recommend those of our readers who have opportunity, to make collections of the different kinds of ores, and of specimens of the metal in the various stages of manufacture. A cabinet thus filled could not fail to afford recreation and instruction, and would be valuable as a means of giving clearer ideas to other people about this highly important element in our national wealth. We might, indeed, with much truth, speak of the iron-trade as the barometer of our country's prosperity, and therefore, as a subject of intense interest.

"ABOUT OURSELVES."

WE do not like to withhold the results of our Literary Competition even one week from our readers. On page 253 will be found the names of successful competitors in three Divisions ; others will follow in our next issue ; and finally, the results of the examination of the Short Stories will be announced. This latter Division is the worst of all, as far as bulk is concerned.

We suffer from an epidemic of exams. just now! How very learned we ought to be, after correcting so many people's mistakes ! Our Spelling Chase is utterly subversive of all our preconceived ideas of orthography—we dare not let our proof readers even *see* the papers, lest the public should suffer.

Of the £100 Competition (closed on February 4th), we shall say more anon. Also our readers may expect some "fun" out of the Definition Competition ("Husband and Wife"), which closed on February 11th. The Acrostic Competition (see our number for December 17th, page 106) remains open till February 29th.

Next week we hope to announce a new Competition. It will equal in interest our Spelling Chase, which has created quite a *furore!* Note our novel "Thirty Nouns" Competition this week, with Two Prizes, on page 254.

Our next week's Number (Feb. 25th), in addition to the opening chapters of L. T. Meade's striking Serial, "That House in London," will contain an article from the gifted pen of Lady John Manners.

"A. L." is proving as seaworthy as heart could wish. Kindly words and warm appreciation waft her along ; we shall have to make fresh stowage for our cargo if we are to carry so many extra "thousands" each month.

DOUBLE ACROSTIC.

By E. M. S.

IN the pleasant woodland shade,
Where the throstle makes her nest,
On a bright summer morning my whole was laid
To rest.
Of the bearers, one was fair,
And the other owned my first,
And they slaked from a spring that was bubbling there
Their thirst.
As they buried me 'neath the tide,
A low, tenderly whispered word
To the fair one, "Say, love, can you be my bride?"
Was heard.
There was one both fond and true,
She had promised one day to wed,
But there's nothing at all that my first can't do,
So my second with sweetness and firmness too
She said.

---

1. This sad and painful we bewail.
2. These cloisters tell a holy tale.
3. And over this we throw a veil.

The Answer will be given in our Number for March 17th.

"QUIT YOU LIKE MEN."

By EMILY S. HOLT.

Author of "Mistress Margery," "The Lord Mayor," etc.

WHAT is a man?

Is that a very easy question? Well, then, try to answer it. It will be found harder than it appears.

Many people have done their best to define man. Plato stands first, with his definition of "a two-legged animal without feathers," which Diogenes ridiculed as merely a plucked cock. Others have offered various ideas : we have had man described as "a fire-making animal," "a cooking animal," "a laughing animal," and all are true, so far as they go, but they do not go far. They aim at some one characteristic which distinguishes the man from the brute ; but in each case it is by no means the highest characteristic of man, nor even the most apparent one. I have heard one definition which goes far beyond all these—describing man as a creature who *can think God's thoughts after Him;* and the more this is examined, the more just and elevated does it appear. Yet, if this be the correct definition of man, how far are most men from it! and, what manner of men ought we to be?

But we must come back to our question—What is a man? Let us study the word as conventionally used in common language. How constantly we hear such phrases as, "He is not a bit of a man," "There was not a man in the lot of them," "If he had been a man, he would have done this or that." What is the leading idea of such expressions? They do not question the age or sex of the individual ; they do not even throw discredit on his intellect ; they refer to the soul that is in him, to his moral nature. The idea is that of moral capability and nobility, magnanimity, strength, courage, sense. This, then, by the unconscious testimony of our own words, is what the ideal man ought to have and be. "Quit you like men" signifies, Be strong, be courageous, be firm, be noble, be capable, be sensible—nay, in a word, for there is no other so expressive, *Be men.*

Why was Rome taken by the Goths? It was because there were no men in her. There were only a few thousands of poor weak creatures—curled, scented, and be-silked, dissipated atoms, selfish animals, who were not men. And whenever a man devotes himself to a life of this kind—when he puts pleasure before duty, and thinks more of the shape of his moustache than of his moral qualities—he has ceased to be a man, and has become a mere animal. Or, whenever a man devotes himself to the money-getting business, simply for its own sake—when he has handled sovereigns, and counted them, and bartered them, and hoarded them, till at last he only thinks sovereigns—he, too, has ceased to be a man, and has become a golden image.

There are plenty of both these types in the present day, and always have been. Every land, and every age, produces both of them. But there is a third type, also very common among us, which seems to be, certainly not peculiar to the latter half of the nineteenth century, but to have come to its full development at this date. And just as some diseases are among the deadliest which are wholly internal, and make no show on the surface, so this third type of human creature, innocent as it often looks, may in time do more mischief than either of the other two.

We have heard of "muscular Christianity,"

and a good thing it is in the right sense of "a sound mind in a sound body." God means men to keep their bodies in health, so far as lies in them, as well as their souls. But what shall we say of mollusc Christianity?—jelly-fish Christianity?—froth and bubble Christianity?—for there is a large superabundance of that in the present day, both in boys and men—aye, and in women and girls too; don't let the ladies suppose themselves the innocent half of creation!—but it certainly shows the worst in men, because it is just the opposite of quitting themselves like men.

A certain Vicar once requested his teachers to ask the boys of their respective classes to attend a night-school, which he was about to open. Among these teachers was a lady who had a rather large class of boys, just at that age when boys are beginning to think themselves men. They were much attached to their teacher; but when she told them of the Vicar's wish, not a voice was heard in answer. Everybody sat still on the forms, and looked at everybody else. She asked them what they meant to do. They shuffled with their feet, and the one or two who made any answer were understood to growl that they "didn't know." So the teacher put her question in a more personal form.

"Will you go, William?"

"Well, I dunno, ma'am; maybe I might. I'll go if Jack will."

"Will you go, Jack?"

"Well, I shouldn't so much mind. I'll go if Charles will."

"Will you go, Charles?"

"I might. I don't know. I'll go if Sam will."

"Will you go, Sam?"

"Dunno. I'll go if Roger will."

Roger was the biggest and eldest of the group, and was evidently the final Court of Appeal. The baffled teacher turned to him. "Well, Roger, will you go?"

But all the answer that could be extracted from Roger was that, "Perhaps he might; he couldn't say."

Now, I find no fault with Roger for taking time to consider; but I do say that William, Jack, Charles, and Sam were anything but men. There was not one of them that appeared to have a scrap of will in him. Had they all said, "I will think about it," I could have respected them, for I was present; but the chorus all round, of "I will go if he will," was too much for me.

"Why, boys!" I cried in astonishment, "have you no wills of your own?"

The boys looked at me in considerable surprise, as if the idea suggested were quite extraordinary. Some seemed slightly ashamed; and William said, apologetically, "Well, ma'am, you see, one wants a bit of company!"

Well, if the proposal had been that they should sign a contract to go and live for a dozen years in Manitoba, thirty miles from the nearest neighbour, I should have thought it most reasonable that the boys should "want a bit of company"; but it did seem preposterous that none of them could spend an hour in a night-school without another boy to back him up, and comfort his weak heart!

Now, this is what I mean by mollusc Christianity—aye, and mollusc humanity, too—this contemptible weakness of a man's moral nature, so that he can do nothing unless somebody will wind him up, and stand by him while he does it. Men, strange to say, are more prone to it than women; and if men knew how women despise them when they show it, it might astonish them a little. A woman expects a man to be morally, as well as physically and intellectually, stronger than herself; and if she finds that he can do nothing without leaning on somebody else, how can she respect him?

All the great things of this world have begun by one man doing one thing. Those men who have begun them have hardly ever been of the mollusc type. They have generally been men who had wills, and set one aim before them, and stuck to it. Do you never notice that when a man says a bold thing, whether right or wrong, a hundred other men will immediately cheer him? Why did they not say it themselves? Very likely some were silent because it did not occur to them; and some because they had not the gift of speech. But the majority, you may be almost sure, were each of them waiting for one of the other ninety-nine to do it.

Three hundred years ago, a king of France visited a prisoner in the dungeons of the Bastile. The prisoner was a poor potter, but the king was anxious to save him, for he was a genius who had re-discovered the lost secret of making Majolica ware. He was accused of no crime but Protestantism; and if he could be persuaded to recant, and profess himself a Roman Catholic, the royal table might continue to be supplied with the choice porcelain.

"Palissy," said the king, "I am very sorry, but if you still refuse to recant, I shall be compelled to give you up."

"Sire," was the prisoner's answer, "have I heard the king of France say, 'I am compelled'? I cannot recant. No man shall compel a potter to bow down to images of clay. But, sire, which of us is the king, and which is the potter?"

He might well ask the question.

Is mere *will*, then, all that is required? Certainly not. A strong will, sanctified and given to God, is one of the most magnificent things on earth. No man can say what superb achievements, under God, may not await it. In like manner, a strong will given to Satan is one of the most terrible things under heaven, for no man can tell what ruin and misery it may cause. But I am not now dealing with this type of man, good or bad, but with the man who has no will, and can be set going in any direction, right or left, like a window-tassel, by a touch of anybody's finger. It is the weak nature of which I speak,—not the earnestly righteous, nor the determinately wicked. Such a man, well-intentioned though he may be, often does as much harm as the positively wicked.

This mollusc type of man is sadly on the increase. A gentleman, born in Canada, who had been a short time in England, said a few years ago that he had always heard of Englishmen as brave, sturdy fellows; but since coming over he had reached the deplorable conclusion that it took four Englishmen to make a man! Ought this so to be?

Even the mollusc men respect a real man: a man who knows what he wants, and what he believes; who acts up to his belief, and sets about supplying his want; who steadily pursues the right course, and lets nothing turn him out of the way. But who respects the mollusc? Poor creature! He dare not say his prayers lest Smith should laugh at him; he is afraid to allow that he holds an opinion, because Jones will despise him for it; he cannot go to church lest Carter should hear of it. He can generally afford to grieve his mother, and often be very blustering to his wife—the two people who care for him most in the world; but he cannot offend Dobbs, for whom he has no regard whatever, and who would not lend him a shilling if he were on his way to the workhouse. He learns to smoke at twelve or fourteen years of age, because, forsooth, he thinks it will make him look like a man. Like a MAN!—as if a man were made of tobacco-smoke, and not of a true heart and an able hand. Poor soul! he cannot behave really like a man, and say quietly and decidedly, "I do not choose to smoke." Why, what would Brown say?—and what would Walker think of him? The habit is costly, useless, dirty, disagreeable to others—but what does all that matter, if Saunders and Jackson do it, and will deride the poor mollusc if he does not do it too? And so with all other bad habits—however foolish or even wicked, the mollusc gives way at once; he cannot stand alone.

But how is the mollusc to become a man? How shall he learn to endure hardness, to brace his will, to be strong? Let him make a friend of The Man, Christ Jesus. Bring *Him* into the company. He will come if He is invited. "Where the Spirit of the Lord is, there is liberty;" but "if any man have not the Spirit of Christ, he is none of His." This is true in both senses, whether we understand it of the Holy Spirit sent by Christ, or of the mind that was in Christ. And as for earthly friends—why, those who are worth having will remain; and those who cannot bear the society of the heavenly Companion are not worth having; let them drop off, and the sooner the better. No man ever yet repented of having sought the friendship of Jesus Christ; many a man has repented of not having sought it sooner. And no man ever did seek it, poor, weak mollusc though he were, of whom it did not make, in the true and real sense of the words, A MAN.

AN ANAGRAM.

QUID est veritas? What is truth?

Ans.: Est vir qui ad est. It is the man who stands there.

The question, "What is truth?" addressed by Pilate to our Lord (John 18. 38), reads in Latin, "Quid est veritas?" It is a significant fact that by a simple transposition of the letters of this Latin phrase, it gives its own answer: "Est vir qui ad est,"—"It is the man who stands there."

Quid est veritas?

Throughout the marble dome it sped,
That eager, questioning cry;
While questioner and questioned stood
Apart from human eye.

The one with weary heart and brain,
Disturbed by anxious care,
Seeking for *truth*, yet knowing not
That *Truth* was standing there.

The other calm, serene, and pure,
Perfect in truth and grace;
The Majesty of heavenly power
Upon His kingly face.

No glimmer crossed the questioner's mind,
No voice the truth expressed;
Unheard, the angelic choirs on high
Cry, "Est vir qui ad est."

E. H. KNAPP.

"Some books are to be tasted, others to be swallowed, and some few to be chewed and digested."—*Francis Bacon.*

HOW OUR LETTERS GO TO INDIA.

By Tracey Layard Robinson.

The heat would be bearable,—but not what comes with it!

Part II.

On arriving at Alexandria, the mails are despatched overland, five or six hours afterwards, by special trains, usually at night, so as to leave Suez the next evening. The route taken by the train through Cairo saves about three days. Passengers overland are recommended to take a little brandy with them, because, notwithstanding the sultry heat of the day, the nights are piercingly cold, and persons unaccustomed to the climate are frequently attacked with cramps. It is necessary also to carry a veil, to be worn while crossing from Alexandria to Suez, as much to protect the face from flies and mosquitoes, as the eyes from the dreadful sand ophthalmia.

Leaving Alexandria, we pass through the flat and uninteresting Delta of the Nile, so called because the mouths of this great river cut the land into a form greatly resembling the Greek letter Δ (delta). One spot that we pass is, however, worthy of notice. This is the lake of Marcotis. The lake is seventy miles in circumference, and was originally a navigable sheet of *fresh water*, six feet in depth. The waters were dried up for ninety years, all communication with the Nile being then cut off. It is separated from the sea by huge mounds of sand, and its bottom is several feet lower than the level of the Mediterranean.

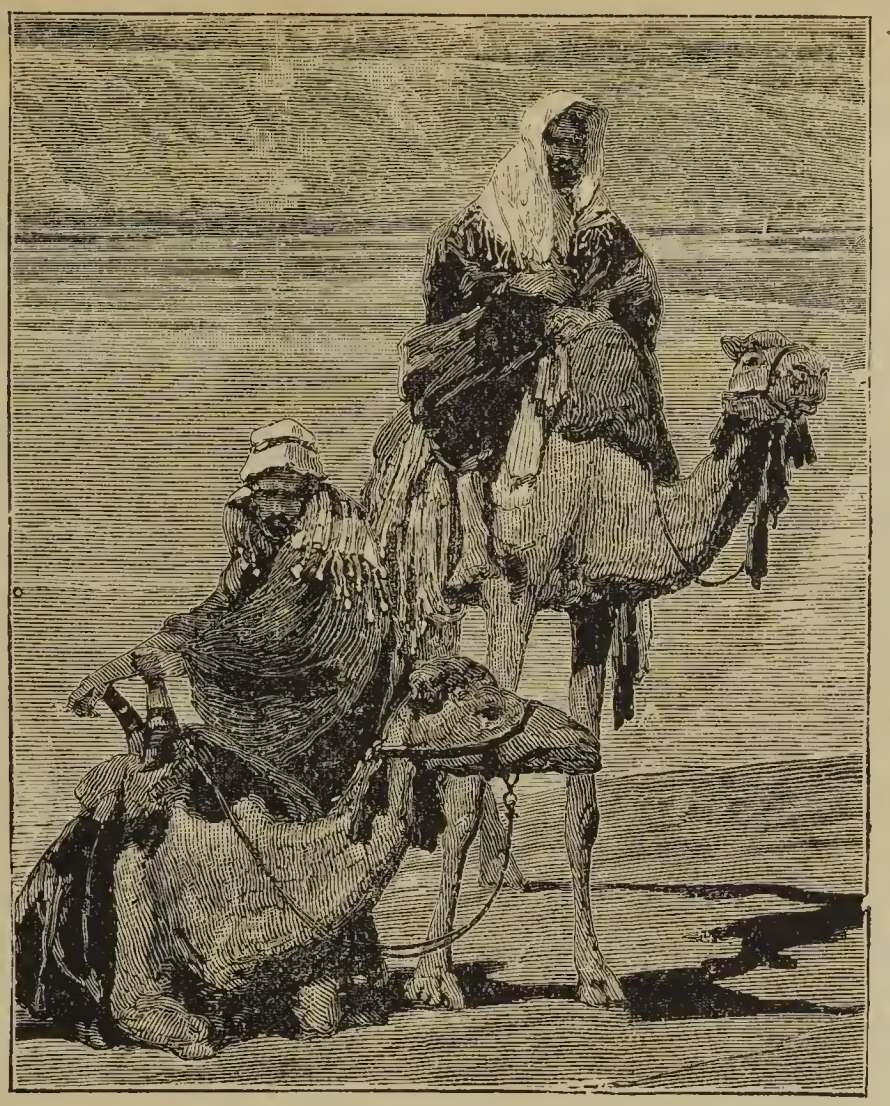
In 1788 the waters of the sea were, for military reasons, let in upon it; the sea flowed in for a week, three hundred villages were swept away, and their sites rendered barren. The bank was closed up again, the communication with the sea cut off, but the salt water remained in large quantities. This was repeated in 1801, 1803, and 1807. The water, when evaporated, leaves behind a vast expanse of dazzling, snow-white, sheet salt. At the annual flooding of the Nile, the lake reappears, but in the dry season it re-assumes its salt state.

A few villages, with dwarf palm-trees, mosques, and clusters of mud hovels, break the dull uniformity of the prospect, which is now and then enlivened, also, by a few sailing-boats passing up and down the Nile. Whole families are seated in these, the women all wearing the *yastmuthar*, or white mask. Hordes of buffaloes and camels wander along the banks, an occasional stray passenger passes on a camel, and the incessant creaking noise of the *sakias*, or water-mills for irrigating the land, is heard. On our route, we pass through Kafr-Dawar, the head-quarters of Arabi Pasha, who made this unknown place prominent, after the destruction of the Alexandrian forts by Admiral Sir Beauchamp Seymour (now Lord Alcester), in 1882. Next Damanhoor, leading to Tantah, where a mob of Arabi's friends, under Suleiman Sami, massacred a great number of Christians, and where, afterwards, 4,000 men and twenty-six guns surrendered to Sir Archibald Alison and his brave Highlanders. On through Birket-el-Sab, until we reach Benha, where the Cairo and Suez lines join.

As we "pass Massowah, going South."

It is here that we pass over the great ten-arch tubular bridge, eight hundred and seventy feet in length, constructed by Robert Stephenson over the Damietta branch of the Nile. The railway passes along the top of the bridge, a path on either side being made for foot passengers. The Nile, in its annual flood, rises to within eight feet of this bridge, which would, therefore, obstruct navigation but for an ingenious contrivance, by which the middle portion of the bridge, one hundred and fifty feet in length, is made to swing round on a pivot, so as to stand lengthways up and down the river when vessels require to pass.

From Benha, we next arrive at Minet-el-Kamh, near Kharieh, where Arabi Pasha was born; and, some thirty miles farther, we pass close to the English cemetery at Tel-el-Kebir, the scene of the terrible battle of September 12th, 1882, and the signal victory of the British army of 11,000 men over Arabi with 26,000, after a night march under the stars, and a twenty minutes' rush over the Egyptian defences. Thirty miles farther on, we catch sight of Ismalia to our left, a port on the Suez Canal, a sort of half-way capital between the Mediterranean and the Red Sea. It is here that the Sweet Water Canal empties; this comes from Zagazig, is forty feet wide, and nine feet deep, and was made to supply drinking water along the line. It turns off south to supply Suez, and sends branch pipes north to Port Said. Water to drink is almost an impossibility in the desert, and most of that around and about the district of Egypt is salt, and most unwholesome. The want of water was one of the most bitterly felt needs of our poor soldiers in the recent Egyptian campaign—a need which must be felt to be realised. We have now but fifty miles more before we reach Suez, the port of the Red Sea, and the eastern extremity of the



In the streets of Suez.

wonderful Canal, which, by remaining with the mail-bags, and taking the Overland Route, we have missed. But by so doing, we have made a gain in all of nearly *five days!*

The population of Suez is cosmopolitan; it consists chiefly of Turks, French, Arabs, Italians, and English, but there is a sprinkling, among the 14,000 people, of natives of nearly every country in the world. As we are going to Bombay direct, we have no trouble about seeking berths or making inquiries as to the time our steamer starts, but we are taken in the train at once to the new docks, and from thence to the ship. Suez has by no means an unhealthy climate. Indeed, although very hot from June to September, the quality of the air is enlivening, and, in winter, many confirmed invalids, suffering from lung disease, come here from Cairo and Alexandria on account of the fine, dry atmosphere. In fine weather, it is sometimes possible to see Mount Sinai. Our watches are by this time two hours and ten minutes slow.

We are now going to begin the most perilous part of our voyage, namely, a six days' trip down the Red Sea to Aden. We have finished the "overland" portion of our journey, and, until we reach Bombay, shall make the rest of it by sea. We do not quit the sight of land, however, altogether, until we get out of the Red Sea, when we shall have another seven days in the Indian Ocean, without a peep at any land at all. The Bahr Malak, or Salt Sea of the Arabs,

How they used to go.

is not reached until our steamer has proceeded a distance of one hundred and eighty miles along the Gulf of Suez, or Jubal Strait, as it is also called, a narrow mouth of water, six to ten miles broad, with ridges of tableland 3,000 feet high on both sides. Piloting is necessarily cautious work about here, for rocks and shoals are at frequent intervals. On reaching the Red Sea, the Gulf of Suez is joined by the Gulf of Akaba on the Arabian side, at an angle which encloses a mountainous region, eight thousand feet in height, including Mount Sinai. In the mouth of the Jubal Strait is Shadwan Island, where the P. and O. Company's steamer, *Carnatic*, was unfortunately wrecked on September 13th, 1869.

The Red Sea begins here; it is 1,100 miles in length, by from eighty to a hundred and fifty miles broad. It is supposed to have derived its name either from the quantity of red coral found in it, or from Edom (which signifies "red"), which was on its eastern shore. The water is singularly blue. It is remarkable for the number and size of its dangerous coral reefs, which are usually twenty or thirty feet below the surface, and are plainly visible in the clear blue water below. A little beyond the Jubal Strait we pass two remarkable rocks, called the Two Brothers, marked by a new lighthouse, opposite Kosseir, a good harbour on the Egyptian side, the nearest point in the Red Sea for the Nile across the Desert. Numerous boats are here seen, conveying passengers (pilgrims) to Jeddah, for Medina and Mecca, the birthplace of Mahomet, about three days' journey inland. From Mecca, this false prophet was driven to Medina, and thither, annually, at the recurrence of the anniversary of that event, all piously-disposed

"*The business of sorting the mails and stamping the letters, is done thus.*"

Mahometans resort, to spend their Hegira (Flight), as the epoch is called. Towards Mecca all Mahometans turn in their devotions. About two hundred miles farther is Souakin, the port of Soudan, the terrible events in which are of too recent a date for special notice.
